Tomatos.—Should the plants intended for autumn fruiting still be out-of-doors they should be placed in a house without delay. When three or four trusses of fruits have set, give the plants a top-dressing of loam and well-decomposed horse manure, and later when the roots have taken hold of this top-dressing give them an occasional sprinkling of some fertiliser. Stop the leading shoot when sufficient fruits have set, and remove all side growths. Water must be applied with care. Keep the plants near to the glass and permit a free circulation of air by opening the ventilators whenever the weather is favourable. Place them into their fruiting pots as soon as they are sufficiently well rooted—9-inch pots will be large enough—and employ a lighter compost than that which was used for the main crop. The flowers must be pollinated every day. Fumigate the house occasionally with a nicotine compound to keep white fly in check.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell
Park, Kent.

Apricots.—After the trees have been cleared of their fruits, late growths should be entirely removed and the necessary pruning attended to without delay. The object in pruning at this time is to remove any shoots that are not required, so that those which will furnish next year's crop may be fully exposed to sunshine and thus become thoroughly ripened before the end

of the season. If the pruning is done now, no winter pruning will be necessary. Give the trees a good washing with the garden engine, and afford water to the roots if required. Note any trees that have made gross growth with a view to root-pruning them next month.

Preparations for planting fruit trees.—If much planting is contemplated this season, it will be advisable to make an early start in preparing the ground. An ideal soil for fruit trees is a deep fertile loam. If the land is naturally poor in quality, it should be enriched with fresh loam at planting time. A compost suitable for mixing with the soil is formed of three parts good loam, and one part burnt soil and wood-ashes, with some old mortar rubble or lime; in the case of stone fruits a good quantity of this last material should be used. If the soil is already sufficiently rich, it should be deeply dug.

Pears, manure should not be used at the time of planting, as it encourages a gross, unfruitful growth, often necessitating root-pruning. The cultivator should encourage his trees to produce firm shoots of moderate size which will develop into fruit-bearing wood

PLANTS UNDER GLASS.

By A. C. BARELETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Violets in frames.—The plants should be transferred to their flowering quarters so as to become established before the winter sets in. Before lifting them see that they are thoroughly moist at the roots. Frames for Violet culture should face to the south, and be well screened from east and north winds. Partially fill the frames with stable litter and leaves or manure

the frames for at least a fortnight, or the foliage will become drawn and weak. The single-flowered varieties are not so amenable to frame culture as the double kinds. In cold districts it is advisable to plant, at least, a few lights of the single varieties. In this case afford 5 or 4 inches more space between the plants. Very fair results can be obtained by placing shallow frames over Violet plants in the borders where they are permanently planted. A few specimens in pots are useful for decorative purposes in the house or conservatory. For this purpose use relatively small pots, pot firmly, and stand the plants in the open for a short time before placing them in their winter quarters.

Preparations for winter.—As frost may now occur at any time, arrangements should be made to safeguard such tender plants as Euphorbias, Cinerarias, Primulas and Salvias, which have

FIG. 84.—BORDERS OF HARDY FLOWERS IN THE GARDENS AT ELMWOOD, KENT.

(See p. 196.)

or bastard trenched, thoroughly breaking up the bottom of the trench; on no account bury the top spit of soil to replace it with the inert sub-soil. If the soil is not naturally well drained, provision must be made for the removal of surplus moisture. Clear the ground of all perennial weeds and burn them, or they will prove a source of trouble later on. Leave the soil rough for the present to allow of weathering. The mistake is often made of digging in rank animal manure previous to planting fruit trees. This applies more particularly to Apples, Pears, and all stone fruits. In the case of small fruits, such as Raspberries and Gooseberries, manure may be used at planting time, as these fruit on shoots of the previous season's growth. In the case of large trees, such as Apples, Plums and

from a Mushroom-bed, treading the litter well, or the plants will sink after they have been planted a few weeks. A layer of soil about 6 inches deep should be placed on the manure and leaves; when the plants are in position they should be just clear of the glass. A suitable compost is one formed of three parts loam, one part each of leaf-soil and decayed manure, and a sprinkling of silver sand. If red spider is suspected, the foliage of the plants should be dipped in an approved wash as they are lifted from the open ground. Allow ample room between the plants and plant them firmly, keeping the crown just above the level of the soil. For a time no water will be needed at the roots, but the foliage should be sprayed towards the close of dry afternoons. Do not place the lights on

been, for some time past, growing in the open on beds of ashes or in cold frames. Moving plants to a fresh position affords a good opportunity for inspecting them for insect pests, tying the growths, or washing the pots.

Miscellaneous bulbs.—Besides the customary Hyacinths, Tulips, Narcissus, &c., such bulbs as Ixia, Babiana, Sparaxis, Camassia, and Chionodoxa are very valuable, when gently forced, for the spring decoration of conservatories, and for use in the house. Their requirements are very similar. The bulbs should be potted moderately closely together in 5-inch pots in a mixture of good soil, with a plentiful addition of sand. Throughout the winter they must be grown under cool conditions, admitting air to the frames as freely as conditions permit.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, SEPTEMBER 20—
Nat. Chrys. Soc. Executive and Floral Coms. meet. at Essex Hall, Sitand.

TUESDAY, SEPTEMBER 21—
Nat. Dahlia Soc. late Exh. at Roy. Bot. Gardens, Regent's Park (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty years at Greenwich—65.9°.

ACTUAL TEMPERATURES.—
LONDON.—Wednesday, September 15 (6 P.M.): Max. 62°; Min. 48°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden London—Thursday, September 16 (10 A.M.): Bar. 30; Temp. 61°; Weather—Sunshine.

PROVINCES.—Wednesday, September 15: Max. 50° Cambridge; Min. 52° Scotland E. coast.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulls, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

THURSDAY—
Clearance Sale of Greenhouse and other Plants, two Houses, Greenhouses, Piping, Sheds, Furniture, and effects, at the Elm Garden, Gollers Green Road, Hendon, by order of Messrs. Morle & Co., by Protheroe & Morris, at 12.

FRIDAY—
A Private Collection of Established Orchids and others, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The
Microscope
as a
Tool for
General
Use.

Many years ago a deputation of silk-worm cultivators waited upon Louis Pasteur, who was engaged in the investigation of the silk-worm disease, then causing much havoc and loss to an important French industry. Pasteur endeavoured to explain to the members of the deputation that the disease of the worms was due to a parasitic microbe, and showed them how the disease could be detected by means of the microscope. To the objection that the microscope was too complex an apparatus for ordinary man to use, Pasteur replied by pointing to his little daughter of 12 years of age, who was acting as a skilled assistant to him in his investigations. Since that time this instrument has come more and more into use, not only in the laboratory, but also in the workshop, and it is certain that, in the near future, the ready assistance which it can render to all kinds of industries will be yet more fully recognised.

Already it is one of the chief agents in use for detecting adulteration in food stuffs: a suspected Tea-leaf may be interrogated by its means in a minute or two and by reason of the peculiarly-shaped

cells or idioblasts which Tea-leaves contain the suspicion justified or dismissed. The structure of dead things, of iron and steel, for instance, is found to be no less extraordinary than that of living tissues, and the changes which dead structures undergo are investigated by its means. It is scarcely an exaggeration to say that the modern industry of brewing is based on the use of the microscope. By its use Hensen, of Copenhagen, was able to show that brewers' yeast as formerly employed consisted of many varieties of Saccaromyces, and that the brewer, in using ordinary yeast, was behaving like a cultivator who used for bread-making purposes all the plants growing in a corn-field. By means of the microscope and modern methods of microbe-cultivation, his pupils were able to weed out undesirable forms of yeast and to obtain pure cultures of those which set up the desired forms of fermentation.

It may be predicted surely that what has been done for beer will be done for cider. The use of the microscope in medicine, in the discovery of new worlds of microscopic organisms, is too well known to need more than passing mention. Now, according to an interesting article by Mr. J. E. Barnard in a recent issue of *Nature* it appears that the microscope is coming into general use in the dairy, the mineral-water factory, in paper-making, printing, and in the cotton and silk industries. The architect is beginning to use it before deciding on the stone for his buildings; the great laundries, dyeing and cleaning establishments are finding in this instrument a precious ally. Not only may the nature of the "dirt" to be removed be determined by its means, but also that of the fabric—whether silk or cotton, for example. By the examination of a thread the nature of the fabric may be discovered, and thus the cleaner or dyer may safeguard himself when an article, reputed to be of pure silk, but which he determines by microscopic examination to be of very mixed nature, is put into his charge.

In horticulture, too, the value of the instrument is coming into more general recognition. With but a very small amount of skill a gardener may detect with certainty many of the fungus and insect pests with which he has to contend. As we all know full well, it is of the first importance to identify these pests at the earliest moment: a few days' delay, and the damage is done. When gardeners recognise how easy it is to use and how valuable a tool it is, they will carry a lens as they carry a pocket-knife, and will provide themselves with a microscope as they provide themselves with a fumigating or spraying outfit, and at very little cost. From being a toy for the leisured, the microscope has become a tool for the busy man.

Artificial
Manure.

We are glad to see the issue of a new edition of Ville's *Artificial Manures*, which almost a generation ago was recognised as the standard treatise on these important adjuncts to good culture. M. Ville was one of the world's most eminent pioneers in educating the agriculturist in the use of what were formerly called chemical manures,

* By M. Georges Ville. Translated by Sir William Crookes, D.Sc., F.R.S. New edition revised by Sir W. Crookes and Prof. John Percival, M.A. (Longmans Green & Co.)

and his exposition of the nature and part played by the latter in the nutrition of crops in general still stands unrivalled for clearness and accuracy. The translation by Sir Wm. Crookes has lost none of the good qualities of the original.

Part I. is concerned with the composition of plants, the assimilation of carbon, oxygen, hydrogen and nitrogen. In regard to the last element it may be mentioned that Ville's experimental work was ahead of his time, and that his conclusions, based upon careful research in respect of the fixation of free atmospheric nitrogen by leguminous plants, although formerly disputed, have been amply corroborated by more recent workers.

The nature of the mineral constituents of plants is discussed in subsequent chapters, and their function in the economy of crop production is emphasised. In chapters 4 and 5 the composition of farmyard manure, its origin and cost in comparison with that of artificial manure, are thoroughly dealt with. After an exposition of the principles underlying the use of typical fertilisers, old and new, Ville devotes the rest of his treatise to the discussion of the best and most economical means of applying them to farm practice. He kept careful accounts of the results and cost of his own farming operations, and obtained similar figures from other sources. Perhaps it is this part of the work which will appeal most forcibly to men on the land, and although the farmer rarely trusts figures which concern the cost and ultimate return from isolated farm operations, he will find carefully marshalled facts and figures which show the economic value of the right application of artificial manures in the growth of all the more important agricultural crops.

The volume has been revised, in the light of discoveries made since Ville's time, without interfering with the work as it was originally presented. Substitutions have been made in the formulae of mixtures of manures for Wheat, Barley, Mangel, Bean, and other crops where cheaper materials have become available, and additional matter has been added upon the nature and use of basic slag, basic superphosphate, nitrate of lime, and other fertilisers which have come into use in recent years.

An excellent and up-to-date chapter has also been written by Sir William Crookes upon the fixation of the nitrogen of the air for manurial purposes.

We heartily recommend the volume as a classic which should be upon the shelves of all who are interested in the raising of crops and the maintenance of the fertility of the land.

M. VIGER, who has recently been appointed an honorary corresponding member of the Royal Horticultural Society, has for many years past occupied the position of President of the National Horticultural Society of France. Wherever French horticulture is represented, either at home or abroad, M. VIGER is to be found in his official capacity. Formerly, when Minister of Agriculture, he gave many proofs of his great interest in the sister industry. English visitors to French horticultural shows are well aware of M. VIGER's kindly courtesy and hospitality. There are many honoured names among those comprised in the list of honorary and corresponding members of the Royal Horticultural Society, but we find only two other names of Frenchmen, namely, M. ANDRÉ and M. GEORGES MANTIN.

SECOND DAHLIA SHOW.—The second show of the National Dahlia Society, which was formerly held under the auspices of the London Dahlia Union, will take place on Tuesday and Wednesday next, September 21 and 22, at the Royal Botanic Gardens, Regent's Park, N.W. Full particulars of the show may be obtained from Mr. E. F. HAWES at the above address.

LEGACY TO A GARDENER.—Under the will of CAROLINE, Lady SAYE and SELE, Hereford, a number of legacies are bequeathed to servants. These amount to about £3,000, and they include a sum of £200 left to her ladyship's gardener, Mr. WILLIAM CLARKE.

MR. J. BENNETT.—Friends of Mr. J. BENNETT, gardener to the Hon. C. H. WYNN, Rûg, Corwen, N. Wales, will learn with regret of the recent bereavement he has suffered in the death of his wife after a prolonged illness.

MESSRS. DICKSON & ROBINSON'S ONION SHOW.—This Manchester firm held a competition on Wednesday last for the finest Onions grown by its customers. Competitors were required to send four bulbs, the judge being Mr. BEN. ASHTON, Lathom House Gardens, Ormskirk. Ten prizes were offered, and nearly 120 exhibits were judged. We are informed by telegraph of the names of the principal prize-winners, which are as follow:—1st, Mr. EDWIN BECKETT, Aldenham House Gardens, Elstree, with four bulbs weighing 8 lbs. 5 ounces; 2nd, Mr. BOWERMAN, Hackwood Park Gardens, Basingstoke, 8 lbs. 10 ounces; 3rd, Mr. WILKINSON, Tyntesfield Gardens, Flax Bourton, 8 lbs. 6 ounces; 4th, Mr. JOHNSON, Duffield House Gardens, Slough, 8 lbs. 4 ounces; 5th, Mr. DUNCAN, Merstham House Gardens, Merstham, Surrey, 8 lbs. 7 ounces; 6th, Mr. AVERY, Loudwater House Gardens, Rickmansworth, 7 lbs. 3 ounces; 7th, Mr. FOLKES, Amptill, Beds., 7 lbs. 10 ounces.

"HORTICULTURAL DIRECTORY."—We are asked to state that the Editor of the *Horticultural Directory*, 12, Mitre Court Chambers, Fleet Street, London, will be obliged if head gardeners will notify him of any changes of title or address that have occurred since October, 1908.

THE CULTIVATION OF INDIGO IN INDIA.—The progress which synthetic Indigo is making may be inferred from the returns published by the Government of India with respect to the areas under different crops. Though, as compared with 1897-8, the areas under cultivation in 1906-7 show, in the case of all other crops, a considerable increase and a total increase of 18 million acres, the area under Indigo cultivation has diminished by about 900,000 acres. Whether improved methods of cultivation will enable the natural product to compete successfully with that prepared in the laboratory remains to be seen.

DRY ROT OF POTATOS.—The evidence that the fungus of dry rot of Potatos may attack not only the stored tuber but the growing plant, appears now to be fairly conclusive. Beside the evidence of SMITH in America, and of Miss LONGMAN in this country, we have that published by Mr. POLE EVANS in the *Annual Report of the Transvaal Department of Agriculture*. Mr. EVANS finds that, in the Transvaal, the fungus attacks the tubers in all stages of their growth, and sets up in them a putrid rot whilst they are still in the soil. It is noteworthy that, whilst the Transvaal does not admit infected Potatos—or, rather, such as can be discovered to be infected—into the country, the other colonies of S. Africa have adopted no such prohibitive measures. When the Union is an accomplished fact, it is probable that uniformity of legislation with respect to the control of horticultural and agricultural pests will be adopted.

LIGNUM NEPHRITICUM.—Those who have been interested in the correspondence concerning the origin of Lignum Nephriticum which was published recently in these pages will find an admirable and conclusive article on the subject from the pen of Dr. OTTO STAFF in the *Kew Bulletin*, No. 7, 1909. The account refers to the attention which, by reason of its medical and physical properties, Lignum Nephriticum attracted in the 17th century, and points out that the suggestion due to Linnaeus that it is the wood of the Horse-radish tree (*Moringa pterygosperma*) is erroneous. After full investigation Dr. STAFF found that the old Mexican vernacular name for Lignum Nephriticum, namely, Coatlî, is mentioned in Mexican literature relating to plant names as referring to *Eysenhardtia amorphoides*. It was then discovered that specimens of the timber of *Eysenhardtia* exist at Kew, and that one, obtained from the International Exhibition at Paris in 1900, was marked Cuatlî. On infusion with water the wood of this specimen gave the blue colour characteristic of Lignum Nephriticum. In the course of his researches, Dr. STAFF obtained a great deal of interesting information on the history of our knowledge of the properties of this wood, which knowledge he has brought together in the pages of the *Bulletin*.

THE BOTANICAL GARDEN OF JOHN HOPKINS' UNIVERSITY.—Like the Berlin Gardens described in a recent issue, the gardens of JOHN HOPKINS' University have been established primarily as an aid to research and instruction. Of the four sections into which the gardens are divided (see *University Circular* No. 217), two are devoted to the cultivation of plants illustrating the vegetative and reproductive organs of plants. The third serves to illustrate plant relationships, species, genera, &c. The fourth is divided into two parts, for economic and cultivated plants respectively. The three genera, *Dianthus*, *Rosa* and *Chrysanthemum*, have been chosen to illustrate the origin of horticultural varieties.

VIOLAS FOR BEDDING.

(See Supplementary Illustration.)

As a lover and cultivator of Violas for nearly 30 years, I rejoice at the renewal of interest in these charming flowers. In looking over reports of trials made many years ago at Chiswick Gardens and at Regent's Park, I was impressed by this fact—how completely the old rayed type of flower has been superseded in recent years. The late Dr. Stuart, of Chirside, Scotland, was one of the first to raise a perfectly rayless Viola. He informed me that a friend remarked to him in his garden one day, "If you could only get that white variety without rays in the centre it would be a great improvement." Dr. Stuart kept a sharp look out amongst his seedlings, but it was 10 years before he succeeded in finding a rayless flower. It was in 1887 that he first found a pure white variety without rays or markings of any kind.

Failures with Violas in the south largely arise from planting the wrong varieties. If Violas can be grown in the Royal Horticultural Society's Gardens at Wisley, they can be grown anywhere in England. The last trial of Violas at Wisley was in 1904-5, and the superintendent, Mr. Wright, in his report, published in the *Society's Journal*, said, "All the varieties made excellent growth, and with a mulch of well-decayed leaf-mould to keep the roots cool and moist the plants blossomed freely and continuously from May to the late autumn." With a view to discovering those varieties which would grow and flower best in the south, I formed at Mark's Tey, Essex, in October, 1907, a large collection from all the leading growers and raisers. The same plants have survived two winters and flowered splendidly during two summers. I have noted the following particulars respecting those which have drawn up the following data on those which have done best:—*White*: Snowflake, a beautiful, pure-white, rayless flower of excellent substance, and a strong grower; Seagull, a charming rayless flower of fine form, the plant is compact and rather dwarf; Peace, similar in form and habit to Seagull, but shows lavender shading in continued damp weather, rayless; Sylvia (Dr. Stuart's), a fine, rayless, creamy-white variety; White Empress, a large-flowered, rather taller-growing, cream-coloured variety, rayless; Pencaitland, white, with yellow blotch and rays, dwarf in habit, and very effective as a bedder. *Yellow*: Kingcup, a clear-yellow rayless flower, the growth is rather tall; Royal Sovereign, dwarfier than the last-named, golden-yellow, rayless; Redbraes Yellow, a splendid yellow variety of medium habit, rayless; Mrs. E. A. Cade, a fine flower medium in shade and habit, rayless; Bullion, very bright and dwarf, early in blooming, rayed; Walter Welsh, a tall, deep-coloured, yellow variety, with rays, excellent for a back row in a bed of Violas. *Primrose*: Primrose Dame, a clear-primrose colour, rather tall, rayless, a most effective variety; Sulphurea, dwarf in habit, very free in flowering, the large flowers are slightly rayed. *Light blue and lavender*: Blue Duchess, a distinct variety, pale blue, rayed like Duchess of Fife, from which it is a sport; Kitty Bell, lavender, hardy and free, rayless; Florizel, similar in colour to Kitty Bell, rayless; William Niel, rosy lavender. *Dark Blue*: Blue Rock, extremely hardy, a most effective variety; Royal Scot, similar in a mass to Blue Rock, but not such a fine flower; Archd. Grant, deepest violet, a strong grower, rather late in blooming; Edna, deep purple-violet, with blotch, really a bedding Pansy. *Crimson-purple*: Jubilee, this proved the hardiest of the crimson-purple varieties, medium in height and most floriferous. All the foregoing were propagated by root cuttings in the summer of 1907, and were planted out in open beds in October of that year on a stiff, clay soil. William Cuthbertson.

CENTENARY OF THE ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

A SUMMARY OF ITS HISTORY.

The origin of the Royal Caledonian Horticultural Society takes our mind back to December 5, 1809, and to a place called "The Physicians' Hall." A meeting held on that date was composed of the following 17 gentlemen:—Sir James Hall, Bart., Alex. Gibson Hunter, James Hare, Dr. Andrew Duncan, sen., Dr. James Home, Dr. Andrew Coventry, Thomas Dickson, Andrew Dickson, James Macdonald, George Whittit, John Fletcher, John Hay, Thomas Shade, Edward Sang, Patrick Lyon, Walter Nicol, and Patrick Neill.

The Last Post has long been sounded over the graves of these men, but we should do honour to their memory, because it was those 17 gentlemen who met together 100 years ago and who formed the society. Dr. Duncan was elected to the chair, and the meeting resolved to constitute itself a society for encouraging and improving the cultivation of the best fruits, flowers, and most useful culinary vegetables. It was moved and seconded "that Sir Joseph Banks, Bart., Thomas Andrew Knight, Richard Anthony Salisbury, each of whom have distinguished themselves as patrons of the English Horticultural Society, be enrolled as honorary members of the society."

The meeting then made choice of the following office-bearers for 1810:—President, the Right Hon. the Earl of Dalkeith; vice-presidents, Sir James Hall, Bart., of Douglass, Dr. Rutherford, Dr. Coventry, and Alex. G. Hunter; secretaries, Mr. Walter Nicol and Mr. Patrick Neill; treasurer, Mr. Andrew Dickson.

The first council was composed as follows:—Professionals: Thomas Dickson, James M'Donald, Edward Sang, Thomas Somerville, John Fletcher, and John Hay. Amateurs: Dr. Duncan, sen., Dr. James Home, R. Hodshon Cay, George Bruce, Thomas Hutchison, and James Smith. This was the first council, and were we to call the roll we should again find none to answer to their names.

Mr. Andrew Dickson was empowered to receive subscriptions and annual payments, and to discharge all debts incurred by the society.

Sir James Hall, Bart., first vice-president, having taken the chair, the thanks of the meeting were unanimously given to Dr. Duncan, sen., for the zeal and activity displayed by him in promoting the institution and for the suitable manner in which he had conducted the business of the day.

Such is the history of the inauguration of the Caledonian Horticultural Society.

The next business was to form committees to draw up schedules, and what was termed "Prize Questions," which was duly done.

The first exhibitor of the society was Mr. M'Donald, Dalkeith Gardens, who showed a quantity of blanched Seakale shoots, and at the same time he read an account of how these had been produced. The first judges were:—Walter Nicol, Robert Liston, Thomas Hutchison, George Bruce, Thomas Dickson, and James M'Donald.

The first prize that was offered was a silver medal for the best Radishes raised in the open ground and offered for sale in the Edinburgh market. This medal was awarded to Mr. James Thomson, gardener, Duddingston, for 300 Radishes brought to market from the open borders. The first communication read to the society was a paper by Dr. Duncan, entitled "An Account of a Method of Preparing a Soporific Medicine from the White Juice of the Lettuce." The second was from Mr. John Sheriff, "On the Curle Disorder in Potatoes," and in connection with this lecture the following extract seems to have been almost a prophecy:—

It may perhaps be alleged that Potatoes in particular situations never become diseased or curled. To this it may be replied that the contrary fact has been ascertained by experience, for it is apprehended that not a

single healthy plant of any sort of Potato that bears apples or berries, and that was in culture 20 years ago, can now be shown.

It may also be said that Potatoes which have become diseased or curled have been restored to health for several seasons. To this it may be answered that vegetables as well as animals may be sick and recover, and that from unknown as well as known causes.

Mr. Knight restored the wood of the languishing Golden Pippin and enabled it to produce fair flowers and fine fruit by protection and a favourable soil, but this was only a temporary renovation, as the health of an aged valentinian is preserved for a few years by the aid of cordials and the general influence of a milder climate.

It is well known that Potatoes cultivated in situations where the plants annually ripen their berries soon become diseased or curled, while plants from the same individual seedling in upland situations, where there is not sufficient warmth any season to mature their fruit, continue for a longer time comparatively healthy. In the first case premature old age seems to be brought on by excessive annual seed bearing. In the last case the plants, or rather bulbs, as they make less exertion continue longer vigorous. The maximum of the duration of the life of every individual vegetable, as well as animal, is predetermined by Nature under whatever circumstances the individual may be placed. The minimum, on the contrary, is entirely determined by these very circumstances. Admitting, then, that a Potato might reproduce itself from bulbs for a considerable number of years in the shady woods of South America, of which it is a native, on the mountainous regions of Europe, we find it soon becomes abortive in the cultivated champaign of Britain. That some particular sorts of Potatoes are longer lived than others cannot be doubted, but surely it is not much more philosophical

the expense of the society, and that the committee be also empowered to make application to Government for aid if such a measure shall seem to them to be advisable." They were afterwards allowed a Government grant of £200 a year.

The first bunch of Grapes of the variety Black Hamburg, was shown on September 3, 1811, of which the largest berry weighed 170 grs., and measured 3.3 inches in circumference. In this instance an extraordinary medal was awarded.

In 1813 awards were made for home-made wines, nearly all the prizes being gained by ladies. In 1814 exhibitors were allowed to choose prizes for themselves, and it is related that some selected spectacles, and others umbrellas, teapots, dessert spoons, mirrors, fruit knives, writing desks, and such like articles. Meanwhile the society continued to offer medals for seedling Apples, Pears, Plums, plants, and flowers, adding to the number of its members and altering its rules and regulations as the exigencies of the times rendered necessary.

In the year 1815 it was proposed by Sir John Sinclair that the society obtain a horticultural survey of the Netherlands made by intelligent men, and it was imagined that this might be

FIG. 85.—GENTIANA FREYNIANA, A NEW SPECIES FROM ASIA MINOR.

to expect that the horticulturist should be able to give everlasting vigour to individuals than that the physician should be able to do so to those of the human race.

Reasoning from what we know, there appears little doubt of the Potato in a cultivated state being a short-lived plant, and therefore, though it may be preserved longer healthy by growing it in elevated or shady situations, and perhaps by cropping the flowers and thereby preventing the plants from exhausting themselves by annually maturing their seeds, yet we have every reason to expect that disease will sooner or later, according to circumstances, make its attack. The obvious inference is that to obtain vigorous plants and secure productive crops, recourse must frequently be had to varieties newly raised from seed.

The third communication was from Mr. MacMurray, on the Gooseberry caterpillar and the maggot which infests Onions. The fourth was from Mr. Wighton, Melville House, on destroying insects and canker in fruit trees, all work which, at the end of 100 years, still occupies our attention.

At a meeting held on March 28, 1811, a committee was appointed "to look out for a proper place for a garden in the neighbourhood of Edinburgh in which experiments on horticulture may be conducted under the direction and at

executed at the expense of £100, but as the ordinary funds of the society could not afford it, a particular subscription was set on foot for this purpose. In 1817 the council signified its wish that the survey should be undertaken in that year. In this year also Messrs. Cuninghame, of Comely Bank Nursery, were awarded a silver medal and five guineas for their Mushroom beds, "from which the inhabitants of Edinburgh may now be supplied with fresh Mushrooms during nearly all the year, and with genuine ketchup."

A medal was also offered in this year to the gardener who had served for the longest period the same master or family to the satisfaction of his employer. The medal was awarded to Mr. Alex. Greig, who had been gardener in the family of Colonel Blair, of Blair, for 45 years.

The Report of the deputation sent by the society to Flanders, Holland, and the north of France was now produced, but, being too voluminous to be read, was meanwhile left over, and was published in book form in 1823 under the title *Journal of a Horticultural Tour Through*

Some Parts of Flanders, Holland, and the North of France. Mr. Neill, who, along with Mr. John Hay and Mr. MacDonald, Dalkeith, formed the deputation, was the author of the Report.

In June, 1818, it is reported how, at one of the meetings, Sir George Mackenzie, Bart., stated that several highly respectable members had suggested the propriety of the society interesting itself to procure the establishment of a commodious permanent and regular fruit and flower market in Edinburgh, the want of which deprived the inhabitants of many comforts and luxuries which in other circumstances would pour into the city from the numerous gardens which surround it. After some observations by the Earl of Wemyss illustrative of the importance of such a market, this business was referred to the council.

On September 4, 1823, the 14th anniversary of the society was celebrated, on which occasion 120 members sat down to dinner. The dessert consisted of 80 dishes of Grapes, 40 of Peaches, Nectarines, Plums, and Apricots, 30 of Apples and Pears, and 20 of Gooseberries, 22 Melons, and 10 Pineapples.

Referring to the meeting held on March 28, 1811, when the advisability of having an experimental garden was broached, we find the matter again brought up on January 13, 1824, when a committee was formed to raise funds for securing and maintaining an experimental garden. On July 15, 1824, the society obtained possession of ground at Inverleith, and Mr. William M'Nab was engaged to provide a plan for laying out a garden, for which he was duly awarded a gold medal. In this year also the Royal Charter was procured. James Barnet was at this time brought from London to be the first superintendent of the gardens, but some years afterwards he was dismissed for mismanagement. Mr. M'Nab was appointed his successor in October, 1836, and he was succeeded in 1850 by Mr. Evans.

The first big flower show was held in the gardens on August 7, 1828, when there was shown amongst other things 35 seedling Gooseberries by Mr. White, of White Hill Gardens, Lasswade.

On July 3, 1830, another flower show was held, and a musical promenade, where refreshments were supplied, proved extremely popular.

The meeting of July 3, 1837, was postponed, owing to the death of King George. *David W. Thomson, Edinburgh.*

(To be continued.)

TWO NEW GENTIANAS.

ANY addition to this beautiful family of rock-garden and border plants is welcome, especially those that are easily grown. During the late summer and early autumn one of the most effective displays in the rock-garden is furnished by a bank of the Willow-leaved Gentian (*G. asclepiadea*), in both blue and white varieties. Although difficult to transplant, this species comes up freely from self-sown seed in damp, shady corners, but, on the contrary, if the seed is gathered and allowed to become dry it takes a long time to germinate. Another late-flowering species is the well-known *G. septemfida*, a native of the Caucasus. This latter is a most variable plant, and three different forms have been figured in the *Botanical Magazine*.

In habit and appearance the new species *G. Freyniana* (see fig. 85) most nearly resembles *G. septemfida*, but differs chiefly in having much larger flowers. These are more inflated towards the mouth, while the fringed crest which intervenes between the larger segments of the corolla is not so prominent. During July and August the beautiful dark blue flowers, with a paler throat, are produced in terminal heads, in which the blooms are closely packed together; each flower lasts in perfection for nearly a fortnight. This Gentian, like most of the other members of the family, prefers a half-shady posi-

tion; the group shown in fig. 85 is growing in a north-western aspect, where the sun's rays only reach in the late afternoon. Planted in deep well-drained, loamy soil, each plant produced several procumbent stems about 9 inches or more in length, each terminated by a head of flowers. *G. Freyniana* is a recent introduction from Asia Minor, the plants illustrated having been received in 1906. Other late-flowering Gentians include the North American *G. Andrewsii*, with blue flowers having a contracted mouth tipped with white, and the Japanese *G. scabra* var. *Buergeri*, a tall-growing, autumn-flowering plant also having blue flowers.

GENTIANA CORYMBIFERA.—All the New Zealand Gentians are somewhat similar in habit and appearance, and were formerly included in one comprehensive species under the name of *G. saxosa*. Cheeseman, however, in the recent *Flora of New Zealand*, admits 16 different species which are described with well-marked characters. Whilst our gardens contain many representatives of the genus from all over the northern temperate regions, so

FIG. 86.—GENTIANA CORYMBIFERA, A NEW SPECIES FROM NEW ZEALAND.

far as I am aware, the new species *G. corymbifera* (see fig. 86) is the only one in cultivation from the south. Seeds were received from New Zealand under the name of *G. pleurogynoides*, which is a Tasmanian species, but which name has been applied by botanists to some of the New Zealand plants. *G. corymbifera* is found on the mountains of the south island at elevations ranging from 1,000 to 4,000 feet. The plant is said to be abundant and flowers there from January to March. It grows from 12 to 18 inches high, with usually simple stems branching toward the top and bearing corymbs of white flowers from $\frac{3}{4}$ inch to 1 $\frac{1}{2}$ inch in diameter. Like many New Zealand plants it did not survive the winter in the open, all those planted out-of-doors being killed. The plant shown in the illustration was grown in a cold frame at Kew. Before sending up the inflorescence it produced a tuft of narrow, strap-shaped leaves about 4 inches long. *W. T.*

PLANT NOTES.

OURISIA COCCINEA.

MR. ARNOTT'S note on this plant (see p. 417) leads me to describe my experience with this beautiful but capricious native of Chili. About six years ago I made a long bed on a ledge about 18 inches above the ground level, which was only exposed to the sun for under three hours in the day. It was composed entirely of sandy peat mixed with small fragments of charcoal. Having obtained several plants of *Ourisia coccinea*, I set them out in this bed and watered them well. The spot is intensely dry, and unless moisture is artificially supplied, none but drought-loving plants can exist. The *Ourisias* grew well, and the second year I had over 40 flower-spikes about 18 inches in height, and congratulated myself that the plants were permanently established. However, the next year their ranks were thinned, although copious waterings were frequently given, and in four years not a plant was left. Last year I wrote to Mr. Walpole, of Mount Usher, where I knew the plant was a weed, and asked him if he could spare me some specimens. He most generously sent me a small hamper full, and these were carefully planted in the same bed and well watered. This was in October, but during the winter they all died, and there is now not one left. I noticed that these plants had been grown in loam, but, seeing that the first lot did so well in sandy peat for a time, I thought that a change to another soil would not affect them injuriously. The first batch was also planted in October and commenced to grow at once, and did splendidly for two years, but those from Mr. Walpole never made any growth. I am wondering if the soil had become sour, and if they would have done better if I had made up a fresh bed of sandy peat. I am very vexed at this failure, especially after having succeeded so well for two years, and, as I am very fond of the plant, am disappointed at being unable to induce it to thrive, though I fear it is useless to persevere in the endeavour. Undoubtedly, the extreme dryness of the garden is much against it, as watering can never satisfactorily take the place of natural moisture. *Wyndham Fitzherbert.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

CURE FOR SHOT-HOLE FUNGUS.—I enclose a fair sample of Peaches and Nectarines grown in a cool Peach-house. After a severe attack of shot-hole fungus (*Cercospora*), I sprayed the trees with liver of sulphur, at the rate of $\frac{1}{2}$ ounce to one gallon of water, but this did not stamp out the disease. On June 21, the trees were completely stripped of their foliage. Thinking I had got some other disease, I sent some leaves for your examination, and you recommended me to spray them with powdered sulphur and lime, with excellent results. The trees have carried an average crop, and the foliage now is very clean. I have sprayed them with the sulphur and lime five times, and you will see the fruit is not damaged in any way. The Peaches are *Violette Hative* and the Nectarine *Rivers' Orange*. *Thos. Pateman.* [The following specific was recommended:—Put 8 lbs. of good quicklime into a barrel, add one gallon of water, and when the lime begins to slake add 3 lbs. powdered sulphur. Stir well until the lime is thoroughly slaked, then add water to make 50 gallons of the mixture. This should be kept stirred during its application to the trees. The specific is most efficacious just when the leaves have first expanded, but its use should be continued at intervals.—*Eds.*]

STRAWBERRY LEADER.—Permit me to thank *R. G.*, p. 187, for correcting my statement respecting *Leader Strawberry*. I have known the variety only for the last four or five years. It was an error to place the note under the heading of a late Strawberry, as my note stated that *Leader* is quite as early in fruiting as *Royal Sovereign*. *W. H. Y.*

VEGETABLE EXHIBITION AT LOWFIELD NURSERY, CRAWLEY.—Messrs. J. Cheal & Sons last year offered prizes for vegetables, the result being so satisfactory that a second exhibition was arranged this season. The show took place on Wednesday, the 8th inst. Sixteen classes were provided and suitable prizes offered in each. The exhibits were accommodated in a large tent erected in the nursery. The chief class was for eight kinds of vegetables, four prizes being offered; the first prize was won by Mr. J. Sparks, of Horsham, in competition with eight exhibitors. There was a similar class restricted to amateur growers, eight exhibits being staged. There were also classes for Potatoes, Turnips, Onions, Parsnips, Celery, Cabbages, Leeks, Brussels Sprouts, and Carrots. In some cases no fewer than 23 persons competed. Large numbers of visitors attended the show, and many also inspected the nurseries. Some 20 members of the Crawley and District Gardeners' Debating Society paid a visit to the exhibition, and were entertained to tea by Messrs. Cheal. *A. D.*

THE ROYAL BOTANIC SOCIETY.—As I have for many years taken an interest in this Society, I would like to say a word on the suggestions that have been made with regard to the future of the Botanic Gardens. These suggestions are: (1) That the gardens should be thrown into Regent's Park, and (2) that the gardens of the Zoological Society should be enlarged with a view to uniting the two Societies. There are many objections to the second proposal. The objects of the two Societies are wholly different. The new buildings that would have to be erected would cost thousands of pounds. The adoption of the first proposal would, in my view, be most unfortunate. London cannot afford to lose the one ideal place still available for flower and horticultural exhibitions and for outdoor receptions by public bodies and societies. Regent's Park is already one of the largest and most attractive in London, covering, with Primrose Hill, some 470 acres, and, except in the principal avenues, the frequenters over acres are few and far between. I favour an amalgamation with the Royal Horticultural Society, a well-managed and consequently flourishing body. Under enlightened control the Botanic Garden would, I am sure, soon become what it should be—one of the brightest and most useful places in London. *J. S. Rubinstein.*

ROBINIA PSEUDACACIA AS A STREET TREE.—As stated by your correspondent Mr. A. D. Webster on p. 187, no tree is more useful for street purposes than the False Acacia and the varieties grafted on it. It is not generally recognised that the conditions under which street trees grow are very different from those which obtain in parks and gardens. In the making of a new street the engineers almost always remove the soil and get to what they call the hard bottom—the subsoil. The tree is expected to live in this subsoil, a solid mass almost devoid of nitrogenous food. Trees on the False Acacia root, being well equipped with nitrifying bacteria, do not suffer through this dearth of nitrogenous food, and, consequently, maintain a healthy green colour and vigorous growth when other trees are starved and withered. The vigorous habit and great brittleness of the growth must be borne in mind by those who use the Robinias in streets and exposed places. The head and side growths should have an annual pruning during the first few years to encourage a stocky growth. If this is neglected the long branches, having a great leverage, break in a most disappointing manner. Those who have dry, hot, sandy banks to deal with, will find a useful friend in the common False Acacia. Taking a lesson from the Belgian railways, where many of the sandy railway banks are held together by False Acacia, I planted a few thousand seedlings on a dry roadside "cutting" three years ago. This cutting was through a loose, sandy gravel. To-day it is a mass of vigorous green bushes, and the moving face firmly fixed by the mass of roots. The Belgians every winter mow the shoots as low as possible with a scythe-like chopper, and the resulting growth is a dense mass of sturdy shoots, often attaining, even on dry, sandy banks, a length of 6 feet by midsummer. One of the best forms I have found for streets is the variety *Bessoniana*. *Inermis* is a variety which lends itself magnificently to archi-

tectural effects—to form a trim line in the front of a bold building. Probably one of the best effects to be seen from *Inermis* is at Leamington, where a row of magnificent trees is to be seen. *P. M.*

—From what Mr. Webster says on p. 187, respecting the capacity of *Robinia* and certain varieties of it, to withstand heat and drought, I fully expect these trees would be more successful than some species in our towns, for what with the paths being either paved or asphalted, and the roads tarred, very little moisture can get to the roots of trees. Species that love moisture do not have a very ideal existence, especially if extra watering to make up the necessary amount is forgotten. *Alec D. Barney, Leamington Spa.*

THE CULTURE OF LILIES.—I am particularly interested in the remarks of A. on p. 163, on the deplorable custom of the Japanese of denuding the bulbs of Lilies of their roots prior to packing them for shipment to England. I have repeatedly called attention to the matter during the past 25 years. This practice appears almost universal among the Lily exporters of Japan. During the past 40 years or so many consignments of *L. auratum* have been worthless, the bulbs being rotten or affected with fungus. Of the sound bulbs which are received, a large number quickly perish when placed in contact with the soil; whilst the few that flower fail to succeed in the following year. The reason of the failure is not far to seek. The Lily makes but two sets of roots each year—the basal and the fibrous. The basal roots are formed when the flowers are fading, and are generally cut away with any old roots that remain. Hence, for any subsequent growth or flowering the plant is dependent upon the stem roots so abundantly produced above the bulb, and the latter usually collapses when the flower-stem is approaching its full height. This is the brief history of many thousands of Lily bulbs that reach England each year, the great bulk of them failing to produce a basal root at all. Were it otherwise, there would be no difficulty whatever in establishing many kinds in large numbers. This state of things is extremely disappointing, and it is time that purchasers demanded that the bulbs be shipped with the full complement of their roots as dug from the soil. Such a proceeding would naturally do away with the existing system that obtains in Japan of moulding the bulbs in tempered clay, and, in place of the now plump-looking and rather heavy bulbs, with rootless base and fungus-affected core, we should see a less plump, fresh-looking bulb, somewhat shrivelled it may be, so far as the outer scales are concerned, but with roots intact and capable of immediate resuscitation when replanted in the soil. To what extent shrivelling would take place would largely depend on the system of packing, though, for *Lilium* generally in the dormant state, ordinary packing between thin layers of rather dry soil would suffice. In this connection, it is instructive to recall the fact that Mr. E. H. Wilson, when collecting Lily bulbs in China, made a point of retaining all the root-fibres to the bulbs, and no trouble was subsequently experienced in establishing the plants. An alternative plan to importing bulbs would be the raising of seedlings on a large scale, and this, in conjunction with the raising of home-grown stocks of Lilies from scales and bulbils, is well worth attempting in this country. An important point to remember in this work is that many species of Lilies require to be treated not as perfectly hardy subjects, but rather as cool greenhouse plants during their two first seasons of growth. At first sight it may appear a little illogical to accord greenhouse treatment to a perfectly hardy subject, but the disappointments, failures and losses of either open-air or cold-frame treatment are known to all who have engaged in the propagation of the Lily by these means. Frequently in the case of *L. auratum* and *L. speciosum* in all their forms, and, indeed, many other species of Lilies that do not produce bulbiferous growths on the more exposed parts of their stems, there will be found near the base and just below the ground level a number of bulbils that will furnish useful stock. Your correspondent speaks of *L. rubellum* as a comparatively free seeder from imported bulbs, and says "seed may readily be obtained and ripened" if the blooms be pollinated. That, however, is not my experience, inasmuch as a large percentage of

the bulbs do not reach the flowering stage at all. But where flowers are produced, there is no better way of increasing this delightful plant. In the note on p. 169, referring to the home-raised Lilies shown in the Supplementary Illustration, the concluding sentence is as follows: "Being a stem-rooting Lily, the bulbs should be planted 3 to 4 inches deep." I believe, however, that all stem-rooting Lilies may be buried much more deeply than this to their advantage. It is also important, too, that these stem-rooting kinds be given a rich food supply, renewed or augmented annually at the surface. *E. H. Jenkins.*

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 14.—Exhibits in the fruit and vegetable section formed the principal feature at the meeting on Tuesday last, held in the Society's hall, Vincent Square, Westminster. The most important display was a collection of fruit trees in pots, shown by Messrs. Geo. EUNYARD & Co., LTD. This was awarded a Gold Medal. There were also fine exhibits of Melons, Grapes and other hothouse fruits; also vegetables, including a large collection of Potatoes. A variety of Strawberry received an Award of Merit from the FRUIT AND VEGETABLE COMMITTEE.

Exhibits before the FLORAL COMMITTEE consisted mainly of Dahlias and hardy perennials. This Committee recommended 12 Awards of Merit to novelties.

There were several interesting displays of Orchids, and the ORCHID COMMITTEE recommended awards which included one Botanical Certificate and one Award of Merit.

At the three o'clock meeting in the lecture room an address on the "Physiology of Pruning" was delivered by Mr. Edward A. Bunyard.

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. C. T. Drury, H. B. May, Jno. Green, A. Kingsmill, J. F. McLeod, Jno. Jennings, W. Howe, Jas. Walker, W. Bain, Chas. Dixon, Arthur Turner, Herbert J. Cutbush, H. J. Jones, Wm. Cuthbertson, Chas. E. Pearson, E. H. Jenkins, W. J. James, W. Y. Baker, George Paul, R. C. Notcutt, R. Hooper Pearson, and R. W. Wallace.

A large and representative exhibit of Bamboos was staged by Mr. L. R. RUSSELL, nurseryman, Richmond. It was arranged as a floor group adjacent to the wall opposite the entrance door, and was as effectively displayed as is possible with a group of this character. The front was undulating in outline, and in the centre was a pool planted with coloured *Nymphæas*. The Bamboos were excellent specimens, some being very large. The more noteworthy were *Bambusa palmata*, a variegated form of *B. disticha* named *Alphonse Karri*, *B. tessellata*, *Phyllostachys Castellonis*, *P. mitis*, *P. violascens*, the specific name being in allusion to the coloured stems; *Arundinaria fastuosa*, *A. anceps*, *A. nitida*, and *A. Simonii*. The Water Lilies were very large, especially fine being the white variety *Wm. Doogue*. (Silver-gilt Flora Medal.)

MESSRS. PAUL & SON, Old Nurseries, Cheshunt, showed a collection of ornamental shrubs and trees as sprays. The group was filled with interesting subjects, and it was a pity they were so crowded, which caused much of their beauty to be overlooked. The autumn tints of the various species of *Acer*, *Berberis* and *Quercus* were very pretty. *Quercus Albertii* has very large foliage, which, when young, is tinted with reddish-brown. Another fine Oak is *Quercus dentata*. *Lonicera Hildebrandtii* is a giant amongst Honeysuckles, the flowers are 6 inches or more in length, the stem being stout and woody. *Paulownia imperialis* was noticed, with its massive leaves; also *Rhus typhina* that assumes such pretty tinting at this season. Berried subjects, including a large-fruited, crimson form of *Pyrus aucuparia* named *fructus dulcis* and *Hippobae rhamnoides* with Crab Apples in variety added a touch of colouring, and the display was further brightened with hardy *Fuchsias*, *Hydrangeas* and *Hibiscus* in flower. (Silver-gilt Flora Medal.)

MESSRS. H. B. MAY & SONS, The Nurseries, Upper Edmonton, showed beautiful specimens of

both golden and silver varieties of Gymnogrammes. The genus is an extensive one, and the plants represented the finest for decorative purposes. None was more elegant than *G. chrysophylla*, of which several forms were shown, including *G. c. grandiceps superba*, *G. c. Regina*, and *G. c. Alstonii*. Others equally beautiful were *G. peruviana* var. *Mayeri*, with silvery farina; *G. flavescens*; *G. schizophylla*, and its variety *elegans*; *G. pulchella* *Wettenhalliana*; and *G. p. W.* var. *superba*, with crested fronds. In addition to the Ferns, Messrs. MAY showed varieties of large-flowered Veronicas. (Silver Flora Medal.)

A very large exhibit of Dahlias was displayed by MESSRS. CARTER, PAGE, & CO., 52 and 53, London Wall, London. It embraced Cactus, Single, Pompon, and Paony-flowered varieties, there being no fewer than 120 distinct kinds of the Cactus type. The majority were displayed in baskets, but vases and tall epergnes were also utilised, the flowers being arranged with grasses, Asparagus, and other greenery. The flowers were in excellent condition, and represented the best in commerce. (Silver-gilt Flora Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, exhibited Dahlias, including a selection of the Paony-flowered type, of which *Yellow Colosse*, *Souvenir de Gustave Douzon* (red), *Madame Van den Dael* (pink, with white centre), and *F. Grinstead* (with striped florets) were prominent. Of the Cactus-flowered varieties, one labelled *Progenitor* had cut florets suggesting tasselling. (Bronze Flora Medal.)

Messrs. T. S. WARE, LTD., Feltham, showed Dahlias and perennial Asters, the latter including *Beauty of Colwall* (heliotrope) and *Feltham Blue*, both excellent varieties. (Bronze Flora Medal.)

Mr. S. MORTIMER, Rowledge, Farnham, Surrey, staged many fine blooms of show Dahlias and an assortment of choice Cactus-flowered kinds. (Silver Flora Medal.)

Messrs. J. T. WEST, Brentwood, also made a fine display with these seasonable flowers, having blooms of all the types. (Silver Flora Medal.)

Other exhibitors of Dahlias were Messrs. JAMES STREDWICK & SONS, St. Leonards; Messrs. J. CHEAL & SONS, Crawley; and Messrs. J. BURRELL & Co., Cambridge. (Silver-gilt Banksian Medal.)

Messrs. J. CHEAL & SONS showed single and pompon varieties in great assortment, besides many of the finest of the show and Cactus types. (Bronze Flora Medal.)

Mr. AMOS PERRY, Enfield Chase, Middlesex, showed named varieties of Delphiniums, of which *Lemartin* (light blue), *Pluto* (dark blue), *Mrs. Creighton* (dark blue with purple centre), and *King of Delphiniums* (opal) were the more noticeable. Interspersed amongst these were spikes of large-flowered Pentstemons, also *Valloia purpurea* (flowering well in small pots), *Amaryllis Belladonna*, and other hardy subjects.

Messrs. R. HARKNESS & Co., Hitchin, showed *Gladioli*, and an extensive group of these flowers was displayed by Messrs. BURRELL & Co., Cambridge. (Silver-gilt Banksian Medal.)

Messrs. W. CUTBUSH & SON, Highgate, London, N., showed a floor group of hardy flowers, in which were large bunches of Pentstemons, Lilliums, Tritomas, Delphiniums, Erigerons, Phloxes, Gaillardias, and other seasonable subjects in the choicest varieties. (Bronze Banksian Medal.)

Messrs. BARR & SONS, King Street, Covent Garden, exhibited a collection which included hybrid *Kniphofias*, the type and coloured varieties of *Anemone japonica*, many pretty Phloxes, Gaillardias, *Coreopsis grandiflora*, *Actea alba* in fruit, also early bulbous flowers, amongst which *Sternbergia lutea* was prominent. Adjoining the hardy flowers Messrs. BARR showed 50 varieties of *Eucalyptus* as seedlings. (Bronze Banksian Medal.)

Mr. FRANK BRAZIER, nurseryman, Caterham, displayed a bank of hardy flowers as a corner exhibit, in which were noticed Pentstemons, Phloxes, Antirrhinums, Scabiosas, early Chrysanthemums, and Carnations.

Mr. MAURICE PRICHARD, Christchurch, Hants., displayed seasonable hardy flowers. *Crimum Powellii*, *Gaura Lindheimeri*, *Lythium roseum superbum*, *Antholyza crocosmiflora*, *Delphinium Dwarf King*, *Montbretias* in variety, and many others were finely shown. (Silver Banksian Medal.)

THE GUILDFORD HARDY PLANT NURSERY also exhibited hardy flowers.

Messrs. Wm. WELLS & Co., Merstham, Surrey, showed decorative varieties of Chrysanthemums, also Pentstemons, Michaelmas Daisies, and other flowers.

Mr. W. LEGGETT, West Bergholt, Colchester, exhibited Rose blooms, amongst which we noticed *Elizabeth Barnes* (rose-red with silvery reverse) and *Mme. Leon Pain* (a pretty bluish variety of pleasing shape).

Messrs. JOHN PLED & SONS, West Norwood, displayed a small rock-garden exhibit largely planted with succulents.

Three large pans of *Vallota purpurea* were shown by Mrs. MATTHEWS, Chesham Park, Atherley (gr. Mr. C. Trower). They were remarkably well-flowered plants. (Cultural Commendation and Silver Flora Medal.)

AWARDS OF MERIT.

Chrysanthemum Leslie Wells.—This early-flowering variety has rich, yellow flowers of decorative size. The plant is said to possess an unusually good habit. (Shown by Messrs. W. WELLS & Co.)

Dahlia Little Bessing.—A most charming Pompon variety of neat form and small size. The florets have a yellow base and red margins. (Shown by Messrs. KEYNES, WILLIAMS & Co.)

Dahlia Edward Mawley.—A brilliant crimson Show variety of the best exhibition form. (Shown by Mr. C. TURNER, Royal Nurseries, Slough.)

Dahlia Jupiter.—This is a large flower of the Cactus type, in which the florets are yellow at the base, the rest being pink splashed with crimson. (Shown by Messrs. STREDWICK & SONS.)

Dahlia Prima Donna.—This is a first-class Cactus variety, with long florets, not so white as *Snowdon*, but having a cream tint. (Shown by Mr. H. SHOESMITH.)

Cactus Dahlias.—Awards of Merit were recommended to the following Dahlias, which were described in the last issue, p. 192, col. 1:—*H. H. Thomas*, *Iolanthe*, *Indomitable* and *Red Admiral*, all from Messrs. J. STREDWICK & Co., St. Leonards.

Helenium "Riverslea Beauty".—Apparently a variety of *H. autumnale*, this plant has bright yellow flowers that would be very effective in a border. (Shown by Mr. M. PRICHARD, nurseryman, Christchurch.) A similar variety with rather deeper tint was recently shown by Mr. Hudson from Mr. de Rothschild's garden at Gunnersbury House.

Potentilla atrosanguinea Gibson's Scarlet.—This is not a new plant, but somewhat rare. The flowers are very brilliant in colour.

Iltus sinica.—A small plant of this species was shown by Messrs. PAUL & SON, The Old Nurseries, Chesham. Its large, pinnate leaves were coloured brilliant scarlet. It is obviously an excellent decorative shrub for the lawn or shrubbery, the colour developing in autumn.

Orchid Committee.

Present: J. Garney Fowler, Esq. (in the Chair), and Messrs. Jas. O'Brien (Hon. Sec.), Sir Jeremiah Colman, Bart., Harry J. Veitch, H. Little, W. Boxall, J. Forster Alcock, R. G. Thwaites, J. Charlesworth, W. Cobb, F. Sander, C. H. Curtis, W. P. Bound, W. H. White, W. H. Hatcher, H. Ballantine, Garney Wilson, J. Wilson Potter, and Stuart Low.

Messrs. SANDER & SONS, St. Albans, staged an effective and interesting group, for which a Silver Flora Medal was awarded. There were excellent examples of *Cattleya Iris* and its finer variety *inversa*, a number of which occupied the centre. Around them were brightly-coloured *Laelio-Cattleya Ella*, *L. C. Carissima*, *L. C. Nysa*, *L. C. Phoenix* (*C. Bowiana aurea* × *L. C. Ily. Greenwood*), *L. C. Bletchleyensis*, *L. C. Baroness Schröder*, *Cattleya Pittiana*, and other hybrids. *L. C. Phoenix*, a very pretty hybrid, with light, buff-coloured sepals and petals, the latter tinged with rose, and claret-purple lip with a golden base; plants of special interest were *Cynoches Egertonianum viride*, with a long raceme of green male flowers, and two erect spikes of large, fleshy female flowers, which were also green, with ivory-white labellums. Each spike bore two flowers. Also *Rhynchostylis retusa*, with two flower-spikes; the pretty little *Sigmatostalix radicans*, and *Polystachya Leonensis*.

MESSRS. CHARLESWORTH & Co., Hayward's Heath, were awarded a Silver Flora Medal for an attractive group, in the centre of which was a fine selection of their original strain of the beautiful *Cattleya Iris* (bicolor × *Bowiana*), the flowers varying from bronzy-orange, with magenta-crimson lip, to reddish-brown, with ruby-purple lip. All the forms are brightly coloured and last a long time in bloom. Among hybrids of *Sophronitis grandiflora* were *Sophro-Cattleya eximia*, with bright red flowers; *Sophro-Laelia Heatonensis*, rich scarlet, with yellow base to the lip; *S. L. Gratixiae*; *Sophro-Laelio-Cattleya Leda*; and *S. L. C. Marathon* (*S. L. Psyche* × *C. Enid*), of *Cattleya* shape, and with very richly-coloured flowers. Other fine subjects noted were *Cattleya Venus*, bright yellow, with a broadly-expanded, ruby-coloured lip, veined with gold; *Cattleya St. Gothard*, a large and finely-formed hybrid; *Cattleya Gaskelliana alba*; and *Oncidium ornithorhynchum album*.

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, were awarded a Silver Flora Medal for a select group of well-grown specimens, containing both interesting species and good hybrids. Among the former were two specimens of *Cynoches maculatum*; the pretty little *Walnawa pulchella*; *Sigmatostalix radicans*; *Physisiphon Loddigessi*, with many racemes of reddish-orange flowers; *Cirrhopetalum refractum*; *Oncidium unicorne*; *Celia macrostachya*; *Cycnoches chlorochilon*; *Angraecum distichum*, &c.; a row of tall, yellow spikes of *Oncidium oblongatum* being at the back of the group. Among the hybrids were two very dissimilar plants of *Sophro-Laelio-Cattleya Dange* (*C. Harrisoniana* × *S. L. leta*), with, in the one case, cream-white flowers, tinged and marked with rose, the other having yellow-tinted sepals and petals. *Laelia pumila delicata*, a pretty, white form, tinged with lavender, and with violet markings on the lip; *Cattleya Haroldiana* var. *Hildegarde*, white, with violet marbling on the front of the lip; and *Brasso-Cattleya Pocahontas alba*, a pretty, white, fragrant flower, were also interesting.

Mr. EDWARD V. LOW, Orchid Nursery, Vale Bridge, Hayward's Heath, staged a small group of *Cattleya Iris*, *C. Adula*, and a plant of a distinct variety of *C. conspicua* (bicolor *Grossii* × *Gaskelliana*), with dull, rose-tinted sepals and petals, the base of the lip being white and the front rosy-lilac. Others shown by Mr. Low were *Cypripedium Maudie*, *C. Lord Ossulston*, and *C. Naudii*. (Silver Banksian Medal.)

R. G. THWAITES, Esq., Chessington, Christchurch Road, Streatham (gr. Mr. J. M. Black), showed the new *Cattleya Roupelliana* (*superba* × *Hardyana*), a pretty and distinct flower, of a bright, deep rose colour, the lip being rose-purple on the outside of the tube, and claret-crimson in front; also *Sophro-Laelia Ortonii* (*S. grandiflora* × *L. Diana*), scarlet, with a yellow base of the lip; and several good plants of *Cattleya Adula*.

Sir JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. Collier), sent *Dendrobium Phalaenopsis* *Gatton Park* variety, a large, white form, slightly tinged with lavender, and marked with violet on the lip; and the pure white *D. P. album*.

Messrs. J. & A. A. McBEAN, Cooksbridge, staged a pretty group, in the centre of which was a good specimen of *Vanda Sanderiana*, with two spikes. The exhibit also contained *Cattleya Iris*, *C. aurea*, two elegant examples of the white *Oncidium incurvum album*, *O. Schlunii*, *Dendrobium Dearei*, *Cypripedium insigne Sanderianum*, *C. Jas. H. Veitch*, and *C. Rothschildianum*.

Messrs. STANLEY & Co., Southgate, showed seven plants of *Cattleya iridescens* (bicolor × *Eldorado*), the variety *splendens* securing an Award of Merit. All had the labellums with an orange-coloured isthmus, the fronts varying in tints of rose and purple; the sepals varied from green to gold colour and buff.

Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), showed the pretty *Sophro-Laelio-Cattleya Dame*, *S. L. C. pum-eximia* (*L. pumila* × *S. C. eximia*), and two rare *Angraecums*. (See Awards.)

Mr. H. A. TRACY, Twickenham, sent a specimen of *Cirrhopetalum maculosum* (syn. *Bulbophyllum umbellatum*), with several umbels of pretty white flowers spotted with purple.

J. FORSTER ALCOCK, Esq., Exhams, Northchurch, sent *Cypripedium Wiertzianum* *Exhams* variety.

AWARD OF MERIT.

Cattleya iridescens splendens (bicolor × *Eldorado*), from Messrs. STANLEY & Co., Southgate. A pretty hybrid, in shape resembling *C. Iris*. Sepals and petals cream-white, slightly tinged with yellow and rose colour. Base of the lip and column white; isthmus orange coloured, the expanded front mottled with purple.

BOTANICAL CERTIFICATE.

Angracum stylosum, from Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White). An elegant species, allied to *A. articulatum* and *A. Ellisii*. The plant bore a pendulous raceme of 12 pure white flowers; the long filiform spurs are greenish and slightly tinged with brown.

CULTURAL COMMENDATIONS.

To Mr. W. H. White, Orchid grower to Sir TREVOR LAWRENCE, Bart., K.C.V.O., for a noble specimen of *Angracum Kotschyi*, with eight spikes of white flowers, with long spurs, tinged with cinnamon brown, and spirally twisted on the apical halves. The plant was illustrated in the *Gardeners' Chronicle*, June 16, 1906, p. 379. The largest spike bore 15 flowers.

To Mr. Collier, gr. to Sir JEREMIAH COLMAN, Bart., V.M.H., for a fine plant of *Angracum Eicherianum*, nearly 3 feet in height, and bearing 13 large flowers, produced singly from the bases of the leaves, and distributing the flowers over the greater part of the plant. In growth it resembles *A. infundibulare*. The sepals and petals are greenish; the lip large and white.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the Chair), and Messrs. J. Cheal, A. H. Pearson, J. Willard, W. Bates, A. Dean, G. Kelf, F. Perkins, Thos. Coomber, A. R. Allan, H. Markham, H. Hooper, G. Hobday, G. Reynolds, J. Jaques, J. McIndoe, C. Foster, O. Thomas, W. Poupard, H. Parr, J. Davis, and W. Fyfe.

Rarely has there been seen at these exhibitions a finer display of pot-grown fruit trees than that shown on this occasion by Messrs. G. BUNYARD & Co., LTD., Maidstone. The group occupied the entire width of the Hall, and included 70 trees, all heavily fruited, and 50 dishes of picked fruit. Apples were largely represented. Peasgood's Nonesuch, Gascoyne's Scarlet, Emperor Alexander, Bountiful, James Grieve, Baumann's Red Reinette, Rival, Cox's Orange Pippin, and Charles Ross were represented by admirable specimens. Of Plums, President, Coe's Golden Drop, Golden Transparent, and Belle de Septembre were very heavily fruited, being amongst the most remarkable specimens. Peaches included Sea Eagle, Princess of Wales, Duchess of York, and Thos Rivers. Pears, Doyenné du Comice, Marguerite Marillat, Princess, and many others. The picked fruit was equally fine. (Gold Medal.)

Messrs. STUART LOW & Co., Bush Hill Park, staged a collection of some 30 Apple trees, including Peasgood's Nonesuch, Newton Wonder, Bismarck, Gascoyne's Scarlet, Pott's Seedling, and Charles Ross. (Silver Banksian Medal.)

Mr. W. MILLER, Wisbech, exhibited a large number of Red Victoria Apples. It is a roundish, slightly-flattened variety of an intense blood-red hue. The fruits are of good size, and would no doubt sell well in shops.

A small plant of the Wonderberry was sent by Mr. C. H. PIKE, Malmesbury, Wilts. With it, provided from open ground at Kingston, was a strong plant of the wild *Solanum nigrum*, showing the growth, leaf, flowers, and berries to be identical with the Wonderberry in the estimation of the committee.

M. DRUMMOND, Esq., Welwyn, Herts. (gr. Mr. G. Kelf), staged in boxes capital samples of 12 varieties of Plums, of which Pond's Seedling, Victoria, Late Orange, Monarch, Sultan and Transparent Gage were especially fine. (Silver Banksian Medal.)

Mr. NICHOLLS sent from Maidstone 18 dishes of pot-grown Pears, many of them superb specimens. Specially good were Pitnaston Duchess, Nouveau Poiteau, Marie Louise D'Uccle, Beurré Bachelier, Marguerite Marillat, St. Lézin, Vicar of Winkfield, Beurré Baltet, Souvenir du Congrès, and Triomphe de Vienne. (Silver-gilt Banksian Medal.)

Lord LLANGATTOCK, The Herdre, Monmouth (gr. Mr. T. Coomber), exhibited 16 fine bunches of Grapes in variety, viz. (black), Appley Towers,

Gros Maroc, Black Alicante, Lady Downe's, and Alnwick Seedling; (white) Muscat of Alexandria and Foster's Seedling. The same exhibitor showed eight beautiful fruits of Melon Hendre Seedling, all being finely netted and richly coloured. (Silver-gilt Knightian Medal.)

W. WALDORF ASTOR, Esq., Cliveden, Bucks. (gr. Mr. Camm), showed six bunches of Black Alicante Grapes from vines three years planted in half paraffin casks. (Silver Banksian Medal.)

H. B. BRANDT, Esq., Nutfield, Surrey (gr. Mr. T. Heron), displayed 50 bunches of excellent Grapes, including good samples of Prince of Wales, Appley Towers, Black Alicante, Gros Maroc, and rather small Diamond Jubilee, Golden Queen, and Muscat of Alexandria. (Silver Knightian Medal.)

Lady WANTAGE, Lockinge Park, Berks. (gr. Mr. W. Fyfe), arranged a large collection of hot-house fruits, charmingly decorated with branches of Crab Apples and coloured foliage. In the background were fine bunches of Muscat of Alexandria, Foster's Seedling, Black Hamburg, Madresfield Court, Black Alicante, and Gros Maroc Grapes, 22 bunches in all. On dishes were fine fruits of James Grieve, Gascoyne's Scarlet, Charles Ross, Peasgood's Nonesuch, Lady Sudeley, and Miller's Seedling Apples; Crimson Galande, Hale's Early, and Dymond Peaches; Lord Napier Nectarines; Kirke's, Lawson's Golden Gage, Magnum Bonum, Jefferson, Washington, Victoria, and other Plums; with numerous other fruits. (Silver-gilt Knightian Medal.)

C. F. RAPHAEL, Esq., Porters Park, Shenley, Herts. (gr. Mr. A. Grubb), staged a remarkably fine and representative collection of vegetables, filling a table 30 feet in length. He had capital red and white Celeries, superb Leeks, several pyramids of Cauliflowers, and Onions, the latter including Giant Rocca and Ailsa Craig; good Conference, Perfection, and Sunrise Tomatos; Autocrat and Gladstone Peas. Several dishes of fine Runner Beans, Potatos, Marrows, and other produce. (Silver-gilt Knightian Medal.)

Messrs. DOBBIE & Co., Rothesay, displayed a collection of 41 varieties of Potatos set up handsomely in baskets. The varieties included Lady Llewellyn, White City, The Factor, Midlothian Early, Favourite, British Queen and Epicure; and of coloured varieties Eightyfold, Rouge Royale, King Edward VII, Crimson Beauty, Queen of the Valley, and Royal Purple. (Silver-gilt Knightian Medal.)

AWARD OF MERIT.

Strawberry Laxton's Perpetual.—This variety resulted from crossing Monarch and St. Joseph. It is a heavy fruiter, the trusses showing 20 fruits on each. The flavour is excellent, the fruits being of good size, roundish, and of a deep red colour. Shown by Messrs. LAXTON BROS.

COMPETITIVE CLASSES.

Of the eight classes in the schedule seven were represented by exhibits. In the class for four dishes of early Pears, Sir MARK COLLETT, Sevenoaks, Kent (gr. Mr. M. Nicholls), won the 1st prize with fine samples of Triomphe de Vienne, Marguerite Marillat, Beurré Mortillet, and Souvenir du Congrès. M. H. PRICE, Esq., Welwyn, Herts. (gr. Mr. T. Bateman), was placed 2nd.

In the class for two dishes of Pears, Mr. F. W. CHURCH was placed 1st with Clapp's Favourite and Souvenir du Congrès. 2nd, Mr. W. AYERS, Rayleigh, Essex.

In the class for four dishes of dessert Apples, assumed to be early, Mr. BATEMAN won the 1st prize with Cox's Orange Pippin, Lady Sudeley, Washington, and Charles Ross, all good. Mr. CHURCH was placed 2nd.

In the class for two dishes of dessert Apples, Mr. NICHOLLS had very fine house-grown fruits of Wealthy and Lady Sudeley. 2nd, Viscount ENFIELD, Wrotham Park (gr. Mr. H. Markham), with Lady Sudeley and capital Worcester Pearmain.

In the classes for culinary Apples, Sir MARCUS SAMUEL, Maidstone (gr. Mr. W. H. Bacon), was awarded the 1st prize for very fine fruits of Grenadier, Peasgood's Nonesuch, Lord Grosvenor, Stirling Castle, Emperor Alexander, and Ecklinville Seedling.

Mr. MARKHAM also excelled in the class for three dishes of cooking Apples, having Peasgood's Nonesuch, Queen, and Ecklinville Seedling. 2nd, Mr. CHURCH, with Warner's King, Belle du Bois, and Lord Derby.

In the trade classes, Messrs. SEABROOK & SONS, Chelmsford, were the only competitors. They filled their allotted space of 9 feet by 3 feet with many baskets of fine Apples and Pears. Specially good Apples were Lord Suffield, Duchess of Oldenberg, Red Bietigheimer, Jas. Grieve, Peasgood's Nonesuch, Stirling Castle, Ecklinville Seedling, Emperor Alexander, Langley Pippin, and Lady Sudeley.

VEGETABLE TRIALS AT WISLEY.

A deputation from the Committee visited Wisley gardens last week to inspect the trials of Runner Beans, Cauliflowers, and late Potatos. Of Runner Beans, the smooth-podded section was first seen, and from these were selected Count Zeppelin, of the old case knife form, stringless pods 12 inches long, singularly tender and delicious eating when cooked (HEINEMANN, Erfurt). Dark Dun, a selection of the climbing French type, very prolific pods, short but fleshy (JAS. CARTER & Co.). Climbing Bean, selected, Tender and True form (CARTER & Co.); and Princess of Wales, a very fine, smooth-podded Bean and a heavy cropper (SUTTON & SONS). Also of the Scarlet or Dutch Runner, all selected splendid croppers. Scarlet Emperor, pods long and deep green in colour, and Red Giant, pods long, narrow, and of pale hue (JAS. CARTER & Co.). Also Prizewinner, certificated in 1892.

Mr. E. BECKETT had sent from Aldenham gardens a white-flowered variety named White Emperor. This was the heaviest cropper of all, and the pods were as long and as handsome as any. All these received three marks, and these awards were sanctioned by the full Committee on Tuesday last.

A large trial of Cauliflowers was inspected, and most of the varieties, so far as they had turned in, produced very fine white heads. The old Early Snowball was the earliest (BARR & SONS), a capital stock. Good successions were King of the Cauliflowers (BARR & SONS), Magnum Bonum (SUTTON & SONS), Dwarf Mammoth (CARTER & Co.), and Conqueror (VILMORIN ET Cie, Paris). All these stocks received three marks, and this was confirmed by the full Committee.

Of Potatos, Up-to-Date seedlings generally predominated. Those selected and placed before the Committee on Tuesday were Duchess of York (W. HOLMES, Tain, N.B.), long, white; Vera O'Brien, flattish oval (TULLISS, Kildare); Widecombe Intermediate, round (PICKERING, Ashburton), and Scottish Chief, large flattish round tuber (BARR & SONS). Each of these varieties received three marks.

THE LECTURE.

At the afternoon meeting of Fellows on Tuesday last, Mr. Edward A. Bunyard, in an interesting address on the subject of the physiology of pruning, emphasised the importance of the pruner approaching his work with a knowledge of plant physiology, thus enabling him to vary his treatment according to the different needs and conditions of the subject.

A series of lantern slides was used to show the structures of leaf, stem, and root. The lecturer pointed to the difference between the ascending inorganic sap and the descending organic or elaborated sap. The development of buds was considered, and the difference between wood buds, dormant buds, and fruit buds plainly shown by diagrams. One of the points elucidated under this head was that the nature of all buds in the embryo stage is the same, the differences being a question of development. The formation of fruit spurs was next considered. Some excellent slides showed the slow addition of buds until finally the fully-developed spur is produced. The lecturer expressed the hope that pruners would study the physiological aspects of their trees, and thus obtain a knowledge which will enable them to prune with intelligence.

Scientific Committee.

AUGUST 31.—*Present:* Mr. G. Masee, F.L.S., V.M.H. (in the chair); Messrs. J. W. Odell, W. Cuthbertson, W. Hales, J. Fraser, G. Saunders, and F. J. Chittenden (hon. sec.), and Messrs. E. Alexander, E. H. Wilson, and F. N. Meyer (of the U.S.A. Dep. Agr.), visitors.

Malformations in Trifolium.—Mr. J. FRASER, F.L.S., showed specimens of *Trifolium*

hybrid with the pedicels elongated, the calyx with elongated teeth, the petals widely separated and the stamens exposed, and the pistil developed into a trifoliate leaf consisting of a stalk bent in the part where the style usually begins, and carrying the leaflets above this. Mr. FRASER remarked that, according to this evidence, the ovary is made up of the base of the petiole with its stipules, the top of the petiole forms the style, and the leaflets form the stigma of the normal flower. He also showed *T. pratense* with the primary capitulum having two opposite bracts at its base, above these a calyx with many teeth, springing from the inside of which were the pedicels, unusually elongated, then a second calyx enclosing a corolla of five petals, sometimes partly affected with chloranth, and exposed stamens, then a leafy bract, and, in the centre, numerous flowers. The central flowers have a well-formed calyx, are apetalous, with exposed stamens and a small pistil in the centre. The chairman remarked that the occurrence of virescence such as was exhibited in the specimens shown was the result of the attack upon the base of the plant of a small grub belonging to the family Diptera.

Hybrid Radicula.—Mr. FRASER also showed specimens of what he considered to be a hybrid between *Radicula (Nasturtium) palustris* and *R. sylvestris*. The plant had occurred in company with both its supposed parents, and had imperfect flowers. In most of its characters it appeared midway between the two plants named, although perhaps nearer to *R. palustris*.

The Wonderberry.—Mr. CUTHBERTSON showed a specimen of the American "Wonderberry," said to have been raised by Mr. BURBANK (see fig. 73 in *Gardeners' Chronicle*, September 4, p. 172). He also showed *Solanum nigrum* for comparison. The plant, though differing in some few details from the specimen of *Solanum nigrum* shown, is apparently only a form of that very widespread and variable weed of cultivated land. Mr. MEYER remarked that the fruit of *S. nigrum* was frequently made into pies and eaten in different parts of the States, and he was unable to distinguish the plant exhibited from the spontaneously occurring plant.

Spencer Sweet Peas.—Mr. CUTHBERTSON also made some remarks regarding the reasons why the Spencer type of Sweet Pea is shy in producing seed, showing photographs and flowers in illustration of his remarks (see fig. 78 in *Gardeners' Chronicle*, p. 185, September 11). The reasons he considers to be as follow:—

1. The keel is not constricted or clamped, and consequently the anthers and stigma are not compressed together as in the old type of flower.

2. The open keel tends to allow the pollen to drop into the base of the keel without coming in contact with the stigmatic point. In the old type this was hardly possible.

3. In many of the waved forms the style grows beyond the anthers before the anthers dehisce, and the point is thus never brought into contact with the pollen.

4. In some, notably salmon and orange-colored varieties, the anthers are nearly sterile.

5. The large waved standard does not act as an umbrella in bad weather. The hooded standard did deflect the rain from the vital parts of the flower.

Note.—The Unwin or moderately waved type of flower is a good seeder. It follows the old type very closely in the formation of its keel.

Chinese plants.—Mr. E. H. WILSON showed an interesting series of photographs of some of the plants he had met with in his last travels in China. Among them were pictures of—

1. *Pinus Bungeana*, taken in S.W. Ichang, at an altitude of 3,500 feet, showing the white bark of the stem and exposed parts of the root. Mr. WILSON said he regarded this Pine and *Pinus sylvestris*, which has in certain parts of the world a very light bark, as the two most picturesque of the Pines.

2. *Cunninghamia sinensis*, a picture of a solitary tree 130 feet in height and 20 feet in girth. This tree forms pure forest in China at an elevation of 5,000 feet, and is the commonest timber tree in Central China, where it is very valuable. The photograph was taken in S.W. Taitien-lu.

3. *Ginkgo biloba*. Mr. WILSON remarked that it had recently been stated that this tree occurred truly wild in China, but although he had traversed the whole of the land where it

was said to occur, he had found only cultivated trees. The photograph was taken at Kiating, and depicted a tree 90 feet high and 24 feet in girth.

4. *Actinidia chinensis*, a beautiful shrub producing green fruit with a russet tinge, of excellent flavour as a dessert fruit, and making good preserves. This plant has flowered in France and England (see Supplementary Illustration and fig. 32 in *Gardeners' Chronicle*, July 31, 1909), but so far only staminate flowers have been produced. Hermaphrodite flowers are borne by some plants, and, perhaps, rarely, pistillate flowers only.

5. *Cypripedium tibeticum*. This is one of the commonest herbaceous plants in open places at an altitude of 11,500 feet to 12,000 feet. It was figured in *Gardeners' Chronicle*, June 2, 1906, p. 347.

Sport in Phlox decussata.—From Mr. DOUGLAS came an inflorescence of *Phlox decussata*, some of the flowers of which were white with the faintest tinge of violet, and others (the greater number) were white with broad stripes of violet-mauve. The plant had for 15 years borne only white flowers, but last year and this year it has produced some coloured flowers.

Winter-rot in Potatoes.—Mr. WIGLEY sent from Hartridge, Gravesend, specimens of Potato badly affected with winter-rot, due to *Fusarium solani*. The variety, Midlothian Early, had been lifted as soon as the tops died down, and some tubers selected for seed next season; these were placed in the sun to "green," and had "sweated with dark liquid drops at the eyes, and had softened on that side and then shrivelled." None of the stored Potatoes (kept cool) showed signs of the disease at present, while 50 per cent. of the portion saved for seed were affected.

Large Larch sawfly.—Mr. E. M. HOLMES sent specimens of the larvæ of this destructive insect (*Nematus erichsoni*) collected in the Lake district, where the Larch is being defoliated by them on Latrigg and Skiddaw. This insect seems likely to destroy the Larches in the district unless some natural enemy should prove effective.

Malformed Cypripedium.—Mr. R. W. RICHARDS, of Usk Priory, sent a flower of *Cypripedium insigne* in which the two lateral petals had a slight tendency towards the form of the lip, and the bract was green and leathery instead of membranous.

Aster diseased.—From Patcham, Sussex, came specimens of Asters attacked by a species of *Fusarium*. This fungus attacks the plants by the roots, which are killed, and the plant wilts through lack of water. It is unsafe to plant Asters in soil where they have previously been attacked. The soil in which Asters are grown should be limed.

ROYAL SCOTTISH ARBORICULTURAL.

SEPTEMBER 4.—The members of the Aberdeen and North of Scotland branch of this society enjoyed an excursion to Fasque Estate, Kincardineshire, on the above date. Most members of the party met at Aberdeen Station, and thence journeyed to Laurencekirk, where brakes were in waiting to convey the company to Fasque, some five or six miles distant. On arriving at Fasque the party was met by Mr. Alexander Dewar, factor on the estate, and the business of the day was at once entered upon. The visitors were conducted through a plantation to inspect the serious damage done to young Larch trees by attacks of aphid. So bad was it that many of the trees appeared to be almost dead. The complete immunity from disease shown by the Japanese Larch, as compared with the common Larch, was the subject of comment. Japanese Larches appeared also to be entirely free from attacks of aphides. The party was joined by Sir John Gladstone, who drew attention to two very fine Larch trees, one on either side of a drive. They are approximately 80 feet in height, one especially being a very fine specimen, perfectly straight, and having a magnificent hole. A fine Beech tree on the lawn in front of the castle measures 15 feet 6 inches in circumference at a height of 5 feet from the ground. It was planted with others in 1707 to commemorate the Union of England and Scotland. A visit was next paid to the gardens. Luncheon was served in the castle.

DERBYSHIRE AGRICULTURAL AND HORTICULTURAL.

SEPTEMBER 7, 8.—The forty-eighth annual exhibition was held under adverse weather conditions. The horticultural tents were well filled with exhibits of flowers, plants, fruit and vegetables. The number of entries was larger than in 1908, the total for this year being over 1,100. The competition in all classes was keen; in the majority of cases the number of entries ranged from 12 to 24. Four magnificent competitive and two non-competitive groups filled the centre of the large round tent, while on the stages around the sides were arranged several large collections of cut flowers, including Roses, early-flowering Chrysanthemums, Dahlias, Sweet Peas, Gloxinias, Violas, &c. In the fruit classes nearly 100 bunches of Grapes were staged, besides large quantities of Apples, Pears, Peaches, Melons, &c. The vegetable classes were keenly contested, while the quality of the exhibits showed high-class cultivation throughout. Floral table decorations formed a pleasing feature, there being no fewer than 18 tables. The principal competitive class was for a group of plants occupying an area of 300 superficial feet. The 1st prize was won by Sir GEO. KENRICH, Whetstone, Birmingham; 2nd, Mr. W. A. HOLMES, West End Nurseries, Chesterfield. The principal prize-winners in the fruit classes were Messrs. W. PARKER, Market Rasen; J. FRITH, Foston Hall; S. BARKER, Clumber; Mr. WADESON, Doveridge Hall; Mr. H. D. SMITH, Alvaston; and Mr. J. DRAKE. Important prizes in the vegetable classes were won by Messrs. H. D. SMITH, S. BARKER, J. WOODWARD, G. WADESON, A. SHAMBEROOK and F. A. BRACE.

Non-competitive exhibits included a large group of Gladioli shown by Messrs. KELWAY & SON, Langport. (Gold Medal.)

Messrs. SEAGRAVE & Co., Sheffield, exhibited Dahlias, Chrysanthemums and Carnations. (Gold Medal.)

Messrs. CLIBRANS, Altrincham, staged an extensive exhibit of vegetables. (Gold Medal.)

Mr. J. KNIGHT, Wolverhampton, showed Cactus Dahlias and Chrysanthemums. (Gold Medal.)

Messrs. W. & J. BROWN, Stamford, staged an imposing group of Roses. (Gold Medal.)

Mr. WM. SYDENHAM put up a remarkably good group of herbaceous Phloxes, Pentstemons, Helianthus, &c.

Sweet Peas were staged in great variety by Mr. EDMUND COLE, Derby.

In the centre of the large tent were fine groups of foliage plants exhibited by Mr. WM. VAUSE, Leamington, and Messrs. WM. BARRON & SONS, Barrowash; the latter firm had a large group of ornamental shrubs in the open.

DUTCH BULB GROWERS'.

The following Awards were recently granted by this society:—

FIRST-CLASS CERTIFICATES.

Tulip van Tubergen.—A new double-flowered variety with golden-yellow flowers, raised from double-early Tulip Couronne d'Or.

Tulip Yellow Queen.—A clear yellow variety recommended for forcing. Apparently raised from the White Pottbakker variety.

AWARDS OF MERIT.

Tulip King of the Scarletts.—A dark-red variety with large flowers; a good variety for bedding.

Tulip President Taft.—A variety with large flowers, the long segments being white, feathered with rose. This variety received an Award of Merit at a former meeting, when it was exhibited as Joost van Vondel.

Gladiolus Lemoine Pink Beauty.—An early-flowering variety, with dark rosy flowers, with a striking dark red blotch.

Gladiolus gandavensis Lily Lehmann.—A seedling variety with pure white flowers, shaded with rose.

Gladiolus gandavensis Pure White.

Gladiolus gandavensis Miba Greutrid.—A seedling variety with creamy white flowers, feathered with rose in the centre.

Phlox decussata Nymph.—A large flowering variety, of soft rose colour, white in the centre.

ORSETT & DISTRICT AGRICULTURAL AND HORTICULTURAL.

SEPTEMBER 9.—The above society held its 15th annual show on this date in the grounds of Orsett Hall in fine weather. Exhibits of hardy fruit are always a leading feature at this show, and this year the fruits of Worcester Pearmain, Warner's King, Stirling Castle, and Peasgood's Nonesuch Apples, in the classes for 12 specimens of these varieties, were remarkably fine, especially those shown by Mr. T. RUDGWELL and Mr. F. KEMP-SMITH, both of Orsett.

The most successful exhibitors in the fruit and other open classes were Mr. T. RUDGWELL, who won six first and three 2nd prizes; Mr. C. BUTCHER, Grays, six 1st and seven 2nd prizes; F. H. B. C. WHITMORE, Esq., Orsett Hall (gr. Mr. E. Neighbour), six 1st and six 2nd prizes; Mr. F. E. BELCHER, Mr. W. SUTTON, Mr. T. SUTTON, and Mr. J. IBBS, Chadwell-St.-Mary.

The vegetable, plant and cut flower classes were fairly well filled, and the exhibits generally were commendable. The same remark applies to the dinner-table decorations and the other decorative classes.

BRITISH GARDENERS' ASSOCIATION. (LONDON BRANCH.)

A MEETING of the London branch took place at Carr's Restaurant, Strand, on Thursday, September 9. Mr. E. F. Hawes occupied the chair. Several applications for membership were accepted. Mr. Vincent Cockram was elected to the post of branch secretary. A discussion followed a resolution put forward by Mr. North to the effect that, in view of the forthcoming borough and county council elections, that this meeting urge upon the executive council the need for drawing up a programme of the hours of labour and rate of pay of the gardeners employed by municipal authorities, and of ascertaining the views of prospective candidates with regard to the programme submitted. Mr. Friend seconded. Mr. Frogbrook suggested that a sub-committee be appointed to collect evidence and enquire into the varying rates of pay adopted by the municipal authorities throughout the country, with a view to placing the results of the enquiry before the executive council. A sub-committee was then appointed by the meeting for this purpose.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

SEPTEMBER 13.—At the monthly meeting of this Society, six new members were elected. The death certificate of the late Mr. J. H. Wilson was produced, and the amount standing to his credit in the Society's books (£65 17s. 3d.) was passed for payment to his nominee, Mrs. Wilson. The amount paid for sickness since the last meeting was £47 6s. The annual dinner will be held at the Waldorf Hotel in October.

Obituary.

WILLIAM FOWLER.—We regret to announce the death, on Sunday, September 12, of Mr. William Fowler, who was for a long period gardener to the present and the late Lord Polwarth, at Mertoun House, near St. Boswells. Mr. Fowler was 81 years of age. He retired from service at Mertoun three years ago, and resided at St. Boswells in a cottage kindly placed at his disposal by his late employer. Mr. Fowler had considerable knowledge of Coniferous plants, and he was well known as a hardy fruit grower. He leaves a widow older than himself, a daughter, and three sons, two of whom have long since resided in America. Mr. Henry Fowler is gardener at Blarnerne, near Duns.

THOMAS G. BISHOP.—We regret to record the death of Mr. Thos. G. Bishop, for 21 years manager at Messrs. Daniels Bros., Ltd., Town Close Nurseries, Norwich. Mr. Bishop journeyed to London with Mr. Daniels on Monday last to attend the autumn sales. On the same evening, after parting with Mr. Daniels at Liverpool Street Station, he proceeded to his hotel alone and was taken suddenly ill in the street, expiring almost immediately. Mr. Bishop was about 60 years of age; he leaves a widow and one son, to whom much sympathy will be extended in their sudden bereavement.

CALCEOLARIA: *F. E. S. & Co.* There is no trace of disease in the plants. The trouble is probably due to the unfavourable season.

CHRYSANTHEMUM: *G. H. P.* No disease is present. The root is decayed owing to the soil being soddened with water.

COST OF TRENCHING LAND: *Reader.* The approximate cost of trenching light soil two spits deep is 10d. per rod. This works out at £6 13s. 4d. per acre.

CYCLAMEN FAILING TO FLOWER: *H. W.* The buds have been injured by mites. Spray the plants with, or dip them in, an insecticide.

DIANTHUS SHOWN AS ANNUALS: *Exhibitor.* You do not state which species was exhibited. Most Dianthus are biennials or perennials, and these would not be permissible.

GOOSEBERRIES DISEASED: *J. B.* The foliage is badly attacked by Gloeosporium ribis. Collect and burn all the fallen leaves. Spray the bushes next spring, when the fruit is set, with Bordeaux mixture.

GUMMING IN CUCUMBERS: *E. M.* The gumming in your Cucumbers is owing to the soil being too wet. When the fruits are young give plenty of ventilation early in the day.

MELONS UNHEALTHY: *P. C.* The plants are affected with the Cucumber-leaf blotch. Spray them with sulphide of potassium. The Begonias have been kept too wet at the root. The Chrysanthemum has no disease on the part sent. The trouble is due to some error in culture.

MILDEW ON OAK LEAVES: *H. D. W. W.* The leaves are attacked by a fungus, Erysiphe guttata. This mildew has been very common on Oak trees this season. The fungus can be destroyed by flowers of sulphur, but you can do nothing in the case of large trees.

NAMES OF PLANTS: *Rev. T. A. H.* Lonicera Halliana.—*H. A. T.* Tropaeolum speciosum.—*R. P. H.* Probably Bulbophyllum Watsonianum. No flower found.—*E. C. Horley* 1. Polypodium aureum; 2. Lomaria (Blechnum) spicant.—*Enquirer.* 1. Erica vagans; 2. E. cinerea; 3. Mentha sylvestris.—*S.* Calluna vulgaris.—*W. O. W.* 6. Alyssum argenteum; 7. abnormal growth of Gentiana Pneumonanthe.—*M. C. P.* Helichrysum petiolatum.—*L. B.* Campanula persicifolia.—*W. L. (Greenhill Park).* Prunus Padus, the Bird Cherry. The fruits are eaten by birds. Though nauseous to most persons, yet in Siberia they are commonly eaten.—*K. B.* 1. Hibiscus rosa sinensis; 2. H. Cooperi; 3. Rondeletia speciosa; 4. Hoffmannia Ghiesbrechtii variegated form; 5. Acalypha Macfleckana.—*F. D. Trout.* 1. Dracena rosacea; 2. D. intermedia; 3. Dieffenbachia Bansei; 4. Dracena congesta; 5. D. fragrans; 6. D. indivisa; 7. Pteris cretica albo-lineata; 8. Scelopendrium vulgare; 9. Rhoë (Tradescantia) discolor.—*O. R. C.* 1. Epidendrum fragrans; 2. E. cochleatum; 3. Oncidium pubes; 4. Ada aurantiaca.—*Cheltenham.* 1. Nicotiana glauca; 2. Veronica tetragona; 3. probably a Pitcairnia.—*Torbay.* Santolina incana.—*W. G. M.* Epilobium angustifolium.

ORCHID LEAVES INJURED: *Gardener.* The injury has probably been caused by some error in the cultivation of the plants, or in the management of the heating apparatus causing an irregular temperature. The greatest danger is when the temperature of the houses is excessive at night-time. A frequent reason for unsightly foliage on evergreen Orchids is allowing the plants to retain their leaves under cultivation much longer than they would in their native habitat.

PALM SEED: *James Burns.* Attalea Cohune, the kernels of which are said to yield an oil used by the natives of British Honduras for lighting and cooking. The oil is thought to resemble that of the Copra nut.

PEACHES DISEASED: *N. B.* The fruits were thoroughly decayed and covered with mould when received. Under these circumstances, the cause of the trouble could not be determined.

PEAR LEAVES DISEASED: *E. Smith.* The trouble is caused by the Pear-leaf blister mite. Hand-picking the injured leaves and fruit in June is the only means of exterminating the pest, which harbours in the buds during winter.

PRUNING APRICOTS: *Amateur.* You will find a note on this subject in the weekly Calendar on "The Hardy Fruit Garden," p. 198. If fruit buds have formed on the bases of the shoots you refer to, do not prune the latter. In course of time they will become established as fruit spurs.

PRUNING BUSH APPLE TREES: *Reader.* Bush Apple trees may be pruned any time from the middle or end of November up to the middle or end of January, but the sooner the trees are pruned after they have shed their foliage the better. Bush Apple trees only require knife pruning once in the year—at the time indicated above—in addition to the summer pinching of the young growths early in July. It is also advisable to go over the trees again towards the end of August and pinch back all extra-strong growing secondary young growths that may have pushed from the more even-sized shoots, in order to promote a balance of growth. The foregoing remarks apply equally to bush, pyramid, standard, and espalier-trained trees of Apple, Pear, Plum and Cherry. During the present year young trees have generally made an unusual quantity of strong secondary growths, which necessitated the shoots being pinched back in August, as recommended above.

RED SPIDER ON PEACHES, &c.: *Peaches.* (1) If a good supply of water is available in your Peach houses so that the trees can be thoroughly watered at the roots and washed overhead on bright afternoons with sufficient force to dislodge any red spider or other insect that might effect a lodgment on the foliage, there should be no difficulty experienced in keeping your trees clean and healthy, providing you have sufficient labour at command to do the work. (2) During the wet and cold weather which we have experienced during the last three or four months, you could not reasonably expect to succeed in growing good crops of Melons and Cucumbers in unheated glass-houses. Had the weather conditions been more favourable no doubt you would have secured satisfactory results. We have known excellent Melons to be grown year after year in unheated pits during favourable summer weather, but the sashes of the pits were covered with mats and shutters on cold nights. (3) Plantations of young fruit trees, generally, have suffered from attacks of aphid and caterpillars this year during the spring and early summer months, owing to uncongenial character of the weather experienced at the time when the trees were developing young and tender growths. The trees have recovered from the check and are now making satisfactory growth. We should advise you to stop the extra strong growths at once (see answer to *Reader*); the weather conditions you refer to afford an additional reason for stopping the young shoots now, as this will result in more light and air reaching the remaining portions of the shoots.

STORING FILBERTS: *E. H. Mundford.* The best place in which to keep Filberts and Cobnuts fresh and plump during the winter months is a cool room or cellar, but not a damp one, or the Nuts will go mouldy. Spread the Nuts on the floor, or on shelves. If the place where the Nuts are stored is dry, they should be placed in layers of dry sand in a tub or other receptacle. On no account store Nuts on hay, chaff, or straw, which may become musty and taint the Nuts.

TOMATO: *A. J. & S.* We do not recognise the variety. As it appears to be immune from the disease which has attacked the rest of your plants, it would be advisable, provided its cropping qualities are good, to save the seed with a view to cultivating it next season.

HARDY CYPRIPEIDIUMS.

OF the hardy Orchids, the *Cypripediums* have undoubtedly the most attractive flowers. The species vary so greatly in stature that the handsome North American *C. Regiœ* has stems 2 feet to 3 feet in height, whilst the Japanese *C. debile*, with its Tway-blade-like leaves and small, greenish-white flowers, is a mere pigmy. Although hardy plants they frequently fail owing to unsuitable conditions, but with a little care and attention in choosing the right situation and allowing them a free-rooting medium, they may be grown with success. *Cypripediums* prefer a cool, sheltered and shady place; they are generally seen in a wild state in open woods, with their roots ramifying amongst the decayed leaves. In the rock-garden suitable places may be found for them in the low-lying, shady parts, provided the soil has plenty of drainage and is well prepared. They are not deep-rooting plants, therefore, all that is necessary is to take out the original soil to the depth of about 1 foot. If the soil

is heavy, plenty of material for drainage should be placed in the bottom of the hole; but if the subsoil is sandy, this will not be needed. The most suitable compost consists of equal parts rough peat and well-decayed leaf-soil, with plenty of sand and some charcoal; a little *Sphagnum*-moss incorporated with the rooting medium is helpful in retaining moisture in the soil. Most of the species will grow well in this compost, but our native *C. Calceolus*, also *C. macranthum*, and *C. ventricosum* are exceptions. These require soil of a calcareous nature, and if lime is deficient it should be supplied by adding old mortar rubbish to the loam.

The best time to plant hardy *Cypripediums* is in the autumn as soon as the crowns can be procured. Do not allow the plants to become dry when planting, as the fleshy roots soon shrivel when out of the ground. As the roots grow in a horizontal direction it will be necessary to make a wide hole when planting,

FIG. 87.—CYPRIPEIDIUM ACAULE. SEPALS, WHITE; LIP, ROSE COLOURED.

so that the roots may be spread out carefully, placing the crowns about 2 inches below the surface of the ground. Soil should then be worked well in between the roots and the whole made moderately firm.

Hardy *Cypripediums* are also well adapted for culture in wide, shallow pots or pans; indeed, it is advisable to adopt this method of culture in the case of some of the smaller, less easily-grown species. The same compost as advised for planting out-of-doors may be employed, and the surface of the pot should be covered with fresh *Sphagnum*-moss except in the case of those species requiring calcareous soil. The plants succeed best in a north frame with the pots plunged to the rims in ashes or other suitable plunging material. They may be fully exposed during the summer months, but should be protected during severe weather in winter.

The following species are to be seen in culti-

vation, although only about six or seven are common:—

C. ACAULE (see fig. 87) (syn. *C. humile*).—This remarkable-looking plant comes from North America. It has a pair of broad, hairy leaves, from between which it pushes up a flower-stem over 6 inches long, surmounted by a green bract in which a single flower develops. The sepals are whitish, while the large pouch is of a bright rose colour veined with crimson. This species is distinct from the others in having the pouch split right down the front, giving it the appearance of a two-lobed flower. *C. acaule* is one of the oldest of cultivated species, having been introduced into this country in 1786.

C. ARIETINUM [*Bot. Mag.*, tab. 1569].—This is a beautiful little plant from the damp woods of North America, but it is less easy to cultivate than most of the other kinds. The sepals are greenish-white, while the lip is white suffused with rose. The species was introduced into this country in 1808.

C. CALCEOLUS (see fig. 88).—A native of this country, and an excellent subject for naturalising in woods, especially where the soil is of a heavy and calcareous nature. In positions where it is suited it soon forms large tufts, and the stems, about 2 feet high, each produce one to three flowers. These have deep-brown sepals, while the lip or pouch is yellow. The plant is also found wild over a great part of Europe, and as far north as Siberia.

C. CALIFORNICUM (see fig. 89).—A charming little plant with stems about 9 inches high, bearing a raceme of four to six flowers, having tawny yellow sepals and a blush-white lip, obscurely spotted with brown. It is a native of California, and has been in cultivation in Europe since 1888.

C. CANDIDUM [*Bot. Mag.*, tab. 5855].—This is similar in habit to *C. californicum*. The flowers have a white lip and greenish-brown sepals. Introduced from North America in 1826.

C. DEBILE [*Bot. Mag.*, tab. 8183].—An interesting little plant from Japan, whence it was introduced some three or four years ago. It has a pair of leaves like our native Tway-blade (*Istera ovata*), from which springs a slender, drooping stem, bearing a small, single flower. The sepals are green, and the greenish-white lip has purplish lines near the mouth.

C. FASCICULATUM [*Bot. Mag.*, tab. 7275].—This species develops several flowers on each stem, which grows about 1 foot high. The sepals are greenish, as is also the lip, which has a purple-brown margin. Plants were introduced from North America in 1888. The species is still somewhat rare, as it has proved difficult to keep in cultivation for any great length of time.

C. GUTTATUM [*Bot. Mag.*, tab. 7746].—Introduced into cultivation as long ago as the year 1820, this species is one of the prettiest, but, at the same time, one of the most difficult to establish. It is remarkable for its wide distribution, being found in Russia, Northern Asia, and North-western America. It prefers soil of a light, open nature, with plenty of moisture when actively growing, but requires to be kept rather drier in the winter. The handsome flowers are of relatively large size, the sepals and lip being white, spotted and blotched with crimson-purple.

C. JAPONICUM.—This Japanese plant is remarkable for its pair of broad and distinctly ribbed leaves, from which one or two flowers are produced singly on short stalks. They are large and handsome, striated, and blotched with green, white, and rose-purple. A full-page illustration is given in *Gardeners' Chronicle*, June 6, 1903, p. 355, fig. 138. The plant grows freely in the shade, but frequently, for some reason undetermined, strong crowns fail to flower. Introduced in 1874.

C. MACRANTHUM (see fig. 90).—This Siberian species is one of the most handsome members of the group, growing about 1 foot high and bearing large, almost uniform, rose-purple flowers. It requires a more loamy soil than most of its congeners, and succeeds best under the same conditions as *C. Calceolus*, with which species it is often found growing wild. It is an excellent plant for pot culture, as it grows freely and forms good turfs in pans. Wide pans are necessary in order to allow the roots to spread laterally. Introduced in 1829. *W. L., Kew.*

(To be continued.)

NURSERY NOTES.

SWEET PEAS AT MARK'S TEY, ESSEX.

I RECENTLY visited the seed farm of Messrs. Dobbie & Co., at Mark's Tey, to inspect the Sweet Peas that are largely grown both for trial and seed purposes. Of the standard varieties there were seen row after row, each line one hundred or more feet in length, and all alike covered with blossoms. The splendid new lavender-coloured variety, Masterpiece, which will be placed in commerce this autumn, was represented by a large stock: it is one of the most floriferous varieties. Mrs. Henry Bell, and the improvement on that variety which will be distributed under the name of Mrs. Hugh Dickson, were both in excellent condition. The rich crimson variety named The King is a notable flower alike in colour, size and substance, but it was found that the colour does not withstand the sun's rays. A somewhat similar variety, named Sunproof Crimson, does not possess this defect.

The bicolor Mrs. Andrew Ireland is one of the best Sweet Peas in cultivation, whether it is regarded as an exhibition, or garden variety. At Mark's Tey it develops a mass of flowers, and the plants are singularly persistent in flowering. I was pleased with a pink variety named Edrom Beauty, which is in the way of Helen Lewis, but is richer in colour and superior in substance. In addition to these novelties, all the standard varieties of Sweet Pea in commerce are represented in the collection. The seeds are sown in pots each season, and the plants are transplanted outside in April.

Many new varieties are raised each year in this nursery; these are carefully inspected, and those which show promise are saved for growing again the next season. At present there are many seedlings of merit. *W.*

WARREN NURSERIES, HAYES.

THIS nursery, devoted principally to the culture of Carnations, has but recently been established by Mr. Charles Blick, for many years gardener to the late Mr. Martin R. Smith. The nursery embraces some four acres of meadowland, and already four spacious span-roofed greenhouses have been erected. These houses contain the entire stock of novelties and seedlings in the Hayes collection at the time of Mr. Smith's death. There are upwards of 20,000 flowering plants in pots, exclusive of 10,000 specimens planted out-of-doors, whilst about half an acre of land is allotted to seedlings. A robust habit of growth

appeals very strongly to raisers of these flowers, and in this direction it is satisfactory that a weakly grower is now rarely seen. In former times the yellow-ground fancies and the edged class were not infrequently weak; to-day such weakness is superseded by a strength which amounts to vigour. Good varieties of a heliotrope shade are not numerous. The variety Silver Fox of this shade surpasses anything seen in this very extensive collection for size, form and substance of petal. Other self-coloured novelties not yet in commerce include some very handsome scarlet-flowered varieties, of which The Chartist, Royal Scarlet and Redskin are of exceptional merit, the two first-named varieties being possessed of a particularly strong fragrance. Black Douglas belongs to those of the maroon-crimson shade, and is in every way excellent. Maharajah, with flowers of glowing crimson, may be regarded as the gem of the crimson set. Selim is of crimson-scarlet and of faultless form. Snowdon, Honey-moon and Magdalene—the last-named notable for its dwarfness—are a trio of pure white varieties of exquisite beauty and purity. Waverley is of pink-cerise shade. Lady Bury, a deep rose-coloured variety, is of especially good form and very distinct. Amongst the "selfs" not yet in commerce is Soliaterre, a large, clear-

the petals are marked with deep rose-scarlet. Both Nicon and Harmony are of buff-yellow with rose suffusion, varying in degree: the latter is the lighter toned. Rhea, Marjory Devas, Deer-slayer, Miss Dalhina Baring, and Tantalus are others of great beauty.

The collection of Picotees is likewise a notable one. Her Majesty, the premier heavy purple-edged variety both in 1908-9, was conspicuous. F. W. Goodfellow, a heavy rose-edged seedling, obtained a Certificate at the National Carnation show this year. Other new Picotees there include Peter Pan, John Ruskin, Dora Spellow, Exquisite, Regal and Peg Woffington—all meritorious varieties. There is also a large collection of standard sorts, the whole, at the time of my visit in August, making a charming display. *E. H. J.*

NOTES FROM A "FRENCH" GARDEN.

THE first batch of Cauliflowers has been sown in frames. During wet weather the frames will be covered with lights, but ample ventilation allowed day and night. The plants must not be coddled, or they will show flower-buds early in March.

Ox-Heart Cabbages are doing well, but we had to put the lights on the frames to prevent their damping-off. In 12 or 15 days they will be pricked out 3 inches apart, rejecting indifferent and blind plants. They must be planted deeply to encourage the development of roots and to strengthen the "collar," which is the weakest part of a Cabbage plant.

The planting of Onions in their final quarters has been deferred until rather late, owing to bad weather having delayed the growth of the seedling plants. We have, therefore, covered the soil with an inch of finely-sifted decayed manure.

Batavian Green and Endives planted in the middle of August require bright weather. When blanching in November, we shall cover them with dry hay or straw, as we fear the usual plan of tying them would cause decay this damp season.

The Carrots sown in the old manure beds will be ready for pulling within a fortnight. This crop has not required much attention, beyond the occasional waterings and thinning in August.

Lettuces sown late in August are now to be placed in their final quarters. After removing the decayed leaves, they will be planted at the rate of four to each cloche. We do not set them too deeply in the soil, as this causes the lower leaves to rot. When well established, the plants may be afforded a little ventilation during the day. The sowing of Lettuces for next spring commences early in October. On October 2, Little Black Gott will be sown, and this will be followed by sowings every two days. Cos Lettuces, the Flat of Paris, the Grey of Paris, and the White of Paris will be sown in the order named, beginning on October 6. The strong-growing varieties, the Passion and Palatine Lettuces, will be inserted on or about the 10th of the same month. The Palatine, although a very old variety, is not much grown, but it forms a good head, travels well, and has a very fine flavour. We have prepared the winter quarters for the Lettuces, and the beds will receive a top-dressing consisting of 3 inches of fine, decayed manure. Care is taken to see that only good material is used for this purpose, as, owing to the damp weather, it is very possible that mildew will be prevalent during the winter. As a rule, gardeners do not make use of manure from old beds for growing Cabbage Lettuces late in the summer, for it frequently happens that, as the nights become colder in September, mildew attacks the roots, and the disease spreads during winter or early spring, when material from the old beds is used.

As the crops are being cleared off the ground, it is dug and heavily manured ready for next season. In this way time is saved early in January, when the making of hot-beds is commenced.

FIG. 88.—*CYPRIPEDIUM CALCEOLUS*.
COLOUR OF SEPALS, BROWN; LIP, YELLOW.
(See p. 209.)

cut, yellow flower. It is unique among the yellow selfs, and in its own set marks considerable progress. The collection of yellow-ground Fancies and Picotees is remarkable. Some 19 Fancy varieties are to be placed in commerce this year, and the display of the whole is a great tribute to the skill of the British florist. The Hayes garden has been renowned for its yellow Fancy Carnations. Some of the more notable varieties are as follow:—King Coffee, a large flower with reddish markings. The Justice, delicate rose, suffused over the yellow ground, flower of superb form; habit of growth, dwarf. Jason has petals suffused with rose and purple, the flower being of great size. Hengist, with crimson markings, is remarkable for its fine petals. Hercules is a magnificent flower some 3½ inches across. Flamingo is a scarlet flower of great beauty. Father O'Flynn, a seedling from Douce Davie, is lined and feathered with scarlet markings. Criterion, a beautifully refined flower, is also tinged with scarlet, while Claude Egerton, a large, perfectly-formed flower has crimson-scarlet markings. Annie Thompson, a flaked and striped flower, is probably the largest of the set. Hera has a rose suffusion over a buff-yellow ground. Defiance is notable for its exceptional dwarfness;

THRIPS.

IN the first volume of the *Gardeners' Chronicle* may be found a description of an attack by the small insects known as thrips on Melons and Cucumbers in frames. Whilst this shows that the destructive habits of so minute an offender have been known to gardeners for a long time, it is by no means the first reference in scientific literature to the possibility of such an attack. It is safe to say that all gardeners now know their thrips, but it is only the occasional farmer who is familiar with the insect, although it occurs just as commonly on his crops, and does much more damage than he generally suspects. The itching sensation produced by thrips as it runs over the face is due to the peculiar structure of the animal's feet, as shown in 1744 by Von Geer, who christened it "bladder-footed"—a name it retains in Germany to this day. The Potato thrip was described by Linnaeus in 1752, but there is another form of attack which we fear it is not possible to credit. John Hill, in his quaint quarto published in London in 1773 and entitled *A Decade of Curious Insects*, is undoubtedly referring to a species of thrips in his description of a "studious gentleman very subject to the headache" discharging vast quantities of an insect whilst sneezing! Other early references are by Pjerkander in 1790, who ascribes damage to Corn by thrips, and by Mars-ham, who gives a full description of a thrips' plague on Corn in England in 1795. Nevertheless, it was still considered an open question by C. A. Dobson in 1847 whether any real damage was done to the Corn by the insect. In 1834 there was a plague of thrips on Olives in Italy investigated by Passerini, and another in 1842, according to Tamburin, who also considered methods of treatment and prevention, whilst Regel records swarms of thrips in the hot-houses of St. Petersburg in 1858. The annual reports of Miss Ormerod are generally a fair index of the ebb and flow of noxious insects of her time, but she only records thrips in her report for 1884, where it is alleged that in one case 25 per cent. of an Oat crop was destroyed by the pest. She merely mentions it again in 1894 as on the same plant.

Thrips are usually much in evidence during hot, sultry weather, when they migrate in large numbers, and are hence known as "thunder fly." The Germans have a useful distinction between black fly (Thripidae)—black in the mature condition and green fly (Aphidae or plant lice). It is usually a species of Thrips that gets into the eye during the summer, and their irritating effect on the skin has been already referred to. They are all very small, and vary from 1-50th to one-third of an inch in length, the latter constituting relatively giant forms not found in Britain. Examined under a magnifying glass, they are easily identified by their four long narrow wings with a conspicuous fringe at the margin. Some species, however, are never winged, and others again are winged according to sex, time of year, or food conditions. The larval form is similar to the adult and has the same food habits, but it is never winged, and in some species is either yellow, orange, or blood red in colour. A kind of pupal stage precedes the adult winged form, which is usually motionless, and in which no food is taken. Thrips feed probably by suction, like green fly, but this is a point difficult to determine, and which has not yet been finally settled. They pump up the juices both of the foliage and of the flower, and in Oats, for example, cause the straw to become deformed and twisted, and the grain to shrivel. Pea and Bean thrips often do very great damage, attacking the plant just as it is about to flower. This species is described in the Board of Agriculture Leaflet No. 43, 1905. On the contrary, one species is said to be even beneficial, and to suck green fly, whilst the thrips themselves are attacked by certain mites, bugs, beetles and thread worms.

The species of thrips of the greatest interest

to gardeners are those which may be referred to generically as the greenhouse thrips. This form has been recently investigated by H. M. Russel (U.S. Department of Agriculture, Bull. 64, 1909), to whose results it is of interest that attention should be drawn. Our knowledge of the greenhouse thrips dates from 1833, and is due to Bouché. The insect punctures the tissues of the food plants and sucks out the plant juices, chlorophyll, &c., immediately about the puncture. It then proceeds to attack another part, with the result that the plant becomes covered with pale spots corresponding to the centres attacked and somewhat resembling a form of red spider attack. With the progress of the attack, and, according to the number of insects present, these spots tend to run together and to form

pupal stage 10 to 15 hours, pupal stage four to five days). Each female lays only a few eggs, probably from 10 to 20, and under favourable conditions 12 generations may be produced each season.

Fortunately, the pest may be controlled by a variety of remedies. Fumigation with nicotine papers gives good results. This should be done at night and in a moist atmosphere, using two sheets of the paper for every 1,000 cubic feet of space. Early in the morning the house should be well ventilated, having been allowed to remain closed all night. This fumigation may, of course, also be effected by nicotine liquid extracts. Spraying with nicotine liquids, however, is only effective in so far as the spray actually reaches the offenders, those remaining often soon re-popu-

FIG. 89.—CYPRIPEDIUM CALIFORNICUM: COLOUR OF SEPALS, YELLOW; LIP, NEARLY WHITE. (See p. 209.)

larger blotches, so that finally the foliage in bad cases is entirely destroyed. Not only, therefore, is the vitality of the plant drained by the withdrawal of its sap and the destruction of its chlorophyll, but the plant becomes useless for ornamental purposes. The eggs are laid singly in the tissues of the food plant, preferably on the fresh young leaves rather than on the limp attacked ones, and the larva when it hatches out settles down on the same leaf to feed. One leaf may contain as many as 250 larvae in addition to pupae and adults. The comparatively simple metamorphosis is effected in situ on the under side of the leaf. The entire life history extends over probably from 20 to 35 days (egg stage, four to eight days, larval stage 12 to 20 days, pre-

lating the plant. Fumigation with hydrocyanic acid gas is very fatal to all thripidae. There should be no difficulty in the necessary preliminary of estimating the cubic capacity of the house, and with ordinary precautions the remedy is a perfectly safe one. The work should be done at night and with the foliage dry. Use from 1-100th to 1-20th of a grain of potassium cyanide per cubic foot of space for a period varying from two hours to all night, varying the strength and exposure according to the circumstances of the particular case (lightness of house, variety of plant, &c.). In all cases the treatment should be repeated from seven to ten days after the first application, as the eggs will produce fresh larvae.

NOTES FROM LA MORTOLA.

CULTURE OF EPIPHYTES.

A FEW trials have been made at La Mortola to establish epiphytic plants in the open. The late Sir Thomas Hanbury was the first to try experiments in this direction by hanging up three plants of *Tillandsia xiphioides* on a piece of wire in the Pergola some 35 years ago. The plants have grown well, and they flower frequently, though they receive little more than rain water. To these a few other similar Bromeliads were added in later years. *Tillandsia dianthoidea* now seems quite at home on the branches of a small Lemon tree. *Tillandsia stricta* has just finished flowering. *T. Duratii* also does well in a very sunny position on a branch, and is very conspicuous with its pure white, scaly leaves.

Tillandsia usneoides was brought from Mexico three years ago by Dr. Ross, of Munich, and sent to us. It has grown very well, and occasionally flowers. It does equally well in the shade and in sunny situations, though the latter may be more to its liking.

grow without any Sphagnum, and send their roots up and down the stem. They flower every year in July, sometimes in great profusion, and are the best proof that epiphytic gardening on the Riviera is well worth trying. There must be a good number of Orchids which will grow as easily as *Oncidium bitfolium*. The difficulties only consist in getting the right species and in ensuring that the plants have not been weakened by long cultivation under glass. A few years ago I procured a few species from South Brazil. They are growing well, and some have already flowered several times, for instance, *Leptotes bicolor*, *Oncidium longipes*, and *Sophronis violacea*. *Cattleya citrina* has just now one flower open. A few other Orchids have been planted this year on trees; it remains to be seen whether they will succeed. They get an occasional watering, and are exposed to wind and cold in winter. The only, yet sufficient, protection during the very cold days of last winter consisted in a few newspapers, loosely wrapped over the plants. *Cattleyas*, most of the *Dendrobiums*, *Stanhepeas* and other tropical Orchids

THE ALPINE GARDEN.

POTENTILLA TONGUEI.

THIS very beautiful Cinquefoil is referred to in the *Index Kewensis* as *P. nepalensis*, but the *Kew Handlist* confirms my opinion that it is of garden origin. In all probability it is one of the set of hybrid *Potentillas* which was raised about the middle of the last century, some of which were very beautiful, although the taste for the double-flowered *Potentillas* caused the single varieties to be overlooked. Whatever the cause, *P. Tonguei* has never been extensively grown in gardens, and not infrequently it has been difficult to procure from the nurserymen. Now, however, it is not so rarely met with in commerce, so that those who wish to own it should have no great difficulty in securing plants.

The habit of growth makes it more adapted to the rockery than to the border, inasmuch as it looks at its best when trailing over rocks, whilst it has long, naturally drooping flower-stalks. The blooms show much better on a rockery than on the level; in fact, it is of little use in the border unless it is planted near the front and allowed plenty of room to develop. When cultivated in the border the flower-spikes should be supported by stakes, as is done in the case of the double-flowered varieties, but the plant is much prettier when supports can be dispensed with.

This Cinquefoil will grow in any ordinary garden soil. On the rockery the roots should be planted on a flat terrace, so that the rain will percolate readily into the soil, and placed so that the stems will hang over the stones in front, where, when its beautiful red and yellow flowers are expanded, it will prove most ornamental. In its general aspect it differs greatly from the ordinary class of summer-flowering rock plants, and its duration of bloom is so prolonged that its worth is all the greater. I have not found it produce seeds, but propagation is easy by divisions of the plants in early autumn, rooting the pieces carefully in pots, as it is difficult to take them off with many roots attached.

GERANIUM FREMONTII.

HARDY Geraniums are somewhat numerous, yet there is still room for new ones of a really distinct character, as it must be admitted that there are several perennial Crane's Bills which are too much alike. There is, therefore, a welcome awaiting *Geranium Fremontii* from those who like the genus and who desire to have a representative collection. This species has been introduced for two or three years, but is rarely catalogued for sale. It forms a pleasing border subject and may also be grown on the rockery, its stature (1 foot or 1½ foot) not being too great for the larger rock-gardens.

With me it thrives satisfactorily in a rather dry and sunny border, producing purple-lilac, dark veined flowers which are larger than a half-crown, and are somewhat starry in form. The foliage is of a soft, light green, lighter underneath, and prettily veined. It is, I believe, a native of Colorado; in any case, the plant is quite hardy in my garden. *S. Arnott.*

PLANT NOTES.

LANTANAS.

THE true species of *Lantana* are very limited in numbers, but the list of garden varieties is lengthy. In many parts of the tropics *Lantanas* are troublesome weeds, but in this country they are exceedingly useful for the embellishment of the greenhouse during the summer months, and also for bedding out, especially in the arrangement of some of the mixed beds of flowering subjects which are so popular nowadays. This year the months of June and July were so wet and cold that many bedding plants proved unsatisfactory, but the *Lantanas* gave plenty of colour throughout the whole of that time, and they are still blooming with the

FIG. 90.—CYPRIPEDIUM MACRANTHUM: COLOUR OF FLOWERS, ROSY-PURPLE.

(See p. 210.)

Several *Billbergias* are doing very well on trees, for instance, *B. nutans*, which grows easily and flowers in great profusion in spring. *Billbergia vittata*, with its large, drooping, highly-coloured flower-spike, forms a large tuft on the stem of a *Cocos capitata*. *Billbergia Binotii* and *B. Limoniana* are just now very fine in flower on the stem of a *Phoenix canariensis*. The large bases of the leaves of these Palms furnish ample opportunity for epiphytic gardening. One may often notice that, behind these leaf bases, a number of plants germinate, and not infrequently little Fig trees (*Ficus Carica*) arise and send their roots down, just as their great cousins do in the Tropics.

The most magnificent epiphytic plants, Orchids, have also been tried in a small number in the open. Prof. Penzig has grown in the Genoa Botanic Garden a plant of *Oncidium bitfolium* for many years. Six years ago a few pseudo-bulbs were brought to La Mortola by Sir Thomas Hanbury, and have been established, some on a little Lemon tree and others on the stem of a large *Ficus macrophylla*. The plants continue to

cannot be expected to grow under these circumstances, but if we can succeed with the hardy species we shall be able to add another charming and interesting feature to our gardens. I should be very grateful if some of the readers of the *Gardeners' Chronicle* would kindly send us hardy epiphytic Orchids from their native places in temperate climates.

A third family producing epiphytic plants is the Cactaceae. Of this family we have some 30 different species of *Rhipsalis* growing on the stems of *Phoenix canariensis*, *Cocos capitata*, and Olive trees, chiefly on the north sides. Once these *Rhipsalis* have taken root, they grow surprisingly well in the open. The large crowns of the Palms afford sufficient shelter against heat and cold, but the epiphytes must be watered occasionally, as little rain-water penetrates through the large masses of foliage. *Rhipsalis virgata* is especially grateful, also *R. Saglionis*, *Cassytha*, *trigona*, *pentaptera*, and many other species. *Rhipsalis* do far better here on Palm stems in the open than in pots wintered under an unheated glass shelter. *A. B.*

greatest freedom. For bedding purposes the larger-growing forms are often grown into good-sized specimens and employed as dot plants or associated with other subjects that attain about the same height. The dwarf-growing varieties, on the contrary, are frequently used for edging purposes. A generation or more ago a great number of varieties were in cultivation; indeed, in the catalogue of Messrs. E. G. Henderson & Son, of St. John's Wood, for the year 1876, no fewer than 54 varieties are offered. It would not, I think, be possible to obtain that number at the present time, nor are so many desirable. A marked peculiarity common to the different *Lantanas* is the great change that takes place in the colour of the flowers after expansion, of which a popular free-growing variety, *Ne Plus Ultra*, furnishes a good illustration. In this the flowers are yellow when first expanded, changing afterwards to bright pink. Other good varieties are *Chelsea Gem*, of an exceedingly rich crimson and amber; *Drap d'Or*, a dwarf variety with bright yellow flowers; *Incendie*, reddish-crimson and orange; *Distinction*, orange and scarlet; *Gogol*, amber-orange; *Magenta King*, magenta-purple; *La Neige*, white; *Raphael*, yellow and maroon; and *Rayon de Soleil*, deep yellow. I have left the mention of one of the most popular kinds till the last, since some confusion prevails with regard to its nomenclature, and also because it is especially valuable as a greenhouse climber.

Treated in this way, the *Lantana* in question has for many years formed a notable feature in the greenhouse at Kew, where it is trained up one of the supports and carried along the roof. Thence the slender shoots hang down and form a living curtain, which from spring till autumn is plentifully sprinkled with its little rounded clusters of lavender-coloured flowers. At Kew it is grown as *Lantana salviaefolia*, but in the parks and other public places where it is so frequently seen it is almost invariably known as *Lantana delicatissima*. Out of doors and fully exposed to the sunshine the flowers acquire a somewhat deeper tint than they do under glass and in a shaded structure.

The propagation and cultivation of *Lantanas* are in no ways exacting. The treatment given to *Fuchsias* will suit them well, as they will, in a greenhouse temperature, remain inactive throughout the winter. In the spring they start freely into growth, and should be repotted at that season. The young shoots so plentifully borne at that period will strike as readily as those of *Fuchsias*. Grown altogether in pots they are benefited by an occasional stimulant during the flowering season. W.

THE ROSARY.

ROSE MRS. F. W. FLIGHT.

In the gardens of Mrs. T. F. Blackwell, The Cedars, Harrow Weald (gr. Mr. J. Dinsmore), Pillar and Rambler Roses are effectively displayed around the flower garden and along the grassy walks through the extensive naturally-arranged garden of flowering shrubs and old-fashioned herbaceous plants. The *Wichuraiana* hybrid Roses are very beautiful, the old *Noisette Aimée Vibert* having masses of white, fragrant flowers. *Lady Gay* is one of the prettiest and most graceful, but the handsome and floriferous *Rose Mrs. F. W. Flight*, illustrated in the *Gardeners' Chronicle*, September 28, 1907, is one of the best, its branches being terminated with large bouquets of rose-pink flowers, each bunch perfect in itself, and the whole bush making a fine sight. In point of effect the old *Crimson Rambler* holds its own, its masses of bloom being visible at a greater distance than any other. B.

ST. GILES'S HOUSE.

ST. GILES'S HOUSE, the Dorsetshire seat of the Earl of Shaftesbury, is situated some 16 miles from the cathedral city. It is approached by a pleasant drive of three miles from Verwood station, on the London and South-Western railway. The mansion (see fig. 91) stands in a beautifully-timbered park of 430 acres. It dates from the 16th century, being a large, solid pile of Elizabethan architecture, erected on the site of a former house. On the south side is an ornamental lake of about 7 acres. This is fed by the river Allen, which divides near the mansion, part running under the house, through what was once a moat, into the lake. From the lake, the river continues its course through the adjacent village of St. Giles.

the chalk subsoil removed to a depth of 4 or 5 feet. Broad gravel paths intersect this garden, being in the form of a cross, and in the middle, where the paths cross, is a fountain, surrounded by a water basin, containing varieties of *Nymphæas*. On either side of the path, and at the same level, is a margin of turf of some 6 feet in width, and then the sunken portions are formed, also in grass, these being about 13 inches below the surroundings. This garden was designed by Lord Shaftesbury, the work being carried out by Mr. W. E. Axford, the gardener. In each of the four excavated quarters large beds have been cut in the turf. These are planted in summer-time with *Heliotropes*, *Antirrhinums*, *Pelargoniums*, &c.

Stretching from this garden, as far as the eye

FIG. 91.—ST. GILES'S HOUSE, THE SEAT OF THE EARL OF SHAFTESBURY.

Near to the lake are some very large trees of the London Plane, also particularly fine specimens of *Pinus pinea*, the Stone Pine.

On the north side of the house, on either side of a gravel path leading to the village church, is a row of Lime trees. These form a pretty avenue, which, in years to come, will add considerably to the beauty of the surroundings. The village church was entirely destroyed by fire last October, and is now in course of reconstruction.

On the south side is a terrace garden, which, at the time of my visit (the first week in August), was gay with summer bedding plants.

On the east side is a sunken garden. This was constructed some four years ago, the necessary land being taken from the park, and

can discern, and on rising ground, is a long double avenue of Beech trees.

Within a short distance of the mansion is a walled-in garden of about 7 acres. This was formerly devoted to vegetable culture, but within the last few years it has been converted into a fruit and flower garden. It includes a pergola, the pillars or uprights of which are built of bricks, and the top cross-pieces of massive Larch poles. It is clothed with Roses in variety, *Ceanothus azureus*, *Polygonum Baldschuanicum*, *Vitis* species, and other climbers. Looking through on either side as one passes beneath this pergola, Roses are seen in profusion, planted in beds in their several varieties. Surrounding these Rose beds on the outer sides are hedges of *Cupressus macrocarpa*. The

yellowish appearance of these Conifers denotes their dislike of the chalk subsoil. Beyond the pergola and in another division of the garden are two small orchards of Apple trees; whilst another part has been transformed into two very pretty formal Rose gardens. Surrounding the Rose gardens, and backed by Yew hedges, 5 feet high, are long borders of herbaceous plants. On the walls are trained trees of Peach, Apricot, Pear, Plum, Cherry, cordon Gooseberries and Currants, all of which have borne heavy crops of fruit this season.

Many improvements have been carried out by the gardener, Mr. Axford, who has had charge of these gardens for the past 10 years.

The glasshouses are devoted to flowering plants exclusively, and among a general assortment of decorative subjects was a fine, healthy collection of *Souvenir de la Malmaison* Carnations. At the time the alterations were made in the walled-in gardens, new vegetable quarters, some 5 acres in extent, were formed in a field situated some distance from the older garden. In these quarters I noticed large crops of vegetables, their condition, as that of the gardens generally, denoting care and attention on the part of the gardener and his staff. *Wilmot H. Yates.*

VEGETABLES.

CABBAGES.

For the past few years I have sown Cabbage seeds in ordinary soil, which is of a sandy nature, and, when large enough, transplanted the seedlings in the heaviest ground in the garden, on a border with a south aspect.

By this system I find that the plants do not have the same tendency to "clubbing" which they had when grown from start to finish in the ordinary soil.

Another aid to the prevention of "clubbing" in Cabbages is to preserve the roots from being broken when lifting the young plants preparatory to planting them out in their permanent quarters, therefore, the trowel should always be used so that the plants can be lifted with a good ball of soil and with the roots intact. It is obvious that in transplanting a good ball of soil can be kept around the roots if lifted from heavy ground, whereas this would not be possible if lifted from gravelly or sandy soil.

When the plants have rooted well, nitrate of soda is applied sparingly between the rows, about once a fortnight, and the soil is afterwards hoed. Before the plants get too large and the roots run too much, the soil is drawn well up around the stems.

When the plants are growing tall and leggy, which has been the case this season, owing to the wet weather, many resort to the practice of plugging, i.e., making a slit with a sharp knife in the lower part of the stem and inserting a plug of wood or cork to keep the wound open. This may delay a plant running to seed, but I have never found it check the length or growth of the stem.

If a plant is inclined to grow leggy, and its own weight causes it to incline to one side, thereby exposing some of the roots, a spadeful or two of soil placed on the exposed roots is all that is required. *Winningstadt* is a good summer Cabbage, as firm as a cannon shot and almost as heavy.

St. John's Day is a profitable variety and a good one for any purpose. Incomparable *Winter* is a good, compact, round Cabbage, and where there is a large demand, as in public institutions, it should always be grown, especially for use during early winter, as it will withstand a considerable amount of frost.

For autumn sowing one of the best is "First and Best." *Meins No. 1* and *Ellam's Early* are also very suitable for this planting. *Thos. Francis, Wednesday, Staffs.*

The Week's Work.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. Ford, Pencarrow, Cornwall.

Coleus.—Insert cuttings of desirable varieties to provide stock for propagating purposes next spring, remembering, however, that, as *Coleus* seeds give a good proportion of excellent varieties, it is unnecessary to save stocks of merely ordinary sorts. With the approach of dull days and cold nights, plants growing in all but the hottest houses will cease to be ornamental. These should be discarded to afford accommodation for the now more valuable winter-flowering plants.

Euphorbia pulcherrima (Poinsettias).—When housing these plants, do not transfer them immediately from cool frames to a hot-house, for such a sudden change of temperature will cause an undesirable burst of activity, resulting in weak "heads." Should the plants have been kept during the summer in pits fitted with hot-water pipes, it would be as well to let them remain there for the time being, for, as the weather turns colder, artificial heat, in gradually increased quantities, can readily be afforded them. Weak applications of chemical manure, alternated with manure water, will now be of benefit.

Schizostylis coccinea.—This valuable bulbous plant only flowers satisfactorily in the open ground in the warmer parts of the country. In most gardens, therefore, it is necessary to pot up, or plant in boxes, a number of early plants in the autumn. Keep them close in a frame for a short time, and the plants, when well established, will flower well in a greenhouse or warm pit. Some excellent cut blooms may be obtained if a temporary frame is placed over the plants when they are growing.

Winter-flowering plants.—Allow ample room to such subjects as *Jacobinia*, *Peristrophe speciosa*, *Thyrsacanthus rutilans*, *Coleus thyrsoides*, *Reinwardtia*, *Eranthemum*, etc. They will only need shade from the sun's rays for a short time on the hottest days. Winter-flowering plants will now require regular supplies of manure. Keep the surface soil free from weeds, and lightly stir it occasionally with a pointed stick.

Auricula.—Winter is usually a critical time for Auriculas, and, unless every care is taken, the most valued forms often dwindle away. Throughout the winter season the frames should face to the south, and the plants should be either stood on a good layer of cinders or gravel, or arranged on a temporary staging. During fine weather the lights should be entirely removed, but the plants must not be exposed to cold rains, for, if water is allowed to remain in the heart of the plants, decay results. At this season, and until growth recommences, Auriculas must be kept on the dry side; but, at the same time, do not let them become quite dry. The essentials for successfully wintering these plants are to keep them as hardy as possible without exposing them to frost, and to water them only when necessary.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Late vinery.—Every effort should be made to get the latest Grapes to ripen perfectly, this being an absolute necessity if they are intended to be kept for a long time before they are cut. The varieties *Lady Downes Seedling*, *Gros Colmar*, and *Lady Hutt* require a longer period for ripening than most other late Grapes, and for this reason they should be grown in a house by themselves. In the case of the variety *Lady Hutt*, the bunches need to be well exposed to the light. This Grape, when properly finished, will last in a good condition until March. Ventilation must now be practised with great care, and the temperature in the vinery must not be allowed to drop below 60 degrees until the Grapes are quite ripe. If wasps are troublesome, the ventilators must be covered with hexagon wasp-proof netting. Remove all new lateral growths and examine the bunches carefully for diseased berries, which must be cut out and burned. Watering will also need to be done very carefully. On no account must the borders be made sodden, and, when water is applied, see that it is the same temperature as the atmosphere of the house. Outside borders, especially where

the subsoil is cold and heavy, are generally in a very soddened state, owing to the frequent rains. If they are covered with a dressing of stable manure, or other mulch, it is advisable to remove this and lightly fork up the surface of the border. When rains are frequent the borders should be covered with boards or lights, to carry off the water, but they should be removed whenever it is fine, so that the soil may receive the full benefit of sunshine.

Young vines.—Vines planted last spring have made satisfactory growth, but it is essential that the shoots should become thoroughly mature before it is time to prune them. For this reason, assist the vines to ripen the wood by allowing a free circulation of air at all times, and, if the weather is very damp, allow a little heat to circulate in the water pipes. Although the roots must be given a sufficiency of moisture, do not apply too much water; damping and syringing may now be discontinued. The lateral growths may be allowed to grow freely.

Mid-season vines.—Remove all lateral growths and shorten the side shoots, if this is necessary, to allow light and air to reach the main stem. Vines which have ripened heavy crops of Grapes should be given a soaking of farmyard manure water before the leaves fall. This liquid manure should not be used in the case of vines whose roots are in an unsatisfactory condition. Such vines should be given the treatment recommended in a previous Calendar.

Melons.—At this season of the year artificial warmth must be freely employed for maturing the fruits. Great care will be needed in the culture of the plants, and especially in watering. If too much water is given, it affects the flavour of the fruit, and it is also liable to cause canker in the stem. Stimulants also must be applied with more consideration than hitherto, and it will be better to withhold liquid manure entirely. A little artificial manure sprinkled over the surface of the bed or placed in the watering-can will be best, but this also must be discontinued when the fruits commence to colour. Do not syringe the plants; all that is necessary in this direction is to damp the walls and paths occasionally. When the fruits are ripening, the atmosphere should be kept quite dry, and a little air admitted by the top ventilators.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Bursford, Surrey.

Damping and watering.—Owing to the unfavourable summer, the growths of most tropical Orchids are much softer in texture than in ordinary seasons, but the cooler-growing species have benefited by the mild, damp weather. The amount of moisture in the atmosphere must be regulated with great care until fire-heat is more extensively employed. In the present weather it is a mistake to maintain so much moisture in the house as is usual during a dry, warm autumn. The East Indian, *Cattleya*, and Mexican houses will require to be damped to a moderate extent only in the mornings and afternoons. In the case of the intermediate and cool houses, where fire-heat is not at present required, one good damping in the morning will be sufficient, although on very bright days it may be advisable to sprinkle the paths, &c., again during the afternoon. Keep the houses comparatively dry during the middle of the day, especially the Mexican house and those in which *Dendrobiums* and *Cattleyas* are cultivated. Afford plenty of ventilation whenever the conditions outside will permit, but not such as to cause great fluctuations in temperature. During sunny periods advantage should be taken to admit an increased quantity of air, as this will assist the ripening of the pseudo-bulbs, of such genera as *Dendrobium*, *Catasetum*, *Cynoches*, *Mormodes*, *Cattleya*, *Lælia*, *Cyrtopodium*, *Lissochilus*, *Chysis*, *Schomburgkia*, *Calanthe*, *Epidendrum*, *Odontoglossum citrosum*, and *O. Londeboroughianum*. These plants are more benefited by direct sunshine now than at any other time of the year, but there are other species of Orchids that are liable to injury if exposed to strong sunlight during autumn. Of these may be instanced *Phalaenopsis* (especially those species with green foliage), *Aerides*, *Angraecum*, *Vanda*, *Anectochilus*, *Phaius*, evergreen *Calanthes*, *Zygopetalum*, *Cypripediums*, *Oncidiums*, *Masdevallias*, and *Odontoglossums*. *Dendrobiums*

now resting require very little fire-heat, but they delight in plenty of sunshine and an abundance of fresh air. Cold draughts must not be permitted, and damping should be reduced to a minimum. The plants will not get dry so quickly as they did a month or two ago, therefore greater care must be exercised in affording water. The cultivator must be guided principally in this matter by the condition of the plant, whether it is in active growth, or at rest, or approaching the flowering stage. In any case, it is necessary to remember that this is a specially wet season, and those who water by rule of thumb and who give the same amount as they have given in other years will probably find later that many of the more tender plants have decayed or the leaves have become spotted and diseased.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Celery.—Advantage should be taken of fine days for the earthing up of the stems. This work requires great care, for good Celery is often spoilt through the earthing up being entrusted to unskilled persons. All offsets, decaying, or split leaves should be removed before the soil is placed in position. On the day preceding the operation the plants should be given a copious watering. Make a good sprinkling of soot between the plants. It is advisable to employ three pairs of hands for this work, one to hold the leaves together and place the soil tightly round the base of the plant, and one on either side to break up and supply the soil. The great secret in the proper blanching of Celery is to apply but little soil at one time and make frequent additions. At this season from seven to nine weeks will be required to complete the blanching. If the work has to be done single-handed, each plant after cleaning should be securely tied round with a piece of raffia, and the soil added at one side at a time, cutting the raffia as the work proceeds. This, however, is a slow process, and is not to be recommended if it can be avoided. Earth must not be added to the later batches for some time to come, bearing in mind that late Celery is likely to keep in a more satisfactory condition through severe weather, when not too early or severely blanched.

Tomatos.—The season is now too far advanced to allow the fruits to remain longer in the open, unless protected by a sunny wall or building. All those that have already attained a moderate size should be cut with long stalks attached and suspended under glass to finish. Although these fruits may not be of the highest quality, they will be found useful for sauces and such-like purposes. Plants fruiting in houses will require a little fire-heat, but, at the same time, it must be remembered that too much will be equally as bad as none at all. Endeavour to keep a free circulation of air night and day, and the atmosphere as dry as possible. Watering should be done early in the morning. Remove all surplus growths and shorten the largest of the leaves. Tie up and expose the bunches as much as possible to the sun. As soon as the fruits show signs of colouring let them be gathered. Plants intended for winter fruiting should be placed in their final pots and grown on near to the glass in an intermediate house. Encourage the plants to make short-jointed, sturdy growths by admitting air freely whenever the weather permits. Avoid excessive fire-heat, and with regard to water at the roots, it is better to keep the plants moderately dry than to apply too much moisture.

Lettuce.—Prick out into cold frames the young plants which have been raised for supplying salad in winter. Varieties suitable for this purpose are Hick's Hardy White, Improved Brown Cos, and Hardy Hammersmith Cabbage. Make one more sowing of these varieties in a cold frame.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Filberts and Cobnuts.—In common with all fruits this season, these are much later in ripening than usual. They will soon be ready for gathering, and this must be given attention or they will drop and many be lost. Nuts should be well dried before storing, and they must be stored in a place where rats and mice cannot reach them.

Walnuts.—In the case of Walnuts it is often best to allow them to fall from the trees and to gather them up daily. The husks should be removed and the nuts partially dried previous to storing them in sand or in tubs in a cool cellar. If Walnuts are kept in a dry atmosphere the kernels will shrivel and rapidly deteriorate.

Raspberries.—If the old canes have not been cut out, this should be done at once. The young canes should be thinned to the required number, remembering that better crops of Raspberries are obtained, and the berries themselves are of better quality, when the shoots are allowed plenty of space. The unfavourable weather has retarded the ripening of autumn-fruiting Raspberries, but, in the event of a sunny period, there is still plenty of time for them to mature. In order to assist the process, the fruits should be exposed to the sun by removing any shoots that are not required. When the canes and foliage hang over the fruits, the latter have little chance of ripening in a season such as the present.

Mulberries.—Mulberry trees are usually planted on lawns; in such cases it is best to allow the fruits to ripen to such a degree that they will fall when the tree is shaken gently, as the fruits are superior in colour and flavour when fully ripe. If the trees are growing on cultivated ground, this practice can also be adopted if clean straw is spread beneath them.

Strawberries.—The planting of Strawberries should be completed without delay, so that the plants may become established before the winter. It is too late now to plant Strawberries for fruiting next season, but they may be put out in permanent quarters for supplying an early batch of runners next summer and furnishing early fruits in 1911. It is a great advantage to have special "layer plants" where large quantities of Strawberries are forced annually, and where home-grown runners are required for the purpose. Remove the runners from established plants and stir the ground with a Dutch hoe whenever it is dry enough. Weeds have grown rapidly this autumn, and every effort should be made during favourable weather to destroy them.

General work.—When the various fruits have been gathered and the nets are no longer required, they should be thoroughly dried for storing. See that they are properly labelled, and place them where mice cannot injure them, as these vermin often cause great damage to nets during the winter months. They are best suspended from the rafters of a dry loft or shed. It will be advisable to remove all mulchings placed about fruit trees, so that the ground may be exposed to the sun's rays.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardsllee, Sussex.

Bedding plants.—Tender plants necessary for stock purposes should now be lifted and placed in pots or boxes, and stood in frames where heat can be used when necessary. If any variety of Pelargonium has not produced sufficient cuttings for next year's stock, the old plants can be lifted and placed either in pots or baskets. The top shoots may be taken off, inserted around the sides of pots, and placed in a warm pit. Such plants as Streptosolen and Plumbago should be lifted from the beds, potted, and placed under glass. In cold districts, cuttings and stock plants of bedding subjects should be shifted from cold frames to a greenhouse or heated frame, the atmosphere of a cold frame being too moist during dull weather and liable to cause damping in the plants. Water the plants only when it is absolutely necessary.

Polyanthus and Primrose.—These should now be planted in their permanent positions, adding plenty of manure and leaf-mould to the soil. Old plants need a top-dressing of decayed manure. They bloom very early in the spring, and a succession of flowers may be obtained over a long period if some are placed in warm, sheltered positions.

Bulbs.—Eranthis hyemalis (Winter Aconite) should be planted without delay. It forms an effective combination with Chionodoxas and Scillas, or interspersed with Snowdrops. The Eranthis is a fine subject for planting in the shade of trees, or on the hardy plant border. Bulbocodium vernum should

also be planted. The ground should be prepared for the planting of Crocuses. Among the best varieties are Queen Victoria (pure white), Caroline Chisholm (white), purpurea grandiflora, Louis d'Or (yellow), and Baron von Brunow (blue). Hyacinths and Tulips should be planted as soon as the beds have been cleared of their summer occupants. The following is a selection of bedding Hyacinths:—Single white: La Grandesse, Mont Blanc, Mme. Van der Hoop. Double white: Avalanche and Florence Nightingale. Red: Von Schuller, Orange Brilliant, Etna, Roi des Belges, Gigantea. Blue: Masterpiece, King of the Blues, Electra, Grand Maitre, Pieneman, Czar Peter. Yellow: Ida, King of the Yellows, La Citronniere, MacMahon. Mauve: Mauve Queen, Haydn, and L'Esperana. When Tulips are planted in the same beds as Hyacinths, a succession of flowers is maintained, as the Tulips flower after the Hyacinths are past. The Tulips should be of different colours to the Hyacinths. For instance, if white Hyacinths are used over a groundwork of blue Myosotis, they can be followed by red or yellow Tulips. It is now time that all orders for bulbs were sent to the nurserymen. On receipt, the bulbs should be taken from the packets and spread out in a cold store until required for planting.

Bulbs for the Alpine garden.—Many of the small-flowering Narcissi, including Narcissus minimus, N. cyclamineus, N. juncifolius, N. triandrus alba, N. citrinus, and N. odoros, are suitable for the rock-garden. They are best planted in clumps, and a quantity of rich soil should be incorporated with the ordinary soil. Other bulbous plants suitable for the rock-garden are Chionodoxa, Camassia, Erythronium, Galanthus, Oursia, Anomatheca, and Calochortus. These should all be planted in light, sandy soil, and, if the soil of the rock-garden is of a cold nature, it will be better to place them all in a layer of sharp silver sand. The following Anemones are suitable for the rock-garden:—A. blanda, A. alpina, A. narcissiflora, A. pulsatilla, and its variety alba.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of City Parks, Cardiff.

The use of flowering trees and shrubs.—There are few better or cheaper methods of enhancing the beauty and charm of public parks during the spring and early summer months of the year than by the judicious planting of flowering trees and shrubs in beds and borders. Evergreens in the form of Laurels, Bays, Aucubas, Hollies, and the commoner types of Conifers have undoubtedly their place and use in the formation of shrubberies, but it must be admitted that the planting of these in most of our parks has been done to the exclusion of many equally suitable but more beautiful subjects. The majority of us who deal with this kind of work have to plead guilty to an excessive use of evergreens in park plantations, and have to confess to finding it difficult to overcome this unfortunate prejudice in their favour. This is all the more regrettable since there is now such a wealth of varied and beautiful material at our command for the purpose. Even when it becomes necessary to hide an object, or block out a view from some standpoint, it is quite possible to attain the desired end without resorting to the use of the usual sombre-looking evergreens. For instance, few plants make a denser growth than does Berberis stenophylla, yet what a graceful habit it has, and what a wealth of bloom it produces in the spring, and how infinitely superior to the Common Laurel as a hedge! Under suitable soil conditions, Rhododendrons, too, though slow growing, make a delightful substitute for ordinary evergreens. To obtain the best results from the use of flowering trees and shrubs, it is advisable to plant them in bold groups and to have them arranged so that different species keep up a succession of bloom for a considerable time in the same border. Shrubberies containing groups of such plants as Almonds, Peaches, Double-flowering Cherries, Pyrus floribunda, Brooms, Double Gorse, Hawthorns, Guelder Roses and Mock Oranges are objects of beauty and interest until such time as the herbaceous border attains its full glory and claims the whole of the attention of visitors. It is needless to point out that the variety to select from is so great that no one combination such as indicated need be repeated frequently in any given park.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, SEPTEMBER 28—
Roy. Hort. Soc. Coms. meet. (Masters' Memorial Lecture on the "Production of Varieties," by Prof. Hugo de Vries at 3 p.m.).

WEDNESDAY, SEPTEMBER 29—
Michaelmas Day. Quarter Day.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—54.6°.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, September 22 (6 P.M.): Max. 68°; Min. 52°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, September 23 (10 A.M.): Bar. 30.0; Temp. 60°; *il catho*—Heavy mist.

PROVINCES.—Wednesday, September 22: Max. 62° Cambridge; Min. 53° Scotland E. coast.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs, at 67 & 69, Cheapside, E.C., by Protheroe & Morris, at 10.30.

WEDNESDAY—
Trade Sale of Bulbs, in variety, Lilliums, &c., at 67 & 69, Cheapside, E.C., by Protheroe & Morris, at 5. 25,400 d. & s. Begonias, at the Cambria Nursery, New Eltham, by Protheroe & Morris, at 1.

FRIDAY—
Imported and Established Orchids at 67 & 69, Cheapside, E.C., by Protheroe & Morris, at 12.45.

By the death of Peter Barr in his 85th year horticulture loses one who, in the last century, contributed largely to its enrichment.

Peter Barr.

Some men so outlive their contemporaries, however, that their names, though not unfamiliar, have nevertheless something of the nature of an echo. So it must seem to the younger generation in respect to Peter Barr, notwithstanding his extraordinary personality, his energy, enterprise, and his devotion to floriculture.

He appeared never to be satisfied with any plant as he found it, but, on the contrary, saw in everything the possibility for development and improvement. Peter Barr was not content to increase plants which were already plentiful and popular, but selected those which others passed unnoticed, or failed to realise what they would become under special cultivation. Those whose memory can recall the history of floriculture in the middle of the last century will remember how he worked upon group after group of plants, collecting as many species and varieties as was possible in each group. With the enthusiasm of a true florist, he would regard certain characteristics in a particular flower as worthy of development, and other features which in his opinion should be eliminated. His patience in carrying out persistent and minute observations was inexhaustible.

Some readers may remember how he collected all the species of *Helleborus* he could discover for cultivation in his trial grounds, which, in those days, were at Tooting. No one had hitherto given these plants special notice, therefore visitors to the trials were impressed by the variety, diversity and beauty exhibited in them. Peter Barr had

a great love for Irises and Peonies, and these were greatly improved and popularised under the cultivation he afforded them. Eventually his attention became concentrated on bulbs. He first studied Tulips, an interest probably inherited from his father, who had a collection of florists' varieties. But even Peter Barr was unable to make these popular, although he greatly advanced the interest in garden Tulips, and especially late-flowering and decorative types. He worked for a considerable time upon Lilliums, and devoted his attention to tracing the origin of varieties with a view to correcting the nomenclature of this genus. It was mainly through his persistent efforts that the Royal Horti-

of them had vanished from gardens. Barr refused to believe that all these varieties were lost, and he at once began a search for them, which was carried into every part of the country. He succeeded in discovering many, and his chief rewards were in finding the collections of Mr. Wm. Backhouse, of Darlington, and Mr. Edward Leeds, at Manchester. These two men, with assiduous care, had been cultivating collections of Daffodils for a quarter of a century. Peter Barr eventually secured both collections, and classified the varieties according to their parentage and structural characters. Later, in 1884, came the Daffodil Conference under the auspices of the Royal Horticultural Society. At this

THE LATE PETER BARR, V.M.H.

cultural Society was induced to hold a conference upon Lilies, which was the means of bringing many species to the knowledge of the public.

But the name of Peter Barr will for ever be primarily connected with the development of the *Narcissus*. If an account of his work in collecting *Narcissi* and tracing the identity of particular varieties for purposes of classification were written, it would afford remarkable testimony to his irrepressible energy and zeal. In regard to the *Narcissus* his imagination was stirred by reading Parkinson's statement, written in 1629, that there had been nearly 100 sorts, but most

conference his classification was discussed and in the main accepted. The conference was the means of lifting the Daffodil into a position of greater prominence. Its cultivation increased in a remarkable manner, and the tendency has continued until the present day. A glance at the list of plants certificated by the Royal Horticultural Society will show what a large number of excellent varieties of *Narcissus* has been introduced by the firm of Barr. One of the finest trumpet varieties ever raised was named after Peter Barr, and was figured in these columns May 3, 1902.

We have not referred to his travels, but it will be remembered that after exploring most

of the Daffodil habitats in Europe. Mr. Barr, when about the age of 70 years, commenced, with all the energy and enthusiasm of a youth, a tour round the world which lasted about seven years. He toured through Canada, and afterwards visited the chief cities and parks in the United States, gradually working towards San Francisco, taking Colorado, Utah, and Nevada on his way. He then proceeded through Oregon and Washington, to British Columbia, and finally started from Vancouver for Yokohama. Leaving Japan, he proceeded to China, to Australia and New Zealand, eventually breaking his voyage home at Cape Colony for the purpose of spending 21 months in South Africa. He was interviewed time after time upon his favourite subject—the Daffodil—occasionally delivering lectures on this plant. In most civilised parts he was hailed as “The Daffodil King”—a name which we believe was first applied to Peter Barr by the late Dr. Masters. Many interesting letters from the traveller were published in these columns.

It need scarcely be said that Peter Barr's name was included in the original list of those selected for the Victoria Medal of Honour in 1897, and no man more richly deserved the honour.

On returning to Britain he settled at Kirn, near Dunoon, on the banks of the Clyde. Although already approaching his 80th year, he acquired a garden and recommenced his trials of hardy flowers, making specialities of Helleborus (a group of plants which, as we have seen, occupied his attention almost at the commencement of his career) and Polyanthus. His death, even at his advanced age, was quite unexpected. Less than a fortnight ago he was present at the Centenary Exhibition of the Royal Caledonian Horticultural Society in Edinburgh, apparently as vigorous in mind and body as ever. A week later he conversed with the present writer at the Royal Horticultural Society's Hall, at Westminster. He had come south on a visit to his relatives, and was staying at the house of his son George. On the day of his death Mr. Barr spent a very busy time in calling upon friends in London, and in the evening dined with members of his family and friends. He was taken ill during the night, and died of heart failure in the early hours of Friday, the 17th inst. The funeral took place on the following Tuesday at Islington Cemetery at East Finchley.

Deceased was born in Scotland in 1825, near the former village of Govan, which has long since been incorporated in the city of Glasgow. He was the son of a Scottish millowner, who was also an amateur florist. He left his father's weaving factory whilst still a boy, and obtained a situation as message lad in Thynne's seed establishment, where he became a seedsman, remaining there until he was 20 years of age. He then removed to Newry, and was engaged in the business of Daly, Drysdale & Co., leaving after a year for Worcester, in which city he served for a few years in Mr. Richard Smith's seed business. Eventually Mr. Barr and a friend from Scotland commenced a business in Worcester, but mainly owing to the indifference of the other partner the business was given up. Mr. Barr proceeded to London and was engaged in the business of Butler & McCulloch, Covent Garden. In 1862 he again

commenced business, with a partner, in the premises of the present firm of Barr & Sons, under the title of Barr & Sugden. The business of Messrs. Barr & Sons will be unaffected by the death of the founder, he having retired from the firm in 1896.

OUR SUPPLEMENTARY ILLUSTRATION shows a group of Eremuri growing in Mr. BEAMISH'S garden at Ashbourne, Co. Cork. Planted informally in a nook with a background of trees, against which the flower-spikes appear in relief, they form a pleasing group. The specimens in flower are principally *E. robustus* and its variety *Elwesianus*. Mr. BEAMISH'S garden is filled with interesting plants, and tender subjects find the situation genial. A description of the garden at Ashbourne is given in the issue for June 19, 1909. Those who are specially interested in Eremuri will find much information in Madame FEITSCHENKO'S note on the genus, published in the issue for September 11, p. 181.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will take place on Tuesday, the 28th inst. In the afternoon Pro-

THE LATE PETER BARR WHEN 22 YEARS OF AGE.

fessor H. DE VRIES will deliver a lecture on “The Production of Horticultural Varieties,” being the second Masters Memorial lecture.

—A special Exhibition of Forced Spring Bulbs will be held at the Royal Horticultural Hall on March 8 and 9, 1910. The object of this show is to demonstrate the varieties best suited for gentle forcing, and exhibits of small and large collections are invited from amateurs and the trade. R.H.S. Awards will be awarded according to merit. At this exhibition, the Council also offer (subject to the general rules of the Society) the following prizes, presented to them by the GENERAL BULB GROWERS SOCIETY at Haarlem:—Division I.—FOR AMATEURS AND GENTLEMEN'S GARDENERS.—Eighteen *Hyacinths, distinct*: 1st prize, £6 6s., and six other prizes. Twelve *Hyacinths, distinct*: 1st prize, £5 5s. and four other prizes. Six *Hyacinths, distinct*: 1st prize, £2 2s., and three more prizes. Four pans containing *Hyacinths, ten roots of one variety in each pan*. The bloom of each pan to be of distinctly different colour to those of the other three pans: 1st prize, £4 4s., and three other prizes. Division II.—FOR TRADE GROWERS.—Collection of 200 *Hyacinths, in at least 36 varieties, grown in pots or glasses*. Prize, the Gold Medal of the General Bulb Growers' Society at Haarlem. Collection of 200 *Hyacinths in 20*

varieties in pans, 10 roots of one variety in each pan. Prize, the Gold Medal of the General Bulb Growers' Society at Haarlem. Regulations: For Classes 3, 4, and 5 each bulb must be in a separate pot, size optional. Classes 3, 4, 5, and 6 must all be single spikes: no spikes may be tied together. Exhibitors may only compete in one of the classes numbered 3, 4, and 5. All bulbs must have been forced entirely in Great Britain or Ireland. BULBS GROWN IN MOSS FIBRE, ETC.—Subject to the general rules of the Society, the Council offer the following prizes, presented to them by Mr. ROBERT SYDENHAM:—Bulbs grown in moss fibre or similar material (not earth) and without drainage.—AMATEURS AND GENTLEMEN'S GARDENERS.—Six single *Hyacinths*, in separate vases, not exceeding 6 inches in diameter, to be selected from any of the following varieties: Innocence, Isabella, Jacques, Johan, King of the Blues, Kohinoor, Ornamente Rose, Princess May, Queen of the Blues, Roi des Belges, Rose à Merveille, Schotel. 1st prize, 25s., and four additional prizes in each class. Six vases of Tulips (vases not exceeding 7 inches in diameter), no restriction as to the number of bulbs in a vase, to be selected from the following varieties: Duchesse de Parma, Duzart, Fabiola, Joost van Vondel, Keizerskroon, Montrésor, Prince of Austria, Rose Gris de Lin, Thomas Moore, Van der Neer, Vermilion Brilliant, White Pottbakker. Six vases of Narcissi (vases not exceeding 7 inches in diameter), no restriction as to the number of bulbs in a vase, to be selected from the following varieties: Beatrice, Beauty, C. J. Backhouse, Emperor, Frank Miles, Glitter, Horace, Leonie, Lillian, Lulworth, Madame de Graaff, Phyllis, Victoria, and White Lady. If there are more than seven exhibits in either of the classes, an extra prize of 7s. 6d. will be awarded.

FLOWERS IN SEASON.—We have received blooms of an improved strain of Papaver nudicaule (Iceland Poppy), from Messrs. STORRIE & STORRIE, Glencarse, Perthshire. The flowers are larger than usual and exhibit many delightful shades of colour. The raisers have given the name Excelsior to the strain.

BRUSSELS INTERNATIONAL EXHIBITION.—An International Horticultural Congress will be held in conjunction with the great International Horticultural Show at Brussels, 1910. The proceedings will extend over four days, viz., April 30, May 1, 2, and 3. The subjects to be dealt with are numerous, and have been grouped into seven principal sections. They are, briefly: I.—Floriculture. II.—Fruit Tree Culture. III.—Market Gardening. IV.—Scientific and Educational. V.—Horticultural Economy. VI.—Horticultural Mechanics. VII.—Special Processes, such as Electricity and Etherisation as applied to Plant Culture. Programmes of the Congress may be obtained from the Secretary, Congrès International d'Horticulture, 28, rue Ste. Catherine, Brussels.

ROYAL BOTANICAL SOCIETY.—The seventieth annual meeting of this society was held on the 21st inst at Regent's Park. The Council's report stated that the visitors to the gardens during the year under review numbered 20,000 more than in the previous year. The financial crisis was again discussed, and Mr. J. S. RUBINSTEIN proposed that the Society should seek for an equitable amalgamation with the Royal Horticultural Society. The Chairman, Mr. C. BRINSLEY MARLAY, stated he could not accept the proposal. He doubted whether the Royal Horticultural Society was as enthusiastic about the matter as Mr. RUBINSTEIN tried to make out. The Council of the Royal Botanic Society had not come to Mr. RUBINSTEIN'S conclusion that the Society was utterly bankrupt.

MR. A. HERRINGTON.—We note in one of the American papers that Mr. A. HERRINGTON, who has hitherto held the position of Parks Superintendent on the Florham estate, has been appointed landscape architect for the purpose of carrying out important alterations. The Florham estate, belonging to Mr. H. McKAY TWOMBLY, is one of the finest in the United States. As many of our readers knew Mr. HERRINGTON before leaving this country some years ago for America, they will be interested to learn that he is regarded in the United States as a landscape gardener of great ability.

ACREAGE OF HOPS.—A preliminary statement has been compiled by the Board of Agriculture and Fisheries from the returns collected on June 4 last, showing the acreage under Hops in England, with a comparative statement for the years 1908 and 1907. In Kent, the premier Hop county, the total acreage is 19,636, compared with 23,975 acres in 1908 and 23,169 acres in 1907. For the other counties the details are as follow:

	1909.	1908.	1907.
	Acres.	Acres.	Acres.
Gloucester	25	45	46
Hants.	1,414	1,636	1,842
Hereford	4,997	5,572	6,143
Salop	94	113	129
Surrey	544	648	744
Sussex	2,775	3,579	4,243
Worcester	3,054	3,353	3,622

The total area in England is 32,539 acres, as compared with 38,921 acres in 1908 and 44,938 acres in 1907.

DR. JEAN MASSART, the distinguished director of the Botanical Institute founded by the late LEO ERRERA, and Professor at the University of Brussels, has just been awarded the Decennial prize for botanical science, given by the Belgian Government. This prize is worth £200. The jury appointed to award the prize was composed as follow: M. MALAISÉ, of the Academy (president), M. MICHELLE, Professor at the Athénée Royal of Liège (secretary), and Professor JEAN CHALON, of Namur, TH. DURAND, Director of the State Botanic Garden, Brussels, and Mous. GRAVIS, Professor at the University of Liège. It is the third time that this prize has been awarded. Twenty years ago it was given to Canon CARNOY, and 10 years ago to Professor COGNIAUX. The prize was awarded on the present occasion by three votes given for Dr. MASSART against two given for Prof. DE WILDEMAN. The jury was called upon to examine all the botanical works published in Belgium during the last 10 years, with the exception of those written by jurymen themselves, whose acceptance of office placed them outside the competition.

ATTEMPT TO DEVELOP BULB CULTURE IN SCOTLAND.—A consignment of 120,000 bulbs of *Narcissus bicolor grandis*, weighing over 3 tons and destined for Fareham, in Hampshire, was recently despatched from Leith by Mr. JAMES W. SCARLETT, Sweethope, Inveresk. A further consignment of the same variety for Inveraray, Aberdeenshire, to be despatched on an early date will bring to a close an attempt which has been made to extend the season of Daffodil blooms and Irises in the markets, principally those of London, Manchester, Leeds and Newcastle. Everyone knows that bulbs can be grown at less expense in the open garden than under glass, therefore advantage is taken of climatic conditions for cultivating them both early and late. Supplies are obtained from Algeria, France, the Scilly Isles, Jersey, Guernsey, Cornwall and other places. The season of cut blooms from outdoor plants commences shortly after the commencement of the year and continues without a break until the latest localities have reaped their harvest. For the purpose of further extending the season Mr. SCARLETT was asked by an eminent London firm eight years ago to cooperate in cultivating bulbs in Scotland. Mr.

SCARLETT spared no time or trouble in carrying out the idea. An area of 5 acres was ultimately planted with Iris (English and Spanish), *Gladiolus Brenchleyensis*, *Narcissi Emperor*, *Horsfieldii*, *grandis*, *Barrii conspicuus*, *Poeticus ornatus*, Grand Monarch, and others. Unfortunately it was found that the blooms were ready for market too early, for those grown in Lincolnshire being just in their prime, the market was glutted. It is to be regretted that such an industry, already giving employment to a considerable number of persons, should have to be discontinued owing to an over supply at a particular season.

CENTENARY OF THE ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

A SUMMARY OF ITS HISTORY.

(Concluded from page 203.)

On July, 1838, Queen Victoria was petitioned to become patroness of the Society, but Lord John Russell refused the request on the ground that the Caledonian Horticultural Society was merely a local institution. The secretary (Dr. Neill) replied to this letter, and the following is an extract:—

I trust being excused for calling your special attention to the great mistake implied in the above answer—in ranking the Cal. Hort. Society as a "local institution." Our Society is in every respect a national one as much as is the Highland and Agricultural Society of Scotland—being incorporated by Royal Charter—in the receipt of £200 a year from the Treasury towards the carrying on of its experimental garden and nursery—distributing its premiums and roots and seeds over the whole kingdom of Scotland from the most southerly counties to the Islands of Orkney and Shetland (to which last we voted a premium only a few months ago)—and being the single and only gardening society of Scotland that possesses these characters.

It will be obliging if you will state these facts to Lord John Russell, as they doubtless remove our Society out of the category of institutions to which His Lordship must be understood as alluding when he characterizes them as *local* and *numerous*.

To S. M. Phillips, Esq. (Under Secretary of State).

The following reply to Dr. Neill's letter was received from the Hon. Fox Maule, Under-Secretary of State:—

Whitehall, July 13, 1838.

Sir,—I am directed by Lord John Russell to acknowledge the receipt of your letter of the 11th instant and to inform you that from the reasons therein stated His Lordship concurs with you in opinion that the "Caledonian Horticultural Society" does not belong to those institutions which are denominated "local institutions," and His Lordship has therefore again submitted your application for patronage to Her Majesty.

And I have the satisfaction to inform you that Her Majesty has been graciously pleased to consent to be the Patroness of "The Caledonian Horticultural Society."

I have the honour to be, &c.,

(Signed) F. MAULE.

Dr. P. Neill, Secretary, Canonmills.

Among the prizes offered in 1839 was one for the best bulbs of Hyacinths produced in Scotland, either as off-sets from bulbs of not less than three years growth in Scotland or from seed ripened in the country. The first Society's medal was awarded to Sir John Robertson for presenting a collection of French Roses to the gardens.

In 1840 a proposal was made to issue a monthly periodical called the *Scottish Gardener*, of which Dr. Neill was the first editor.

Dr. Neill died on September 3, 1857, and by his will left £500 sterling for the purpose of the interest thereof being applied to furnish a medal or other award every second or third year to a distinguished Scottish botanist or cultivator, to be voted by the Society, consideration to be had to the productions exhibited by such individual at the Society's competitions.

In May, 1841, there was another great show held, and a band of music was brought from Glasgow by swift canal boat. At this show there were seven exhibitors of Cape Heaths; Mr. Stirling, Melville Castle, gained the first prize. In December of the same year it was decided to build a horticultural hall, and the treasurer was instructed to collect subscriptions for this purpose. Plans and estimates were provided by George Cousins, architect, Edinburgh,

the estimates amounting to £557; he was instructed to proceed with the building. In May, 1843, the first meeting was held in the new hall. Among other exhibits were six *Calceolarias* from Archerfield, which had been carried all the way by two men on a handbarrow, a distance of 21 miles. Each man was awarded 5s. for his trouble! In 1834 a *Camellia-house* was added to the garden, and Lord Murray offered to build a Mushroom-house at his own expense. An orchard-house was also built in this year, and a great Hollyhock and Dahlia show was held in 1845.

Mr. James M'Nab, having been appointed his father's successor in the Botanic Gardens in 1849, resigned his position in the Society's gardens, and was succeeded by a Mr. Evans. In 1850 I notice the first mention of John Lamont's name and that of Mr. Thomas Methven as showing at the exhibitions, but Messrs. Dickson & Co. and Dickson & Sons were frequent exhibitors previous to that year.

In April, 1853, it was suggested to build a Crystal Palace at a cost of £16,000, in which to hold an Industrial Exhibition, and to retain the building as a permanent fixture in the garden. In 1856 the Society found itself in financial difficulties, and turned the garden into a nursery, which, however, was not a success. An endeavour was then made to get the Government to take it off their hands, which, though at first refused, was ultimately agreed to, the Government paying the Society £1,000 for the buildings they had erected. The garden now forms part of the Botanic Gardens.

There are only two persons now living, so far as I can trace, who used to exhibit at the shows held in these gardens. One is Mr. David Thomson, who showed Muscat Grapes from Archerfield, and the other Mr. John Paterson, late of Millbank, now of Salton, who showed Heaths in the year 1858—51 years ago.

Contemporary with the Caledonian Horticultural was another society, called the Edinburgh Horticultural Society, which at this time was in a prosperous condition. On December 6, 1865, the suggestion was made to unite the two Societies, as it was superfluous to have two doing the same work. It being agreed that the union would be altogether beneficial, the Edinburgh Horticultural Society was incorporated with the Royal Caledonian Horticultural Society. Mr. John Stewart, W.S., was secretary, Mr. William Young, assistant secretary, and Mr. Cumming, treasurer. I would here express the hope that history will repeat itself, and that once more we may see horticultural societies uniting to make one strong national society for Scotland.

The first meeting of the united Societies was held on December 7, 1865, at which all the then councillors of both Societies retired, and the opportunity was afforded of remodelling the council to suit the views of both Societies.

The first president was His Grace the Duke of Buccleuch.

Vice-presidents.—The Duke of Argyll, Earl of Dalkeith, Earl of Stair, and Earl of Haddington.

The first councillors were:—Sir W. Gibson-Craig, Professor Syme, Alex. James Adie, C.E., David Smith, W.S., Thomas Methven, John Downie, Andrew Lawson, John Lamont, W. Thomson (Dalkeith), Alex. M'Leod (Newbattle), W. Melville (Dalmeny Park), and John Currie (Grange Road); and the secretary, John Stewart, W.S.; assistant secretary, William Young; and treasurer, Charles Cumming. And yet again, as in 1809, the "Last Post" has been sounded over the graves of this band of workers.

No history of this Society would be complete without a few remarks about Mr. Young.

Extract from *The Gardeners' Chronicle*, of September 12, 1891.

Mr. William Young, Assistant Secretary to the Royal Caledonian Horticultural Society, is an amateur gardener of more than local fame. Reared in the town of Haddington, the centre of East Lothian gardening in

the earlier decades of the century, he carried with him to Edinburgh, where he eventually settled, his taste for florists' flowers, particularly Auriculas, in the culture and breeding of which he is a specialist. His knowledge of florists' flowers and his aptitude for managing flower shows, quickly brought him into notice with all interested in gardening progress. For the past 50 years he has been a foremost figure in horticultural movements. He was 15 years Treasurer to the Scottish Pansy Society, for seven years he was Secretary to the Edinburgh Horticultural Society, and for 30 years he has acted as Assistant Secretary to the Royal Caledonian Horticultural Society, twenty years of that time *con amore*, and without salary or any pecuniary benefit whatever. In short, he is an enthusiast whose enthusiasm increasing years in no way lessens.

PRESENTATIONS TO THE LATE ASSISTANT SECRETARY.

In 1865 the Edinburgh Horticultural Society and the Pansy Society recognised his services to horticulture by the presentation of a gold watch and chain, and a marble timepiece for his efficient and gratuitous services as secretary. The Pansy Society, at the same time, presented him with a writing desk.

1884.—Royal Caledonian Horticultural Society presented him with the Neill Prize.

1893.—His friends in horticulture presented him with £100 and a silver salver suitably inscribed in recognition of his 50 years' services to the cause and advancement of horticulture.

1897.—Last act: R.C.H.S. erected a monument over his grave in Warriston Cemetery. His death occurred in November, 1896, and followed close on his resignation in the same year.

Amongst the first acts of the reconstituted Society was the calling of a meeting, at the request of Mr. W. Thomson, to consider the propriety of holding an international show in 1869. The show was held on September 15 and 16, 1869, and is described as follows in the gardening papers of the day. "It must be confessed, in every sense of the word, that it was one of the grandest exhibitions of Grapes ever held. One of the most singular features of the show was the bringing to the fore in such a conspicuous manner of an entirely new exhibitor, Mr. Johnston, of Glamis Castle, who took all the leading prizes in the Grape classes. The fruit was cut from three-year-old vines and grown in aerated borders. The exhibition of plants was also very fine, the Heaths in particular."

One thousand five hundred gardeners visited the show on the first day between the hours of 9 to 11, previous to the public being admitted. A dinner was held in the Douglas Hotel, the Earl of Dalkeith being in the chair, at which 150 gentlemen were present.

In 1875 another international show was held, and it was described as being one of unusual magnitude as regards both the quantity of fruits and the number of plants, which, it may be said, were literally crammed into the Assembly Rooms, the Music Hall, and its side rooms. There were fruit, and plants, and vegetables enough to have set off to splendid advantage a place at least three times the size; but, unfortunately, there was no such place available.

The next incident of importance occurred in 1882, one which many will remember. The Music Hall being too small for our exhibitions, we resolved to rent the Waverley Market, though in fear and trembling lest we might not get enough exhibits to fill that great space. We were agreeably surprised to find that the exhibits had become so numerous that they taxed the capacity of the Market to the utmost. This was also an international show, which has been described as follows:—"This show could scarcely have been a greater success. The place of exhibition is almost perfect for a gathering of the sort, and the exhibits were very numerous and, as a rule, of high merit. The management was excellent, and the number of visitors exceeded 15,000, and there was £1,000 offered in prize money. Plants were never more numerous shown in Edinburgh before, nor was the quality ever better."

In the year 1891 another great international show was held, which was, without doubt, the finest and most extensive flower show held in

Scotland, £1,300 being offered in prize money. Our last international was held in 1905. The Centenary show on September 8 and 9 last compared favourably with those of former years. *David. W. Thomson, Edinburgh.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE LATE PETER BARR, V.M.H.—It was with a deep sense of sorrow I learned of the death of Peter Barr. He was a figure in horticulture that will not be easily replaced. His reputation was entirely of his own making. From humble conditions he gradually climbed to prosperity and repute. Endowed with perseverance and energy, he yet had in him the warmest of human instincts, joined to the richest fund of humour. Few men had a heartier hand-grip for friends, a cheerier or more joyous laugh. May his peaceful end be that of all of us, and may we be able to look back in our last hours with that deep sense of satisfaction which marked the closing days of our old and dear friend. *A. D.*

—The somewhat sudden death of Peter Barr will come as a painful surprise to a large number of those who saw him on the previous Tuesday at the Royal Horticultural Hall, when the "Daffodil King," strong-voiced and with much of his usual vigour of speech, appeared in fairly good health. Mr. Barr led a most strenuous life until he retired from the firm which he founded. Upon hundreds of occasions have I seen him at 6 a.m. speeding away towards the trial grounds at Tooting, there to put in a couple of hours or so prior to a hurried breakfast and away to the shop in Covent Garden, where he remained very often until quite late at night. At Tooting the whole of the stocks of seed trials came under his personal observation, though without doubt he displayed his greatest zeal when working among the Hellebores, Paeonies, Lilies, Colchicums or Irises, and, indeed, it may be said of him that he acted as a pioneer in popularising these groups of plants. At that time, too, Mr. Barr had in the late Robert Parker a near neighbour and contemporary worker in the same field. Tulips and Daffodils, the latter particularly, took up much of his time, and when engaged in separating and roughly grouping and describing the "Edward Leeds" Daffodils on their first flowering at Tooting, his zeal and enthusiasm knew no bounds. It was in this superb lot of early seedlings that were found such well-known sorts as Grandee, Frank Miles, Wm. Goldring, Katherine Spurrell, Cynosure, John Nelson and others. I had the privilege of seeing many of them on their first flowering in the early 'seventies at the Tooting trial grounds. It is interesting to recall that at one time Mr. Barr was the most ridiculed man who came to the South Kensington shows, because he persistently exhibited his flowers in blacking bottles. To-day, however, the most approved exhibition vase for other flowers besides Daffodils is but a modification of the blacking bottle of former years. From the very narrow beds of Daffodils as first seen at Tooting to the acres of these flowers at Surbiton and elsewhere to-day, is a great stretch, but this vast industry, giving employment to thousands of people, is the result of Peter Barr's labours, and he lived to see it in its full development. *E. H. Jenkins.*

VIOLAS FOR BEDDING (see p. 101).—In an interesting and instructive communication on these plants, Mr. Cuthbertson remarks that, "if Violas can be grown in the Royal Horticultural Society's garden at Wisley, they can be grown anywhere in England," and many will be inclined to agree with him. For my own part, however, I have long since regarded the very shallow, light, loamy and gravel drained soils of this portion of south west Middlesex a more severe test to Violas, inasmuch as directly under the 15 inches or so of top soil there are several feet of roughish gravel and sand through which all moisture percolates as through a sieve. In soils

such as obtain at Wisley, there is usually a great depth of the material present, and this, whilst of a hungry nature, is not of a dust-dry character. Having obtained an unqualified success with Violas even in my own district, and knowing also of the Wisley success, I unhesitatingly say that there is no occasion for failure even in the South of England and on very light or sandy soils. My method of procedure was as follows. The stock was increased by means of freshly-rooted cuttings and not by division, this being essential to success. The ground was dug as deeply as circumstances permitted, a little lime being worked in and a heavy dressing of cow manure placed deeply in the soil. The cow manure was useful as a moisture-conserving agent. Planting was done in October. Firm planting is essential; I believe Violas resent loose soils about their roots as much as dryness. The surface of the beds were kept as low as possible, and rather deep trenches were drawn the full width of a 6-inch wide hoe, the young plants being firmly bedded in the centre. The object of the trench was to admit of earthing up the plants to the level of the bed, and the young plants being stopped, growths quickly appeared from the base. By drawing the soil about them in this way a greater number of roots was secured. This method is strongly recommended to those having to deal with light soils. In ordinary bedding arrangements a far greater measure of success may be secured by similar means and by arranging the surface of the bed in a slight depression or level with the surrounding soil instead of being mounded as so often seen. The list of varieties given by Mr. Cuthbertson is of great value, and appears at a most opportune moment. *E. H. Jenkins, Hampton Hill.*

DAMAGE BY THUNDERSTORM.—I have never before witnessed such a severe thunder and hail-storm as that which occurred here on the afternoon of Friday, 17th inst. The storm was at its height for three-quarters of an hour, during which time rain fell to the amount of 1.85 inch. The total rainfall during the whole of the storm was 2.12 inches. Hailstones of unusually large dimensions fell and covered the ground to the depth of nearly 3 inches. Much damage was done in gardens. The ground beneath Apple and Pear trees was covered with fruits and leaves, and most of the fruits that did not fall are badly bruised. Great damage was also done to Chrysanthemums, much of the foliage being stripped off, and the buds badly damaged. Kitchen garden crops, including Celery, Lettuces, Beet, Cauliflowers and Winter Greens have the appearance of being riddled with shot. Several Oak trees on the estate and the adjoining one of West Hall, were struck by lightning. *J. B. Lowe, Broadoaks Gardens, West Byfleet, Surrey.*

OURISIA COCCINEA.—On p. 203 Mr. Fitzherbert relates his unfortunate experience with this plant. He need not, however, despair of being able to grow it successfully. For many years I have cultivated the species and studied its habits. I should think that when grown in an elevated, sunny position it would be necessary, during hot weather, to stand over it with a watering-can to keep the plant from wilting. It does best with me on the ground level and in partial shade. I have plants in a position where they get scarcely any sun; they have grown well, but they produce very few flowers. Mr. Fitzherbert speaks of it doing well in one place for one or two years and then going off. Such an experience with herbaceous plants is not uncommon, and is mainly due, I think, to the condition of the soil. Most of the Achilleas, for instance, grow and flower abundantly here on the same site for two years. In the spring of the third year it is only round the edges of the group that living portions are found. I have come to the conclusion that in such cases the plants exhaust the soil of the particular kind of food they require, and the more generous the cultivation the sooner do the plants suffer exhaustion. In porous soils the plants are the shortest lived, whilst in retentive, heavy loam they succeed longest. The shoots of Ourisia, which are always pushing out in search of food, indicate their need for fresh soil. As soon as the plants have flowered they should be lifted and replanted in good turfy soil with a little heat mould and manure added. Treated thus, they have given me excellent results. *Michael Cuthbertson, Rotham.*

HYDRANGEAS AT RUFFORD ABBEY GARDENS.—During a recent visit to Rufford Abbey Gardens I was much impressed with a number of plants of *Hydrangea hortensis* flowering in tubs. The plants were ranged each side of a broad terrace walk. They were uniform in size, being nearly 6 feet in height and 21 feet in circumference. Each plant carried, on an average, 100 well-developed trusses of bloom, which, in spite of the cold, inclement weather, looked remarkably fresh and of a good colour. *A. Bullock, Coppal Hall Gardens, Epping.*

PROPAGATION OF CLIANTHUS DAMPIERI.—*F. M.* (p. 182) fails to indicate that this plant, which is known as the Glory Pea, is of a climbing or trailing habit. It can be grown easily as a cold, greenhouse climber trained to the rafters, but its best effects are obtained as a basket plant. The basket should be not less than 18 inches in diameter and of corresponding depth. Well-grown specimens drape the sides with their trailing shoots 4 or 5 feet in length, bunches of vivid scarlet and black flowers being produced from every node of the previous year's wood. The variety tricolor has red, white and black flowers, but is not so brilliant as the type. There is some difficulty in growing the seedlings to a suitable size for grafting if the seed is sown in felt or blotting paper as recommended. They will germinate quite well in a porous, sandy compost. As a stock, and especially for plants intended for outdoor culture, I prefer them worked on stocks of *Colutea arborescens* raised from seed. This stock is much harder, and has a tendency to dwarf slightly, the growth of the scion. Side or veneer grafting is preferable to wedge grafting when the stock and scion are so small and tender. All that is necessary is to bare the cambium layer on one side of the stock and on the corresponding side of the scion, binding the stock and graft firmly together with soft wool. No trouble will be experienced with growths from the stock if the latter is cut off below the seed leaves or cotyledons. The *Colutea* seedlings may be slightly drawn to produce a longer stem for grafting, but care must be taken not to overdo this. When sowing *Colutea* seed for stocks, two seeds should be placed in a 2½-inch pot filled well up to the rim with soil. For grafting select the stronger plant, removing the other. The "Glory Pea" likes a dry atmosphere, and the hairy foliage should not be wetted. When repotting, keep the point of union well up out of the soil. It is useless to attempt to graft shoots of *Clianthus Dampieri* when they have attained their full dimensions and are clothed with the woolly tomentum. No matter what stock is used, the scion wilts or rots. Seedlings, however, treated as described, grow together quite readily. The soil in which established plants are growing should be kept on the dry side in winter. *H.*

MAKING AND PLANTING OF FRUIT TREE BORDERS.—Mr. Ward's article on this subject (see p. 195) is very opportune, as the season is near when the making of borders will demand attention. I have formed many fruit borders during the last decade, and experience has proved that a small border well filled with fibrous roots is far preferable to a wide, deep border containing roots of a whip-thong character. I am a firm believer in concreting the bottom of all fruit borders, and in enclosing the borders within brick walls, so that the roots are strictly confined and the cultivator knows where they are. As regards the size, I would give less area than Mr. Ward advocates, and I prefer the bottom to have a sharper incline than he states in order to afford a more perfect drainage. The question of soil for the borders requires consideration; in selecting the time-honoured top spit, care should be taken that such loams do not contain an excess of iron. I have handled a top spit from a deer park in which every kind of fruit tree (except vines) produced first-class crops, but in the same kind of soil Muscat vines dwindled away. The sectional preparation of the border is undoubtedly the best, but I prefer stout planks for supporting the sections and keeping them in position rather than turf walls, and would only add another section to the border when the first one was well filled with roots. When the necessary loam for the border has to be bought in, the section system spreads the expense and labour over a number of years. *T. H. Slade, Horsham.*

SOCIETIES.

ROYAL HORTICULTURAL

Scientific Committee.

SEPTEMBER 14.—*Present:* A. W. Hill, Esq., M.A. (in the Chair); with Dr. Voelcker, and Messrs. J. Fraser, W. Hales, J. W. Odell, and Geo. Gordon, V.M.H.

Prunus Chaproni.—Mr. ODELL submitted the fruit and leaves of a *Prunus* growing in a plantation at Henley. A comparison with the description and plate of the *Revue Horticole*, 1881, p. 467, of *Prunus Chaproni*, showed apparent agreement except that the fruits of the sample were a little smaller. Mr. HILL undertook to see whether he could determine anything further regarding it from the Kew records.

Eurothera sp., etc.—Mr. FRASER showed a specimen of *Eurothera Lamarckiana* in flower which he had found in his garden, and was self-sown. He took the form to be that of the primitive species named *E. rubrineris* by DE VRIES. Last year the veins of the leaves were reddish, whilst this year they were almost white, due possibly to the sunless season. The fruits, however, were streaked with red. Mr. FRASER thought that this variety was taking the place of *E. biennis* in Surrey in both the garden and the wild state.

A flesh-coloured specimen of *Echium vulgare*, collected in 1901 by Mr. FRASER, was shown still retaining the flesh colour. Mr. FRASER showed further sprigs of *Calluna vulgaris*, var. *glabrescens*, and *Erica cinerea*, gathered in Surrey growing on a chalk cliff at an elevation of 700 feet. The difficulty of growing Heaths and Rhododendrons on chalky soils is generally known, and Mr. FRASER was surprised to find the present specimens. The soil was about 18 inches deep, with a further 6 inches of decayed chalk. As 5 inches of soil would be a sufficient depth for the *Ericas*, it was thought possible that the upper stratum was free from lime, and Dr. VOELCKER undertook to analyse a sample if sent to him.

Diseased Pear.—Mr. WIGLEY, of Whitehill, Gravesend, sent some Pears attacked by the fungus *Gloeosporium fructigenum*. The trees should be winter sprayed with copper sulphate solution (1 lb. to 25 gallons of water), and with Bordeaux mixture in summer.

Lettuces dying.—Cos and Cabbage Lettuces, both young and old plants, were received from Mr. HASKINS, of Bournemouth, the leaves of which were browned and decayed at the edges. Mr. GORDON said that he had experienced the same trouble, and he thought it was due merely to the excessively wet season and cold weather, and was not attributable to either soil conditions or disease.

NATIONAL ROSE.

SEPTEMBER 16.—The autumn exhibition was held on this date in the Horticultural Hall, Westminster. It was not expected that the show would prove remarkable, as all classes of garden flowers have been more or less adversely affected by the unfavourable summer. Nevertheless, the Hall was well filled with exhibits, and, although the quality of the blooms generally was below average, from a spectacular point of view the show was a great success and the attendance satisfactory. The feature of the exhibition was the splendid exhibits shown by nurserymen in the classes for displays of Roses.

NURSERYMEN'S CLASSES.

There was excellent competition in the class for 36 blooms of distinct varieties shown on boards. Scottish and Irish exhibitors won all the prizes, their blooms being larger and much brighter than those shown by southern growers. The 1st prize was won by Messrs. J. COCKER & SON, Aberdeen, with large, well-coloured blooms, showing generally little damage from weather. The varieties were as follow:—J. B. Clarke, *Caroline Testout*, *Annie Wood*, Mrs. D. McKee, *Marie Baumann* (fine bloom), *Gustave Piganeau*, Mrs. T. Roosevelt, S. M. Rodocanachi, Mrs. John Laing, Mme. E. Verdier, A. Ricotard, Gladys Harkness, Alfred Colomb, Mme. Melanie Souper, Hugh Dickson (extra large, finely-coloured bloom), Lyon Rose, Frau Karl Druschki, Duke of Edinburgh (a fine dark Rose), Capt.

Hayward (exquisite in shape), Bessie Brown, Louis Van Houtte, Mme. Wagram, Richmond, Lohengrin, Duc de Rohan, Comtesse of Gosford, Carola, Lady Suffield, Marquise Litta, Freiherr von Marschall, A. K. Williams, and Farbenkönigin. 2nd, Mr. HUGH DICKSON, Royal Nurseries, Belfast, with a fine exhibit. Notable blooms were those labelled *Caroline Testout*, Hugh Dickson, Mme. Haussman, Mrs. Stewart Clark, Mme. Wagram, Comtesse de Strenne, Comtesse of Caledon, Gladys Harkness, and Mme. Eugene Verdier. 3rd, Messrs. ADAM & CRAIGMILE, Aberdeen; 4th, Messrs. ALEX. DICKSON & SONS, Newtownards.

In the class for 18 blooms of Tea and Noisette varieties, Messrs. ADAM & CRAIGMILE were placed 1st, followed by Mr. GEO. PRINCE, Longworth, with Mr. J. PIGG, Royston, 3rd. The blooms generally were below average quality, many showing traces of damage in the basal petals.

BLOOMS SHOWN IN VASES.

The class for 36 distinct varieties, the blooms shown in trusses, all types of the flower being admissible, was represented by four good displays. Each group measured 10 feet by 3 feet, the vases being arranged on a terraced staging, with a dark cloth background and base.

The 1st prize was won by Messrs. FRANK CANT & CO., Colchester, who showed Hugh Dickson, Lady Ashtown (pink), Mme. Melanie Souper (a buff-tinted H.T. variety), Rainbow, Betty (very fine), Princess Marie Merchetsky (pale pink), Sulphurea (yellow), Mme. Abel Chatenay, Gustav Grünerwald, Mme. Ravary (small, but of beautiful form), Clara Watson, &c. 2nd, Mr. JOHN CROSSLING, Penarth, with an exhibit containing many fine examples, notably Mamam Cochet, Mrs. Sharman Crawford, Mamie, Betty, Victor Hugo, Mme. Jean Dupuy, J. B. Clarke, and Mme. Abel Chatenay. 3rd, Mr. J. MATTOCK, New Headington, Oxford, who followed Mr. CROSSLING closely.

Five growers competed in the class for 12 distinct varieties, seven blooms each, shown in a space not exceeding 6 feet by 1 foot. The 1st prize was won easily by Mr. HUGH DICKSON, Belfast, but the use of inelegant zinc vases did not enhance the beauty of the display. The flowers of Mrs. John Laing, Hugh Dickson (magnificently coloured), Frau Karl Druschki, Princess Marie Merchetsky (soft pink), W. E. Lippiatt, Gladys Harkness (especially good), Ulrich Brunner, Dean Hole, Mme. Wagram, J. B. Clarke (deep red), and Mrs. Stewart Clark were all of excellent quality. 2nd, Messrs. JAS. COCKER & SONS, Aberdeen, with smaller blooms. They appeared rather stiff, being wired, but their colours were finely developed, notably in Hugh Dickson, Gustav Grünerwald, A. K. Williams, and Alfred Colomb. 3rd, Messrs. ALEX. DICKSON & SONS.

Very keen competition resulted in the class for 12 blooms of any variety of Rose, to be shown in a vase. The pink Mrs. John Laing, finely shown by Mr. JOHN MATTOCK, Headington, was adjudged the best, although we preferred a vase of Hugh Dickson which was unplaced. The 2nd prize was also awarded to Mrs. John Laing, shown by Mr. W. FERGUSON, Dunfermline; 3rd, Frau Karl Druschki, shown by Messrs. D. PRIOR & SON, Colchester. There were nine exhibits.

DECORATIVE ROSES.

In this section all H.P., H.T., T., and Noisette varieties mentioned in the Society's *Arrangements for 1909* were not admissible. The schedule required the bunches to be arranged so as to show the foliage and habit of growth of each variety.

The largest class was for a group measuring 8 feet by 4 feet, and embracing 24 distinct varieties. Not fewer than three, nor more than seven, trusses of each variety were required. There was good competition amongst four exhibitors, all staging bright and pretty displays.

The 1st prize was won by Messrs. FRANK CANT & CO., Colchester. The more prominent varieties were *Trier*, *Irish Glory*, *Edu Meyer*, *Rainbow*, *La Tosca*, *Georges Nabonnand*, *Apricot*, and *Ecarlate*. 2nd, Messrs. PAUL & SON, Old Nurseries, Cheshunt, with *General McArthur*, *Mme. Ravary*, *Betty*, *Le Progrès*, *Mrs. E. G. Hill*, and other pretty sorts. 3rd, Mr. JOHN MATTOCK. Not much difference was observable between these three exhibits.

There was a class for 12 varieties, other conditions being similar, and in this the prizes were won by Mr. CHAS. TURNER, Slough, Mr. J. CROSSLING, Penarth, Mr. W. FERGUSON, and Mr. GEO. PRINCE, Longworth. Mr. CROSSLING and Mr. FERGUSON were bracketed equal 2nd, Mr. PRINCE receiving the 3rd prize. Mr. TURNER, who was awarded the premier place, showed Betty (rose on creamy yellow, fine, big blooms), Irish Elegance (big, pink single), Le Progrès, Liberty, Mme. Ravary (soft apricot), Mme. Abel Chatenay, Gustav Grünerwald, &c.

Pernet Ducher, Betty (rose on pale lemon), Gruss an Teplitz (fine, dark, fragrant rose), Viscountess Folkestone, Mme. J. Grolez, and Mrs. H. Cutbush (Polyantha). 2nd, Mr. J. MATTOCK, who showed Laurette Messimy (a pretty, small variety, a shade of gold shot with rose, and tinted deeper at the edges), Irish Elegance, Bardou Job, &c.

DWARF POLYANTHA OR POMPON ROSES.

There were five exhibits in a class for 12 varieties of these charming little Roses, shown in

GROUPS OF ROSES.

For a group of Roses arranged on the floor, in a space not exceeding 100 square feet, there were two competitors, Messrs. HOBBIES, LTD., Dereham, Norfolk, and Messrs. PAUL, Chesbunt, the prizes being awarded in the order given. Both were corner exhibits, Messrs. HOBBIES having a number of rambler varieties, which lend themselves admirably for grouping. Intermixed with these there were choice blooms of H.T., T., H.P., and other large-flowered kinds. Messrs. PAUL filled baskets with large blooms, amongst which we noticed Mrs. George Laing, Fisher Holmes, Mrs. R. G. Sharman, Crawford, Mme. Abel Chatenay, Richmond, Irish Glory and La Tosca.

The best efforts were seen in the class for a representative group of cut Roses arranged on tables in an area of 18 feet by 6 feet. Mr. G. PRINCE, Longford, won with a splendid exhibit, in which good blooms were shown. It was a tower of Roses arranged with the skill of an artist, nothing appearing obtrusive or overcrowded. 2nd, Messrs. W. & J. BROWN, Peterborough, also with an elegant exhibit; 3rd, another fine display shown by THE KING'S ACRE NURSERY CO., Hereford.

Mr. F. M. BRADLEY, Peterborough, excelled in the class for a group of Roses occupying 60 square feet, this being the fourth time in succession he has won the 1st prize in this class; 2nd, Messrs. HARKNESS & Co., Hitchin.

AMATEUR CLASSES.

The quality of the flowers shown by amateur growers was generally much below that in the nurserymen's exhibits. For 18 blooms of distinct varieties, M. E. B. LINDSELL, Bearton, Hitchin, was placed 1st with Frau Karl Druschki, Alf. Colomb, A. K. Williams, Hugh Dickson, Gladys Harkness, Beauty of Waltham, Maman Cochet, S. M. Rodocanachi (a fine bloom), Comtesse de Rainbaud, and Caroline Testout, &c.; 2nd, Mr. CONWAY JONES, Hucclecote, Gloucester, who showed good flowers of the varieties W. E. Lippiatt, Hugh Dickson, Victor Hugo, and Mrs. W. J. Grant.

Nine exhibitors competed in the class for 12 blooms of distinct varieties, Mr. W. O. TIMES, Hitchin, winning the 1st prize with a very bright lot, but some blooms showed evidence of damage by unfavourable weather. We noticed Mrs. John Laing (a remarkably fine bloom that was awarded a Silver Medal), Horace Vernet, Frau Karl Druschki, White Maman Cochet, Bessie Brown, Hugh Dickson, Prince Arthur, Helen Keller and Duchess of Bedford. 2nd, Mr. G. SPEIGHT, Market Harborough, with an even lot, very fine being Gustav Grünerwald, Chas. Graham and George Harkness.

In competition with two other exhibitors, Mr. W. Upton, Claremont Street, Leicester, showed nine good blooms in Class 18, having Caroline Testout (very big), Horace Vernet, W. E. Lippiatt (very dark), Maman Cochet, Ulrich Brunner and Mrs. J. Laing as his best examples. Those in the 2nd prize group, shown by Mr. C. F. LESLIE, Hertingfordbury, were large, but rather over-blown.

In Class 19, for six blooms, the 1st prize was won by the Rev. H. S. ARKWRIGHT, Binfield Rectory, Berks., with six excellent flowers, including Gustave Piganeau, Frau Karl Druschki, Earl of Warwick (this gained a Silver Medal), Mrs. David McKee, Kaiserin A. Victoria and La France; 2nd, Mrs. C. M. BARNES, Rochford, Essex.

Mr. H. R. DARLINGTON, Potters Bar, excelled in the class for 12 distinct varieties shown in trusses with an excellent display; and the 2nd prize group, shown by the Rev. J. H. PEMBERTON, Havering-atte-Bower, was also good.

Tea and Noisette Roses were generally of inferior quality. The 1st prize for 12 blooms was won by Mr. CONWAY JONES; whilst Mr. W. WHITTLE, Leicester, showed best in the class for six varieties.

Considerable space was devoted to decorative classes, one annexe being filled with decorated dinner tables, the 1st prize being awarded for an arrangement in which silver bowls and vases were filled with Mme. Abel Chatenay Roses, relieved with greenery.

PREMIER BLOOMS.

Nurserymen's Classes.—H.P. Mrs. John Laing, H.T. Earl of Warwick, both shown by

FIG. 94.—ANGRECOM KOTSCHYI: FLOWERS, WHITE.

[Shown by Sir Trevor Lawrence, Bart. (gr. Mr. W. H. White) at the meeting of the R.H.S. on September 14. A Cultural Commendation was awarded. See p. 206.]

There was a class for 12 varieties, shown in as many Bamboo stands, each stand having accommodation for nine blooms. Three growers entered, the 1st prize being awarded to Mr. CHAS. TURNER for a smart display, more noticeable for its general effect than its high-quality blooms. We noticed Papa Gontier, Mme.

trusses. Much the best collection was staged by Messrs. FRANK CANT & Co., who had Martha (rose), Philippine Lambert (flattish, but elegantly shaded blush with a golden base), Eugenie Lamesch, Perle d'Or, Leonie Lamesch, &c. 2nd, Messrs. B. R. CANT & Sons, with pretty sprays of Leonie Lamesch, Perle d'Or, and White Pet.

Messrs. ADAM & CRAIGMILE; T. Souvenir de Pierre Notting, shown by Messrs. S. M'GREY & SON.

Amateurs' Classes.—H.P. Mrs. John Laing, shown by Mr. W. O. TIMES; H.T. Earl of Warwick, shown by the Rev. H. S. ARKWRIGHT; T. Maman Cochet, shown by Mr. E. B. LINDSELL.

GOLD MEDAL ROSES.

Claudius H.T.—A very fragrant variety, the tone being bright rose, suffused with purple. Shown by Messrs. B. R. CANT & SONS.

Miss Cynthia Forde H.T.—Somewhat after the type of Lady Ashtown: a big, round bloom, blush pink, with paler colour on the upper surface of the petals. The colour is more pronounced in the infolding petals. Shown by Mr. HUGH DICKSON.

Mrs. Edward J. Holland.—A more elegantly-shaped flower than those already described, the petals recurving pleasingly. The colour is pale rose, lighter at the edges. Shown by Messrs. SAMUEL M'GREY & SONS, Portadown.

STIRLING AND DISTRICT HORTICULTURAL.

SEPTEMBER 14.—The monthly meetings of the above society were resumed on the above date. The President, Mr. Geo. Petrie, occupied the chair. The subject for the evening was "Roses," the essayist being Mr. Geo. Shearer, manager at Messrs. Wm. Drummond and Sons' nurseries, Stirling. The lecturer treated his subject in an exhaustive manner, and was accorded a well-merited vote of thanks. The evening was also observed as "Hospital Night," the members bringing floral contributions which were afterwards distributed to the local hospitals. Mr. Chapman, Torbrex Nursery, has offered a prize for the best paper, limited to 1,500 words, on the society's summer excursions.

NATIONAL CHRYSANTHEMUM.

SEPTEMBER 20.—A meeting of the Executive Committee was held at Carr's Restaurant, Strand, on this date; Mr. T. Bevan presided.

Mr. Curtis reported on the forthcoming conference to be held at the Essex Hall, on October 6. Papers on the following subjects will be given: "Chrysanthemums as Annuals," "Early Single Chrysanthemums," "Late Market Chrysanthemums," and "The Best Chrysanthemums for Cut Flowers." There will be two sittings, at each of which two papers will be read and discussion invited: the first sitting will be held from 3 o'clock to 5 p.m., and the second from 6 o'clock to 8 p.m.

To increase the interest of this gathering, exhibits not exceeding 20 feet by 3 feet are invited. It was arranged, subject to confirmation, that the annual dinner be held at the Holborn Restaurant on November 29.

The chairman and Mr. Harman Payne gave some particulars concerning the representation of British horticulture at the Brussels International Exhibition, 1910.

NATIONAL DAHLIA.

SEPTEMBER 21, 22.—The second show held this season by the above Society took place in the Royal Botanic Gardens on Tuesday and Wednesday last. The exhibition ranks with the finest held by the National Dahlia Society. All types of Dahlias were well represented, competition being keen in most of the classes. The attendance was satisfactory, the day being beautifully fine. The Society is now encouraging the culture of decorative Dahlias, as distinct from those valuable for show purposes only. There was a record number of entries.

OPEN CLASSES.

In the class for three vases of Cactus Dahlias, of distinct varieties, put into commerce for the first time in 1907-8, Mr. JOHN WALKER secured the leading honours with Harold Peerman, C. E. Wilkins and Helium; 2nd, Messrs. KEYNES, WILLIAMS & Co., Salisbury; 3rd, Mr. M. V. SEALE, Sevenoaks.

In the class for 12 Cactus varieties arranged in six's, Messrs. J. STREDWICK & SON, Silver-

hill Park, St. Leonards, secured first honours, staging magnificent blooms of Harold Peerman, Red Admiral, C. E. Wilkins, Dawn, Indomitable, W. Marshall, Satisfaction, Quimbo, Snowdon, W. H. Wenham, Ruby Grinstead and H. H. Thomas; 2nd, Messrs. J. BURRELL & Co., Cambridge; 3rd, Messrs. J. CHEAL & SONS, Crawley.

Messrs. STREDWICK & SON also excelled in the class for 24 Cactus varieties, distinct, arranged on boards, being closely followed by Messrs. J. BURRELL & Co., and KEYNES, WILLIAMS & Co., in the order named.

Mr. M. V. SEALE obtained the first prize in the smaller class for 12 Cactus varieties, having choice blooms of Mrs. T. W. Willis, Imperial, Lady Kenmare, Chinchin and Diadem; Mr. S. MORTIMER, Rowledge, and Messrs. J. CHEAL & SONS were placed 2nd and 3rd respectively.

The best six blooms of one variety of Cactus Dahlia were staged by Messrs. KEYNES, WILLIAMS & Co., the variety being Glory of Wilts.; 2nd, W. Marshall, shown by Mr. JOHN HICKS.

The best nine bunches of Pompon Cactus varieties, in not fewer than six varieties, were shown by Messrs. J. BURRELL & Co., Cambridge, who showed a fine, even set of flowers, including Wm. Marshall, Lena, Nora, Martha, Argus, Cheerful, Mimima, Alwyn and Mary; Mr. M. V. SEALE followed closely, and Messrs. J. CHEAL & SONS, Crawley, were placed 3rd.

The class for 24 show and fancy Dahlias brought a fair competition. Mr. JOHN WALKER was awarded the 1st prize, having well-finished blooms of T. Pendered, S. Mortimer, Kathleen, R. T. Rawlings, Mr. J. Downie, Blush Gem, Duchess of York, J. T. West, and Chieftain; 2nd, Mr. S. MORTIMER, Faruham, with bright but slightly smaller flowers; 3rd, Mr. M. V. SEALE.

In the smaller class for 12 show and fancy varieties, distinct, Mr. R. BURGIN, Bedford, was placed 1st, Messrs. J. CHEAL & SONS being awarded the 2nd, and Mr. S. H. COOPER the 3rd prizes.

Pompon Dahlias were shown splendidly in a class for 12 varieties, by Mr. CHAS. TURNER, Slough; Messrs. J. BURRELL & Co. being placed 2nd; and Mr. M. V. SEALE 3rd.

Single Dahlias.—For 12 varieties, Messrs. J. CHEAL & SONS took the leading honours, followed by Mr. JOHN WALKER.

The best vase containing three varieties of a Peony-flowered Dahlia was shown by Mr. CHAS. TURNER; and this exhibitor also won the premier prize for six bunches of garden Cactus Dahlias.

AMATEURS' CLASSES.

In the class for nine varieties of Cactus Dahlias Mr. F. GRINSTEAD, Battle, was placed 1st; Mr. CHAS. LUCKIN 2nd; and Sir JOHN KENNEDY, K.C.B., Holmhurst, St. Leonards (gr. W. E. Peters), 3rd.

The best six blooms of white or pink varieties of Cactus Dahlias were shown by the Rev. A. BRIDGE; 2nd, Mr. A. TOFIELD, New Malden.

Mr. H. JACKSON obtained the 1st prize for six varieties of Cactus Dahlias in bunches of three blooms; Mr. E. MAWLEY, Berkhamsted, following.

Other prize-winners in the classes for Cactus varieties were Mr. JOHN HICKS, Mr. F. H. CURRY (Palmer's Green), Mr. H. BROWN (Luton), Mr. H. JACKSON, Mr. F. GRINSTEAD, Mr. GEO. DAVIDSON (Thornton Heath), Mr. THOMAS JONES (Ruabon), and Mr. A. H. BURGESS.

Show Dahlias were best shown by Mr. S. H. COOPER and Mr. CHAS. LUCKIN, who were awarded the 1st prizes in the classes for 12 and six varieties respectively.

First-class Certificates were awarded to Prima Donna (Cactus), shown by Mr. H. SHOESMITH, and Tristan (Pompon), exhibited by Mr. CHARLES TURNER.

NON-COMPETITIVE EXHIBITS.

Dahlias were shown by Messrs. DOBBIE & Co., Rothesay (Gold Medal); Messrs. HOBBIES, LTD., Dorcham (Gold Medal); Messrs. T. S. WARE, LTD., Feltham (Gold Medal); and Mr. J. WEST, Brentwood (Gold Medal). Messrs. J. BURRELL & Co., Cambridge, staged a group of Gladioli (Gold Medal); Messrs. R. HARKNESS & SON, Hitchin, exhibited cut Roses (Gold Medal); and Messrs. WEBB & BRAND, Saffron Walden, showed Hollyhocks in variety (Silver-gilt Medal).

THE WEATHER.

THE WEATHER IN WEST HERTS

Week ending September 22.

A cool, dry and gloomy week.—The present spell of unseasonably cold weather has now lasted five weeks, during which period the highest temperature in the thermometer screen has on only six days exceeded the average for the time of year, while on four of the nights the exposed thermometer indicated readings slightly below the freezing point. Both at 1 and 2 feet deep the ground is now 1° colder than is seasonable. A light fall of rain took place on the first day of the week, but since then the weather has been quite dry. No measurable quantity of rainwater has passed through either of the percolation gauges for more than a fortnight. The sun shone on an average for only 3½ hours a day, which is 1½ hours a day short of the usual duration at this season. Calms and light airs have alone prevailed during the week. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 4 per cent. E. M., Berkhamsted, September 22, 1909.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

Mr. F. W. GREEN, 1½ years Foreman at Kings Weston House, Bristol, previously 2 years at Greenham Lodge, Newbury, as Gardener to A. J. PELL, Esq., Wilburton Manor, Ely, Cambridgeshire.

Mr. W. J. GUISE, for 7 years Gardener to JAMES PORTER, Esq., Berthlywyd, Conway, N. Wales, as Gardener to A. BRADBURY, Esq., at the same address.

Mr. S. J. MARTIN, Gardener to FRANK TAYLOR, Esq., Craig Wen, Menai Bridge, Anglesey, as Gardener to Mrs. SANDEMAN, Dan-y-Park, Crickhowell, Breconshire.

Mr. R. E. WRIGHT, recently in the Gardens at Brightleigh Outwood, and previously at Chartreuse, Thun, and Prigny, Geneva, as Gardener to W. MALING GRANT, Esq., Sandhurst Grange, Sand, near Woking, Surrey. (Thanks for contribution to R.G.O.F. box.—Eds.)

Mr. JAMES WIGGINS, late of Northwood Cottage, Hindhead, as Gardener to J. WEBSTER, Esq., Tower Lodge, Sandown Park, Tunbridge Wells, Kent.

Mr. S. G. SMALLBRIDGE, for the past 8 years Gardener to Mrs. R. D. HILLS, Holfield Grange, Coggeshall, as Gardener to the Rt. Hon. Sir HUDSON KEARLEY, Bart., M.P., Wittington, Marlow, Bucks.

Mr. THOMAS TEMPLETON, for nearly 5 years Foreman in Skibo Castle Gardens, Dornoch, N.B., as Gardener to Mrs. HOBHOUSE, Hadsden House, Castle Cary, Somerset.

Mr. CHARLES A. HEATH, for the past 4 years Gardener to Mrs. ALFRED LOOER, Aldwickbury, Harpenden, Herts, as Gardener to LOCKETT AGNEW, Esq., Hallingbury Place, Bishops Stortford, Herts. (Thanks for 2s. received for R.G.O.F. Box.—Eds.)

CATALOGUES RECEIVED.

DOBBIE & MASON, 22, Oak Street, Manchester—Bulbs.
STUART LOW & Co., Bush Hill Park, Middlesex—Orchids.
C. R. SHILLING, Hartley Nurseries, Winchfield, Hants.—General.
H. CANNELL & SONS, Swanley Junction, Kent—Bulbs, Roses, Strawberries, and Violets.
HAYES & SONS, Keswick, Cumberland—Hardy Plants.
DICKSONS, The Nurseries, Chester—Roses.

FOREIGN.

F. DELAUNAY, 100, Route des Font-de-Cé, Angers (France)—Trees, Shrubs, Roses, Fruit Trees, &c.
J. M. THORNBURN & Co., 33, Barclay Street, New York, U.S.A.—Seeds of American Trees and Shrubs.
PETER HENDERSON & Co., 35 and 37, Cortlandt Street, New York—Bulbs.
WILHELM PFITZER, Stuttgart, Germany—Roses and Bulbs.
GEORG ARENDS, Ronsdorf (Rheinland), Germany—Hardy Plants.

DEBATING SOCIETY.

BATH GARDENERS'.—The first meeting of the winter session was held on Monday, September 13, at the Forester's Hall. Mr. W. Grant (vice-chairman) presided over a good attendance. Unfortunately the lecturer appointed for the evening was prevented from attending through illness. The vacancy was filled by the secretary, who read extracts upon the French system of Intensive Gardening. A. B.

MARKETS.

COVENT GARDEN, September 22.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing cut flowers and their prices. Includes items like Asters, Carnations, Dahlias, Enchiridians, Gaillardias, Gladioli, Lilium auratum, and various foliage plants.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing cut foliage and their prices. Includes items like Adiantum cuneatum, Agrostis, Asparagus plumosus, Berberis, Croton leaves, and various ferns.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing plants in pots and their prices. Includes items like Angolopsis, Aralia Sieboldii, Aspidistra, Asparagus plumosus nanus, and various ferns.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing plants in pots and their prices. Includes items like Marguerites, Pelargoniums, Selaginella, Spiraea japonica, and various ferns.

Fruit: Average Wholesale Prices.

Table listing fruits and their prices. Includes items like Apples (English), Bananas, Figs, Grapes, Lemons, and various vegetables.

Vegetables: Average Wholesale Prices.

Table listing vegetables and their prices. Includes items like Artichokes, Beans, Broccoli, Cabbages, Carrots, Cauliflowers, and various leafy greens.

REMARKS.—There is a slight improvement in the Apple trade, especially for large culinary varieties. Plums have not been plentiful, but are now arriving on the market in increased quantities; their prices are low, except for selected fruits. There are large quantities of English Pears on the market, but they are selling slowly. There has been a good demand for Californian fruit, which doubtless will continue. Supplies of French Williams' Bon Chrétien Pears are practically finished; a few crates only are coming from the Paris district. Lemons are selling freely, but consignments are short. Home-grown Tomatoes are much cheaper owing to larger supplies. E. H. R., Covent Garden, Wednesday, September 22, 1909.

Potatoes.

Table listing potato varieties and their prices. Includes items like Bedford's, British Queen, Epicure, and various other varieties.

REMARKS.—There is no alteration in either prices or consignments. Edward J. Newborn, Covent Garden and St. Pancras, September 22, 1909.

COVENT GARDEN FLOWER MARKET.

One of the most difficult matters connected with these notes is the quoting of prices. If they are placed at a low estimate the country buyer complains he is overcharged, but if they are given high those who sell on commission grumble. There is a surplus of most subjects. This morning, after the close of the market, large supplies were left unsold. Good specimen blooms of Chrysanthemums were obtainable at 2s. per dozen; yet 3s. to 4s. might be regarded as an average value; a few of extra special quality make fancy prices, but ordinary blooms are very cheap. Asters are remarkably good, and since the foreign grower found it unprofitable to send blooms, English growers have been doing better. Dahlias do not make the prices they did in former years and it is only the best quality blooms that sell at remunerative prices. Roses of best quality have been selling better. Supplies of Carnations have fallen off a little, but flowers will soon be available from plants housed early. Blooms which sell one morning at 1s. per dozen are often worth 2s. a day or two later. Lily of the Valley is down in price again. Gardenias are more plentiful and are not cleared except at greatly reduced prices. Of hardy flowers many are of inferior quality.

POT PLANTS.

There is not much that is new in this department. Chrysanthemums are the leading feature in flowering plants, and it is difficult to give their prices, which range from 8s. to 30s. per dozen, but 9s. to 12s. per dozen is an average quotation. Ericas have not been selling readily. Marguerites are well-flowered and have good foliage, but since Chrysanthemums have been available they are not wanted. Pelargoniums, Fuchsias, Heliotropes, and other summer flowers are not quite finished. Growers of Hardy Evergreens, Climbers, etc., have already commenced to send in supplies. Wall-flowers and various other hardy plants are seen. A. H., Covent Garden, September 22, 1909.

ENQUIRIES AND REPLIES.

HYDRANGEA.—We have in these gardens two plants of Hydrangea hortensis growing in tubs. One plant is carrying 201 flower trusses and the other 198. The tubs are about 2 feet in diameter. Is this a record? H. S., Alice Holt Gardens, Farnham. [We have no records in this matter (see also p. 220).—Eds.]

The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

AMATEUR EXHIBITOR: H. F. According to the Code of Rules for Judging, issued by the Royal Horticultural Society, no person is allowed to compete as an amateur who sells plants (except when giving up possession of the place where they grow, or in the case of new seedlings or sports), grafts, cuttings, or buds for budding, nor any person in the employ of a nurseryman. A further paragraph states that the rule does not necessarily exclude a person who occasionally sells surplus produce arising from an over-abundant crop, but who, in the judgment of the officials of the show at which the question arises, does not intentionally grow crops for sale. An amateur, therefore, is a person who grows his produce solely for his enjoyment or domestic use, and not with the object of pecuniarily benefiting by it. Assuming the circumstances are exactly as stated in your letter, we think the accepted rules on the question would permit the committee to regard you as an amateur.

BELLADONNA LILY: Amateur. In order to cultivate Amaryllis Belladonna successfully in pots liberal treatment is necessary. The best time to pot the bulbs is about midsummer, or in early winter, after they have finished flowering. Place one large bulb in a 6-inch pot, or three bulbs in a 7-inch pot, using a compost consisting of six parts fibrous loam, one part leaf mould, one part dried cow manure and sufficient coarse sand to make the whole porous. During winter the bulbs may be grown in a cold frame, affording ventilation on favourable occasions and covering the glass with mats or litter during severe frosts. When the plants are growing freely in late winter and early spring give a little weak manure water occasionally. It is not advisable to repot the bulbs for several years provided the drainage of the pots is good and the soil sweet. Remove a little of the surface soil after the flowering period, replacing this with equal parts fibrous loam and cow manure. Feed liberally with

manure water when the plants are growing. For the culture of the plants in the open air, select a south border preferably in front of a greenhouse, or at the foot of a south wall, as the Belladonna Lily is not perfectly hardy. Take out the soil to a depth of 2 feet, and in the trench thus formed put a 4-inch or 6-inch layer of brick rubble for drainage; over this spread a layer of manure, filling up with good fibrous loam intermixed with a little leaf-mould. Plant the bulbs 6 inches to 9 inches deep, placing coarse sand around each as it is planted. During severe weather it is advisable to protect the young growths with Fern bracken or similar material. Mulch the border annually with well-decayed manure, and water liberally if the weather is dry during the season of active growth.

BOOK-KEEPING: *Anxious.* You will find J. Thornton's *Primer of Book-keeping* (Macmillan & Co.; Is.) useful for your purpose, or *First Lessons in Book-keeping* (Macmillan; 2s. 6d.) by the same author. Evening classes on such subjects are now commonly held in most districts; enquire if there is not one within easy reach of your neighbourhood.

CULTURE OF VALLOTAS AND NERINES: *Kensington.* The secret of success with these bulbs is not to disturb them while the soil remains in a good condition. Some of the finest plants are found in cottage windows in country districts, where they remain in the same pots for many years. During summer, when growth is active, Vallotas require an abundance of water, with occasional applications of liquid manure. Unlike most bulbous plants, Vallotas should never be kept dry for a resting season. Repotting, when necessary, is best done in September after flowering. Use a compost of fibrous loam, mixing with it a little leaf-mould, dried cow manure and coarse sand. Nerines flower best when pot-bound, so that it is not advisable to repot them till the bulbs almost crowd each other out of the pot. Potting should be done in July, or immediately after flowering, about the end of October. As Nerines make their growth during the winter, they should be grown close to the glass in a pit or house facing south. Maintain a temperature not lower than 45° to 50° at night-time, rising to 55° during the day. Never allow the soil in the pots to become dry during the growing season. Liquid manure is very beneficial when the pots are full of roots. In spring, when the foliage shows signs of decay, gradually withhold water and place the pots in a frame where the bulbs will receive a thorough baking from the sun. In August or September, when growth is starting, soak the soil with water, after which the flower-spikes will soon push forth. For a potting compost use the following mixture: three parts fibrous loam, one part leaf-mould, one part dried cow manure, and plenty of coarse sand. (Gladiolus next week.)

CYCLAMEN: *G. H.* When once the plants are so badly infested with thrips, as those you describe in your letter, it is difficult to eradicate them. The pest gets down in the crown, between the leaf and flower stalks, consequently fumigation is not perfectly effective. Your best plan will be to thoroughly wash the plants in a solution of nicotine emulsion, prepared for use according to the directions supplied by the makers. This washing should be repeated at frequent intervals before the plants bloom. Keep the Cyclamen apart from any other infested plants. If they are not thoroughly clean at the time they bloom, the plants must be fumigated with a nicotine compound. Read the article on thrips on p. 211.

EXHIBITIONS: *R. E. G. 1.* The Law Reports only quote decisions in cases which are heard in the High Court of Justice, and we cannot find any case reported which covers the precise facts to which you refer. Technically, we see no reason to prevent your prosecuting by issuing a summons for "attempting to obtain money under false pretences," where the fraudulent intent is obvious. However, the jury would, of course, make up their own minds in each particular case as to whether the defendant really intended to defraud, or whether he honestly thought the rule was one which would not be strictly adhered to. Case No. 1 seems to be the most flagrant. In case No. 2 the defendant would probably urge that he thought there would be no objection to his representing the

family combined. (2) Under the circumstances, we do not think any one would blame you for totalling disqualifying the exhibitor. Steps of this kind are often taken in competitions of another nature.

GRAPES MOULDY AND SPOTTED: *E. W.* The bunches are infested with mealy bug and they are in a very dirty condition generally. There is no disease present. Mealy bug can be eradicated by means of a brush and methylated spirit.

INSECT IN POTATO: *F. Y. M.* The decayed Potato is swarming with one of the spring tails (*Lipura fimetaria*). This is a very abundant insect, and often swarms in soil heavily charged with manure or other rotting vegeta-

FIG. 95.—AN ABNORMAL HELENIUM.

tion. Remove decayed vegetable matter and burn it. Give the land a good dressing of gas lime and use artificial manures as far as practicable.

MUSCAT GRAPES DISEASED: *H. N.* The berries are affected with the fungus *Glaeosporium fructigenum*. Apples are often attacked with the same disease. Cut out and burn all diseased berries and spray the vines with Bordeaux mixture or Potassium sulphide. Diseased Apples should also be burned.

NAMES OF FRUITS: *W. L. S. 1.* Beauty of Bath; 2, Kitty Pippin; 3, Lane's Prince Albert.—*K. B. atom.* The fruits were not numbered. The large Apples are Ecklinville Seedling, and the smaller ones Dumelow's Seedling (syn. Wellington).—*Zola.* The Plums received were covered with mould.—*J. B. H. 1.* Lane's Prince Albert; 2, Manks Codlin; 3, Tower of Glamis; 4, Harvey's Wiltshire Defiance.—*Groves.* Pear Beurré d'Amanlis, Apple Lane's

Prince Albert.—*Gordonston.* 1, Manks Codlin; 2, Lane's Prince Albert; 3, Dumelow's Seedling; 4, Black Diamond; 5, Lord Suffolk; 6, Lord Grosvenor.—*Hodgins.* 1, Beurré Sterkmans; 2, Beurré Diel; 3, Louise Bonne of Jersey; 4, Gloire Morceau; 5, Beurré Hardy; 6, Conseiller de la Cour; 7, not recognised; 8, Beurré d'Amanlis; 9, Chaumontelle; 10, Doyenné du Comice.

NAMES OF PLANTS: *S. McG. & Son.* *Pittosporum tenuifolium* var. *Mayi*.—*Rev. J. A. Hyde.* *Ilex Cassine*.—*E. F. 1.* *Mesembryanthemum spectabile*; 2, *Lastrea spinulosa*; 3, *Polystichum aculeatum*; 4, *Athyrium Filix-femina cristata*.—*C. 1.* *Staphylea pinnata* (Bladder Nut); 2, *Polygonum cuspidatum*; 3, *Colutea arborescens* (Bladder Senna); 4, *Cupressus nootkatensis*; *R. T. 1.* *Odontoglossum gloriosum*; 2, *Oncidium prætextum*; 3, *Brassia variegata*; 4, *Oncidium flexuosum*.—*A. M., Barnett.* 1, *Didymochlæna lunulata*; 2, *Asplenium Belangeri*; 3, *Codiaeum* (*Croton*) *angustifolium*; 4, *C. Johannis*; 5, *C. Evansianum*; 6, *Ruellia macrantha*.—*D. M.* *Sempervivum tortuosum variegatum*—the type form is figured in *Botanical Magazine*, t. 296.—*W. D. B.* *Asclepias Curassavica*.—*Worcestershire Young Gardener.* *Catalpa bignonioides*.—*Y.* *Phlomis fruticosa*.—*F. A. C.* *Ligustrum lucidum salicifolium*.—*J. O. S.* Both forms of *Cattleya Harrisoniana*.—*W. L. 1.* 1, No flowers, probably *Coronilla glauca*; 2, 3, 4, garden varieties of *Montbretia crocosmiflora*; 5, *Antholva paniculata*; 6, a *Salvia*, probably *S. involucrata* (Bethelii); send when in flower.

PROLIFIGATION IN HELENIUM AUTUMNALE: *K.* (See fig. 95.) This is a case of proliferation. The whole capitulum and the proliferations in your specimen are virescent, the branchlets appearing to arise from the centre of the flower. Proliferation in this species is not to be seen frequently, but nevertheless specimens have been sent us previously, and we now reproduce the figure.

SEQUOIA GIGANTEA: *G. C.* Your tree is not so large as many specimens to be found in different parts of the country, some of which are upwards of 100 feet in height. It certainly had not reached its full limit in 50 years, which is only a short time in the life of the Sequoia, and has probably died through the soil being too cold and wet, as this tree requires a deep but moderately dry and warm soil. The wood is of little value except for firewood and rough fencing, being soft, cross-grained, and stringy.

TREE PLANTING ON DISUSED PIT BANKS AND RUBBISH HEAPS: *W. P.* Several pit banks in the Black Country have been planted with trees during the past five years. The best plan is to dig fairly large holes and to put some fresh soil, say, half a bushel basket-full in each. The best trees for planting are those not taller than 12 or 18 inches, as the situation on these mounds is an exposed one, and taller trees are liable to damage by wind. Trees of Scotch Fir, Austrian and Corsican Pines, Spruce, Alder, Birch, Wych Elm and Turkey Oak succeed best. Larch, Oak and Sycamore do not grow so freely as the other kinds named. The Scotch Fir, Birch, and Alder grow rapidly after two years' planting.

VALLOTA: *A. T.* We can only suppose that the firm overlooked the condition stated in your first letter. At any rate, it is a commercial transaction that we cannot discuss in these columns, for it is governed by ordinary trade usage.

WONDERBERRY: *D. M. L.* See fig. 73 in the issue for September 4, p. 172. Information on this subject appeared in the *Gardener's Chronicle*, March 27, 1904, p. 204. See also report of the Scientific Committee in the last issue, p. 207.

Communications Received.—*F. W.* (We are glad you have found the treatment satisfactory.)—*H. G. K.* (We have published similar reports from your county.)—*H. Dew* thanks for 2s. received for the R.G.O.F. box)—*D. C.* Fisherville, U.S.A.—*H. A.*—*M. D.*—*F. S.*—*M. N.*—*S. M.G.* & Sons—*George Bunyard*—*A. B.* (Pear Slug)—*J. F. M.*—*J. W. P.*—*H. S.*—*E. THE AMPEZZO DOLOMITES.

THE Ampezzo Dolomites are not, I believe, genuine Dolomites at all. But, anyhow, they are strangely beautiful, and, of their beauty-spots, Misurina is certainly the most marvellous. A large and hideous, but delightful, hotel stands on the ridge at the end of a little emerald lake, and beyond it the ground goes falling into unimaginable depths, on the far side of which towers gigantic the back wall of the Cortina Mountains—Marnarole, Antelao, and the Pfalzga stone slopes up among the wastes at the back of Sorapiss. Then, immediately above Misurina to the right, looking up the water from the hotel, stands the gaunt and ghastly mass of the Cadinenspitze, which from Misurina seems only a long rampart of naked jags; on the left the ridge and high round tower of Popena hides Cristallo. The lake itself is deep-bosomed in woods, and its shores artistically wave in and out, with as much appearance of design as any Chinese pool. At the end, mirrored in the green water, placed uncannily at precisely

the right point, rise the three tremendous peaks of the Drei Zinnen, huge pyramids of naked dolomite, golden, peach-coloured or apricot by day, beneath a blue film of detritus: and on a lucky evening (preferably in September) glowing to an incandescent scarlet at the moment of sundown.

And the actors are worthy of their stage. On the grassy lawn by the roadway abound huge ancient clumps of *Gentiana asclepiadea*; the woods and cussy slopes are thickly starred with exquisite *Anemone trifolia*, a magnified counterpart of *A. nemorosa*, but flushing far more commonly to a celestial blue. *Atragene* flops and flounders over every bush, and the air is sweet with the pallid clusters of *Daphne striata* laxly wandering among the poached-egg-like butterflies of *Polygala chamæbuxus*. On many banks the white *Pinguicula* grows fine and fair as my *Haberlea rhodopensis virginalis*. Here and there on high knolls in the woodland the visitor is surprised by clumps of *Gentiana acaulis*, and sometimes, on a boulder, by strayed seedlings of *Saxifraga squarrosa*. I even found, by the very lakeside, a truant bush or two of *Rhodothamnus Chamæcistus*, still covered with its wide salvers of pink.

The Col di Varda is that neck of broken cliff at the far south end of the Cadinenspitze, just above the hotel. Thither I made my first expedition from Misurina. Up and up through that delightful forest as undergrowth, was *Bellidistrum Micheli*, like drifted snow, and the *Anemone*, with the *Atragene* lavishing everywhere its tone of purple. Commoner plants abound, *Arenarias*, *Saxifraga rotundifolia*, *Pinguicula*, and masses of delicate *Silene pusilla*, virginal in the purity of its little flowers, so daintily notched at their edge. But lovely as is the type, it can never hope to rival the rose-red form, which I found at Heiligenblut (too late to write about in my last letter—see p. 67, July 31, 1909). This lived in running water, forming wide tufts all covered with sprayed blossom of the purest and most brilliant salmon-rose. Fortunately it has arrived safe at home, where I hope its beauty may as bountifully continue.

The path now wanders towards open places, and stone slopes are seen coming nearer. *Polygala* and *Daphne* cover the ground, the bushes of *Alpenrose* are rich with blossom. And then, on the first stony bank, of cliff and scree, *Rhodothamnus* begins to come by its own. Here and there one has already seen it, but the cliffs and crannies are clearly its real home. For *Rhodothamnus Chamæcistus* is, to my great surprise, one of the most passionately saxatile of rock-plants, haunting microscopic chinks even more inseparably than *Potentilla nitida*, and almost as exclusively as *Phyteuma comosum*. Further, though what soil it has is vegetable humus, all the rock in which it grows is clearly limestone of the most limy character. On these bone-white cliffs, now that one has come up above the Pine woods on to the open slopes, everywhere, high and low, are flaunting bushes of *Rhodothamnus*, all aglow with their wide rosy cups. The only hope of getting sound roots is from small seedlings, which, when gently tugged at in their cleft, may possibly come out with fibres intact, or by a rare blessing, the sandwiching slabs may be lifted or prised away, and thus the whole plant secured.

Under one's feet in the screes, *Saxifraga cæsia* and *S. squarrosa* occur in inseparable brotherhood. I started, last year, admirably clear and definite theories as to the distribution of these two *Saxifragas*, so distinct and yet so near. I made up my mind that one occurred in one region and one in another. Well, now I have all my mind to unmake again. I confess I can trace no sort of a rule to judge the distribution of *cæsia* and *squarrosa*. I daren't even say that *cæsia* begins lower and that *squarrosa* goes higher; as soon as I think I have settled this I am sure to find *squarrosa* abundant at a low level and *cæsia* at a high elevation. But this perversity is nothing compared with their habit of growing together. Why, in the name of goodness, should the two separate species have ever been evolved if their only result is to form combined colonies? And they are so very close together. Surely the only possible reason for such a clear, though minute differentiation should be a differentiation of habitat and requirement? And yet, apparently, they have gone to all the trouble of forming two separate species with no other motive than to go on living together as if they were one. True it is that often, in other ranges, *Saxifraga cæsia* occurs alone, and in the mossy gorges of Sotto Agudo *S. squarrosa* holds sole sway; but here, on these stony slopes, it is first one and then the other, until at last one grows perfectly bewildered and unable to tell one from the other.

Higher still, and higher, among big naked cliffs and over shingly slopes which offer the best chance for strayed seedlings of *Rhodothamnus* or *Potentilla nitida*. For this silvery jewel now clusters densely in all the rock rifts, though I will not yet treat of her in detail, until we come to the high ridges of the Drei Zinnen, where it forms sheets of flower. Among the fallen stones grow other things—a white *Silene acaulis*; here and there a rare tuft of *Papaver rhæticum*, an exquisite hairy, blue-leaved form of alpinum, with big lemony blooms; *Gentiana Clusii* (probably), smaller in flower but far more brilliant in blue than the big, dingy goblets of *acaulis* in the woods below; *Rhodothamnus* everywhere now, in sheets of rosy glory; and, under one damp rock, in a barren scree, the fragrant lilac tufts of *Iberidella*, with big, fringy white bells of *Soldanella* growing in the mossy dells of shadow. But there are no more *Saxifragas* now except the silver stars of the dingy-blossomed *S. crustata*, which in these limy Alps seems wholly to displace what one had believed to be the universal *S. aizoon*. *Reginald Farrer*.

NEW OR NOTEWORTHY PLANTS.

BERBERIS GAGNEPAINII.

THIS elegant Barberry is one of a number of closely-allied forms, or species, inhabiting the mountains of Northern India and Western China, several of which have been raised by Messrs. J. Veitch & Sons from seeds collected for them by Mr. E. H. Wilson. *B. Gagnepainii*, C. K. Schneider (*Bull. Herb. Boiss.*, 2me serie, vol. viii., 1903, p. 196) (see fig. 96), first flowered in Messrs. Veitch's nursery in 1907, and was then identified at Kew with *B. acuminata*, Franchet (*Bull. Soc. Bot. France*, vol. xxxiii., p. 337), and figured in the *Botanical Magazine*, t. 2185, under

that name, and described by Dr. Stapf as differing from the Indian *B. Wallichiana*, D.C., in having narrower leaves with a longer tapering tip and longer, more numerous, stronger marginal spines. Typical *B. acuminata* has also larger, coarser, thicker leaves, armed with stouter spines than those of *B. Gagnepainii*; this is also under cultivation by Messrs. Veitch. How far these differences in foliage and habit are due to local conditions is uncertain; but they do not correlate with obvious floral modifications. Schneider founded *B. Gagnepainii* on Wilson's No. 5,148, collected at an altitude of 10,000 feet, and the specimens in the Kew Herbarium bearing that number have smaller leaves than the present plant. The specimen figured in the *Botanical*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT LYTHAM HALL.

THE collection of Orchids in the gardens of J. Talbot Clifton, Esq., at Lytham Hall, Lytham, has become one of the most important and interesting in Europe. So rapidly has the collection increased, that a new block of houses has been constructed, which accommodate the plants comfortably, there being separate houses or divisions for each important section. The beneficial results following this provision are already to be seen. The main block of commodious, span-roofed structures are fitted internally with the latest improvements in

species which are just establishing themselves were collected by Mr. and Mrs. J. Talbot Clifton on their tour in the East this year, when they visited Ceylon, Java, the Malay district, the Philippine Isles, and Burmah, from most of which districts plants were collected, Mrs. Talbot Clifton finding *Phalænopsis tetraspis*, a feat which no other European lady has yet accomplished.

In the first house entered on a recent visit to Lytham, we found a remarkable collection of *Aerides*, *Vandas*, *Saccolabiums*, *Angræcums*, and allied plants. Every species obtainable was present, and some of the rarest, including both the white and yellow forms of *Vanda Dearei*, had been personally collected or imported direct. The fine spikes of *Vanda cœrulea*, the white, fragrant sprays of the plant known in gardens as *Saccolabium Harrisonianum*, *Angræcum Eichlerianum*, and some others were in bloom. An enormous mass of *Vanda Roxburghii* attracted attention, also some grand specimens of *Angræcum sesquipedale*, now developing flowers, *Angræcum inbricatum*, and the yellow *Vanda spatulata*, collected in Ceylon. In the next division was a remarkable collection of *Cœlogynes*, including recently-imported plants of *C. Rochussenii*, and some undetermined species lately collected; also a number of species of *Catasetum*, some of the plants being in bud. There were many *Eulophias* and *Microstylis*, including the low-growing *M. commelynaefolia*, covering the surface of the pot in which it is grown; *Cynorchis purpurescens*, and other *Cynorchis* in flower; also *Calanthe Masuca*, *Chytroglossa Marileoniae*, *Sigmatostalix radicans*, *Polystachya campyloglossa*, with singularly-formed flowers, and a number of other species of botanical interest.

In the next warm house, a quantity of *Calanthe vestita* varieties, *C. rosea*, and other Orchids brought from Singapore were well established, and *Acanthophippium bicolor*, and many rare species were showing flower.

THE ODONTOGLOSSUMS.

Included in the collection of *Odontoglossums* was a very fine lot of *O. crispum*, among which were many choice varieties and spotted forms. The plants were in splendid condition, but the show of flowers was made chiefly by the hybrids, which are grouped at the ends of the houses. In one of the groups of plants in bloom was a distinct hybrid with finely-formed flowers, the sepals of which were cowslip-yellow evenly blotched with red-brown, the broad petals, which are white at the base and canary-yellow on the margins and tips, being without spot. Another hybrid of unknown parentage had white flowers, prettily spotted with purple, and resembling a large, spotted *O. Pescatorei*. At the end was a healthy lot of *Disas*, *D. grandiflora* having recently flowered. This house, like most of the others, has the staging arranged with the lower tier spread with shingle for giving off moisture, the plants being arranged on the open woodwork stage above. In another cool house there is no lower, moisture-holding stage, but the moisture evaporates from the somewhat raised natural earth base of the house. This arrangement overcomes the difficulty often experienced where the lower staging for giving moisture is arranged, and which interferes with the equal distribution of the heat from the water pipes.

In the next cool house, containing *Odontoglossums*, *Cochlidodas*, and *Odontiodas*, the arrangement of plants in bloom, included the rare *Odontoglossum crocidipterum*, a very fine variety of *Odontoglossum Cro-Skinneri*, *O. Rolfeae*, *O. Cooksonii*, *O. grande*, several good *O. Adrianae*, and other species and hybrids. A large specimen of *Odontoglossum coronarium* suspended overhead promised well for bloom.

The large, new, span-roofed house had in the main division a very complete collection of *Dendrobiums*, some of the rarer plants having special

FIG. 96.—BERBERIS GAGNEPAINII: FLOWERS YELLOW.

Magazine is numbered 1503, and recorded as a shrub 3 to 6 feet high, from elevations of 5,000 to 6,000 feet. So it is a little uncertain whether they are really the same. The flowers of this species are of a delicate yellow, and the fruit is of a pale, glaucous green, changing to glaucous purple. Seedlings of the plant now figured are 3 feet in height in Messrs. Veitch's nursery, and it is estimated they will grow to 6 feet. The habit is compact, and the plants flower and fruit freely. The group of species to which *B. Gagnepainii* belongs is characterised by having four seeds in each berry, or at least by having four ovules in the ovary, for sometimes only two or three develop into seeds. They are attached by relatively long stalks or funicles to the base of the ovary. W. Botting Hemsley.

staging, and ample provision is made for the storage of rain-water, without which Orchids seldom thrive for any length of time. A beautiful feature on the outside of the main block is made by a broad rockery, extending along the end and sides of the block, and planted with a great variety of Alpine and herbaceous plants.

Good hybrids, fine varieties of showy species, and pretty, curious, and interesting Orchids alike find a place in the Lytham Hall collection; but the natural species are the special favourites, as might be expected, seeing that Mr. Talbot Clifton, during his many years exploring in all parts of the world, is familiar with them in their native habitats. Many of the plants have been obtained on these journeys, and some rare and probably new

interest to their owner as being his own introductions. These included an interesting lot of Burmese species, of which *D. ciliatum* had many plants in flower. So also had the well-grown batch of *D. fucosum giganteum*, whose large, snow-white flowers showed great variation in the tint of the yellow on the labellum, some of them being red at the base. A batch of the typical *D. Phalaenopsis*, generally called *D. Statterianum* in gardens, had many sprays of rose-purple flowers, quite distinct from the *D. Phalaenopsis Schröderianum* flowering beside it, and with a good number of the graceful, rose-coloured *D. bigibbum*. Others noted in bloom were *D. Fytchianum*, *D. glomeratum*, *D. crystallinum album*, *D. cariniferum*, *D. longicornu*, *D.*

Cattleyas, some of which were in flower, the superb *B.-C. Cliftonii*, which secured a First-class Certificate on December 8, 1908, was in excellent condition, and Mr. Float, the gardener at Lytham Hall, has succeeded in establishing a duplicate plant. In these houses we noticed a considerable number of *Cattleya Iris* in flower; a very dark *Lælio-Cattleya Gottoiana*; several good *L.-C. Nysa*, of which Clifton's variety was much the best; some hybrids of *Sophronis grandiflora*, including the new *Sophris-Lælio-Cattleya de Vere Beauclerk* (*L.-C. Bletchleyensis* × *S.-L. heatonensis*), with a three-flowered inflorescence of *Cattleya*-shaped, rose-purple flowers, with ruby-red veining on the lip. The collection contains a full set of species and hybrids of *Cymbidium*,

large, white flowers. There were also wonderful collections of *Bulbophyllums*, *Cirrhopetalums*, and *Megacliniums*, all the varieties available in cultivation being included, as well as some recently-collected species, which are thought to be new. *Cirrhopetalum pulchrum* var. *Cliftonii* was a very fine plant; *C. ornatissimum*, *C. Thouarsii*, and others bear pretty umbels of flowers; all the large-growing, eastern, evergreen *Bulbophyllums* and *Trias picta*, and other allies of *Bulbophyllum* were in excellent condition.

Cypripediums are not favourites at Lytham, but a small collection is cultivated, and some specimens were in flower.

WIGTONSHIRE GARDENS.

DURING the past month I had the privilege, through the kindness of the Earl of Stair, Mrs. McDouall, of Logan, and Lady Augusta Orr-Ewing, of visiting some of the most beautiful gardens in the south-west of Scotland. Notwithstanding the recent unfavourable weather, with its constant "sound as of an abundance of rain," Logan Gardens, when I saw them on September 4, were full of interest, likewise of promise for abundant autumn bloom. The Carnations, Roses, Begonias and Sweet Peas were especially effective. A new rock-garden has been recently created by Mr. Findlay, the gardener, and it already shows features of floral fascination, especially in the direction of Alpines and miniature campanulate flowers. Conspicuous among recent additions to the herbaceous borders have been a luminous scarlet *Salvia* and the distinctively-coloured *Astilbe Davidii*. The Solanums, Allamandas and Bougainvilleas in the conservatories have been glorious, so also have the magnificent "Malmaison" Carnations. Logan Gardens, in which both Mr. and Mrs. McDouall take a practical interest, are at this season extremely picturesque, and they have in addition this peculiar charm, that at every turn unexpected beauties are suddenly and radiantly revealed.

At Corsewall Gardens, which I visited on the invitation of Mr. Carrick Buchanan's capable gardener (Mr. McColin), who has of late effected some striking transformations there, I was greatly impressed by the vista of the herbaceous border which, immediately on entering, illuminated the gaze. The floral combinations are, in deed, supremely attractive. They have an exquisitely beautiful background of *Wichuraiana* Roses, and the choicest Sweet Peas. The flower garden fronting the mansion, which looks out upon Loch Ryan, has also much fascination, and the *Hydrangeas* in the surrounding woodlands are the grandest I have seen, *H. paniculata* being especially impressive. Mr. Findlay (of Logan Gardens) tells me that this variety is strikingly effective when grown upwards through the dark, contrasting branches of *Prunus Bissardii*, the Persian Plum.

Lady Augusta Orr-Ewing's garden, situated above a very famous Glen near Port Patrick, is also highly interesting from various points of view, and under the supervision of her ladyship's gardener (Mr. Jowett), has been greatly improved. He receives every encouragement from Lady Augusta, who is a daughter of the Earl of Glasgow. Lord Glasgow's garden at Kelburne is exquisitely illustrated in Sir Herbert Maxwell's latest book. Lady Augusta is especially attracted by the culture of Ferns, Sweet Peas, Roses and Oriental Lilies, which are grown with wonderful success. *Lilium giganteum*, in the gardens at Dunskey, is a veritable giant, and worthy of its name.

I had not the pleasure of seeing the fruit under glass at Castle Kennedy, inasmuch as, by the time I cycled there, it was growing late in the day, and the gardener, Mr. Cruden, was absent; but Viscountess Dalrymple, who was residing at Lochinch Castle, showed to me all the objects of chief interest in the private flower garden, which was looking its loveliest in the sunlight of a tranquil and exquisite day. Especially

FIG. 97.—*CYPRIPEDIUM PARVIFLORUM*.

Sepals and petals, brown-purple; lip, yellow. (See p. 228.)

secundum, *D. eriaeflorum*, *D. lamellatum*, and other rare species. When the wide range of the natural habitats of the various species grown together in this house is considered, it is surprising that all should represent such fine condition. A cooler, drier house is used for the deciduous varieties after the flowering period.

The next large intermediate house range contained, in the first division, a good selection of *Cattleyas* and *Cattleya* hybrids, with a noble specimen of the Dove Orchid (*Peristeria elata*) as a central plant at the entrance. This plant had four very strong spikes of its large, fragrant, white flowers. Around this specimen were grouped hybrid *Lælio-Cattleyas* in bloom, of which there is a very rich collection. Among a batch of *Brasso-*

Lycaste, *Masdevallia*, and other important sections, each of which had an interesting series in bloom, and especially the *Masdevallias*, *Miltonias*, *Pleurothallis*, and *Oncidium*. *Stenoglotis longifolia*, *Ancistrochilus Thompsonianus*, *Catasetum fimbriatum*, some *Cyanoches*, a well-flowered lot of *Vanda Kimballiana*, *Zygopetalum Roeblingianum*, a bright lot of *Epidendrum vitellinum*, the singular and extremely rare *Chondrorhyncha Ledyana*, some *Plajones*, and many other pretty and rare plants were also in bloom.

The *Phalaenopsis* house contained a vigorous collection of most of the best species, the *P. amabilis Rumstediana* having been brought from Java on the last visit, and these have flowered well for a long time, bearing still many sprays of

charming were the Roses, Nymphreas, herbaceous plants (including the Gentians and Anchasas), and flowering trees, of which there is a good collection at Lochinch, as of Pines, and Cedars and Araucarias at Castle Kennedy. The "wild garden" of the Viscountess, situated in a sheltered wood behind the castle, in which she cultivates several Japanese Lilies such as *Lilium auratum* and *L. speciosum*, with gratifying results, is exceedingly interesting. If, as I conceive, environment means inspiration, then the proud owner of Lochinch and Castle Kennedy should unquestionably be the most inspired of men. For that renowned region of terraces and lakes, and gardens, set in a frame of grandly-wooded hills, may be described as Nature, glorified by Art. *David R. Williamson, Manse of Kirkmaiden, Wigtownshire, Scotland.*

HARDY CYPRIPEDIUMS.

(Concluded from page 210.)

C. MONTANUM (*C. occidentale*) [*Bot. Mag.*, tab. 7519].—A beautiful and distinct little species introduced from North-western America in 1885. Three or four flowers are borne on each stem. The sepals are brownish-purple; the lip is white, striped with red inside. This is one of the easiest of the smaller kinds to cultivate, and it is quite hardy.

C. PARVIFLORUM (see fig. 97).—As may be seen from the accompanying illustration, this North American species is eminently suitable for pot culture, as well as for growing out-of-doors. The stems are leafy, about 18 inches high, and bear usually two flowers. These are fragrant, with yellow lips, and brown-purple sepals and petals. This species is sometimes considered a variety of *C. pubescens*, but although there are intermediate forms connecting the two, for garden purposes they are quite distinct. Introduced in 1759.

C. PUBESCENS [*Bot. Mag.*, tab. 911].—This is a robust species which was introduced in 1790 from North America. The plant grows about 2 feet high, and it is one of the hardiest for the shady rock-garden. The large flowers are borne two or three on a stem; they have pale yellow lips and twisted yellow sepals spotted with brown.

C. REGINE (syn. *C. spectabile*) [*Bot. Mag.*, tab. 216].—This is one of the finest of the genus and the easiest to grow. It will thrive well in a shady border and form large tufts, with many stems 2 feet to 3 feet high, two or three flowers being borne on each stem. These are pure white, with the greater portion of the lip suffused a rich rose colour. This species is known as the Moccasin flower. A pure white variety has been in cultivation, but is probably lost. The type has been in cultivation since 1731.

C. THUNBERGII (see fig. 98).—This is the Japanese form of *C. macranthum*, with rather smaller and paler-coloured flowers. It is quite distinct from a garden point of view.

C. TIBETICUM (see fig. 139 in *Gardeners' Chronicle*, June 2, 1906, p. 547).—A handsome species from Western China and Tibet, whence it was introduced by Messrs. Veitch & Sons through their collector, Mr. Wilson. It was awarded a First-class Certificate by the Royal Horticultural Society in 1907. It somewhat resembles *C. macranthum* in habit and form; the flowers, however, are larger, with sepals tessellated dark purple, and a chocolate-purple coloured lip.

C. VENTRICOSUM (see fig. 99).—A natural hybrid from Siberia, where it is found growing in company with its two parents, *C. calceolus* and *C. macranthum*. It is intermediate in habit between the two parents.

In planting Cypripediums, it should be borne in mind that they dislike open situations and drying winds. The places they prefer are moist, well-drained rockeries facing to the north or west, the shady banks of small streams and the hardy fernery. *W. L.*

PLANT NOTES.

LILIUM SULPHUREUM.

OF the remarkable Lilies introduced from Upper Burmah about 20 years ago this has proved the most amenable to cultivation. It flowers in late summer and early autumn, and is, therefore, particularly valuable for the decoration of the conservatory at that time.

Within the last two or three years considerable importations of this Lily have been made, and its large, compactly-formed bulbs can now be purchased at a moderate rate. *Lilium sulphureum* may be either grown in pots or planted in a prepared bed, this latter method being preferable.

In favoured parts of the country the plant may be regarded as hardy, but in other districts, even if protected from the winter's frost, it flowers so late that many of the blooms fail to develop, hence the species must be regarded generally as a greenhouse subject.

Good examples of this Lily will attain a height of 5 feet to 10 feet, the long wand-like stem

FIG. 98.—CYPRIPEDIUM THUNBERGII.
Flowers, pale purple.

being very thickly clothed with narrow leaves which when young are tinged with reddish-brown. As in many other Lilies, the leaves widen considerably towards the top of the stem. The flowers are amongst the largest of the trumpet-flowered section, being creamy-white tinged on the exterior with reddish-brown and suffused inside with rich yellow.

A notable feature is the production of comparatively large bulbils in the axils of the leaves, such as occur in the Tiger Lily (*L. tigrinum*). These bulbils afford a ready means of increase, though, of course, they are some time before they attain the flowering size.

Lilium sulphureum (see Supplementary Illustration, *Gardeners' Chronicle*, July 7, 1900) was first shown in flower by Messrs. Low at a meeting of the Royal Horticultural Society on June 25, 1889, when a First-class Certificate was awarded it under the name of *Lilium Wallichianum superbum*. Though Mr. Baker, of Kew, was responsible for this name, it aroused a good deal of controversy on the

ground that the Lily in question was specifically distinct from Wallich's Lily. After a year or two, Mr. Baker raised it to specific rank and named it *Lilium sulphureum*.

The latter part of the '80s was remarkable for the introduction of several striking Burmese Lilies; in 1888 *Lilium nepalense* was received, the next year *Lilium sulphureum*, followed soon afterwards by *Lilium primulinum*, shown under the specific name of *claptonense* (now, I believe, lost to cultivation), and, lastly, *Lilium Bakerianum* or *Lowii*. *W.*

TREES AND SHRUBS.

CLETHRA.

The Clethras are as a rule at their best during the latter part of August and September.

C. alnifolia, the Sweet Pepperbush of the United States, deserves a place amongst the best of flowering shrubs.

It forms a freely-branched, rather upright-growing deciduous shrub, that reaches a height of 3 feet to 5 feet. The flowers are borne freely in spike-like racemes, being white and very fragrant. Though it does not flower till the latter part of August in the open, this Clethra readily lends itself to forcing, and good examples have before now been noted at the Temple Shows.

There are four varieties of *Clethra alnifolia*, but the most marked is that known as *tomentosa*. Apart from its decidedly tomentose character, this variety does not flower till two or three weeks after the type, for which reason it is particularly valuable.

Other species are the larger-growing *Clethra acuminata*, also a native of North America, and the Japanese *Clethra canescens*. This last is said to attain the dimensions of a small tree in its habitat, but it flowers freely in Britain as a bush. The blossoms, however, are for the most part over before those of *Clethra alnifolia* are expanded.

Clethras delight in a cool, moist soil of a peaty nature, such as *Rhododendrons* thrive in; indeed, it is useless to plant them in dry or chalky soils.

A member of the genus widely removed from the preceding species is *Clethra arborea*, a small evergreen tree native of Madeira. Good examples may sometimes be met with in conservatories. The spikes of waxy-white flowers somewhat resemble those of the Lily of the Valley; they are produced freely during the autumn months. *W.*

FOREIGN CORRESPONDENCE.

ACTINIDIA CHINENSIS.

SEVERAL members of this Department were greatly interested in the Supplementary Illustration of *Actinidia chinensis* and the account of its flowering in England, as given in the *Gardeners' Chronicle* for July 31 last. Some of your English readers might likewise be interested to know that the vine has already flowered for three consecutive years, beginning in 1907, at the Plant Introduction Garden of the United States Department of Agriculture, at Chico, California. The plants belonging to the department were secured from the American Consul at Hankow, China, in 1904, from Chungking, and were said to have been from the same lot which was secured by Mr. E. H. Wilson on the borders of Yunnan, when in the employ of Messrs. James Veitch & Sons.

Although flowering profusely, the plants at Chico have not produced fruit. An observer at the garden reported that the flowers were apparently perfect, and that he pollinated some by hand, but that in each case the stigmas withered and died. Plants propagated from the original importation and seedlings grown from a later one have been widely distributed in the Pacific and Gulf States of the Union. It is hoped that this beautiful plant may soon be found fruiting, especially near the Gulf of Mexico, where the climate is probably much better suited to it. The plant is a very rapid grower. *Walter Fischer, United States Dept. of Agriculture (Bureau of Plant Industry), Washington, D.C.*

THE FERNERY.

THE POLYSTICHUMS.

THE shield Ferns of Great Britain embrace three species, viz., *P. Lonchitis*, the Holly Fern, *P. aculeatum*, the Hard Shield Fern, and *P. angulare*, the Soft Shield Fern, all of which display that peculiar mitten or fingerless glove-shaped segmentation characteristic of the genus. They obtain their popular name from the fact that the spore heaps are protected, not by a kidney-shaped indusium or cover as in the *Lastreas* (*Nephrodiums*) attached to the frond at the indentation, but by a perfectly round or shield-shaped cover attached, Mushroom fashion, at the centre. A further peculiarity which facilitates identification of the species early in the year, when the fronds arise, is that after the tip has uncoiled to some extent the coil turns over backwards, while in the *Lastreas* it merely loosens so as to form a long hook, pendulous in front of the frond. The mitten-shaped sub-divisions are serrate with acute points, a pointed, thumb-shaped, secondary subdivision projecting at an angle from the base on the upper side, thus imparting the resemblance to a fingerless glove. In the Holly Fern (*P. Lonchitis*), which in this country is a true mountain Fern, being rarely found below 2,000 feet (I have found it at 1,100 feet), the frond is only once divided, the pinnae or side divisions being somewhat leathery and of the shape described throughout, a point to be borne in mind since young plants of *P. aculeatum* strongly resemble this species, but always have the pinnae subdivided again. *P. Lonchitis*, reported to have been found at lower levels, have frequently been misnamed, owing to neglect of this characteristic. The fact, however, that this undivided feature constitutes the main difference between *P. Lonchitis* and *P. aculeatum* involves a difficulty in the direction of variation. Both *P. aculeatum* and *P. angulare* vary considerably, and often in the direction of extra division, their normally bipinnate fronds becoming tri- and even quadripinnate. Hence, it is obvious that any sport in this direction in *P. Lonchitis* would lead to its acceptance as *P. aculeatum*, and, in point of fact, the writer found among a colony of *P. Lonchitis*, on Ben Lawers, a plant which exactly resembled *P. aculeatum*. It is, moreover, a fact that unaccountable plants of *P. aculeatum* have cropped up in *P. Lonchitis* spore sowings. Whether such plants represent decompose sports of *P. Lonchitis* or the results of stray spores of *P. aculeatum*, it has been impossible to ascertain. One thing is certain, however, and that is that if *P. Lonchitis* be removed from its natural high-level habitats to ordinary low-level situations, it persistently retains its mountain once-divided character. Crested forms of this have been found several times, so in this direction it may be considered as amenable to variation, as its very protean congeners. *P. aculeatum*, the Hard Shield Fern, grows to a much larger size than *P. Lonchitis*. Its fronds are bipinnate, have a shiny, hard surface, and are somewhat narrowly lance-shaped in outline. It is intermediate between *P. angulare* and *P. Lonchitis* both in texture and habitat, being found in abundance in Scotland, especially in the glens. *P. angulare* is rare in that country, occurring only sparsely on the border counties, though the writer found a solitary plant in Perthshire, where it had not previously been recorded. It was growing amid a colony of *P. aculeatum*, and thus forms a sort of parallel with the plant of *aculeatum* found among *Lonchitis* above alluded to. It is difficult to draw a hard and fast line between the three species, since, although *P. angulare* is much softer, it has not the lucent character of *P. aculeatum*, and differs somewhat in the outline of the frond. I have found examples with *angulare* characters combined with *aculeatum* toughness and lucency, so that it was impossible to determine to which species they should be allocated. The idea

has been suggested that in more southern parts *P. aculeatum* becomes transformed into *P. angulare*; but this is certainly wrong, since quite recently, in Devonshire, I found, in one and the same lane, plants of *P. aculeatum* and *P. angulare* side by side, with their differentiating characters fully displayed. In their varietal or sportive capacity, both the Hard and the Soft Shield Ferns have shown great versatility. The latter species especially has yielded a very large number of distinct forms to the Fern hunter, no fewer than 253 being described in Mr. E. J. Lowe's *British Ferns*, and 25 of the former species, while the results of selective sowings have been simply wonderful. At the time of the publication of that list (1891) there were respectively 151 and 9 forms recorded, to which a number of others from subsequent finds and raisings might now be added. Most of these varieties are characterised by much finer and more extended dissection or division of the fronds, accompanied by such a lengthening and widening and piling up of the delicate subdivisions as to utterly transform the Ferns so affected and rank them among the most

FIG. 99.—CYRIPEDIUM VENTRICOSUM.
A hybrid from *C. Calceolus* × *C. macranthum*.
(See p. 228.)

beautiful types extant. *P. aculeatum* has recently provided a new section, or, rather, two sections, both of extreme and unique beauty. In one, the "gracillimum," or slender type, the normal half-inch long pinnule has been lengthened into delicate filaments nearly 3 inches long, with finely-fringed sub-tassels on their tips, while in the other, the "plumose" section, the variation has taken the decompose form, the said pinnules being greatly widened and divided again and again. Curiously enough, a batch of about a score of such varieties originated from *P. aculeatum pulcherrimum*, found nearly 40 years ago by a farm labourer in Dorset, and which has only once furnished spores. These, when sown, gave rise to the batch of plants alluded to, a number of plants closely resembling the parent and a few which reverted rather more in the direction of *P. angulare* than *P. aculeatum* being more or less intermediate. The *Polystichum* family (classed with the *Aspidiums* botanically) is a fairly large one, and it is somewhat curious that while we have so many variants of wild origin, those of exotic species of the same family are few. *Chas. P. Drury, F.M.H., F.L.S.*

THE ROSARY.

CULTURAL NOTES FOR OCTOBER.

THE weather having been so unsettled, the ground generally is thoroughly moist, and trenching and manuring should be commenced at once, so that the soil will be in a suitable condition for planting by the end of the present month or early in November. Trench the soil to a depth of 18 inches, incorporating plenty of fresh turfy loam and manure, also some half-inch bones. If the ground is waterlogged it should be drained. Roses are fine subjects for planting on lawns. Oval or rectangular-shaped beds, varying in size according to the extent of the lawn, should be cut in the turf. The beds can be planted with varieties of Roses in one or more colours, but the best plan is to employ distinct colours for each bed. The planting of Standards of a distinct colour, intermingled with dwarf plants of dissimilar varieties, form a pleasing bed when the colours are properly blended. Standard and China Roses can be employed for this system of bedding. The China varieties are constant bloomers. Some of the old varieties are amongst the best for the purpose, including Old Blush, Louis Phillip (crimson), Laurette Messimy (pink and bronze), Eugène de Beauharnais (amaranth), Cramoie Superieure (scarlet), Mme. Fabyier (dark crimson), Hermosa (pink), and Grass an Teplitz (brilliant scarlet). These can be planted 1½ feet to 2 feet apart, according to their habit of growth. Both half-Standard and Standard plants, 3 feet to 4 feet high, should be employed; being of varying height they will break up the uniformity of the bed. The following varieties, all white flowering, are suitable: Margaret Dickson, Mme. Lacharme and Frau Karl Druschki. In smaller beds the taller plants could be placed 3 feet apart. Dwarf Hybrid Tea varieties are also suitable for a groundwork. Of these, Kaiserin Augusta Victoria (sulphur-white), Gustave Regis (canary-yellow), Vicomtesse Folkestone (creamy-pink), Bessy Brown (creamy-white), and Mme. Hoste (lemon colour) may be employed with Standards of Ulrich Brunner (rich carmine), Dupuy Jamain (bright red), and General Jacqueminot (brilliant crimson). Another pleasing combination is (Dwarfs) Scuateur Vaisse (bright crimson), Charles Lefebvre (bright scarlet), Duke of Edinburgh (scarlet crimson), Sir Garnet Wolseley (bright crimson), Victor Hugo (crimson), and Prince Camille de Rohan (velvety crimson), with Standards of Captain Christy (rose), La France (blush), Mrs. Sharran Crawford (pink), and Countess of Rosebery (salmon).

Climbing and Pillar Roses trained to arches, walls or fences should be trimmed and made tidy. Groups of the old-fashioned summer-blooming Roses such as the White Provence or Unique, Cabbage Crimson (damask), Crested, (pink), Maiden's Blush (moss), White Bath, Blanche Moreau (white), Old Pink and Crested (moss), and Lanei are a pleasing feature dotted about in odd corners of the garden. To these may be added Hybrid China Roses such as Charles Lawson (rose), Mme. Plantier (white), and Paul Ricaut (crimson). The Japanese Roses (*Rosa rugosa*) are very showy, as much for their sweet-scented flowers and handsome, nearly ever-green foliage, as for their pretty hips; *rugosa alba* (single white), *rugosa fimbriata* (pink and blush), *Blanche de Coubert* (double white), and *atropurpurea* (rich crimson) are some of the best of this class.

October is the best month for planting Rose cuttings in the open. Well ripened shoots about 9 inches long should be taken off with a portion of the old wood. The ground should be well trenched, mixing plenty of sand or grit and leaf mould in the bottom of the trench. Cut out a sloping trench, place the cuttings in two-thirds of their length and make them firm by treading the soil. They can be planted either in lines or in beds 4 feet wide. Place them 2 inches apart, allowing 1 foot

between the rows. They are best planted in a position facing due north. Apply a mulch of waste fibre over the beds as a protection during winter, and to prevent evaporation of moisture in the summer. Tender varieties should be inserted under frames or handlights. The soil in the frames should be mixed with plenty of road grit, burnt earth or wood-ashes, with a layer of sand placed on top. Before placing on the lights, well water the cuttings.

Vacant ground should be reserved for planting Standard Briar and other Rose stocks. In the meantime the ground should be well manured and trenched. It is always useful to have a supply of healthy stocks for budding, so that new and desirable kinds can be increased at a trifling cost.

PEGGING SHOOTS IN AUTUMN.

The following statement may not appear orthodox, but the results in my experience perfectly justify the treatment. I have found, where long, ripe shoots are available on dwarf plants during late autumn, it is a more satisfactory time for pegging down than in the spring, as it causes a more regular and earlier break over the entire length of the shoot and a more even distribution of the sap. Besides, with the exception of shortening the shoot a few inches to a sound eye, it obviates the severe cutting back of shoots that have been damaged either owing to the severity of the weather or because the growth was made too early. This seems to be a loss of vital force, and in some cases could well be avoided. It is much easier to protect the wood of tender varieties from severe frosts by covering them with litter or Fern when bent horizontally.

Newly planted Standard and Dwarf Roses must be secured to stakes. When planting place the roots not deeper than they were originally, and finish by placing a good mulch of fermented manure on the surface. Established plants will also be benefited by this treatment, but the ground should be lightly pricked up with a fork before applying the mulch, so that the manurial properties will be washed into the soil by the autumn rains.

Established Roses in pots that were forced last season, and repotted and top-dressed last month, may be brought into a cold house or frame. Early H.P.s, Noisette, China and Tea varieties should be allowed ventilation both day and night for several weeks to come, but the amount of fresh air should be gradually reduced as the nights get cooler. After the first watering, keep the plants rather drier at the roots, and, on bright days, give a light overhead syringing in the morning. The scented Tea varieties should be lightly pruned, but the Hybrid Perpetuals may be pruned a little more severely, although not nearly so much as when the season is more advanced. The plants should be well fumigated when brought into the house. Thoroughly cleanse the glasshouse, including the stages, so as to destroy spiders and other injurious insects. The Tea, Hybrid Tea and China roses respond to gentle forcing much better than the Hybrid Perpetual varieties.

If the stock of Pot Roses requires renewal, October is a good time to lift and pot the maiden plants from the open ground. Preference should be given to those of the Tea section where cut flowers are in request. Select and take up carefully those plants which have three or more well-ripened shoots and plenty of fibrous roots, as these, when finally pruned back in the spring, will break into six or more shoots and form a bushy and compact head. When the potting is completed, they may be plunged in ashes outside until required. The remainder of the Pot Roses propagated during winter and spring and plunged outside, which are now in bud and flower, may be removed carefully and brought into a cool house. But before this is done, the plants should be well vaporised and lightly pruned. The ventilators should be left open for the present both night and day. If the plants

are rooted through the pot, it will be better to stand them on the stage, slightly plunging them in fibre, or some light material. This will keep the plants going until they have finished flowering, until the end of November.

Planted-out Roses under glass are now breaking freely, and the wood being thoroughly ripened, they may be given plenty of moisture at the roots. A sprinkling of freshly-slacked lime lightly forked in the surface of the bed will serve to keep the ground sweet and free from grubs. The top-dressing given to the borders last month should have enabled the plants to make a vigorous growth, and the foliage will occasionally require to be well cleansed with water applied from the garden engine. After this month less fresh air will be necessary, admitting just a little during the night at the top of the house, accompanied by a little heat in the hot-water pipes. *J. D. Godwin.*

TOWN PLANTING.

CATALPA BIGNONIODES.

FOR various reasons this fast-growing tree is to be recommended for planting in smoky localities. It grows with vigour in many situations, such as in the Middle Temple Gardens, near the Houses of Parliament, and at Chiswick, Lambeth and Camden Town. It is a tree of handsome proportions, and, when fully established, flowers freely. The violet-white of the petals is well set off by the purple and yellow of the throat. A valuable trait in the character of the Indian Bean is that, should accident befall it, and the stem get injured, numerous strong suckers are produced, which, as they grow with great rapidity, soon restore the dimensions of the tree. It succeeds in almost any sort of soil. Amongst remarkable trees of this kind in London is that known as Bacon's Catalpa. This fine old tree, which is said to have been planted by Bacon, grows near the centre of Gray's Inn Gardens. It is of unusual appearance, owing to having been partially uprooted many years ago. The stem, which is about 18 inches in diameter, rests on the ground for about 9 feet of its length, and has, fortunately, been well preserved by filling up the hollow portions with cement, while the far-spreading, heavy branches have been supported by props, and thus prevented from breaking away from the main stem. Though there are many dead and dying branches on the tree, yet its general health is good, and, should no accident befall it, it will live for many years. It produced flowers freely in the season 1900. Perhaps it may be of interest to state that the Gray's Inn Gardens were laid out under the direction of Bacon towards the close of the 16th century. *A. D. Webster.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

The new potting materials.—In large and varied collections of Orchids there are, at all seasons of the year, some species or hybrids that require repotting. A few remarks, therefore, to amateurs now beginning to interest themselves in Orchids, as well as to those who have had considerable experience, may prove useful. For a great number of years past fibre of peat has been largely used for potting the plants, being considered the best material. Unfortunately, however, when mixed with Sphagnum-moss, this decayed very rapidly, and it was necessary to repot the plants frequently. Although various materials, such as Belgian lent-soil, English Oak and Beech leaves, &c., have been tried for the purpose of superseding peat, none has proved so acceptable and lasting to many English growers as the American Osunda and Polypodium fibres. My experience shows that the majority of plants, when properly potted in these materials, cut up and mixed together, have benefited. Therefore, I am anxious to encourage those who are not quite satisfied as to the value of these new potting materials. Growers complain that, after the plants have been turned out of their old material and repotted into the new mixture, the new pseudo-bulbs or growths do not attain to the strength or size they did in the old soil. This, in many instances, I know by

my own practice to be quite true, especially in the case of Cattleyas, Laelias, Dendrobiums, and Odontoglossums. But the grower will find that the second and subsequent growths will be double or treble the size of those which were formed immediately after the plants had been repotted, that the flower-spikes are stronger, and the flowers of greater substance, also that they will last much longer both on the plants and when cut than they did in the old potting mixture. After making a first small growth in the new soil, it is advisable to remove the flower-spike for one season. By so doing, the plant will make the next growth earlier. When repotting becomes necessary, Cattleyas and Odontoglossums, in particular, need not be disturbed at the root nearly so much as was necessary when the old materials were used. The latter having become worn out in a year or two, it had to be removed, and, in most cases, this could not be done without causing considerable injury to the roots. On the contrary, the lasting qualities of Osunda and Polypodium fibres afford the operator every facility to repot the plants without unduly disturbing their roots, especially those in front of the leading growths or pseudo-bulbs, and which are of the greatest consequence to every plant. As regards Odontoglossums and Oncidiums, I find that, if the plants, as is generally the case, are repotted soon after the current season's bulbs have flowered, new growths appear from the base of these growths, and the pseudo-bulbs shrivel to such an extent that it takes a very long time to bring them round to their normal condition. Therefore, after having produced a strong inflorescence, it is advisable to allow the plant to remain in the old soil, provided, of course, that it has not become sour or decomposed. But immediately a flower-spike appears low down in the axils of the leaves or growths, it should be removed. When the next growth is about 2 or 3 inches high, the plant may be repotted without fear of deterioration. Beginners in Orchid culture, who generally commence with small, imported pieces of Odontoglossum crispum, and are naturally anxious to see their plants flower, would do well to remember that the practice of allowing these tiny plants to produce a spike of bloom has the effect of weakening the plants for a very long time. It is, therefore, desirable to take the future into consideration and to remove the flower-spikes for a season or two. Let the sole object of the cultivator be to grow the plants stronger and stronger until they have become so thoroughly established that they can develop to perfection yearly, without distress, spikes of from 10 to 20 flowers, all of good form, size and substance.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Figs.—The cold and damp weather early in the summer retarded the growth of Fig trees, the result being that very few good fruits have been gathered in this locality. The trees have since made a considerable amount of growth, therefore care should be taken to see that the shoots are thinly trained, in order that they may be exposed to the autumn sunshine. It will need every care to get the lately-formed shoots sufficiently well-ripened to withstand winter frosts. Fig trees growing in situations where the roots are allowed to extend into rich soil are seldom satisfactory. In such cases steps should now be taken to restrict the rooting space. Trees may often be seen bearing satisfactory crops from season to season, whilst their roots are confined to very small borders close to a hard path or roadway. Such trees make only a little growth, but this is short-jointed and it matures well. If a Fig tree has its roots extending into rich soil, such as that which has been heavily manured for vegetable crops, a trench should be taken out about 3 feet from the wall on which the tree is drained, and the trench should be made to the depth of the drainage material. All strong roots that are found crossing the trench should be cut off. The best thing to do afterwards is to build a small wall to entirely restrict the roots from entering the vegetable garden. A wall, however, may not always be practicable, in which case the trench should be filled with clinkers, brick-bats, or chalk, ramming these materials thoroughly firm as the work proceeds. After such treatment the trees may make but little growth in the following season, but it will

be of such a character as tends to fruitfulness. Fig trees already growing in restricted borders and carrying crops of fruit require copious waterings and plenty of stimulants during dry weather. When Fig trees have to be planted, care should be taken to provide, in the first instance, means for restricting the roots. This will save much time, and prevent disappointment.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Chrysanthemums.—Although it is advisable to keep the plants out-of-doors as long as this can safely be done, at this date all must be housed, except, perhaps, the very latest-flowering varieties. Before the plants are removed indoors, cleanse the pots and spray the foliage with a fungicide, such as a solution of sulphide of potassium or weak paraffin emulsion. When more plants are grown than can be properly accommodated in the houses, there arises the temptation to overcrowd them. This should be resisted, as overcrowding always leads to disappointment. In such cases, only the best plants should be placed in the show house. It is too often thought that the leaves have served their entire purpose when the flower-buds are in course of development. On the contrary, if the leaves are sacrificed by overcrowding directly the plants are removed to the houses, the flowers are bound to suffer in consequence, and this notwithstanding the fact that occasionally one sees good flowers developed on shoots that, in the absence of foliage, appear to be mere sticks. For some time after the plants are removed indoors they should be given liberal ventilation by night as well as by day, taking care, at the same time, to prevent cold draughts and drips of water from the ventilators. It will doubtless be necessary to fumigate, or vaporise, the plants on several occasions at intervals of five or six days to make certain that thrips and aphids will not disfigure the flowers. Watering must now be carried out with great care, and the strength of manure water or other stimulants be decreased gradually. Let any plants which are still left out-of-doors be made thoroughly secure against gads.

Doronicum plantagineum.—In gardens where large, cool houses have to be kept bright in spring-time, a batch of this *Doronicum* should be potted into 5-inch pots for wintering them in cold frames. These plants will flower in advance of those in the border out-of-doors if given very gentle forcing.

Codium (*Croton*).—At this season there are plenty of good, well-coloured cuttings, and it will be found that they will root more readily now than cuttings will in spring. As soon as they have made roots, they should be kept growing steadily in a position as near to the glass as possible.

Schizanthus.—Seeds should be sown now in pans of light, sandy soil and placed in a cool house. The plants will flower early in spring. As soon as the seedlings can be handled, prick them off into 5-inch and 6-inch pots, using a compost of loam, leaf-soil, and sand. Three plants will be sufficient to put in a 5-inch pot, and five may be placed in a 6-inch pot. These receptacles will be quite large enough for the plants to flower in. Shade the seedlings for a few days after transplantation, and afterwards place them on a shelf in a cool, well-ventilated house.

THE KITCHEN GARDEN.

By E. BRICKELL, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Onions in the store.—Take advantage of wet days to perfectly clean and rope the Onions. This simple way of preserving them in a good condition until next spring is still the best known to me. The bulbs should be kept distinct in respect to variety, and roped according to size. Reject any bulb which appears unlikely to keep well, especially those with thick necks, which may be utilised for immediate use. The smallest of the bulbs can be used for pickling purposes, although those of the Silverskin variety are to be preferred on account of their better appearance. The ropes of Onions should be suspended in the coolest shed available, for, even an open shed is sufficient for well-ripened bulbs which merely require to be kept dry.

Autumn-sown Onions.—Use the Dutch hoe frequently between the rows, and pull out any weeds that are found amongst the plants. Apply an occasional dusting of fresh soot. Make another liberal sowing in an unheated frame for supplying young plants for winter salads.

Rubishes.—If these are in much demand, it will be well to make frequent small sowings in slightly-heated pits. The beds should be formed as near to the glass as practicable. Air should be admitted to the pits whenever outside conditions will allow.

Cabbages.—Plant out the latest batch of Cabbages in well-prepared ground. Let the rows be made 20 inches to 24 inches apart, and set the plants at distances of 1 foot in the rows. Fill up any vacancies there may be in the earlier plantations, and use the flat hoe frequently amongst these latter. Prick out any surplus plants from the seed beds into small beds where protection can be afforded during the winter.

Cauliflowers.—Autumn-sown plants should now be pricked out into cold frames on beds which will support the plants within a distance of about 12 inches from the glass. If the soil is very rich, the plants will make more growth than is desirable during the winter. Put the plants at distances of 3 inches to 4 inches apart all ways, and make each plant very firm at the root. Examine Cauliflowers which are now becoming fit for use, and keep them thoroughly protected in case of frosts by bending some of the leaves over the flower. Directly the heads are of a satisfactory size, lift the plants and place them thickly together in an open shed. In such conditions they will remain good for many days.

Carrots.—This crop is now ready for its final blanching. Place brown paper around the plants first and hay bands afterwards. Earth up plenty of fine soil on either side of the plants and make it firm about them.

Celeries.—Let this crop be lifted and stored in sand or ashes, cutting off the top growths and roots.

Chicory.—This is a most useful and convenient plant for furnishing salads in autumn and winter. Lift a few roots as required, cut back the foliage close to the crown, and place the roots in the darker end of the Mushroom-house or cellar.

Beetroot.—This crop should be lifted and stored, for winter use, either in the root room or under the shade of a north wall.

FRUITS UNDER GLASS.

By E. HARRIS, Fruit Foreman, Royal Gardens, Frogmore.

Pot vines.—In order to have ripe Grapes at the end of April or early in May, the vines must be prepared for starting early in November. Assuming that these are thoroughly matured, they may be shortened to the desired length, and afterwards scrubbed with a solution of soft soap and sulphur. Let them be placed in an exposed position until it is necessary to remove them to the forcing house. More than ordinary care will be needed in selecting the vines for early forcing this unfavourable season, for, unless the growths are thoroughly matured, the best results cannot be expected. First-class vines are those which have made short-jointed growth of medium strength. Before placing the vines into the forcing house, remove a portion of the surface soil by means of a pointed stick, and afterwards apply a top-dressing, consisting of rich loam and a liberal quantity of fresh bones and wood-ashes. This top-dressing should be made firm by means of a wooden rammer.

Early vines in borders.—If these vines are to be started at the beginning of November, the wood should now be sufficiently matured to admit of the pruning being carried out. It is not good practice to prune severely old vines which have been subjected to early forcing for a number of years. In such cases as this, the cultivator should make sure of at least two or three good prominent buds on a spur. Such long spurs should be tied closely in to the old rods, or they will look unsightly. In cases where there is room to lay in a little young wood, this should be done, for thereby a better and more even crop will be obtained. After the pruning is finished, the cleansing of the rods and the house must be given attention. Where mealy bug has been present, the cleansing operations must be done the more thoroughly. The glass, woodwork, and

trellis should all be well scrubbed with soft-soapy water, and afterwards the trellis should be painted with paraffin, well working the liquid into any holes there may be in the trellis. Next remove carefully all the loose bark from the vine, paying particular attention to any holes and crevices in which insects pests might secrete themselves. Spread a sheet of canvas under the vines to catch all that is scraped from them, as this refuse should be promptly removed and burned. The next operation will be to wash the vines two or three times with the Gishurst Compound, or a solution of soft soap and sulphur. Then apply a good coating of limewash to the walls. Lightly fork the surface of the borders to the depth of 2 or 3 inches, and remove all the loose soil that can be got away without injuring the roots, next applying a top-dressing consisting of fresh loam, lime rubble, wood-ashes, and crushed bones. Should the borders require water, this should be given them before the house is closed. After that time, water must not be applied until the vines have made some growth.

Strauberrics in pots.—If these plants are crowded, they should be given more room, especially those which will be required for forcing early, it being particularly necessary, in their case, that the crowns should get thoroughly mature before the plants are removed to the forcing house. Liquid manure may now be given more frequently and with increased strength, as the pots are full of roots. Remove all runners and side growths. Should the leaves be affected with mildew, they must be syringed with some weak fungicide.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Flower beds.—As soon as the summer-flowering plants have been removed from the beds, the soil should either be deeply dug or trenched. In either case a liberal application of manure is usually necessary, especially in those beds which are utilised for the stronger-growing plants. When this has been done, the beds should at once be planted with spring-flowering subjects, selecting dry weather for this operation. Some of the more popular plants for the purpose are Wallflowers, *Silene*, *Myosotis*, Canterbury Bells, Primroses, Polyanthes, and various sorts of bulbs. Hyacinths should be planted about 5 inches deep. If the bed is composed exclusively of bulbs, a mulching of short, decomposed manure or fibre should be applied; but, in the case of beds that are in close proximity to the dwelling-house, it is better to plant a few dwarf, berry-bearing shrubs, or even Wallflowers, Canterbury Bells, or *Myosotis*, in order to give to the beds a moderately-furnished appearance during winter. Crocuses need only be put 2 inches deep in the soil, and 2 or 3 inches apart from each other. Scillas and Snowdrops should be planted 4 inches deep and 3 inches apart.

Narcissi.—Large beds intended for *Narcissi* need shelter from the prevailing winds, and the soil should be well trenched. If there is a path on the sunny side, so much the better, because the flowers, being drawn slightly towards the sun, will be seen at their best. A trowel should be used in planting, in order that each bulb can be placed on a proper base. There is always the danger, if dibbles are used, of "hanging" the bulb, which means that a hollow space would be left under its base. *Narcissi* in borders should be planted in clumps, each clump consisting of one variety. They also make an excellent ground work for beds containing shrubs. Some of the erect-growing varieties may be advantageously planted amongst hardy Ferns. Notwithstanding all the new yellow varieties, it is exceedingly difficult to beat *Maximus* and *King Alfred*.

Senecio.—*Senecios* form admirable subjects for the sides of lakes or other moist positions. In August and September they are indispensable. If grown in moderately rich soil and preserved from the attacks of slugs and other insects, the foliage and flowers are equally handsome. *Senecio Veitchianus* grows 6 to 7 feet in height, *S. Wilsonianus*, 7 to 8 feet in height, is probably the best in the group. *S. Cauticus* has a peculiarly graceful appearance, owing to the form of its inflorescences; whilst *S. Clivorum*, with its immense leaves and deep, orange-coloured flowers, is as striking in moist positions of the herbaceous border as it is in the bog garden.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Appointments for October.

- SATURDAY, OCTOBER 2—
Soc. Franc. d'Hort. de Londres meet.
WEDNESDAY, OCTOBER 6—
Nat. Chrys. Soc. Conference at Essex Hall, Strand.
MONDAY, OCTOBER 11—
United Hort. Ben. & Prov. Soc. Com. meet.
TUESDAY, OCTOBER 12—
Roy. Hort. Soc. Coms. meet. Affiliated Societies Fruit Competition. Conference of Horticultural Mutual Improvement Societies at 4 p.m. (Lecture at 3 p.m. by Mr. Thomas H. Mawson, on "Some Gardens of the later Renaissance.") British Gard. Assoc. Ex. Council meet.
THURSDAY, OCTOBER 21—
Brighton and Sussex Hort. Soc. lecture.
MONDAY, OCTOBER 25—
Nat. Chrys. Soc. Executive & Floral Coms. meet at Essex Hall, Strand.
TUESDAY, OCTOBER 26—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by the Rev. Prof. G. Henslow, on "Remarkable Instances of Plant Dispersion.") Croydon Chrys. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—54.6°.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, September 29 (6 p.m.): Max. 57°; Min. 53°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden London—Thursday, September 30 (10 a.m.): Bar. 29.9; Temp. 55°; Weather—Dull.

PROVINCES.—Wednesday, September 29: Max. 60° Cornwall; Min. 51° Yorkshire.

SALES FOR THE ENSUING WEEK.

- MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.
TUESDAY—
Clearance sale of Greenhouse Plants and Greenhouses, at Oxford Nursery, Oxford Road, Gunnersbury, by Protheroe & Morris, at 12.
Unreserved sale of 12,400 Established Orchids at the Nurseries, Plumpton, Sussex, by order of Mr. F. J. McBean, by Protheroe & Morris, at 12.30.
WEDNESDAY AND THURSDAY—
Clearance sale of Nursery Stock at Tunbridge Wells Nurseries, Tunbridge Wells, by Protheroe & Morris, at 11.30.
FRIDAY—
Unreserved sale of a portion of the Under Fell collection of Cyrtopodiums, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 1.

Sand-Binding Grasses.

The recent Report on afforestation and coast erosion, dealt with considerable fullness on the former subject, but reserved a detailed consideration of the latter.

If, however, the proposal to establish a development fund for the amelioration of the resources of this country is adopted—and all who care for the progress of our country hope that it will be—then among the more modest schemes which might be undertaken without delay is one to tie down the sand of the sea-shore by means of sand-binding Grasses. For it is well known that, in certain districts, the constant blowing inland of the sand is at once a source of danger to the permanence of the coast-line and a menace to agriculture. More than 70 years ago Sowerby, in his *Grasses of Great Britain*, drew attention to the havoc wrought in certain localities by the wind-borne sand and to the power, long recognised, of sea Grasses, and in particular of the Marram Grass (*Psamma arenaria*) to give stability to dunes and banks of sand. Speaking of Marram Grass, he observed: "Its economical

value is of no trifling amount, as thousands of acres of fertile land, adjoining the low, sandy parts of our coasts, must within a few years be reduced to almost hopeless sterility were it to be removed. To form an adequate idea of the distressing effects produced upon cultivation by the drifting of sea-sand, we must visit districts liable to its inroads and notice, during the prevalence of high winds, the manner in which it is borne by their resistless force inland."

In Elizabethan times the service rendered by Marram Grass in maintaining the coast-line on sandy shores was so fully recognised that an Act was passed prohibiting persons from destroying it. By reason of its fibrous texture and because also of the large amount of silica it contains Marram was in much demand for the making of mats and ropes. Hence the need for the Elizabethan Act, which was renewed in the reign of George II. That the damage done when once the shore-sand begins to shift is enormous we may learn from the old records. Thus, in the past century the sand-floor advanced into the interior, swallowing up a strip of fertile land five miles in width. In the course of a few years, a district of more than 10 square miles on the west coast of Scotland, called by reason of its fertility the granary of Forres, was completely inundated by blown sand. Manor house, orchards, all were buried. It is known that in this case the calamity was caused by some persons thoughtlessly pulling up the tract of Marram Grass which bound the surface of the sand-hills in the neighbourhood. Marram Grass owes its sand-fixing properties to its powers of living on poor, sandy soil, of resisting drought, and of refusing to be buried, no matter how deep the sand piles itself about the plant. Like so many Grasses—Couch, for instance—it roots readily at the nodes, and so, when cut to pieces, each bit forms a mature cutting, which strikes root at once. In use as a sand-binder it is planted generally in late autumn in rows from 1 to 3 feet apart at right-angles to the direction of the prevailing winds. Wherever it takes hold it offers resistance to the movements of the sand, and soon sand-hills are formed. Thus, in a leaflet for farmers, issued by the New Zealand Department of Agriculture on the subject of sand-binding Grasses, records are given of its speedy effect: "At New Brighton Marram Grass was planted on the shore in 1899. There are now large sand-hills, and the further drift of the sand, which previously, was very dangerous, has been completely checked."

In New Zealand other plants are also used for the same purpose; for example, Sea Lyme Grass (*Elymus arenarius*), which resembles a gigantic Wheat, and a native Grass (*Spinifex hirsutus*) and Sedge (*Scirpus frondosus*). But of all the plants that serve the purpose of forming sand-banks and thus at once preventing the drift of sand over fertile land and of resisting encroachments by the sea, Marram Grass is best, for the reason that, when it has bound the sand into a stable state, it gives place to other forms of vegetation. These serve, by their decay, to enrich the ground with humus and so help to gradually build up a fertile soil. A piece of work which might well be undertaken by the aid of the Development Grant would be a survey of sandy coast-lines and extensive Marram plant-

ing. Such reclaimed land might serve in turn for the planting of coniferous trees, as it serves in France and Germany.

OUR SUPPLEMENTARY ILLUSTRATION represents a flowering branch of *Lycium pallidum*, a hardy, ornamental shrub. The genus *Lycium* contains upwards of 70 species, but few are of horticultural value. They are natives of dry, sub-tropical parts, including the Mediterranean region, South Africa, Southern China, Western South America, and the Southern United States. *Lycium pallidum* is the most ornamental of the cultivated species. It has been known to botanists since 1844, in which year it was discovered by FREMONT on one of the tributaries of the Colorado River in New Mexico. Its habitat extends into Utah and Arizona. The plant was introduced into this country through the agency of the Arnold Arboretum in 1838. It has proved a very attractive shrub, and is especially useful for planting on a dry, sunny bank, bed, or border, being perfectly hardy. Cultivated specimens at Kew form spreading bushes from 3 feet to 4 feet high, with numerous short, thorny branches. The flowers are produced in clusters, in the month of June they are an inch long and of a pale greyish-green colour. The glaucous-green leaves are 1 inch to 2 inches long, elliptic, or elliptic-spathulate in shape. The bright red berries set freely in this country.

ROYAL APPOINTMENT.—MESSRS. CLIBRANS, Nurserymen, Altrincham, Cheshire, have recently been granted a Royal Warrant appointing the firm Nurserymen to his Majesty the King.

THE LATE PETER BARR.—At the meeting, on Tuesday last, of the Floral Committee of the Royal Horticultural Society, the chairman, Mr. W. MARSHALL, proposed a vote of condolence with the family of the late Mr. BARR, who was formerly a regular attendant at the meetings of this Committee. The resolution was adopted. In another column of this issue, Mr. JNO. WRIGHT makes a suggestion for raising a memorial to Mr. BARR, which will also have the effect of strengthening the Orphan Fund. The proposal deserves general acceptance.

"THE BOTANICAL MAGAZINE."—The issue of this journal for October contains figures and descriptions of the following plants:—

CEREUS AMECAMENSIS, tab. 8277.—Mr. N. E. BROWN describes this Mexican species as being closely allied to the brilliantly-coloured *Cereus speciosissimus*. The stems of the two plants are similar in appearance, but those of *C. speciosissimus* are mostly 3-4-angled, whereas in *C. amecamensis*, whilst the more erect stems are 3-4-angled, those which grow more or less horizontally are often, at least in part, 5-angled, and the growing shoots do not show the dull purplish tinge at the tips which characterise those of *C. speciosissimus*. Another great difference is in the flowers, these being pure white; they are produced in May or June. The cultivation recommended for this species is similar to that generally afforded *Phyllocacti*, namely, an abundance of heat and moisture, with ample sunshine in summer, and dryness near the root in winter. The figure printed in the *Botanical Magazine* has been made from a plant presented to Kew in 1900 by Mr. H. J. ELWES.

CISSUS ADENOPODUS, tab. 8278.—This species was introduced to Kew by Mr. M. T. DAWE, who sent it from the Mufukamata Forest, Uganda, in 1905. Mr. SPRAGUE describes it as being nearest to *Cissus Buchanania*, which differs in having five leaflets in place of three, and a very glandular inflorescence. The average length of the petioles is 1¼ to 2½ inches, and the leaflets, which are deciduous, 2 to 4 inches long, and 1¼ to

2½ inches wide. The upper surface is green and the under side a brilliant red, with prominent nerves. The flowers are produced in autumn, and the fruits ripen in the following spring. Attention is drawn to what are described as "pearl-glands" on the inflorescence, young leaves, and stipules. They are supposed in certain cases to serve as "food bodies" for ants. Like *Cissus discolor*, *C. adenopodus* is an ornamental plant in the tropical house, its long trailing stems clothed with red leaves, being very attractive in summer.

LAURELIA SERRATA, tab. 8279.—This delightful and fragrant evergreen was the subject of a detailed illustration in the *Gardeners' Chronicle*, December 10, 1904, p. 401, under the name of *L. aromatica*.

RHODODENDRON COOMBENSE, tab. 8280.—The figure has been prepared from specimens sent to Kew in 1907 by Messrs. J. VEITCH & SONS, who have raised a large number of forms from seed collected by Mr. E. H. WILSON, in China. Mr. BOTTING HEMSLEY explains that in proposing a distinctive name for this plant, he does so with the object of avoiding possible confusion, rather than for the purpose of expressing a conviction that *R. coombense* deserves to rank as a species. The group of *Rhododendrons* to which *R. concinnum* and *R. coombense* belong, includes a considerable number of very closely allied plants. A comprehensive study of the whole material, including the introductions by WILSON and the seedling forms raised at Coombe Wood, is necessary in order to lead to a better knowledge of the extent to which seminal variation occurs. *R. coombense* is a dwarf and densely branching shrub, with sparsely set leaves 1¼ to 1½ inch long. The flowers are borne in trusses of three to five blooms at the tips of the branches and are 1½ to 1½ inch long, being coloured rosy-pink with a tinting of yellow on the outside of the petals.

BULBOPHYLLUM (CIRRHOPE TALUM) CAMPANULATUM, tab. 8281.—Mr. R. A. ROLFE has referred this plant and the whole of the section *Cirrhoptalum* to which it belongs, to the genus *Bulbophyllum*. At the same time it is suggested that the recognition of the section *Cirrhoptalum* as a floristic group apart from *Bulbophyllum* has certain practical advantages that appeal to cultivators. Therefore it is likely that this plant will generally be known as *Cirrhoptalum*. The species is a native of Sumatra, and was introduced to the Brussels Botanic Gardens. A plant was presented to Kew in 1903 and flowered in October of the same year. The specific name has reference to the shape assumed by the inflorescence in consequence of the strong decurvature of the lateral sepals of the individual flowers. The flowers are a very light purple colour.

CHRYSANTHEMUM CONFERENCE.—We are furnished with further particulars of the programme to be observed at the National Chrysanthemum Society's Conference, at the Essex Hall, Strand, on October 6. The conference will be divided into two sessions, afternoon and evening. The president, Sir ALBERT ROLLIT, LL.D., D.C.L., will preside at the afternoon meeting, when the following papers will be given: "Chrysanthemums as Annuals" and "Early Single Chrysanthemums," by Mr. W. WELLS. From 5 p.m. to 6 p.m. there will be an interval for tea, after which the evening meeting will commence under the chairmanship of Mr. THOMAS BEVAN (chairman of the Executive Committee). A paper on "Late Market Chrysanthemums," and two short papers will be read on "The Best Chrysanthemums for 'Cut Flowers'"—(a) from a commercial point of view, by Mr. P. A. CRAGO, (b) from an aesthetic point of view, by Mr. D. B. CRANE. The proceedings of the conference

will be concluded about 8 p.m., so that there will be an opportunity for members who may arrive late to inspect the exhibits until 9 p.m. Prizes are offered by Messrs. W. WELLS & Co. for six vases of early single Chrysanthemums staged at the meeting.

FRENCH HONOUR FOR A BRITISH AGRICULTURIST.—Sir THOMAS ELLIOTT, Secretary to the Board of Agriculture and Fisheries, has been nominated by the French Government to be a Commander of the Order "du Mérite Agricole."

ANGLO-JAPANESE EXHIBITION, 1910.—At the Anglo-Japanese Exhibition, to be held at the White City next year, the Japanese gardens will be laid out by skilled gardeners from Japan. These gardens will be good object-lessons to those who contemplate the formation of Japanese gardens in this country.

*** UTILISATION OF VEGETABLES BY MAN.**—A general survey of the history of the utilisation of vegetables by man and the part that plants in general play in human life has been issued under the joint authorship of M. D. BOIS and M. G. GADECEAU. The chapters are written from a historical as well as a scientific point of view, and are most comprehensive in their scope. The work contains 370 pages divided into 10 chapters. Starting with the origin of life on the globe and the relations of the several kingdoms, the authors proceed to discuss such subjects as the first utilisation of plants by primitive man, the influence of man on vegetation, plants for food, economic plants, forage plants, industrial plants, medical and poisonous plants, and, finally, ornamental plants. In each of these divisions the authors have sub-headings, in which the various questions are exhaustively treated, and following each chapter are explanatory notes or references to authors quoted. The historical matter recorded helps us to follow the gradual progress made by the various races of mankind in cultivating and using vegetables.

AGRICULTURAL EDUCATION.

A PARLIAMENTARY paper (Cd. 4886) has just been issued jointly by the Board of Agriculture and Fisheries and the Board of Education concerning agricultural education. The paper is signed by Lord Carrington and Mr. Runciman.

We extract the following clauses which specially relate to the distribution of grants by either and both departments:—

"2. In order to avoid overlapping or duplication of work in the sphere of Agricultural Education between the Board of Agriculture and the Board of Education, and at the same time to secure that every portion of the field is as largely aided and developed as possible, by the combined and separate efforts of the two Boards, it has been arranged that in future all Parliamentary grants in respect of Agricultural Education shall be distributed, in the case of institutions giving instruction to students taking advanced courses in Agriculture or in some special branch thereof as further defined below, by the Board of Agriculture, and as regards other forms of Agricultural Education by the Board of Education. But this distribution will be carried out by both Boards under conditions which will secure that the various sections of work thus aided are in due relation to one another. And, in order to facilitate this, an Inter-Departmental Committee consisting of responsible Officers of the two Boards will be constituted, to consider and report to the Boards on all questions which may arise either as to the correlation of the duties of the two Boards or as to the grants to be made in cases in which they are mutually interested. This Committee will meet from time to time as may be required. Officers of either Board, other than those appointed as members of the Committee, may assist the Committee from time to

time as the Committee or either Board may think desirable.

"3. The sphere of work thus falling to the Board of Agriculture and Fisheries will comprise institutions of two types:—

"(a) Those whose predominant purpose and work it is to provide comprehensive courses of Agricultural Instruction of an advanced nature, of which the proper benefits can only be received by students who, on admission, have received a satisfactory general education, whole-time, up to the age of 17 (or thereabouts), or later, or who have otherwise obtained a preliminary education of a similar standard. Each such institution should serve more, usually considerably more, than one Local Education Authority's area.

"(b) Institutions restricted to one special section of Agricultural Instruction (e.g., Forestry, Dairying, Cider-making), the main purpose of which is to provide a course of specialised teaching in that subject on such a plane as will equip those who pass satisfactorily through it to be competent Instructors in that section of Agricultural work in Agricultural Institutions or as local Instructors in all parts of the country.

GRANTS TO EXISTING INSTITUTIONS.

"Government Grants will thus be paid by the Board of Agriculture and Fisheries in respect of their agricultural work to the following institutions, and to such others as may in future be found to be of a similar character or on the same educational plane:—

University College of North Wales, Bangor; University of Leeds; Armstrong College, Newcastle-on-Tyne; University College of Wales, Aberystwyth; University of Cambridge; University College, Reading; Royal Agricultural College, Cirencester; South-Eastern Agricultural College, Wye; Midland Agricultural and Dairy College; Harper Adams Agricultural College; College of Agriculture and Horticulture, Holmes Chapel; Harris Institute, Preston; Royal Veterinary College; British Dairy Institute, Reading; Royal Horticultural Society's Garden School, Wisley; Horticultural College, Swanley; National Fruit and Cider Institute.

"4. While the special functions of the Board of Agriculture will, as above shown, be to deal with and to influence the Agricultural Colleges and other independent institutions named in the foregoing list, the relations of the Board of Education will, in the main, be with the County and other Local Authorities and such other Bodies as are supplying part of the local system of provision of Public, including Agricultural, Instruction. And it will be the business of the Inspectors of the Board of Education to represent to the County and other Local Authorities the need for continuous development of special provision for Agricultural Education, and to draw attention to the various types and grades of work thus required, particularly as regards the need for a largely increased provision of Farm Schools. The Inter-Departmental Committee with the views of the Rural Education Conference before them will give to the Board of Education all the advice and information they can as to types of School, methods of instruction, and lines of organisation of instructional staff, most needing to be encouraged in particular parts of the country.

"5. There is, at the same time, an important matter in connection with some of the cases comprised in the foregoing paragraph for which some special arrangement seems desirable, viz., the provision and efficient maintenance of Farms and Experimental Stations in connection with Farm Schools and such other similar places of Agricultural Instruction as fall within Section 4 above. These Farms and Stations are greatly needed if the educational work of institutions of this type is to be carried on with full efficiency; and, as it is in the highest degree desirable that such forms of practical work should be kept in close touch with the latest and best developments in practical agriculture, it is believed that such Government supervision and aid as is made to them should be from the Board of Agriculture. It has, therefore, been arranged that such Parliamentary Grants as may be, or be made, available for the establishment and maintenance of the Farms and Stations, and of any experiment:

* *Les Végétaux, leur rôle dans la Vie quotidienne*, by D. Bois and G. Gadeceau. (Héro Roger & Co., 54, Rue Jac 6, Paris.)

or investigations carried on in connection therewith, shall be distributed by the Board of Agriculture; the Grant in respect of the Educational work of the Farm Schools being made by the Board of Education, and all necessary arrangements for maintaining due relation between the two functions of the Schools and Stations, and for making the corresponding grants, being determined by the two Boards on the report of the Inter-Departmental Committee above described."

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE FOUNDER OF THE ROYAL BOTANIC SOCIETY.—The affairs of the Royal Botanic Society being prominently before the public at the present time, the following remarks may be of interest to some of your readers. While recently walking in the churchyard of Hazlemere, near High Wycombe, Bucks, I came across a gravestone with the following inscription: "In memory of Philip Barnes, F.L.S., formerly of Norwich; Founder of the Royal Botanic Society of London. Died Feb. 24, 1874; aged 82 years." Inside is a small stained-glass window. In memory of Philip Barnes, Founder of the Royal Botanic Society, 1839," also the words "Consider the Lilies." Making enquiries, I found the stone does not mark the actual grave, that being under a large Beech tree, beneath which it was his wish to be buried. A small stone slab, level with the turf, with the letters "P. B.," marks the actual spot; the larger stone was moved from under the tree because the vicar thought the continual drip would spoil it. C. E. L.

THE LATE MR. PETER BARR.—Having known the late Mr. Barr intimately for 40 years, may I suggest that his memory should be fittingly perpetuated? If this could be done in a way that would secure permanent good, without calling for appreciable sacrifice on the part of those contributing towards it, surely it would be worth the doing! I am led to make a definite proposition all the more worthy of consideration remembering Mr. Barr's own efforts on behalf of an object which we all know to be a good one. Mr. Barr's name stands first on the list of the first committee of the "Royal Gardeners' Orphan Fund," which he assisted in establishing, and only those who acted with him, including the present writer (in 1887), can know how zealously our deceased friend worked for the accomplishment of that object. Would it not, therefore, be especially appropriate if, by a large number of small gifts, an adequate sum were secured to endow a memorial in perpetuity in connection with that beneficent charity, and thus commemorate—in a way we know he would rejoice in—the honoured name of "Peter Barr"? J. Wright, F.M.H.

WOOLLY APHIS.—I think probably most fruit-growers and nurserymen will agree that this is one of the most troublesome pests which they have to contend against, and a good number of gardeners and amateurs will be interested in anything relating to it. Something has been done in the way of combating the plague in the Antipodes and also in America, by working Apples upon stocks such as Northern Spy and Winter Magetin, which, it is said, are proof against the American blight, and I thought years ago of trying the effect of these stocks in this country; but when I saw at Chiswick the old tree of Northern Spy covered with woolly aphid, I concluded that it would be waste of time and money to import stocks of this variety. Of course, we know that this aphid prefers certain varieties of Apples to others; whilst Cox's Orange Pippin, Blenheim Pippin, and others may be completely covered, one rarely, if ever, finds a trace of the pest on Duchess of Oldenburgh, although growing alongside. Still, I think this is only a question of preference, and I do not believe we should be free from the pest if we grew no other variety than Duchess of Oldenburgh, that is, upon land previously infested by the blight. I have occasionally seen it upon trees of this variety, and if there were no other hosts, I think it would increase upon this. It would be vain to tell of all the remedies which

have been tried in order to get rid of *Schizoneura lanigera*. I have tested most of them. Paraffin is useful, but very dangerous, and, I believe, it always injures the trees to a greater or less extent. Methylated spirit, in the hands of a *preserving* amateur, is a certain cure; but if his neighbour re-stocks his trees, it is a heart-breaking job to recommence the cleansing process, and, of course, it is out of the question to treat large standards with a camel's hair brush and a drop of spirit. Whale oil is useful, but, alas! it is neither pleasant to use nor agreeable to look upon; and so we go on through the list. I would not have written thus far if I had only failures to chronicle; but I think I may say that at last I have met with success. I tried some nicotine for Apple sucker (*Psylla mali*), and noticed that some patches of American blight on the stems of some standard Apple trees turned a yellowish colour, lost all their fluffly appearance, and decayed away. So I bought a lot more nicotine, and sprayed some bush trees, but failed to see the least result, although used in exactly the same way. A second spraying did a little good, but was by no means satisfactory, so we tried the mixture stronger, with the most happy result, for now it kills every bit of American blight. The remedy is prepared by Messrs. Walter Voss & Co., Millwall, London, E., and is called "Woburn Tobacco Extract." I use a pint of this to 12 gallons of water, and I dissolve 3 lb. of best soft soap, and mix it in a paraffin cask full of water. The cask holds about 36 gallons, and thus 5 lb. of soap and 3 pints of nicotine are required; I find the soap helps to keep the nicotine on the trees. I suppose it is a confession of weakness to admit that I could find American blight in our nursery to experiment upon; but I feel sure that such will not be the case next season. When I wrote in these columns some five years ago (see *Gardeners' Chronicle*, May 21, 1904, p. 298), telling how Black Currant mite could be destroyed, most people thought the remedy was too cheap and simple, and others gave us credit for having a stock of mite on hand, and so would not buy trees; but things come round in time, and, although one still sees and hears that no remedy is known for the Currant mite, many growers have thanked me for clearing their plantations. The present remedy may take on better, for it certainly does not err on the side of cheapness. As we all know, American blight hibernates on the roots of the trees, so it must not be neglected during the winter. One of the winter washes will be useful to cleanse the branches and stems of the trees. I have used Cooper's V.I. Fluid with good effect. February is the best time to apply this, and a good dressing of soot upon the surface of the soil is most beneficial. A dusting of sulphate of ammonia will also destroy the underground aphid, and if gas water can be got, such as the gas men pump out of the mains, it is fatal to American blight when watered into the soil. I have no interest in any of the things named in this paper, but simply speak of them as I have found them for the common good of all interested in fruit or fruit-tree culture. A. H. Pearson, Lordham.

COSMOS. The annual *Cosmos* has hitherto been looked upon as purely an autumn flower in this country, but recently a new race of early-flowering varieties has appeared. It has been sold under several names, such as *Cosmos precocx*, *Cosmos Express*, *Cosmos New Early-flowering*, and in America as *Cosmos Julia E. Lee*. No matter under what name, if one gets the new early-flowering strain, one obtains something very different from the old one. This new strain can be relied on to begin blooming in July (it did so even in this late season), and if no severe frost occurs, it will continue in bloom until October or even November. To obtain early flowers the seed must be sown as other half-hardy annuals; that is, it ought to be sown in February in gentle heat. The seedlings should be transplanted into boxes, or potted up singly when large enough, or they may be planted out under glass towards the end of May or early in June. This *Cosmos* can be planted 2 feet to 3 feet apart, as it makes great growth and forms fine bushy plants 3 or more feet high and 2 feet to 3 feet in diameter. The flowers vary from 2 inches to 4 inches in diameter, and they are gracefully and beautifully formed. The colours are white, rose and crimson, and they come re-

markably true. The foliage is similar to the old bipinnatus, reminding one at a little distance of *Asparagus Sprengeri*. Both foliage and flowers last remarkably well when cut. I have had them for several days on my table, and they make a welcome change from the usual summer flowers. C.

BUPHTHALMUM SALICIFOLIUM.—One of the most useful of the summer-flowering perennial herbaceous plants is *Buphtalmum salicifolium*. Not at all fastidious as to soil or situation, it makes a brave show all through the summer months when covered with its bright yellow, daisy-like flowers. If planted in bold masses, it produces a striking effect. The plants grow about 2 feet high, and produce their flowers on stems 9 inches long. The flowers last well in a cut state in water. The plant is readily increased by division in early spring. W. H. Yates.

SCYPHANTHUS ELEGANS.—This pretty, yellow-flowered trailer is known in its native country (which I believe is Mexico) as the golden cup flower, as implied in the first portion of its name, which is the Greek for a cup. It is figured on plate 238 of volume iii. of *Sweet's British Flower Garden*, and on plate 5028 of the 34th volume of the *Botanical Magazine* under its synonym of *Grammatocarpus volubilis*. I received seeds of it this spring from California, and having some two dozen plants more than I require for my own use I shall be glad to send them to readers of the *Gardeners' Chronicle* who have a greenhouse and would like to have one specimen. Each correspondent will kindly send me a strong, small cardboard box and three or four stamps to pay its postage by parcel post. W. E. Gumbleton, Belgrove, Queenstown, Ireland.

HYDRANGEAS IN TUBS (see p. 220).—We have six plants growing in tubs, which measure 3 feet in width and 20 inches in depth. The average height of the plants is 8 feet and the width 10 feet. They are carrying about 350 well-developed trusses of bloom. During the summer months they are used on the terraces here, and placed in a cool greenhouse during the winter. *Matthew Nicholls, St. Clare Gardens, Kemsing, Sevenoaks.*

OSMANTHUS (OLEA) FRAGRANS.—I received recently from a friend in England a flowering specimen of a charming shrub under the name of *Olea fragrans*. He had received it from the nursery of Messrs. Rovelli, at Pallanza, on the Lago Maggiore. It had small bright orange-coloured flowers, extending for about an inch down the stem under the bunch of leaves which terminated the shoot. On looking up *Olea fragrans*, now referred to *Osmanthus*, in the *Botanical Magazine*, I found it figured on plate 1552 of the 38th volume, but it did not quite agree with the specimen sent me. I shall be glad if any reader of the *Gardeners' Chronicle* can tell me whether the orange flowered plant is correctly named or not. W. E. Gumbleton, Belgrove, Queenstown, Ireland. [We have received specimens of the same plant from Mr. Bennett-Poe, who also obtained it from Messrs. Rovelli Brothers. It is undoubtedly *Osmanthus fragrans*, which is very variable, especially in leaf characters. Dr. Henry collected yellow, as well as white-flowered forms of it in China, where it is cultivated for its highly fragrant flowers used for scenting tea. The figure in the *Botanical Magazine* gives a poor idea of the plant. *Osmanthus* is closely related to *Ligustrum*, *Syringa*, and *Jasminum*, and the colour of the flowers is rather Jasmine-like. *O. aquifolium*, also a native of China and Japan, is almost as variable in foliage as the Holly.—Eos.]

ROMNEYA COULTERI.—A plant of *Romneya Coulteri* in the gardens of E. Byron, Esq., Culver, near Exeter, has spread beneath an asphalt path, and the shoots have forced up the surface. The path was made with 3 inches of concrete and superficially with 4 inches of asphalt. The off-set growing through the path has formed a strong bush and bore many flower-buds. The parent plant, which was planted by the gardener, Mr. G. Camp, about five years ago, is now 8 feet high and 12 feet through. A. H.

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 28.—The usual fortnightly meeting was held on this date in the Society's Hall, Westminster. There was a remarkably fine display of flowers, fruits and vegetables, the annexes as well as the large hall being filled with exhibits. Although the weather was very unfavourable—rain fell unceasingly during the day—the attendance was good. Dahlias, Michaelmas Daisies, Border Chrysanthemums, Gladioli, and Roses were very numerous. A representative collection of ornamental vines, including many new species, shown by Messrs. JAS. VEITCH & SONS, LTD., was awarded a Gold Medal.

Exhibits of vegetables and fruits were as numerous as at the last meeting, there being two important groups of fruit trees in pots in addition to large exhibits of gathered fruits, and several collections of finely-grown vegetables. Exhibits of Orchids were not so numerous as on some occasions, although there was plenty of interest in this section, including several novelties. The FLORAL COMMITTEE granted eight Awards of Merit, four being given to new Dahlias. The ORCHID COMMITTEE conferred one First-class Certificate, three Awards of Merit, and one Botanical Certificate.

The FRUIT AND VEGETABLE COMMITTEE recommended a First-class Certificate to an Apple and Awards of Merit to a perpetual-fruiting Strawberry and a variety of climbing Bean.

At the 3 o'clock meeting in the lecture room, the second of the Masters's Memorial Lectures was delivered by Prof. Hugo de Vries before a large audience. A report of the lecture is given on p. 238.

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. W. Bain, W. J. James, W. P. Thomson, J. T. Bennett-Poe, Chas. E. Pearson, H. B. May, Chas. T. Drury, Jas. Walker, John Green, Wm. Cuthbertson, G. Renthe, J. F. McLeod, R. Hooper Pearson, F. Page Roberts, R. C. Reginald Nevill, W. A. Binney, E. A. Bowles, Jas. Hudson, A. Kingsmill, J. W. Barr, Geo. Paul, Chas. Dixon, H. J. Jones, W. T. Ware, W. J. Bean, W. Howe, E. H. Jenkins, E. T. Cook, C. Blick, Arthur Turner, and R. W. Wallace.

Messrs. JAS. VEITCH & SONS, LTD., King's Road, Chelsea, showed more than 50 varieties and species of *Vitis*, which now includes those plants more commonly known in gardens as *Ampelopsis*. The specimens were shown as pot plants trained to tall poles, several being 14 feet in height. Many were new introductions from China. The autumn tinting of the leaves was very beautiful in such species as *Vitis Coignetiae*, *V. armata*, *V. Thomsonii*, *V. Thunbergii* and *V. Henryana*. Some had leaves of very large size, others much smaller foliage. In some, such as *V. armata* and *V. repens*, the leaves were simple, almost cordate, whilst others bore compound leaves, which were sometimes, as in *V. orientalis*, bipinnate. Especially interesting were *V. aconitifolia*, *V. odoratissima*, *V. heterophylla* and *V. leodei*. In addition to the vines, Messrs. VEITCH showed sprays of brightly-berried trees and shrubs, including *Viburnum rhytidophyllum*, with red and black fruits in corymbs; *Crataegus Crus-galli*, *Hippophaë rhamnoides*, *Rosa Mayesii*, with red, urceolate hips, and *Cotoneaster rugosa Henryii*, with bright green, lanceolate leaves and clusters of scarlet berries. The same firm staged a large-flowered *Tritonia* labelled Lord Roberts. (Gold Medal.)

Mr. L. R. RUSSELL, Richmond, Surrey, showed, as a corner exhibit, a group of large-flowered Clematis, set off by coloured *Vitis* and Bamboos at the back, with a front row of the variegated *Veronica Andersonii*. Amongst the more noticeable of the Clematis were *Mme. Ed. André* (claret-coloured), *Nelly Moser* (having a broad pink line on a pale blue ground), *Beauty of Worcester* (light blue), *Ville de Lyon*, and *Clematis integrifolia Durandii* (a very free-blooming variety with flowers a metallic blue shade). As a separate exhibit, Mr. RUSSELL showed 16 varieties of hardy Heaths, including *Erica vagans rubra*, *E. vulgaris Searlei*, *E. v. alba pumila*, *E. vagans carnea alba*, *Meuziesia pedifolia atro-purpurea*, and *M. p. alba*. (Silver Banksian Medal.)

Messrs. PAUL & SON, Cheshunt, showed, as at the last meeting, a large collection of ornamental

trees and shrubs as sprays, with several in flower and fruit. *Rubus laciniatus* had large bunches of Blackberries, the fruits being very fine for tarts, and much superior to ordinary bramble berries. The fruits of *Berberis Thunbergii* are coral-red berries that at once attract the eye with their pretty colouring. (Silver-gilt Flora Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, showed *Veronicas* of the *Andersonii* section, in batches of various coloured varieties. Two of the best were *Eveline*, with salmony-pink flowers, and *Valiere*, a large-flowered blue variety. Adjoining the *Veronicas* were plants of *Bouvardia grandiflora* and *Salvia splendens*, the white and scarlet flowers intermixed forming a charming combination. Messrs. MAY also exhibited a collection of *Polypodiums*, all varieties of *P. vulgare*. There were two dozen distinct kinds, and it was hard to believe they had all originated from one species. A selection of the more handsome includes *P. v. trichomanoides*, with finely-cut leaves; *P. v. cambricum Prestonii*, *P. v. grandiceps Foxe*, *P. v. cambricum*

Messrs. GARAWAY & Co., Bristol, showed a new Tea Rose labelled *Teresa Bevan*. The shade is a coppery-rose.

Other exhibitors of Roses were Mr. W. LEGGETT, Colchester; Messrs. MCGREY & SON, Portadown, Ireland, who had seedling and new varieties (Silver Flora Medal), and Rev. W. CHALMERS-HUNT, William Rectory, Hitchin.

Messrs. DOBBIE & Co., Rothesay and Marks Tey, showed Sweet Peas and early-blooming Chrysanthemums. These latter were very fine, and included *Caledonia* (white), *Carrie* (yellow), *Ethel* (lemon-yellow), *White Massee* (really a lemon shade), *Holme's White*, *Mrs. J. R. Pitcher* (blush), *Harrie* (bronze), and *Agnes* (bronze), all excellent varieties. (Silver Flora Medal.)

Messrs. W. WELLS & Co., Merstham, Surrey, showed early-flowering Chrysanthemums, of which we noticed *Leslie* (yellow), *Roi des Blanc* (white), *Perle Chatillonnaise* (buff with palest rose), *Tapis de Niede* (white), and *J. Bannister* (a bronze sport from *Perle Chatillonnaise*). The same firm showed border Phloxes and Pentstemon. *Iris* is a fine bluish-mauve-coloured

[Photograph by Elliott & Fry.]

PROFESSOR HUGO DE VRIES, OF AMSTERDAM, WHO DELIVERED THE SECOND "MASTERS" LECTURE ON TUESDAY LAST.

Barrowii, with large fronds, each beautifully lacinated, and *P. v. elegantissimum*. (Silver Flora Medal.)

A charming exhibit of Roses was shown by Messrs. WM. PAUL & SONS, Waltham Cross, Herts. There were boxes, baskets, and epergnes filled with bright blooms, small Palms, Ferns, and other foliage being intermingled amongst them. The Roses were in great variety, prominent kinds being *Pharisæer*, *Liberty*, *Betty* (yellow, with a suffusion of palest rose), *Mme. Jules Greolez* (rose), *Joseph Hill*, *Warrior*, *Ecarlate* (red blooms, in sprays), *La France*, and *Mme. Abel Chatenay*. (Silver-gilt Flora Medal.)

Messrs. FRANK CANT & Co., Colchester, exhibited Roses in great assortment. In the centre of the display was a bank of *Frau Karl Druschki*, and a red variety intermingled. There were also fine vases of *Mme. A. Chatenay*, *Lady Bat tersea*, *Papa Gontier*, *Lyon Rose*, *Duke of Teck* (red), *La Tosca* (blush pink), and other well-known kinds. (Silver-gilt Flora Medal.)

Messrs. B. R. CANT & SONS, Colchester, showed Roses, amongst which the new variety, *Claudius*, was prominent; also *Lady Beay* (a new H.T. variety, with pink flowers, recommended as a bedder), *Killarney* and *White Killarney* were both well shown. (Silver Banksian Medal.)

Phlox, *Sheriff Ivory* and *G. A. Strohleim* (red) are also fine varieties of the perennial *Phlox*. (Silver Banksian Medal.)

Messrs. J. BURRELL & Co., Cambridge, showed a large number of seedling Gladioli, Cactus Dahlias and Roses. The Dahlias were all seedlings. *Rosalind* (pale pink with a white centre), *Rival* (yellow), *Leda* (pink), *Janet* (bronze), and *Oswald* (scarlet) are all worthy of notice. The Roses included pretty bunches of garden varieties. (Silver-gilt Banksian Medal.)

Mr. W. TRESEDER, Cardiff, also showed Roses and Dahlias. Two bouquets of Dahlias showed the suitability of the flower for this method of floral decoration. There were many fine show Dahlias, *W. Powell* (yellow) being exceptionally good. The Cactus and Pompon varieties included the leading kinds. (Silver-gilt Banksian Medal.)

Mr. JAS. STREDWICK & SON, St. Leonards, exhibited a stand of Dahlias of Cactus varieties of their raising, most of which have been described in these columns. (Bronze Flora Medal.)

Mr. CHAS. TURNER, Slough, showed Dahlias in variety, including many of the show and Pompon-flowered types. *Eccentric* is of this large-flowered kind, being red with white tips. Mr. TURNER also exhibited the varieties of Pompon

Dahlias selected after trial by the National Dahlia Society as being best for garden purposes (see p. 240). (Silver Flora Medal.)

Messrs. J. CHEAL & SONS, Crawley, Sussex, exhibited Dahlias, including single, Pompon, and Cactus varieties. The single kinds were very pretty, especially Columbine, Serita (crimson), Formosa (red), Peggy (rosy-mauve), Flora, and Miss Roberts. The best of the Pompon varieties were Cyril, Elsa, Tommy Keith, and Nerissa (a shade of silvery-rose). (Silver Banksian Medal.)

Mr. M. V. SEALE, Sevenoaks, had a large exhibit of Dahlias intermingled with coloured foliage, the display being made very decorative. It contained good blooms of the most popular kinds. (Silver Flora Medal.)

Messrs. CARTER PAGE & Co., London Wall, London, again made a fine display with Dahlias of all varieties as at the last two meetings. (Silver Flora Medal.)

Exhibits of Dahlias were also shown by Mr. S. MORTIMER, Rowledge, Farnham, Surrey; Mr. J. T. WEST, Brentwood (Silver Banksian Medal), and Messrs. T. S. WARE, LTD., Feltham, who also showed perennial Asters. (Bronze Flora Medal.)

Mr. H. J. JONES, Hither Green, Lewisham, showed 50 bunches of perennial Asters in 44 varieties. The group was arranged very attractively, each variety being shown in a glass vase. Mrs. F. Brazier (pale blue), Decima (white), Mrs. Twinam (pink), Finchley White (the largest of the white varieties), Hilda Morris (slatey-blue), and Mrs. S. T. Wright (rosy-purple) are a selection. (Silver Flora Medal.)

Messrs. W. CUTBUSH & SON, Highgate, showed miscellaneous hardy flowers. Helianthus rigidus Miss Willmott is a fine variety of this showy sunflower; Potentilla Gibson's Scarlet is an improved variety of *P. atrosanguinea*. There were also Pentstemons, Michaelmas Daisies, Delphiniums, of which Dwarf King is a fine deep-blue variety, Pernettya mucronata in fruit, Phloxes, Lilliums, Rudbeckias, Polygonum Bistortii, and other seasonable subjects. The same firm exhibited a fine group of Carnations, principally of the perpetual-flowering type. Lady Millar, of the Souvenir de la Malmaison type, produces its pretty bluish pink blooms at all seasons of the year. (Silver Flora Medal.)

Messrs. R. WALLACE & Co., Colchester, showed hardy flowers in variety. Pentstemon Myddleton Gem has rose-pink and white flowers. Amongst varieties of Asters, we noticed *A. Bessarabicus*, *A. B. major*, *A. Anellus Riverslea*, and other attractive varieties, including that known as Favourite. There was also a large number of Kniphofias and many varieties of Montbretias. Kniphofia Wilson Ker is a large red flowered variety. At one end of the group were strong clumps of Colchicum Bormmuller and *C. giganteum*.

Mr. FRANK BRAZIER, Caterham, showed decorative or border Chrysanthemums. Ethel Blados, Nina Blich, and Leslie were prominent. The group also contained perennial Asters. Mrs. F. Brazier (with big blue flowers), Cottage Maid (paler blue), Hilda Morris, and Mrs. S. T. Wright were noticed. Mr. BRAZIER also showed Pentstemons and Phloxes in variety.

Messrs. BACKHOUSE & SON, York, showed strong spikes of Colchicum speciosum, *L. s. album*, and a dark variety labelled *atro-rubens*. In the group was *Cheiranthus Allionii*, also Monkshoods, Miss Mellish Sunflower, and Michaelmas Daisies in variety.

Messrs. GUNN & SONS, Olton, Birmingham, exhibited large pans of *Viola cornuta*. The flowers, some white as well as blue, were exceedingly numerous. (Silver Banksian Medal.)

Messrs. BARR & SONS, King Street, Covent Garden, London, showed seasonable hardy flowers, also *Vallota purpurea*, *Nerines* and *Colchicums* as pot plants.

THE SIX MILLS NURSERY, Stevenage, exhibited *Heleniums*, Asters, *Gypsophila paniculata* fl. pl. and other border flowers.

Mr. G. REITHE, Keston, Kent, set up a group of hardy flowers in which we noticed a carmine-flowered variety of *Lobelia cardinalis*.

Messrs. J. & A. CLARK, LTD., Dover, staged seasonable border flowers, amongst which were some excellent spikes of *Cnicifuga simplex*. (Bronze Flora Medal.)

A fine plant of *Platycodon*, albicorne was shown by Miss S. G. ABERNATHY, Moswell Hill (gr. Mr. E. P. Cooper). (Cultural Commenda-

AWARDS OF MERIT.

Carnation O. P. Bussett.—A tree or perpetual variety, with very fragrant, scarlet flowers, in which the petals were much fringed. Shown by Mr. A. F. DUTTON.

Pentstemon Myddleton Gem.—This variety has pretty, clear rose-coloured flowers with white throat, rather smaller than those of the best florists' strain. The point in this one is its extreme hardiness in the severest frosts common in this country. It forms large bushlike plants in Mr. Bowles's garden at Waltham Cross, and flowers abundantly. Shown by Messrs. WALLACE & Co.

Rose Flower of Fairfield.—This is stated to be a perpetual-flowering variety of Turner's Crimson Rambler. In other respects the novelty does not exhibit any marked difference. Shown by Messrs. STUART LOW & Co.

Dahlia Quimbo (Cactus).—A maroon-coloured variety with exceptionally incurved florets and of very regular formation.

Dahlia Gold Crest (Cactus).—A very pretty variety, having a bright yellow base and glowing scarlet-tipped florets. Both these varieties were shown by Messrs. H. STREDWICK & SON.

Viola Wilsonae (see fig. 101).—A new species from China, of the *armata* type. The leaf is

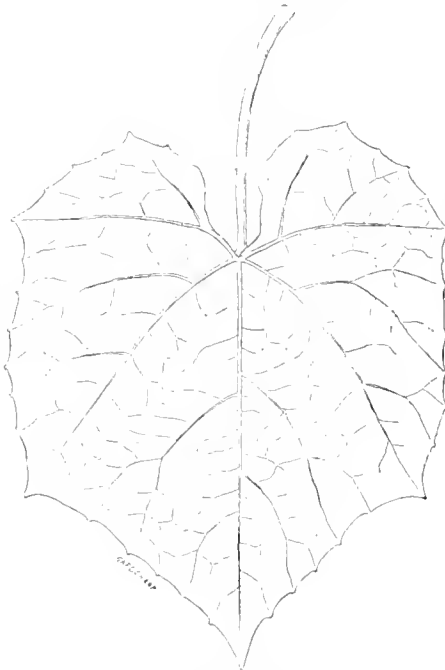

FIG. 101.—LEAF OF VIOLA WILSONÆ: HALF NATURAL SIZE.

(Obtained an Award of Merit on Tuesday last.)

almost regularly five-sided, with a circular depression at the stalk end. The margins are almost entire, but the principal veins terminate in small points. The foliage assumes a deep red colour in autumn, which was well shown in many of the basal leaves on the specimen exhibited. Shown by Messrs. JAS. VEITCH & SONS, LTD.

Dahlia Little Donald (Pompon).—A finely-formed flower of this miniature type, the flower being of a shade of maroon. Shown by Mr. S. MORTIMER.

Dahlia The Lancer (Cactus).—A dark red variety of free-blooming habit. Some of the stems carried three good flowers on long stalks. It is recommended as a garden variety. Exhibited by Mr. H. SHOESMITH.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, F. J. Hanbury, R. Brooman-White, J. Forster Alcock, A. A. McBean, H. G. Alexander, Walter Cobb, J. Charlesworth, H. A. Tracy, W. H. Hatcher, H. Ballantine, Gurney Wilson, W. Boxall, W. Bolton, C. J. Lucas, C. H. Curtis, and Sir Jeremiah Colman, Bart.

Lieut.-Col. G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander), showed a splendid plant of the chastely-beautiful *Cypripedium Acteas Bianca* (*Leanum Prospero* × *insigne Sandere*) (see *Gardeners' Chronicle*, fig. 114, October 10, 1908, p. 261), which was given a First-class Certificate, September 29, 1908. It is a very large flower, of perfect form, and fine substance, the large snow-white dorsal sepal having a pale emerald-green base, the rest of the flower being yellow. Lieut.-Col. HOLFORD also showed *Laelio-Cattleya Golden Fleece* (*Golden Gem* × *Dowiana aurea*), with a spike of seven Buttercup-yellow flowers, having some Indian-red markings on the lip; and the fine *Laelio-Cattleya Pizarro* Holford's variety (see Awards).

Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate (gr. Mr. Collier), staged an effective little group, principally of *Dendrobiums*, and which included a good example of the rare *D. taurinum*, with a strong spike of pretty white and rose-coloured flowers; several of the true *D. Phalenopsis* Fitz., with many sprays of claret-rose flowers; and of the lighter-coloured *D. P. Schroderianum*, including a specimen of *D. P.* Gatton Park variety, with large white flowers having violet markings on the lip; *D. bicaudatum*, a Java species much resembling some of the Australian kinds; *Cirrhopetalum appendiculatum*; and the yellow and rose-coloured *Laelio-Cattleya Ophir rosea*.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford, staged a small group of finely-grown, rare *Cypripediums*, including the handsome *C. Thalia* Mrs. Francis Wellesley; *C. Thalia New-Hall* variety; *C. Milo*, and the dark-coloured *C. Milo Cobb's* variety; a very dark form of *C. Baron Schroder*, *C. Ballantinei* Westfield variety, and a splendid plant of *C. Fairricarm*.

Messrs. CHARLESWORTH & Co., Haywards Heath, were awarded a Silver-gilt Flora Medal for a group rich in good things. In the centre was a varied selection of their handsome hybrids of *Sephonitis grandiflora* varying in tint from light scarlet and red to rose and purple. Behind them were two good plants of the rare *Angraecum Bayssonii* and some good specimens of *Vanda caerulea*. The group contained many hybrid *Cattleyas* and *Laelio-Cattleyas*, including a selection of the variable and pretty *Cattleya Iris* and *C. Rhoda*. With them were fine specimens of *Odontoglossum grande* *O. crispum*, the *O. crispum xanthotes Charlesworthii* being a chastely beautiful form; a batch of the rose-coloured *Phalenopsis Esmeralda*, a very rich scarlet *Odontioda*, near to *Vuylystekeae* in form; *Dendrobium Cologyne* and other *Dendrobiums*; a superb, dark-coloured *Odontoglossum Harryanum*, the singular *Chondrorhyncha Chestertonii*, *Oncidium incurvum album* and two new *Cattleyas* (see Awards).

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for a good group of hybrid *Cattleyas*, *Laelio-Cattleyas*, *Odontoglossums*, &c., among which were noted the new *L.-C. nitens* (*Heiena* × *Dowiana aurea*), a bright flower of medium size and having yellow sepals and petals tinged with red and crimped rose-coloured lip with ruby-red centre having golden lines running from the base; and *L.-C. Walter Gott* (*C. bicolor* × *L.-C. Bletchleyensis*), the petals being yellow deeply tinged with bronzy-red, the lip rose-purple with a white base. In the centre of the group were several plants of the new white *Dendrobium Sandere*, and others noted were *Lycaste macrophylla*, *Cirrhopetalum refractum*, the graceful *Eria densiflora*, some curious *Cycnoches*, with both male and female flowers; the yellow *Dendrobium velutinum*, and other rare species.

Messrs. MANSELL & HATCHER, LTD., Rawdon, Yorkshire, secured a Silver Flora Medal for an attractive and interesting group of showy hybrids, and rare and curious species. The centre was composed of 20 well-flowered plants of *Cattleya Iris* with varying tints of bronzy-yellow, rose and purple in the flowers of the different specimens. With them were *Cattleya Folia*, *C. Armstrongiae*, *Brasso-Cattleya Thorntonii*, some pretty hybrid *Odontoglossums*; *Cypripedium Wiertzianum* J. Wilson Potter's variety; *C. Maudie*, *C. Flambeau*, and other *Cypripediums*; the interesting species being represented by a fine *Mormodes pardunum unicolor*, with two strong spikes; the elegant little *Seraphyta*

multiflora, Bulbophyllum Godsefianum, Brassavola nodosa grandiflora, Cynchophetatum maculosum, the elegant Angraecum pellucidum, with fringed-lipped and semi-transparent flowers, &c.

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, secured a Silver Flora Medal for an excellent group of well-grown and finely-flowered Orchids, which included several good novelties and rare species. The finest in the group was Cattleya Rhoda conspicua (see Awards). The centre of the group was of hybrids, which included a fine specimen of Cattleya Minucia, with a spike of seven flowers, good C. Iris, the pretty C. Harold, and others. At the back were graceful spikes of the yellow Oncidium oblongatum, and on either side a selection of finely-flowered Dendrobium formosum giganteum and Cattleya Gaskelliana, one charming light form of which bore nine flowers. Among the species were several plants of Cynoches chlorochilon, Calogyne Veitchii with two long drooping spikes of pure white flowers, several Cynchophetatum, Pseudochallis, Oncidium unicorn, &c.

Messrs. STANLEY & Co., Southgate, showed several plants of their Cattleya iridescens (bicolor \times Eldorado) varying in colour. Also C. St. Gilles, C. Minucia, and C. Gaskelliana alba.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), sent Odontoglossum Macnabianum Rosenfeldense, a very finely-blotched flower with a large white labellum with purple markings in front of the crest.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), showed a very fine specimen of Cypripedium Chapmanii superbum.

E. ROGERSON, Esq., Oakdene, West Didsbury, Manchester, sent the handsomely-blotched Odontoglossum crispum Ethel, a very fine and richly-coloured flower, which had to be passed by the Committee, as the spike had been restricted.

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), sent Odontoglossum Stamfordianum (bictoniense album \times Uro-Skimmeri), with greenish sepals and petals and silver-white lip; and the pale yellow and white O. grande Pittianum.

AWARDS.

FIRST-CLASS CERTIFICATE.

Laëlio-Cattleya Pizarro Holford's var. (L. Jongheana \times C. Dowiana aurea), from Lieut.-Col. G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander).—A notable flower in every respect and in which the influence of *L. Jongheana* in narrowing the lip is quite eliminated, the flower being uniformly broad in all its parts. The sepals and petals are bright purplish-rose, with a small white base. The broad crimped lip is deep copper-red, changing to rose in front, the disc being ruby-red of a velvety or dusky tint, and obscurely veined with gold.

AWARDS OF MERIT.

Cattleya Rhoda conspicua (Iris \times Hardyana), from Messrs. STUART LOW & Co., Bush Hill Park.—This is the most remarkable and beautiful of this very variable cross, some plants of which closely resemble *C. Iris*, while others are distinctly of *C. aurea* type, the present plant being in effect a white-petalled *C. Hardyana*, except that the lip is more openly displayed and there is more of a violet tint in the colouring of the lip. The sepals and petals are cream-white, the front of the lip violet-crimson, and the discs yellow, with golden-yellow veins from the base.

Cattleya Basil (Enid \times Mantinii), from Messrs. CHARLESWORTH & Co.—In this the colour and fine substance of *C. Mantinii* is transferred to the large-flowered *C. Enid* (Mossie \times Warscewiczii). The flowers are large; the sepals and petals are rose-purple and the lip is finely expanded, ruby-crimson, with yellow disc.

Cattleya Mrs. Pitt superba (Harrisoniana \times Dowiana aurea), from Messrs. CHARLESWORTH & Co.—A pretty light rose-coloured flower, with a distinct prismatic arrangement of purple lines in the tube of the lip.

BOTANICAL CERTIFICATE.

Disa polygonea, from Messrs. JAS VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea.—A very singular species from S.E. Cape Colony, with tall, erect spikes, densely set on the upper part with small yellow flowers. The plant was finely cultivated and bore four spikes.

Fruit and Vegetable Committee.

Present: G. BUNYARD, Esq. (in the Chair), and Messrs. J. CHEAL, E. BECKETT, W. BATES, H. PARR, A. R. ALLAN, J. VERT, H. MARKHAM, J. DAVIS, G. REYNOLDS, J. JAGUES, F. PERKINS, A. DEAN, J. MCINDOE, O. THOMAS, H. S. RIVERS, J. LYNE, FRED. THIESEDER, G. WYTHES, and C. FOSTER.

Sir MARK COLLETT, Bart., Sevenoaks (gr. Mr. Nicholl), exhibited some fine Pears named Calabasse Oberdick, grown under glass. It was thought to be identical with Vicar of Winkfield variety, and it was decided to ask the exhibitor to send fruits from out-of-door trees to the next meeting for comparison.

Mr. W. BATES, Twickenham, sent several heavily-fruited branches of Langley Bullace to show its cropping qualities. Numerous Apples and several Plums were submitted for award, but none was granted this distinction.

Messrs. STORRIE & STORRIE, Dundee, sent a seedling Apple, which the Committee wished to be grown at Wisley to test its merits in the south.

Mr. G. W. MILLER again showed the deep-red-coloured Apple Red Victoria.

Messrs. H. CANNELL & SONS, Swanley, showed two heavily-cropped roots of a new late Potato named South Pole. They were asked to send tubers to Wisley for trial, the variety being one of promise.

A group of fine fruit trees in pots some 50 feet in length was staged by Messrs. T. RIVERS & SONS, Sawbridgeworth. In the front were baskets of choice, gathered fruits. Apple trees included finely-fruited specimens of Gascoyne's Scarlet Seedling, King of Tompkins County, Melon, Washington, Emperor Alexander, and others. Of Pears there were excellent trees of Conference, Louise Bonne of Jersey, Fondante d'Antoine, and Doyenné Boussoch. These, with Plum President, Cherry Gaigne de Winkler, and various Figs, Oranges, and Peaches, constituted the principal features of the group. The gathered fruits included superb Peasgood's Nonesuch, Ribston Pippin, Cox's Orange Pippin, and Gascoyne's Scarlet Seedling Apples, and President, Coe's Golden Drop, Admiral, Transparent Gage, Monarch, and Late Orange Plums. There were also many bunches of Grapes in nine varieties, and some capital Pears. (Gold Medal.)

The entire upper end of the Hall was occupied by a wonderful collection of bush, pyramid, and flat-trained trees, all lifted the previous day from the open ground at Messrs. JAS. VEITCH & SONS' fruit nursery, Langley. There were 100 trees in all. Of Apples the new variety Rev. W. Wilks was shown as maiden trees superbly fruited. This is a grand early Apple, judging by the excellent specimens shown. Very fine also were Tyler's Kernel, Grantonian, Lane's Prince Albert, Mrs. Barron, Bramley's Seedling, Cellini Pippin, Lord Derby, King of Tompkins County, Bismarck, and Cox's Pomona. Pears included Benrè Clairgean, Louise Bonne of Jersey, President Hardy, Durondeau, Princess, Conference, and St. Luke. There were also Brown Turkey, White Ischia, and Boujassotte Noire Figs. A tree of Langley Bullace carried an enormous number of fruits. (Gold Medal.)

Messrs. JAS. VEITCH & SONS also set up a large collection of some 50 dishes of vegetables, having fine Onions, Leeks, Beets, Carrots, Parsnips, Potatos, Red and White and Savoy Cabbages, Tomatos, and other kinds. (Silver Knightian Medal.)

J. A. NIX, Esq., Tilgate, Crawley, staged a fine collection of fruits, including Grapes Black Alicante, Black Hamburg, Lady Downe's Seedling, Gros Maroc, Mrs. Pince, Appley Towers, Madresfield Court and Muscat of Alexandria; also of Peaches good fruits of Wallburton Admirable, Prince of Wales, and the Nectarine. In addition were Nectarines Victoria and Pineapple, good Apples and Pears and other fruits, the whole constituting a remarkably good collection. (Silver-gilt Knightian Medal.)

Messrs. H. CANNELL & SONS, Swanley, showed a large collection of hardy fruits grown on orchard trees. The fruits were not over large, but very clean, and otherwise in excellent condition. Of kitchen Apples, Potts' Seedling, Grenadier, Edward VII., New Hawthornden, Lord Derby, Peasgood's Nonesuch, Stirling Castle, Warner's King, and Bramley's Seedling were all excellent.

Of dessert Apples we noticed good samples of Allington Pippin, Lady Sudeley, Baumann's Red, Wealthy, Worcester Pearmain, Graevenstein, Col. Vaughan, and Ben's Red. Pears were represented by Pitmaston Duchess, Durondeau, Benrè Hardy, Triomphe de Vicme, Vicar of Winkfield, and others, and Plums by Prince Engleheart, Pond's Seedling, Grand Duke, Kirke's Blue, Wyedale, and Goliath. Besides these there were numerous other fruits. (Silver-gilt Knightian Medal.)

Messrs. S. LOW & Co., Bush Hill Park, Enfield, displayed a few Apple trees in pots and several dishes of fruit, including some of Red Victoria Apples.

Messrs. SPOONER & SONS, Hounslow, set up a table of fine market samples, including Apples Hollandbury, Hambling's Seedling, Emperor Alexander, Peasgood's Nonesuch, Gloria Mundi, Baumann's Red, Red Quarrenden, The Queen, Flower of Kent, Bowhill Pippin, Stirling Castle, Warner's King, and Wealthy. Also Plums Grand Duke, Monarch, Magnum Bonum, and Emperor. (Silver Knightian Medal.)

Mr. G. HOBDAK, Romford, staged a representative collection of vegetables, having a table some 20 feet in length fully furnished. Generally, the vegetables were rather under than over the usual exhibition size, as Mr. HOBDAK holds what is best suited for cooking should be the exhibition standard. (Silver-gilt Knightian Medal.)

Mrs. BANKS, Grosvenor Square, London, W., set up a large group of bottled fruits, all bottles having the screw capsules. Almost every kind of fruit, and even Rhubarb stems was represented. (Silver-gilt Banksian Medal.)

AWARDS.

FIRST-CLASS CERTIFICATE.

Apple St. Evarard.—A seedling from Cox's Orange Pippin crossed with Margil. The fruits are of medium size, roundish like Cox's Orange Pippin, but they have the stripe of Margil. The flesh is very richly flavoured and juicy, the variety being a first-class dessert Apple. From Messrs. JAS. VEITCH & SONS.

AWARDS OF MERIT.

Strawberry Atkins' Continuity.—The fruits are roundish, deep red in colour, very crisp and of good size. The plant is evidently a free cropper. Shown by Mr. J. ATKINS, Beckenham.

Runner Bean White Emperor.—The pods are a great length and of the tough runner type. Grown under trial at Wisley, it proved to be the heaviest cropper. The flowers and seeds are both white. Shown by Mr. E. BECKETT, Aldenham House Gardens.

COMPETITIVE CLASSES.

In the class for three dishes of Peas, the Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), won the 1st prize, having specially fine pods of Gladstone, Late Queen and Duke of Albany; Lady COWPER, Panshanger, Herts. (gr. Mr. Staward), was placed 2nd. For one dish of Peas, C. WATNEY, Esq., Watford (gr. Mr. C. Dyke), was awarded the 1st prize for capital pods of Autocrat; 2nd, the Rev. CHALMERS HENT, Hitchin. The class for nine kinds of vegetables saw Mr. BECKETT again to the fore, he having superb samples of Leeks, Cauliflowers, Pink Celery, very fine Onions, good Windsor Castle Potatos, Perfection Tomatos, Intermediate Carrots, Perseverance Runner Beans and Brussels Sprouts; H. L. TATHAM, Esq., Elstree (gr. Mr. W. Gaiger), was awarded the 2nd prize for excellent products. In the class for six kinds only, Mr. A. BASILE, Woburn Park Gardens, Addlestone, was 1st with capital Cauliflowers, Celery, Leeks, large, flattish Onions, Best of All Tomatos, and supremely fine Factor Potatos; 2nd, Mr. C. HOBDAK, Romford. There were three other exhibits in this class, but in all cases the prizes are restricted to two, no matter how good the competition.

There was no entry for the graders' class for 12 kinds of vegetables. In that for a collection of salads, Mr. BECKETT again won the 1st prize easily, his group including Celery, Beets, Tomatos, Cos and Cabbage Lettuces, Broad leaved and Curled Endives, Chicory, Cucumbers, Radishes, and Mustard and Cress; 2nd, Lady COWPER (gr. Mr. Staward). There was no entry in the class for a collection of autumn Strawberries.

SECOND "MASTERS" LECTURE.

THE PRODUCTION OF HORTICULTURAL VARIETIES.

ON Tuesday last, Prof. Hugo de Vries delivered the second "Masters" Memorial Lecture before a large audience at the Royal Horticultural Society's Hall, Vincent Square.

Mr. A. D. Hall, F.R.S., who occupied the chair, in briefly introducing the lecturer, referred to the purpose of these lectures, which are intended to keep alive the memory of the late Dr. Masters, and to bring before the horticultural world the researches of science as its discoveries bear upon the practice of horticulture, and thus to continue the work—the application of science to horticultural practice—which Dr. Masters never lost an opportunity of furthering.

Prof. de Vries, in his first lecture (see *Gardeners' Chronicle*, June 26, 1909, p. 419) dealt with Dr. Masters's own researches in vegetable teratology; in this one his subject was mainly his own researches into the origin of horticultural varieties. He pointed out that Darwin's work on the "Variations of Plants and Animals under Domestication" had led the way for prolonged

of doubling of flowers or variegation of foliage. Only after careful selection and constant care do such variations become so marked as to ensure a sufficient contrast with the species from which they were derived to make them worth cultivation as novelties.

There are thus two types of varieties with which the horticulturist has to deal—the "constant" variety and the "ever-sporting" variety. The former type, Prof. de Vries calls "mutants," and in reply to a question, pointed out that "mutants" differ from other variations, fluctuating variations as they may be called, in that the former arise suddenly and not by small degrees, and when they have once appeared they "breed true" to their new characters provided they are self-pollinated, while varieties formed after the tedious, oft-repeated selection of small differences, differences depending very often upon methods of cultivation, belong to the "ever-sporting" type.

Good examples of "mutants" are furnished by white "sports" of many flowers and by dwarf varieties. With these the florist's work in fixing lies in securing isolation, and if isolation be complete, the fixing is accomplished in a single year.

The extent and even the occurrence of variegation in certain plants, as in the variegated Horse Radish, depends largely upon the method of cultivation, and, the extent of doubling seen in other plants may vary enormously even on a single plant at different seasons of the year. These afford examples of the "ever-sporting" varieties. Such varieties may arise fully developed or may appear only by steps. Small indications of possibilities appear first, and the florist has to isolate them and "work them up" by constant selection of the most marked variations in the desired direction.

The lecturer then went on to show how varieties had been produced under his own observation in plants whose histories had been known for many generations.

His first example was the peloric form of the common Toad Flax. This form has, in all its flowers five spurs, instead of only one spur as seen in the common type. It has been found in a considerable number of widely-separated places under circumstances that leave no reasonable doubt that it has been produced from seed of the common type. It rarely produces seed, but, being perennial, is able to hold its own for a considerable number of years, though it may finally disappear. Prof. de Vries sowed seed of the common type in his garden and watched the progeny through eight generations always excluding the chance of cross-fertilisation, without observing any change whatever. In the ninth generation, however, a plant bearing peloric flowers suddenly appeared. Thus a sudden variation had occurred under his own observation without any previous indication of deviation from the type. The seed he was able to save from this abnormal specimen reproduced the variation, and similar variations had arisen from succeeding generations at intervals.

In like manner he had seen sudden variations arise in *Oenothera biennis*, where a form with very narrow petals, which he had called "cruciata," had appeared, and in the Dahlia, where the tubular corollas were darkly coloured inside instead of outside, as is usual.

As an example of an "ever-sporting" variety, the lecturer gave an account of the experimental development of the Double Corn Marigold (*Chrysanthemum segetum*), since double flowers of Compositæ form an excellent example of "ever-sporting" variations.

The seed in this case was derived from the large-flowered garden variety, in which there are on an average 21 rays, though the range of variation in number is up to 24 and down to nine. In the fourth year, by selecting flowers showing the largest number of rays each year, the average was raised to about one hundred.

It might have been expected, said the lecturer, that the average number of ray florets might be increased by this process of selection, but there was also the chance that a double variety might be secured, and this was actually the case, for in the fifth year one was secured in which about 200 rays were present in the head. Thus, by selecting what was at first a slight variation from the normal, and breeding from those of its

FIG. 103.—"POLLINATION CAGE," FORMED OF METAL GAUZE, IN PROF. DE VRIES' EXPERIMENTAL GARDEN AT AMSTERDAM.

progeny which showed the greatest development of that variation, a fixed double form was at length reached.

Another instance of an interesting "ever-sporting" variety was afforded by the race of five-leaved Clovers which the Professor had succeeded in establishing.

The case of "mutants" in *Oenothera Lamarckiana*, to which the lecturer next referred, afforded an instance of not one, but several new forms, arising suddenly in one generation, from seed of one plant. About a dozen of these "mutants" could be relied upon to appear each season; the number of different "mutants" is, of course, not unlimited, but the same novelties spring from it almost every year, and in cases where they can be got to produce seed by self-pollination, they breed true.

One of the most interesting of these "mutants" is the dwarf form known as *nanella* (see fig. 102), which, though much shorter in the stem than the type, bears flowers quite as large and is, therefore, very showy. This form appears in the proportion of about 2 per cent. of the seedlings from *Lamarckiana* every year.

FIG. 104.—VIEW IN PROF. DE VRIES' EXPERIMENTAL GARDEN, SHOWING THE COVERING OF WIRE NETTING.

Another "mutant" named *lata* (see fig. 102) has weak stems, and much broader leaves of a paler green colour than the type, and with rounded tips, while a form known as *albida* is also fairly common, and, like the others, may be distinguished from the type even in the seedling stages; it has narrow, whitish leaves (see fig. 105). Many other mutants have occurred and usually reoccur among the seedlings of *Lamarckiana* every year.

FIG. 102.—*OENOTHERA LAMARCKIANA* AND TWO OF ITS MUTANTS WHICH IT PRODUCES ANNUALLY AT AMSTERDAM.

investigation in showing how great a significance attached to these variations in supporting the theory of evolution. Varieties may be regarded as "small species," i.e., groups of plants differing from one another in only one or at most a few characters, but differing so that if their origin were not known, some botanists would regard them as distinct species.

If, as will be generally admitted, the facts of variation strongly support the argument for evolution, the lecturer pointed out that the process by which variations arose in all its details became a most interesting and important subject of enquiry. While the actual manner in which species are produced in Nature may differ, and it probably does differ in details, from that in which varieties are produced in horticulture, yet the laws governing the process will be the same in both cases. In "fixing" the varieties which arise in the garden, there is generally the difficulty of guarding against cross-pollination, since numerous closely-allied forms are usually cultivated in close proximity to the new form, and there is the fact that many of the variations which it is desired to reproduce and develop are only faintly indicated at first, as in the cases

An illustration of the field in which the original plants of *O. Lamarckiana* from which the seed was obtained was shown, as well as figures of the "mutants" themselves.

Professor de Vries then showed slides of his experimental garden at Amsterdam (see fig. 104) to illustrate the methods of cultivating the plants and ensuring the exclusion of insects likely to carry pollen by enclosing the flowers in paper bags or growing the plants in metal gauze houses (see fig. 103). The whole garden is protected from birds, mice, etc., by being caged with wire netting (see fig. 104).

THE DISCUSSION.

Professor Percival raised the question as to whether there was any periodicity in the occurrence of the periods during which mutations occur, suggesting that perhaps every ninth, tenth, or twentieth generation or so might see their recurrence in certain species. Mr. Drury also referred to this question, basing his remarks upon his experience among the many "mutants" which occur naturally among British Ferns. Prof. de Vries thought that perhaps fifty generations might be nearer the period at which mutations might occur, but pointed out that the question must be pursued for a long period, in order that it might be answered. So far no answer could be given.

Mr. C. C. Hurst expressed his obligations to the lecturer for his lucid lecture and emphasised

mens of polished sections of various timber trees, and cases of sand-dried specimens illustrative of inflorescences, the classification of fruits, the dispersal of seeds, &c.

On two large cards were mounted specimens of pressed Alpine plants, showing in a very practical manner certain lime-loving plants and their corresponding allies, found chiefly on the older siliceous and granite rocks, as follows:—

Plantae calcicoles.—*Anemone alpina*, *Rhododendron hirsutum*, *Primula auricula*, *Gentiana acaulis*, *Erica carnea*, *Doronicum scorpioides*.

Plantae siliceoales.—*Anemone sulphurea*, *Rhododendron ferrugineum*, *Primula viscosa*, *Gentiana Kochiana*, *Calluna vulgaris*, *Arnica montana*.

The most important exhibit was a magnificent collection of Conifers by Monsieur LACHENAL, of Neydens (Haute Savoie). It comprised 137 species and varieties, of which the following were described as "novelties," viz., *Retinospora obtusa crispata* (a golden form from Japan), *R. obtusa nana*, *R. tetragona*, *Taxus adpressa variegata*, *T. cuspidata*, *Wellingtonia compacta nana*, *Pinus glauca*, *P. g. pendula*, *Pinus Fremontiana*, *Abies alcockiana glauca*, and *A. mobilis glauca argentea*.

This large collection of trees and shrubs, in beautiful condition, won a Grand Prix d'Honneur, with the special congratulations of the judges.

Messrs. GEORGES BOCCARD FILS, of Petit Saconnex, had another collection of Conifers, in-

arranged in perfect symmetry, a fashion which we hoped was dying out in both France and Switzerland.

Most of the exhibits of fruit and vegetables were extremely fine, the best fruit being shown by Messrs. MOREL ET CHASSET, of Lyons, and the ÉCOLE CANTONALE D'HORTICULTURE.

It was amusing to see exhibited specimens of *Erica tetralix* labelled var. *rosca*, for it was the ordinary pale pink form most common in the British Isles. But *Erica tetralix* is not found in Switzerland.

A storm of wind and rain has greatly injured some of the flowers since the opening of the exhibition. H. S. Thompson.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

SEPTEMBER 9.—*Committee present*: Messrs. E. Ashworth, R. Ashworth, Arthur Ashton, Ball, Cowan, Holmes, Holden, Keeling, Leemann, Parker, Smith, Sander, Ward, Warburton, and P. Weathers (hon. sec.)

J. T. CLIFTON, Esq., Lytham Hall, Lytham (gr. Mr. Float), staged a group of plants in great variety. It contained a well-grown specimen of a fine variety of *Vanda cœrulea*, also a grand plant of *Peristeria elata* bearing half-a-dozen flower spikes. Awards of Merit were voted to *Cattleya* × *Lytham Hall* (a hybrid between *C. × Grossii* × *C. Gaskelliana*), *Miltonia Schröderiana*, *Phalenopsis Sanderiana* Coundon Court variety, *Houlletia odoratissima*, *Angraecum Eichlerianum*, *Cattleya* × *Armstronge*, *Laelio-Cattleya* × *Nysa Lytham Hall* variety, and *Cattleya* × *Maronii Clifton* variety. Botanical Certificates were awarded to *Phalenopsis Regnierii*, *Sigmatostalix radicans*, *Stenoglottis longifolia*, *Dendrobium canaliculatum*, *Pleurothallis platyrachis*, and *Angraecum Scottianum*. First-class Certificates were awarded to *Vanda cœrulea* (Clifton's var.), *Dendrobium acuminatum*; and a Cultural Certificate for *Peristeria elata*. (Silver-gilt Medal.)

Z. A. WARD, Esq., Cringlewood, Northenden (gr. Mr. Weatherby), staged a charming group of *Cattleyas*, *Laelio-Cattleyas*, and choice hybrids, including several beautiful forms of *Cattleya* × *Iris*. (Silver-gilt Medal.)

H. J. BROMLOW, Esq., Rainhill (gr. Mr. Morgan), showed a small exhibit of *Cypripediums*. Most of the plants shown had been previously certificated. (Bronze Medal.)

Mr. C. PARKER, Fern Bank, Preston, was awarded a Bronze Medal for a small group of well-grown *Cypripediums*, including *C. × A. de Lairese*, *C. × Burtonii* var. *superbum*, *C. × Massanum* var. *superbum*, and *C. × Helvetia*.

Mr. E. V. Low, Vale Bridge, Haywards Heath, exhibited *Cypripedium* × *Fletcherianum*, a hybrid between *C. × Lord Derby* × *C. Godefroye* var. *leucochilum*. It was awarded a First-class Certificate. *Cattleya* × *Iris* Vale Bridge variety received an Award of Merit.

A. WARBURTON, Esq., Vine House, Haslingden (gr. Mr. Dalgleish), exhibited *Cypripedium Godefroye* var. *The President*, to which an Award of Merit was voted.

J. RUTHERFORD, Esq., M.P., Beardwood, Blackburn (gr. Mr. Lupton), exhibited *Brasso-Cattleya* × *Madame Chas. Maron*.

N. GALLOWAY, Esq., Great Horton, Bradford, was awarded a Silver Medal for a group of Orchids, of which *Cypripediums* were the principal subjects.

E. ROGERSON, Esq., West Didsbury, exhibited *Cypripedium* × *Rosettii*, *C. × Stanley Rogerson*, *C. × Olga Bagshaw* var. *The Gem*, and *C. × Martha E. Rogerson*, the latter being a hybrid between *C. Godefroye* var. *leucochilum* and *C. niveum*.

The Rev. J. CROMBIE HOLME, Clayton-le-Moors (gr. Mr. Marshall), gained an Award of Merit for *Cypripedium* × *argenteum*, a hybrid between *C. Stoneii* × *C. Chamberlainianum*.

J. McCARNEY, Esq., Hey House, Bolton (gr. Mr. Holmes), showed a group of *Cattleyas*, *Ladias*, and hybrids. *Laelio-Cattleya* × *Bayardo*, *L. C. × Henrietta*, and *Cattleya* × *His Hey House* variety, were given Awards of Merit. (Silver Medal.)

J. J. BODEN, Esq., Southport (gr. Mr. Johnson), received First-class Certificates for *Cypripedium* × *Hollenii*, a beautiful albino hybrid of *C. × Madame* × *C. callsum* var. *Sandera*, and an exquisite form of *Cattleya* × *Iris*, labelled *Auburn House* var.

FIG. 103.—MUTANTS OF *OENOTHERA LAMARCKIANA*, SHOWING HOW EASILY THEY MAY BE DISTINGUISHED EVEN AT THE SEEDLING EARLY STAGE.

the importance of the facts Prof. de Vries had stated, namely, first that "mutants" were germinal variations which breed true so long as they are isolated and, secondly, they were of sudden occurrence completely developed.

The chairman, in conclusion, thanked Prof. de Vries for the lecture, and expressed the hope that all who are in any way employed in raising new varieties of plants will keep careful records of their work for, in order that greater knowledge of the laws that underlie the causes of variation may be obtained, there was abundant need for experimenters to "watch, wait, and record."

GENEVA INTERNATIONAL EXHIBITION.

THIS exhibition attracted large numbers of visitors during the second week of September, and it was the most important show of the kind yet held in Geneva. On the Scientific Committee figured the names of such well-known and distinguished botanists as de Candolle, Chodat and Briquet, and indeed the scientific exhibits on the balcony of the hall were an interesting and somewhat novel feature of the exhibition. They comprised a most instructive exhibit from the ÉCOLE CANTONALE D'HORTICULTURE, with good speci-

cluding very fine plants of *Abies excelsa pyramidalis* and *Cedrus atlantica glauca*.

The floral exhibits, as a whole, were disappointing, but the recent bad weather may partly account for it. The finest collections were sent by Mons. GEORG, Petit Saconnex (gr. Mons. A. Prodalbet). They included fine masses of *Geraniums*, *Primulas*, *Cyclamen*, *Solanum Wendlandii*, and *Ferns*. There were two splendid collections of *Begonias*, one by Messrs. VACHOUX-DUVAL ET FILS, of Carouge; and another by Mons. CHAS. MARTIN, a private gardener at Petit Saconnex; several blooms were 8 inches across.

Mons. CORREYON, of Chêne Bourg, and Mons. L. VORAZ-MOLIN, of Lyons, showed herbaceous plants, which included *Physostegia virginica*, *Leucophytus Brownii*, *Morina persica*, *Sylphium albidiflorum*, *Romneya Coulteri*, &c., but many of the plants were not in good condition. The *Gladioli* of Herr WILHELM PRETZER, of Stuttgart, were very fine and showy; and, from Florence, the ÉCOLE ROYALE D'HORTICULTURE sent a collection of varieties of *Anthurium hybridum* obtained from seed. The ÉCOLE CANTONALE D'HORTICULTURE had a fine show of *Nepithes* and foliage plants, and there were two other good lots of handsome foliage plants. The table decorations were very poor and ill-arranged, and the few water plants, which occupied the centre of the hall, were spoilt by being

Mrs. S. WOOD, Moorfield, Glossop, showed a group consisting of well-grown Cattleyas and hybrids. Cattleya \times Miss Barney, and C. bicolor \times C. Eldorado each received an Award of Merit.

Messrs. KEELING & SONS, Bradford, showed a number of choice Cypripediums. C. \times Lily Measures, C. Dourdanense, and the rare *Odontoglossum bictonense* var. album received Awards of Merit. (Bronze Medal.)

SHEFFIELD CHRYSANTHEMUM.

SEPTEMBER 17, 18.—This Society holds two exhibitions annually. The early show took place on these dates in the Corn Exchange. The schedule included only 19 classes, of which two were open to any exhibitor, the others being restricted to members of the Society. The display of flowers, fruits and vegetables was an exceptionally good one. Nearly 100 exhibits were staged, including many handsome non-competitive groups displayed by nurserymen. Gold Medals were awarded to Messrs. W. R. ARTINDALE & SONS, Sheffield, who exhibited a very large collection of flowering plants, including Gladioli, Dahlias, early-flowering Chrysanthemums, &c.; Messrs. SEAGRAVE & Co., who displayed early-flowering Chrysanthemums, Dahlias, and ornamental plants; Messrs. SUTTON & SONS, Reading, for an attractive stand of flowers, fruits and vegetables; Messrs. DOBBIE & Co., Rothesay, who exhibited Dahlias and Potatoes; and Messrs. R. PROCTOR & SON, Chesterfield, for a display of Roses in more than 100 varieties. A Bronze Medal was awarded to Messrs. PENNELL & SON, Lincoln, for an exhibit of Dahlias, Gladioli and other flowers.

In the competitive classes the best collection of cut flowers arranged for effect, occupying a table space of 30 feet by 3 feet, was shown by Messrs. SEAGRAVE & Co., the 2nd prize being awarded to J. J. WHEAT, Esq. This last-named exhibitor secured the 1st prizes for a collection of vegetables, a collection of fruit, and a collection of cut flowers respectively.

The class for a collection of vegetables was open to all, and in this Mr. WHEAT, who won the 1st prize, was followed by Mr. W. BARKER.

Early-flowering Chrysanthemums were best shown by Mr. J. HARRISON, Mr. WHEAT gaining the 2nd prize in this class.

Mr. W. GREEN showed the best six vases of early-flowering Chrysanthemums in not fewer than four varieties, and in this class Mr. W. CARNALE was placed 2nd.

Mr. CARNALE, however, excelled in all the classes for Dahlias, having the best 12 Show or Fancy Dahlias, the best 12 blooms of Cactus Dahlias in not fewer than six varieties, and the best six bunches of Pompon varieties.

The Brincliffe Challenge Bowl, presented to the Society by H. Atkin, Esq., and offered for the best-kept cottage or allotment garden, was won by Mr. SHAW.

There was also a prize for the best-kept flower garden. In this case the prize was won by Mr. J. BINGLEY.

NATIONAL DAHLIA. TRIAL OF POMPON DAHLIAS.

SEPTEMBER 22.—Thirteen members of the Committee visited Mr. Charles Turner's nursery at Slough, on the above date, to inspect the trial of Pompon Dahlias. The number of varieties inspected was 75. The Committee considered their value from a garden as well as from an exhibition point of view. The maximum number of marks obtainable in each case was three, so that a variety could gain six marks if it had the best qualities of a garden, as well as a show, flower. Eighteen varieties obtained three marks for garden decoration, and 14 for exhibition value. Only six of this number obtained six marks. The following obtained three marks for garden decoration: Daisy, amber, shaded orange; Darkest of All, maroon; Falcon, orange-yellow, tipped with scarlet; Iris, amber and fawn; Isabel, orange-scarlet; Mars, bright scarlet; Montague Wootton, white, heavily edged with crimson lake; Nerissa, soft rose; Portia, deep mauve; Ideal, yellow; Romulus, crimson-lake; Silvia, edged with rose; Tommy Keith, crimson, tipped with white; Vara, yellow; Virginale, pure white; Whisper, clear yellow, edged with red; White Aster, pure white; and Gerlina, crimson-maroon. Of these, Tommy Keith, Nerissa, Montague Wootton,

Falcon, Daisy and Ideal also obtained three marks as exhibition varieties. Others that were awarded three marks for the same quality were Adela, Nellie Bromhead, Hecla, Cyril, Clarence, Douglas, Adelaide, and Edith Bryant. The wet season caused the growth of the plants to be unusually robust. Each variety was represented by six or more plants.

SOCIÉTÉ POMOLOGIQUE DE FRANCE AT NANCY.

SEPTEMBER 28.—The Pomological Society of France, whose yearly meetings are held in various parts of that country, this year chose Nancy as their venue, and the show was made in the grounds of the exhibition now being held there. Though Nancy is not among the great fruit districts of France, except in respect of the Vine, the show was not what might be expected from this Society or from French cultivators; indeed, the locality was but poorly represented. The finest collection of fruit was that sent by Messrs. NOMBLOT-BRUCNEAU, of Chatenay. There were Pears shown as we expect to see them in France, and Apples, too, were good, the new variety Jean Hardy being especially well shown. This is an Apple which should do well in England and make a valuable addition to our exhibition fruits. The show included many collections of Dahlias, but not of the quality we are accustomed to see in England. Perhaps the only exhibit which would have arrested attention at the Horticultural Hall at Westminster were the superb Gladioli shown by Messrs. LEMOINE ET FILS. A noticeable feature of this show, as of so many French exhibitions, was the lack of amateur support, which is much to be regretted.

ANSWERS TO CORRESPONDENTS.

APPLE: *Belvedere*. You should have sent the fruit without cutting it. We do not, however, think there is any disease present. The superficial mould developed after the fruit had become split.

BANANAS: *F. S.* The Banana is cultivated in only a very few gardens in this country. The plant requires a warm, lofty house and plenty

FIG. 106.—PEAR SLUG-WORM AND CHERRY SAWFLY.

A, maggot; B, chrysalis. (The lines indicate nat. size.)

of room for the development of its large leaves. It fruits in two or three years from the sucker. We think the story you mention is very unlikely to be true.

CELERY DISEASED: *W. H. S.* The plants are affected with root-rot, caused by *Sclerotinia sclerotiorum*. The fungus is present in the soil, which should be treated with lime. No disease is present in the Pelargonium.

CYCLAMEN UNHEALTHY: *Mayo*. The damage has been caused by thrips. Dip the plants in, or syringe them with, tobacco water.

DAFFODIL BULBS UNHEALTHY: *A. J. B.* The injury is caused by the bulb-mite. Apply lime to the infected soil.

FAIRY-RINGS IN GRASS: *T. M. N.* See reply to *F. G.* in the issue for September 11, p. 192.

FILBERT: *J. W. P.* The holes appear too large for the nut-weevil; one of the cavities is large enough to suggest mice as the cause. The nut-weevil is *Balaninus nucum*. In autumn the maggots leave the nuts and bury themselves in the ground, to appear as perfect insects about May or June. If you shake the trees on quiet evenings in May or June many of the weevils will fall to the ground and can be caught on paper coated with tar or some other sticky substance. Scrape the top layer of soil from beneath the trees and burn it.

LOBELIA DISEASED: *J. M.* A fungus—*Theilavia basicola*—has attacked the roots. Treat the soil with lime.

NAMES OF FRUITS: *F. C. P.* The Pear was rotten when it reached us.—*Bristol*. Colonel Vaughan.—*H. M.* Pear Souvenir du Congrès, Apple Norfolk Dumpling.—*O. M.* 1, Your fruit much resembles Lord Grosvenor; 2, Northern Greening.—*W. P. H.* Peasgood's Nonesuch.—*S. J. H.* Plum Decaisne.

NAMES OF PLANTS: *S. McG. & Sons*. *Acer rubrum*.—*T. K.* *Polygala myrtifolia grandiflora* (syn. *Dalmaiana*).—*W. B.* *Helxine Soleirohii*.—*J. F. M.* *Sedum maximum*; *Solanum jasminoides*.—*F. C. P.* 1, *Gentiana asclepiadea*; 2, *Euphrasia officinalis*; 3, *Sanicula europea*.—*F. E.* 1, *Fagus sylvatica incisa*, cut-leaved Beech; 2, *Lycostera formosa*; 3, *Olearia Haastii*; 4, *Ptelea trifoliata*, illustrated in the *Gardeners' Chronicle*, September 29, 1894, p. 375; 5, *Cratægus Pyracantha*; 6, *Choisya ternata*.—*O. R.* 1, *Oncidium flexuosum*; 2, *Cattleya Harrisoniana*; 3, *Masdevallia simula*; 4, *Liparis longipes*; 5, *Octomeria diaphana*; 6, *Selaginella umbrosa*.—*Surridge*. 1, send when in flower; 2, *Sempervivum tortuosum variegatum*; 3, *Ruellia Portellæ*; 4, *Gesneria elongata*; 5, *Maranta Massangana*; 6, *Chlorophytum elatum variegatum*; 7, probably a drawn-up specimen of *Poa trivialis variegata*; 8, probably *Cosmos bipinnatus*, no flowers.

PEAR SLUG: *A. B.* *Epping*. The sawfly (see fig. 106) lays its eggs just under the upper surface of the leaves of the Cherry and Pear, in June or perhaps earlier. The slug-worms, which are covered with a greenish secretion, when about six weeks old cast their green or blackish-looking coats and appear as buff caterpillars free from slime, being smooth and transversely wrinkled. These caterpillars go down into the ground, spin a cocoon, and from these the sawflies emerge in the following summer. The larvae feed on the upper surface of the leaves, which, in some instances, they remove entirely, leaving the Pear or Cherry leaves as skeletons. Dust the slug-worms over with quicklime or gas-lime. The first application they will throw off by exuding a coating of slime, but they cannot continue doing this, and if a second application is made soon after the first it will kill them. The trees may be syringed with strong soap-suds or tobacco water, or with water containing 2 lbs. of soft soap and a peck of lime to each 30 gallons of water. Following a severe attack, the surface soil should be removed during winter to the depth of 3 or 4 inches. This will contain a very large number of cocoons, and should be burned or buried deeply with some quicklime or gas-lime. Vaporite might be inserted in the soil in autumn, if the soil cannot be removed. Many of the sawflies may be caught by shaking the trees in the evening over a freshly tarred board or cloth.

ROSE LEAVES DISEASED: *S. M'G. & Sons*. The fungus causing the injury is the second stage of the Rose rust—*Phragmidium subcorticatum*. The first stage appears as yellow, powdery spots on the stem and leaves, and should be sprayed with potassium sulphide solution—1 ounce in 3 gallons of water. Collect and burn all diseased sprays.

TO DESTROY WORMS IN A LAWN: *W. W.* Dissolve $\frac{1}{2}$ ounce of corrosive sublimate (poison) in 15 gallons of water, and apply it over the lawn. Take care that poultry does not eat the dead worms. Another plan is to mix a peck of freshly-made quicklime in 40 gallons of water, allowing it to stand until clear, and then apply the liquid from a rose watering-pot.

TOMATOS: *Broughton*. The discoloration of the fruits is due to an absence of potash in the rooting medium. No disease is present. Dress the soil with sulphate of potash.—*B. T. A.* The plants are affected with Tomato-canker, caused by a fungus—*Mycosphaerella citrullina*. An account of this disease is given in the issue for September 11, p. 186. It is recommended to spray the plants with the Bordeaux mixture.

HARDY HEATHS.

IN their excessive appreciation of exotic plants horticulturists are apt to overlook many beautiful species in our own British flora. Amongst these are the Heath and Ling, which adorn hill and moor with their conspicuous masses of colour. In districts where these plants abound in a wild state, the cultivation of the native species is unnecessary. Even in such places, however, the many beautiful varieties and several hybrids should receive attention, together with other hardy species not found wild in the British Isles, for they exhibit great variation in form in the colour of the flowers; rivalling indeed the Heaths of the Cape of Good Hope.

In a wild state Heaths are confined to peaty soil; but, provided the ground is fairly free from lime, it is not difficult to establish them in the wild garden, pleasure grounds, or in open spaces in the woodland, planting bold masses which, when in bloom, last for a long time and form an imposing display. A Heath garden, or one devoted mainly to these plants, can be made a very interesting and singularly beautiful spot, for though, as may be readily seen from the appended notes descriptive of the various species, the chief displays are in spring and autumn, one or two of them may flower even in mid-winter.

The soil need not be deeply dug when preparing it for Heaths: the principal point is to bury any grass that may be present sufficiently deep to prevent it growing the following year. The "Creeping Couch" or "Couch Grass" (*Triticum repens*) is the worst enemy in this respect, and as far as possible it should

be picked out and burnt. Leaf-mould or peat, if available, may be dug in with advantage when preparing the ground. Subsequent top-dressings of leaf-mould for two or three years after planting will also be beneficial.

In gardens where lime is present in the soil, beds of Heath may be made by digging out a good depth of the soil, say, about 18 inches to 2 feet, and replacing it by peat and leaf-mould. The plants, however, must not be artificially watered unless with water taken from a rain-water tank, because there may be much lime in the ordinary water of the district.

Heaths are readily propagated by means of seeds, cuttings, and layers. Preference is usually given to cuttings, which, as a rule, make the best plants. August and September are the most suitable months to insert them. They may be rooted in pots in a close propagating frame with a little bottom heat, or under hand-lights outside. Convenient pots to use are 5-inch (48 size). Fill these at least half full of drainage, cover the drainage with a layer of rough peat, making it up with finely-sifted sandy peat, pressed very firm, and over this place a layer of sand. The most suitable cuttings are the points of the semi-mature, small side-shoots clothing the stems. These may be about an inch in length, and should be inserted fairly close together and firmly in the pots. When rooted, which should be in from six weeks to two months, the pots may be placed on a light shelf in a cool greenhouse, and transferred later to a cold frame. April is a good month for planting the rooted cuttings in a prepared nursery bed, set out 3 inches between the plants and 6 inches between the rows. The young plants should be shaded from sun till established in the new soil. To induce the formation of dwarf, bushy specimens, the points of the shoots should be removed several times during the growing season. The following spring the plants should be again moved, either transferring them to their permanent quarters or, preferably to the nursery for another year, giving them more room to grow. Each plant should be lifted with a good ball of soil adhering to the roots, it being useless trying to establish Heaths with little or no soil attached to the fibrous roots. But when once established, they require very little attention. In beds and conspicuous positions the plants look more shapely and tidy if the old flower-heads are cut off when the blooms fade.

E. ARBOREA (the Tree Heath).—The species is a native of the Mediterranean region and the Caucasus, and was introduced in 1658. In favourable localities specimens sometimes grow 15 feet or more in height. In the London district it is slightly tender: thus, the points of the taller growths were cut back by frost last winter. At Kew, *E. arborea* forms a bush some 4 feet to 6 feet in height. The flowers appear during March, April, and May, and are of a delightful fragrance, suggesting Vanilla or Hawthorn. The variety *alpina* is a native of the mountains of Cuenca, Spain, and grows at an altitude of 4,000 to 5,000 feet. It is a very distinct plant from the type and quite hardy, flowering a little later than the type. Very upright and stately in habit, it gives promise of making a useful lawn specimen. The foliage is a rich green, and the flowers white.

E. AUSTRALIS.—Although introduced into this country in 1769, this is by no means a common plant in gardens. Last winter the young shoots were badly cut in some districts, but the tall, woody growths were not harmed, and by June the plants were beautiful and green. In habit they are inclined to be straggling, hence the young plants should be pinched frequently. The leaves are dark green, the flowers red, produced during March and April. The species grows 4-6 feet high, and it is a native of Portugal.

E. CARNEA is a common plant on the mountain ranges of Europe. It is said to have been first introduced to this country from Germany in 1763. The plants are dwarf in habit, 6 inches being about the average height. The leaves are disposed in whorls, the flowers pale red and pendulous, appearing from January to May. This is one of the first plants figured in the *Botanical Magazine*, tab. 11 being devoted to it. A common nursery name for this plant is *E. herbacea*. A white-flowered form is named *alba*.

E. CILIARIS.—This is a common species in South-western Europe, and it is also plentiful on several of the Cornish Heath-lands and in Dorsetshire. The stems are thin and straggly, the plant about a foot high, and the ciliated leaves rich green. The red flowers are terminal and produced from June to October, being especially beautiful in July. *E. Mawiana*, of nurseries, and a native of Portugal, is considered by botanists to be a variety of *E. ciliaris*. Flowering from July to October, this is undoubtedly one of our best Heaths. Compact in growth, the rich purplish-crimson flowers are larger than those of the type.

E. CINEREA.—In company with the Ling (*Calluna vulgaris*) this is the Heath so commonly met with on the moors of the British Isles and in Central and Western Europe. The flowering season is August and September. The height varies from 6 inches to a foot. The drooping reddish-purple blossoms are borne in whorled, leafy clusters. There are numerous varieties, differing chiefly in the colour of the flowers. *Alba* is sometimes found growing wild; in the garden, when planted in masses, it forms a perfect sheet of white in August and September. *Alba minor* is a small-growing form, with a lesser number of flowers in each raceme and brighter green leaves. *Atrosanguinea*, deep red, and *coccinea*, bright red, are beautiful varieties, but unfortunately not over-robust in growth. *Purpurea* and *rosea* are similar in habit to the species *rosea* being the brighter in colour.

E. LUSITANICA.—The common name of this species in gardens is *E. codonodes*, Lindl., under which name it is figured in the *Gardeners' Chronicle*, 1877, vii., 463, fig. 70. *E. polytrichifolia*, Salisb., is a second synonym. In severe winters the taller shoots are usually cut by frost, but the plants soon recover. This is a spring-flowering species, with white blossoms, which in the bud state are tinted with pink. In habit it is upright, forming a very handsome and striking specimen not unlike *E. arborea*. It is a native of Spain and Portugal, and with us it grows from 4 feet to 5 feet in height. Under more favourable conditions it would no doubt grow much taller. *A. O.*

(To be continued.)

ORCHID NOTES AND GLEANINGS.

BULBOPHYLLUM SAUROCEPHALUM.

OUR illustration, which was taken from a specimen that flowered in Sir Frank Crisp's collection at Friar Park, Henley-on-Thames, represents this curious Philippine Bulbophyllum, which was described by the late Professor Reichenbach in the *Gardeners' Chronicle*, 1886, vol. ii., p. 262, and has frequently appeared in gardens since it was shown by Mr. James O'Brien at a meeting of the Royal Horticultural

swollen rachis, along which the flowers are arranged, closely pressing against it. In the species illustrated, the rachis is of a reddish-claret colour, the flowers being whitish, marked with rose-purple. It is a very free-growing plant if placed in an intermediate house, and it is highly probable that all the specimens in cultivation have been derived from the plant originally imported. The genus *Bulbophyllum*, including *Cirrhopetalum*, is one of the most varied and singular in the whole of the vegetable kingdom. Several leading Orchidists pride themselves on their collections of these plants, and only those

that the inflorescence is decurved and not erect, as shown in the drawing. Sir Frank Crisp informs us that his plant bore four inflorescences.

Other and showier sections of *Bulbophyllum* include the large hooded *B. grandiflorum*, and a number of large and pretty Malayan species, which have from time to time been illustrated in the *Gardeners' Chronicle*.

The *Cirrhopetalum* section is the most elegant, the flowers being arranged in parasol-like umbels, with some of the segments fringed.

MILTONIA VEXILLARIA RUBELLA.

THIS pretty variety has smaller flowers than the type. They are a bright rose tint and are produced later than those of the large-flowered kind. Several specimens, each with five or six flower-spikes, are in bloom in the gardens of Mrs. T. F. Blackwell, The Cedars, Harrow Weald (gr. Mr. J. Dinsmore). They are effectively arranged with other Orchids, including the deep mauve-tinted *Cochlidia vulcanica*, the orange-coloured *Epidendrum vitellinum*, specimens of *Cattleya Gaskelliana* and a tall plant of the showy *Dendrobium calceolaria* with five spikes of its large creamy-buff flowers, the slipper-shaped, pale-yellow lip having deep claret-purple blotches on each side.

NEW OR NOTEWORTHY PLANTS.

DECUMARIA BARBARA.

(See Supplementary Illustration.)

DECUMARIA is related to *Hydrangea*. Only two species are known, namely, *D. barbara*, a native of the Southern United States, and *D. sinensis*, which Dr. Henry discovered in Ichang, China, as a "creeper, hanging down from the wall of a cliff in the Ichang gorge, with beautiful clusters of fragrant, white flowers." Both species have opposite, entire leaves and stems which cling and climb by means of rootlets exactly like Ivy and *Hydrangea scandens*. *D. barbara* often ascends trees to a considerable height. Although introduced into British gardens more than a century ago the North American species is scarcely known in cultivation, and this may be due to its tenderness, for it does not thrive out-of-doors in the neighbourhood of London without some protection. At Kew it is happy in the temperate house, and it is also grown in Messrs. Veitch's Coombe Wood nursery. The specimen figured in the Supplementary Illustration is from the garden of Mr. Gumbleton, where it flowered for the first time on an open wall in July of this year. The flowers are white and fragrant. The fruit is a turbinate, ribbed capsule containing numerous small seeds and an abundance of very minute acicular raphides lying loose among the seeds. The purpose of these raphides is not evident. The close relationship between *Schizophragma* and *Decumaria* was pointed out by Asa Gray, the main difference between them being in the flowers, which are all uniform and fertile in *Decumaria*. Mr. W. G. Smith has shown the flowers in section, and also the rootlets with their viscous sucker-like tips. The Chinese species does not appear to be in cultivation. W. H.

LILIUM YOSHIDA.

ABOUT four years ago Herr Max Leichtlin flowered a Lily which he had raised from seeds obtained from the Philippines, and which he thought sufficiently distinct to rank as a new species. He therefore named it in compliment to Mr. S. Yoshida, Secretary of the Horticultural Society of Tokio, who procured the seeds for him. The seedlings made rapid growth, and in their second year one plant had three stems

FIG. 107.—BULBOPHYLLUM SAUROCEPHALUM, FROM SPECIMENS SUPPLIED BY SIR FRANK CRISP: FLOWERS WHITISH, MARKED WITH ROSE-PURPLE.

Society on April 24, 1894, when it was accorded a Botanical Certificate.

Bulbophyllum saurocephalum belongs to the clavatum group, based on *B. clavatum* (Thouars), originally found in the Mascarene Isles, but more recently in the West Indies, from which specimens it was renamed by Griesbach *B. pachyrhachis*. Several other species of the group are known, there being a very strong resemblance between them in general appearance. The characteristics of the group are the curiously

who have actually given way to the hobby can appreciate the great amount of interest and pleasure to be derived from the pursuit.

B. saurocephalum is one of the least showy species, yet the examination of the arrangement of its curious flowers, somewhat resembling an alligator's head, repays the trouble, and after the flowers have passed, the appearance of globular seed-capsules, occasionally introduces another phase, the dark-coloured flower-stem remaining fresh for a considerable time. It should be said

bearing 15 flowers. The following year it had 22 flowers. It was grown in a frame, from which frost was excluded, and appeared to be biennial and evergreen. Several plants of this Lily have recently flowered at Kew, and I see no material difference between them and *L. philippinense*, of which a figure and description by Mr. Baker were published in the *Gardeners' Chronicle*, 1875, p. 114. There is also a figure of it in the *Botanical Magazine*, t. 6250 (1876). This plant was introduced from the Philippines by Messrs. Wallace, of Colchester, and first flowered by Messrs. Jas. Veitch & Sons, in 1875. Although it is said to grow at a considerable elevation, under cultivation here it has proved too tender to live out-of-doors. Probably, now that the Philippines are better known, this fine Lily will be found widely distributed and exhibiting some amount of variation. The type comes near *L. longiflorum*, but it has smaller bulbs, thinner stems and narrower leaves than any form of that species. The flower also is longer and narrower in the tube, and it is more elegant. The plants which have recently flowered differ from that figured in the *Botanical Magazine* in their flowers being tinged with red on the ribs of the tube, but they are produced singly on the stems, although the plants flowered at Baden Baden had several flowers on a stem. It would be worth the while of some enterprising collector to send home a big consignment of the bulbs of this Lily from the Philippines. It ought to be hardy in the warm parts of the British Islands. W. W.

NEW GARDEN WORMS.

In the *Gardeners' Chronicle*, March 12, 1904, p. 161, I gave an account of certain annelids which I had received from the Botanical Gardens at Oxford. Among them was a new variety of *Allobophora veneta* which I named *tepidaria*. Having recently had occasion to examine the earthworms found in other gardens in different parts of the country, I am able now, not only to extend my remarks respecting the various forms which this very polymorphic annelid assumes, but also to report on the discovery of certain other species and varieties.

I purpose, in the present contribution, limiting myself to one species with its various sub-species or varieties. In the year 1886 Dr. D. Rosa published an account of the earthworms of Venice, and among them he described a new species under the title *Allobophora veneta*. About the same time I found a similar worm in Ireland, and named it *A. hibernica*. The two differed in certain details, and as Dr. Rosa was before me in point of time, the Irish worm was regarded as a variety of the Venetian one. In 1904 a second variety was discovered at Oxford, and more recently a second variety in Ireland. But up till the present year no trace of the typical form had been found in England. Now, however, I am able to record that not only does the type occur in our gardens, but two other very strongly marked varieties or sub-species which are new to Britain, if not to science.

I had occasion during the past summer to visit Kew Gardens, and was able to secure from the Director and some of the staff ready promises of help in my pursuit. As a result, a fine collection of annelids from the Frame House reached me on September 5, and among the different species represented was the type of Rosa's Venetian worm. As Rosa's account is in Italian, and is not accessible in England, I give a summary of his diagnosis, in order that we may the better understand the character of the variations which we find in the other English forms. *Allo. veneta*, Rosa, as found in the Campo di Marte, is from 50 to 70 mm. (or 2 to 3 inches) long when preserved in alcohol, and numbers from 120 to 150 segments. It is 5 mm. broad, and almost exactly resembles the well-known *Brandling* (*Allo. fortida*) in colour, shape and size. The male pores on segment 15 are visible on small papillae, the girdle normally extends from

the 27th to the 35rd segment, and there are special organs (tubercula pubertatis) on segments 30 and 31. The worm is exceedingly agile, and emits a yellow fluid from the dorsal pores.

The other details, relating to the disposition of the setae and the internal organs, are of interest only for systematic purposes, and need not be translated. It will, however, be seen that in certain points there seems to be a close affinity between the Venetian worm and the *Brandling*. On the other hand, it bears a close resemblance to another species known as the Alpine worm (*Allo. alpina*, Rosa); but the English forms have never hitherto recalled the *Brandling* until I received the type from Kew. It must be admitted that a well-developed specimen is an exceedingly graceful worm, but the colour bands are not so distinctly marked in the English form of *A. veneta* from Kew as in the *Brandling* and in the Continental type.

Among the specimens from Kew there was a good deal of variation, and one of the number almost exactly corresponds with a sub-species, which I shall now proceed to describe. I obtained, a few days ago, a good collection of worms from St. James's Gardens, West Malvern, and among them were about a dozen specimens of a worm which was new to me. For some time I found it difficult to determine whether or not it was one of the forms of *Dendrobæna*; but repeated examination has led me to the conclusion that it is a new and very strongly marked form of *Allo. veneta*. On account of its striking resemblance to a worm which has been known as *Dendrobæna arborea*, I have named it *Dendroidea*, as being the best term to express the fact that it resembles *Dendrobæna* or the tree worm.

This new variety is about 35 mm. (or 1½ inch) long in alcohol, and 3 mm. at its widest part. When alive and fully extended it may reach as

FIG. 108.—A NEW EARTHWORM.

Allobophora (*Eisena*) *veneta*, Rosa: new sub-species *robusta*, from specimen preserved in alcohol. Should be 5 less in diameter.

much as 3 inches. It has the warm brown colour of the *Dendrobænas*, with a light girdle and a somewhat octohedral tail. The girdle usually extends over seven segments, and the tubercula pubertatis, which are normally on segments 30 and 31, sometimes cover a part of the adjacent segments, and so make the resemblance to other worms all the more striking.

Along with these worms I found a large number of another which must also be referred to the same species, but are so unlike any of the other forms I have ever seen that I have named it *robusta*. In alcohol it is about the same length as the last, but is nearly twice as stout, being 5 mm. in width. When alive, it is a far more delicate-looking worm than the other forms, has a flesh-coloured head, and a body which is wanting in the brown colour of the *Dendrobænas*. In alcohol it resembles *Allo. rosea*, but it differs from that worm in having the girdle segments well compacted on the dorsal surface. In *Allo. rosea* they are distinct, and the dorsal pores are very conspicuous. The worm has an under surface similar to that of the *Brandling*, and when two specimens are engaged in impregnating each other's ova, they form a knot which is so complete that the bodies are lost in each other's embrace, and cannot be distinguished the one from the other.

I cannot here discuss the problems which are raised by such facts as I have just adduced. They will be considered elsewhere, but it will help to present the matter in a clearer light if I close with a brief summary, setting forth the main points of difference.

The English forms of *Allo. veneta* now known are four in number, in addition to the two found in Ireland.

1. *Allobophora* (*Eisena*) *veneta*, Rosa.—The type found at Kew in the Frame Houses, September 2, 1909. Colour like the *Brandling*, 50 to 70 mm. long and 5 mm. in diameter in alcohol. Widely distributed in Europe, but subject beyond most annelids to great variation.

2. *Allo.* (*Eisena*) *tepidaria*, Friend.—Found at Oxford in January, 1904, and described in this journal. Girdle limited to four segments, 29 to 32, length in alcohol 40 mm., with a diameter of 2 to 3 mm.

3. *Allo.* (*Eisena*) *dendroidea*, new sub-species, closely resembling *Dendrobæna arborea*.—Shorter than the last, as that is shorter than the type, but similar in diameter. Colour in alcohol brown on the dorsal surface, lighter underneath. Found at Kew and at West Malvern.

4. *Allo.* (*Eisena*) *robusta*, new sub-species (see fig. 108).—Quite distinct in appearance, both when alive and in alcohol, from the others. Length in alcohol 35 to 40 mm., with a diameter of 5 mm. A very robust appearance in spirits, though the worm is more delicate-looking when alive, and much less active than the last. Plentiful at St. James's Gardens, West Malvern.

Should readers of this article be interested in the subject they are invited to send collections of annelids to the writer in tin boxes with damp moss, and any particulars respecting locality, soil, distribution, frequency or the like, which might prove of value for purposes of identification. *Hilderic Friend, St. Asaph, Malvern.*

THE ROSARY.

NEW POLYANTHA ROSES.

APPLE BLOSSOM (Schmidt).—This variety is a profuse bloomer, exceptionally well suited for forcing, ordinary pot culture, and as a bedder. The flowers are double, and of the pretty shade indicated by the name; they are freely produced in clusters. In form and size they somewhat resemble those of the well-known *Crimson Rambler*, the petals being rather short and rigid. The plants may be induced to yield several crops of flower throughout spring and summer by removing the withered flowers and inducing fresh growths. Every shoot produces blooms, as is also the case with many others of its class, such as *Baby Rambler* (Mme. N. Levassieur), *Baby Dorothy Perkins* (Maman Levassieur), of which *Apple Blossom* is said to be a sport, and Mrs. W. J. Cutbush.

PRINCESS ENA.—This variety is stated to be a sport from the *Baby Crimson Rambler*. Its single flowers, about 1 to 1½ inch in diameter, are produced in clusters. They are of a deep rose colour on first opening, but quickly pass to a dull, pink shade, and showing to a marked degree the plum colour so noticeable in the flowers of its parent when in an advanced stage. The flowers of this new variety are of short duration.

BIRDIE BLYE (Conrad Jones & Co.).—A variety of the *Rambler* type, with large, pale green foliage, and producing sparingly, on long, slender stems, rather large, double, rosy-carmine flowers, that possess the scent so marked in the old-fashioned *Roses*. The clusters of blooms are usually composed of three, four and sometimes five individual flowers, each about 2½ inches in diameter. The texture of the petals is slightly flimsy, and likely to suffer from scorching.

VEILCHENBLAU.—This variety has been described as a blue *Rose*, but the colour is a shade of rich, reddish purple. It is an exceedingly vigorous-growing *Rose* of the *Rambler* type. The flowers are semi-double, about 1½ inch in diameter, and they are borne in loosely-arranged sprays of 8 to 10. In the bud state the colour is crimson, and it is only when the flowers are fully expanded that the presence of the purplish blue tint is detected. The habit of the plant is strong;

the shoots being inclined to be rigid and perhaps a trifle coarse. Its distinct colour should place it in demand amongst lovers of Pillar Roses. It is of German origin, and the raiser fails to give any clue as to its parentage.

BUTTERCUP (W. Paul & Sons).—A free-growing climber, with large, glossy, green, leather-like foliage. Its single flowers are of a rich yellow colour when forced, but they are said to be almost orange coloured in the early stages, gradually passing to cream when grown under cool treatment. The sprays are somewhat long and thinly studded. The individual flowers measure about $1\frac{1}{2}$ inch across. *W. M.*

THE PATRINIAS.

The Patriniæ are erect, glabrous or hairy perennials, belonging to the Valerian family. Their chief habitat is Central and Eastern Asia, although some are found in Japan. There are about 10 species known to science; but the majority are not of great interest as garden plants, and only five or six are in cultivation. Like the Valerians, they all grow in damp or shady situations, and prefer a light, rich soil. The oldest species in cultivation is the yellow-flowered *P. sibirica*, which was grown in gardens about 150 years ago; the latest introduction is *P. palmata*, a Japanese species (see fig. 109). All the Patriniæ may be cultivated with ease and will grow well in any shady border. Propagation may be effected by means of seeds and division of the roots.

P. INTERMEDIA (SYN. *P. RUPESTRIS*).—This is one of the prettiest flowered species, a native of Siberia and Eastern Asia. It is figured in the *Botanical Magazine*, t. 714, as *Valeriana sibirica*, and has been in cultivation since the beginning of the last century. The plant attains to a height of about 1 foot to $1\frac{1}{2}$ foot, and has pinnatifid leaves with lanceolate segments and a large terminal lobe. The corymbs of fragrant, yellow flowers are produced in May and June.

P. PALMATA (see fig. 109).—This is a low-growing, spreading plant, 6 inches to 1 foot high. It is found in the central mountains of Japan at an elevation of 2,000 feet to 7,000 feet, mostly in shady, moist places. As the specific name implies, the leaves are palmate; they are nearly all radical. The flower-stems bear corymbs of numerous, fragrant, golden-yellow flowers. These appear in July and August. The plant illustrated is growing on the edge of a bog garden. Seeds of the species were received at Kew Gardens from the Tokio Botanic Garden, in 1906, and plants flowered for the first time in this country in July of last year. *Patrinia palmata* is quite hardy in sheltered places.

P. SCABIOSÆFOLIA.—In general habit and form of leaves this plant greatly resembles our native *Scabiosa arvensis*. Both *P. intermedia* and *P. palmata* are glabrous, but *P. scabiosæfolia* has a pilose stem, the pinnatifid leaves being also hairy. The plant is strong-growing, reaching a height of 2 feet. The loose corymbs of white flowers are developed in May. The species has a wide distribution, being found in Northern Asia, China, and Japan.

P. SIBIRICA.—Although this species was the first of the genus introduced into this country (it is figured in the *Botanical Magazine*, t. 2325, as *Valeriana ruthenica*), it appears to have gone out of cultivation. It comes from the Altai mountains in Siberia. The stems are glabrous and grow about 1 foot high; the radical leaves are spatulate and almost entire; the cauline foliage is partly pinnatifid. The small, golden-yellow flowers are borne in close corymbs and possess a Jessamine-like fragrance.

P. VILLOSA.—This is the coarsest-growing member of the genus, reaching a height of between 2 feet and 3 feet. The stem and lobed leaves are thickly covered with stiff hairs. The plant is a native of China and bears loose corymbs of whitish flowers in summer. *W. L.*

TREES AND SHRUBS.

SHRUBBY HYPERICUMS.

The Hypericums flower during late summer and early autumn. They are easy to grow, provided that they are not disturbed frequently. It is, however, a good plan to renew the plants as soon as they show signs of exhaustion, rather than try to coax worn-out plants back to health, for most of the species are easily increased by means of cuttings in summer, whilst others may be propagated from seeds which usually set freely. An annual cutting back in spring is necessary with most species, care being taken at the same time to remove any old wood that can be spared. Hypericums rejoice in good loamy soil and like a position shaded from the midday sun, whilst a few species may be used advantageously in positions where the shade is moderately dense.

The numerous species are widely distributed in Europe, Asia, and North America, whilst some are also found in North Africa. Considerable difference is noticeable in habit.

inch across and noticeable by reason of their pale yellow petals and golden-coloured stamens. The leaves are distinct, being oblong and about $2\frac{1}{2}$ inches long by half an inch in width.

H. BUCKLEYI is a charming little plant for the rockery. Growing 6 to 9 inches high, it forms a pretty little clump with tiny leaves and golden-coloured flowers of moderate size. It inhabits the mountainous regions of North and South Carolina and Georgia.

H. CALYGINUM is well known as an excellent carpeting plant for shady places, whilst it also thrives in moderately open situations. A native of Europe, it is sometimes found wild in Britain, and, like *H. Androsæmum*, is known by the common name of "Tutsan," whilst it is also sometimes referred to as the "Rose of Sharon." It grows but 9 to 12 inches high, suckers freely, and rapidly forms a large mass. The flowers are golden in colour, with reddish anthers, and are about 3 inches across.

H. DENSIFLORUM.—This North American species is a neat-growing plant of rather com-

FIG. 109.—PATRINIA PALMATA: FLOWERS YELLOW.

for, whilst some grow into large, dense masses 3 or 4 feet high, others form dainty little plants suitable for special places in the rock-garden. In the following notes those species only are mentioned which are of garden value.

H. ANDROSÆMUM.—A strong-growing species of good habit, growing $1\frac{1}{2}$ to $2\frac{1}{2}$ feet high and suitable for the shrubbery or wild garden. It may be distinguished by its oval leaves, which are about $2\frac{1}{2}$ inches long and $1\frac{3}{4}$ inches wide, large heads of yellow flowers, each flower being about 1 inch across, and black fruits, which ripen during September and October. The fruits are distinguished from those of other Hypericums by being fleshy. During the process of ripening they turn from green to red before assuming the black colour of the ripe fruit. This European shrub is known under the common name of Tutsan.

H. AUREUM is a native of the southern United States. It is of moderately-strong growth and attains a height of 3 feet. The blossoms appear in August and September. They are from 1 to $1\frac{1}{4}$

feet high. The leaves are small and linear; the flowers rich yellow, less than 1 inch across and borne in great profusion. This plant requires less pruning than the strong-growing kinds; in fact, little more than the removal of the dead flower-heads.

H. ELATUM.—As is the case with a great many of the species, this has been known under a variety of names, and nine synonyms are recorded. It is one of the showiest of the large-growing set and forms a bush 3 to 4 feet high. The flowers are 1 to $1\frac{1}{2}$ inch across and borne in good-sized inflorescences during July and August. It is a native of the Canary Islands.

H. GALIODES is found in the south-eastern United States, and is somewhat similar to *H. densiflorum* in habit. It grows $1\frac{1}{2}$ to 2 feet high and bears small, yellow flowers.

H. HIRCINUM.—This is easily distinguished from other species by its strong smell, which resembles that given off by goats. It attains a height of 3 or $3\frac{1}{2}$ feet. The leaves are nearly 2 inches long and $\frac{3}{4}$ to 1 inch wide, sometimes

mottled with grey. The flowers are about 2 inches across, the petals being small and the stamens long and so numerous as to almost hide the petals. It is a southern European species. A dwarf variety, in cultivation under the name of *minus*, rarely exceeds 6 inches in height.

H. HOOKERIANUM.—A Himalayan species which attains a height of $3\frac{1}{2}$ or 4 feet. The young branches are glaucous, the leaves oval and the flowers yellow, somewhat cup-shaped and 2 inches across. It is of decorative appearance and one of the best of the larger-growing varieties.

H. KALMIANUM.—This North American species grows about 2 feet high and bears small yellow flowers in terminal heads. The leaves are short and narrow, and are retained until well on into the winter.

H. MOSERIANUM is a hybrid between *H. patulum* and *H. calycinum*, and is intermediate in habit between these two species. The flowers are almost as large as those of *H. calycinum*, but more shapely. It is a very free-flowering plant, and an excellent subject for a bed on a lawn in a prominent position. It commences to blossom early in July, and continues to flower until frost occurs in autumn.

H. PATULUM.—This species is found both in India and China, and is of elegant habit with rather small, light foliage and shapely, golden-yellow flowers $1\frac{1}{4}$ to $1\frac{1}{2}$ inch across. It is not so hardy as most of the species, and should not be planted in cold situations. The var. *Henryi* is a strong-growing plant, somewhat like *H. Hookerianum*. The growth is sturdy and both leaves and flowers are considerably larger than those of the type. It is also hardier than the type.

H. URALUM is a sub-evergreen shrub from the Himalaya. It grows 3 to 4 feet high under favourable conditions, but is often seen about 2½ feet in height. It is of more account by reason of its light and elegant habit than of its flowers, which are rather small and borne somewhat sparsely. W. D.

PELARGONIUM ECHINATUM,

This pretty species, native of the Cape and of Australia, is seldom seen except in botanic gardens, although it has been in cultivation since 1795. Hence it must be supposed that it has never been well known, or that it has been crowded out by the more showy varieties.

It is, however, a plant which appeals to the taste of those who appreciate graceful habit and dainty markings.

The stems are green and somewhat glossy, clothed with spines which turn downwards; they appear to have developed from stipules which have become fleshy and rigid, and no doubt serve as protection against browsing animals during the resting season. The lobed leaves are clothed with soft hairs, especially on the under surface, which give to the plant a greyish appearance.

The flower-stems appear in May and June, and measure a foot or more in length, with four or five branches, each of which is terminated by an umbel of seven or eight flowers (see fig. 110).

The three lower petals are white, the two upper possess a purple spot, and some stripes of the same colour at their bases. The plant was first flowered by Mr. Colville, a nurseryman in the King's Road, Chelsea, in 1795.

Pelargonium echinatum is not a difficult plant to cultivate, but requires a definite period of rest by being dried off at the root gradually after it has finished flowering, when it will lose all its leaves. Repotting should be done in the autumn, and the plants will then start slowly into growth. To form a graceful plant, the shoots should not be cut back, but tied into the desired shape either for baskets or pots. E. J. Allard, Cambridge Botanic Garden.

FOTA, CO. CORK.

FOTA, the residence of Lord Barrymore, is renowned for its fine Conifers and other trees, many of which are exceptionally splendid specimens. The lake, in which the best of the Water Lilies are grown, contains a somewhat extensive island, and is one of the many beautiful spots in the grounds. It was formerly planted with *Arundinaria Falconeri*, but in 1904 the plants flowered and died. However, since then a fresh planting of Bamboos has been made, and these are now about 10 feet high. Around the island are enormous Gunneras. Water Lilies and the Canadian Rice, *Zizania aquatica*, grow well in the water. Another charming spot is the retreat in which the tree Ferns are grown. It is entirely surrounded and overshadowed by trees, where no sun can penetrate and no gales intrude. There are about 20 huge Ferns, with stems some 10 feet in height and a frond-spread of over 12 feet rising from an undergrowth of *Woodwardia*

Liquidambar styraciflua, 50 feet; *Fitzroya patagonica*, 30 feet; *Ilex latifolia*, fruiting freely, 30 feet; and *Prumnopitys elegans*, also bearing fruit, 30 feet. The specimen of *Cornus capitata*, better known as *Benthamia fragifera*, is probably the finest in the United Kingdom, though there are taller examples at Heligan, in Cornwall, where it was first introduced into this country. The Fota tree is 40 feet in height, and has a branch-spread of 63 feet, and when in full flower is a glorious sight. *Embothrium coccineum* is represented by a very healthy tree about 30 feet in height, which has sent up numerous suckers, some of them many feet distant from the parent trunk, an occurrence which rarely happens in Cornwall. If these suckers are given room it appears as if they would in time form a large group which would be an exceedingly handsome object when they are in flower. The specimen of *Parrotia persica* is of somewhat prostrate growth, not being higher than 12 feet at its tallest point, but it has a spread of 33 feet and must be a marvellous sight when in its autumnal glory. A fine

FIG. 110.—PELARGONIUM ECHINATUM; FLOWERS WHITE WITH PURPLE SPOTS AND STRIPES.

radicans and *Lomaria procera*. One of the finest trees on the estate is a perfect specimen of *Pinus Montezumae*, about 40 feet in height and of like diameter. There are also good examples of this rare Pine at Tregothnan and Menabilly, in Cornwall. Other good Pines are *P. Ayacahuite*, 70 feet; *P. insignis*, 65 feet, with a branch-spread of 80 feet; *P. patula*, 65 feet; *P. religiosa*, 60 feet; *P. parviflora*, and *P. coriensis*, a very rare tree, of which this specimen is supposed to be the finest known. *Abies grandis* is 70 feet in height and *A. religiosa* 65 feet, while others of this family are *A. firma*, covered with cones, 50 feet; *A. brumoniata*, *A. sachalinensis*, *A. brachyphylla*, *A. bracteata*, *A. Albertiana*, *A. Sieboldii*, *A. Veitchii* and *A. Webbiana*. *Cupressus Knightiana* is a very distinct tree, and there is a good specimen of *C. Macnabiana*. Other good trees are *Cryptomeria japonica*, 70 feet in height, with a clear stem of 20 feet; an Oriental Plane, with delicately cut foliage, 70 feet in height, with a spread of 50 feet; a fine Tulip tree (*Liriodendron tulipifera*), with an enormous hole, 60 feet; a specimen of

tree of the Caucasian Walnut, *Pterocarya fraxinifolia*, bore in July long, pendulous, white flower-spikes. *Acacia melanoxylon* is 30 feet in height; *Eucalyptus coccifera* is a healthy tree, and there are good examples of *Torreya myristica*, *Sciadopitys verticillata*, and *Juglans boliviana*. The rare *Fagus Cunninghamii* is 40 feet in height. *Magnolia Campbellii* is 30 feet high, and there is a good example of *M. Thompsonii*. Of shrubs, there are three large bushes of *Edwardsia* (*Sophora*) *grandiflora*, standing in the open with no wall in proximity. The tallest is 15 feet in height, and was, in July, covered with seed-pods. The female form of *Garrya elliptica*, which is an uncommon plant in gardens, was in fruit. A curious sight was a common Laurel, some of the foliage of which was pure white. *Osmanthus* (*Olea*) *ilicifolius* flowered this year. *Pittosporum Mayi* was nearly 40 feet in height, and there was an enormous bush of *Escallonia Phillipiana*, 25 feet through. A good specimen of *Davidia involucreta* was 10 feet in height; *Drimys aromatica* was of the same stature, as was *Drimys Winteri*, and the rare *Rhaphithamnus cyanocarpus* was

16 feet high. *Desfontainea spinosa* was exceptionally fine and smothered in scarlet and yellow flowers, being fully 9 feet in height with the same spread. Other shrubs were *Aralia trifoliata*, *Clerodendron trichotomum*, *Feijoa Selowiana*, *Eucryphia cordifolia*, *Hakea pugioniformis*, 15 feet; *Escallonia argentea*, *Pittosporum crassifolium*, *Xanthoceras sorbitifolia*, *Descainea Fargesii*, *Coprosma lucida*, *Olea lucida*, *Podocarpus chinensis*, *Eucomia ulmoides*, and *Lomatia ferruginea*. There was a fine group of Dogwoods, including *Cornus brachypoda*, fruiting: *C. Kousa*, *C. florida*, *C. latifolia*, in profuse bud; *C. Spathii*, with golden foliage, very handsome; and *C. Mas*, 15 feet in height and 18 feet through. *Lavatera maritima bicolor*, grown against a wall, was 12 feet in height. This plant has for some time been grown in the south-west under the name of *Lavatera assurgentiflora*, which is a very scarce plant, but it was growing by the other *Lavatera* at Fota and bearing pink flowers. Against the same wall was an enormous plant of *Asparagus deflexus*, overtopping the coping and spreading many feet. *Semele androgyna*, perhaps better known as *Ruscus androgynus*, was bearing fruit, which it occasionally does in Cornwall. A pretty unknown climber from Tasmania was bearing large, purple berries. This I met with in two other Irish gardens, but in all without a name. Other wall plants were *Fremontia californica*, 14 feet; *Brachysema lanceolata*, *Hermannia candelans*, *Manettia bicolor*, *Casalpinia Gilliesii*, and *Indigofera Gerardiana*. In a bed a large group of *Lilium longiflorum* from the Azores was blooming finely, and there were large numbers of Bamboo seedlings ready for planting out in their permanent quarters. There were some exceedingly fine examples of *Olearia macrodonta* in the grounds, the largest being about 15 feet in height and 18 feet in diameter. In an open spot were two splendid specimens of *Phoenix senegalensis*, with a height of about 12 feet and a leaf-spread of 15 feet. In a damp position *Buphthalmum cordifolium*, 30 feet in diameter, was in full flower. *Leptospermum scoparium* was 20 feet in height and 18 feet through, *Carpenteria californica*, against a wall, 9 feet; and *Grevillea sulphurea*, over 6 feet. In a piece of ground in a walled garden were small specimens of *Pinus canariensis*, *P. cembroides*, *P. leucodermis*, *Quercus macedonica*, *Cercidiphyllum japonicum*, *Schinus Molle*, *Acacia podalirifolia*, *Coprosma repens*, *Aralia papyrifera*, *Corynocarpus levigatus*, *Calodendron capensis*, *Astelia Cunninghamii*, *Gaya Lyallii*, *Aristolelia racemosa*, *Gordonia anomala*, *Kennedyia rubicunda*, *Olearia papuracea*, *Myrtus bullata*, *Buddleia auriculata*, *Myrsine Urvilii*, *Plagianthus divaricatus*, *Metrosideros florida*, *M. lucida*, *Rhamnus purshianus*, and *Andrela serrata*. *Wyndham Fitzherbert*.

THE ALPINE GARDEN.

SUN AND LIME-LOVING ALPINES.

SOME Alpine flowers need full exposure to sunshine and also thrive best when lime is present in the soil. On rockeries or sunny banks where such conditions exist, the following plants will be found suitable:—

The *Acantholimon*s, or Prickly Thrifts, the best being *A. acerostum* and *A. venustum*; *Achillea rupestris*, *A. umbellata*, *A. argentea*, and *A. tomentosa*; the *Ethionemas*, with their pretty Candytuft-like flowers; *Lyall's Bayonet* plant, *Aciphylla Lyallii*, of quaint and unusually effective appearance; the *Alyssums*, including *A. saxatile compactum*, *A. alpestre*, *A. argentum*, and *A. serpyllifolium*; some of the species of *Anthemis* or Chamomiles, *A. Biebersteiniana* being one of the finest for the purpose; *Anthyllis montana*; *Astragalus tragacantha*; all the species of *Aubrietia*; the curious little *Centaurea stricta*, which should be given a place by itself so that it may not crowd other occupants of the rockery; the *Cerastiums*; the pretty, yellow-flowered *Coronilla iberica*; hardy *Cyclamens*; almost all the *Dianthus*s, or Pinks, especially those with white, grey or whitish leaves.

Erodiums, of which *E. guttatum*, *E. sibthorpi-annum*, and *E. chrysanthum* are especially good; some of the best of the hardy *Geraniums*, such as *lancastricense*, *argentum*, and *cinerum*; *Helianthemum*s, or Sun Roses; *Lithospermum pros-*

tratum and *L. purpureo-caruleum*; *Micromeria Piperella* and *M. rupestris*, two tiny, shrubby plants of fragrant odour and very pleasing for the purpose; and *Phloxes* of the *subulata* or *setacea* section.

Amongst the Saxifrages, *Aizoon*, *crustata*, *lantoscana*, and others of this section may be included; also *Sedums* and *Sempervivum*s; and lastly, although far from exhausting the list, *Veronica saxatilis* and its variety *alba*.

It is not, however, everyone who has a rockery composed of limestone, therefore, some may require to make other arrangements to cultivate these lime-loving plants. Such may find a way out of their difficulties very simply. Some limestone chippings and small bits of the same material may be mixed with the soil, but a much easier plan for most people is to use some old mortar rubbish, such as may be secured during the demolition of old buildings. This material, broken small, is much better than fresh lime, which should be avoided, but I have found some of the ground lime now being sold for agricultural purposes useful when old mortar was not obtainable. Even a little bonemeal will be helpful in the absence of the other materials recommended. *S. Arnott*.

The Week's Work.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODGE, Bart., Leonardlee, Sussex.

Sweet Peas.—Any seeds to be sown during autumn should be put into the ground as soon as possible. Autumn sowing has always succeeded well in my experience, the plants flowering earlier than those from spring-sown seed. This year we commenced cutting Sweet Peas in the last week in May, and they grew 9 feet high and flowered very abundantly until August. The soil should be well trenched and heavily manured. After this has been done, some broad drills should be made, placing in these drills some fine, rich soil. The seeds should be sown fairly thickly, in order to allow for some failures. Sweet Peas should be sown in separate colours. After the seeds have been covered, make an application of soot over each row, and directly the plants are seen above the surface soil, let another dusting of soot be given. At the same time, some cotton should be placed along each row, and drawn tightly, in order to preserve the plants from sparrows. A sharp look-out for mice must be kept during winter, and if severe weather occurs, it will be well to place some coal-ashes close to the rows on either side to protect the roots. Some of the very best Sweet Peas for garden purposes are:—Dorothy Eckford (white), Helen Lewis, John Ingman (scarlet), King Edward VII., Evelyn Hemus, Evelyn Byatt, Frank Dolby, and Countess Spencer.

Border Carnations.—The time has arrived when the layers may be severed from the parent plants, and planted in their permanent quarters. If the soil has been prepared by deep trenching and heavy manuring, as was recommended in a former Calendar, all that will need to be done now is to lightly tread the soil and rake the surface ready for planting. In taking up the layers sever the stem with a sharp knife, if this was not done 10 days previously. Secure each layer with a good ball of earth about the roots, and do not plant too deeply. After the planting is done, dust the ground about with soot, and place a label to each variety. The best position for Carnations is one exposed to the sunshine. If they are planted in mixed borders, they should be placed in groups of 6, 12, or 18, according to the size of the border. Those plants intended for supplying flowers merely for cutting should be put in an exposed garden border in the reserve garden or kitchen garden. In some localities it is difficult to keep border Carnations in good condition out-of-doors during winter, and in such cases the layers should be potted up into 3-inch pots, placing them in such a position that glass lights may be placed over them during severe weather. It is not frost that injures Carnations so much as excessive damp. Therefore, a good porous soil should be used, and measures adopted to have the pots thoroughly well drained, taking care to avoid over-watering. The plants may be stood thickly together

in cool frames, or on a sheltered border. Sparrows are frequently troublesome to Carnations, eating the young leaves: therefore, some rows of black cotton should be placed about the plants, just an inch or two above them.

General work.—The present is a good time for trenching the ground and preparing it for planting. Any portions intended for trees or shrubs should be dug deeply, or trenched, and any old tree roots or large stones should be removed. When trenching is being done, the soil should be thrown high enough to allow for sinking. The inexperienced frequently make a mistake in this matter, the consequence being that the ground afterwards falls below the desired level. As frosts may now occur at any time, care should be taken to see that herbaceous plants, tuberous and bulbous plants, whose growth will be cut down by the first severe frosts, are properly labelled before this happens. *Lobelia cardinalis* var. *Queen Victoria* should be taken up and put into pots, unless the district is so favourable that this plant will suffer no harm out-of-doors. These which are put into pots must merely be placed in a cool structure, where no heat is employed. *Plumbagos*, *Abutilons*, *Grevilleas*, *Streptosolens* and *Fuchsias* should be treated in a similar manner. The lawns may now be mown for the last time this season, but the work should be carried out on dry days as far as possible.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Cattleyas.—Any plants of *Cattleya Trianae*, *C. Mendelii*, *C. Mossiae* and others which have completed their new pseudo-bulbs, and require more root-room, may be safely repotted. Now that growth is completed, the principal pseudo-bulbs will make many new roots, therefore the plants will quickly become re-established. It being advisable to disturb the roots as little as possible, the old receptacle should be carefully broken, and the crocks taken away piece by piece without disturbing the drainage or roots. After this has been done, the whole may be placed into a pot of suitable size, filling in with crocks up to the top of the old drainage and surfacing firmly with the new Orchid compost described in last week's Calendar. Such plants as *C. zigas* and *C. Warneri* that have completed their growths may also be repotted. Following this operation water must be afforded very sparingly, merely keeping the compost moist around the edge until each plant has made plenty of roots in the new soil. *C. Downiana* and its variety *aurea* are the most handsome *Cattleyas*, and are always highly appreciated for hybridising purposes. Plants of this species, as they pass out of flower, should be kept for a few weeks on the dry side, and more light and air should be afforded them; this treatment will assist in the maturing of the new pseudo-bulbs. If kept too moist after the flowering period, the plants, as a rule, do not send out a sufficient number of roots to enable the plants to recover from the strain of flowering. Plants of *C. labiata*, whose flower-buds can be seen pushing up through the sheaths, should be afforded the lightest position in the house. Moderately water each plant whenever the compost is dry, but avoid over-watering. Although the plants may not show the effects of too much watering directly afterwards, they are likely to do so soon after the flowers have faded. Owing to the rain and bad weather, the present season is a critical time with many *Cattleyas*, *Laelias*, and their hybrids now completing their new growths. In some plants the grower will notice that, from lack of sunshine and air, the thin papery sheath which encircles the new pseudo-bulbs has become soft and of a dark colour. The moisture, either from the sheath or the new pseudo-bulb, appears to get between the two, and this is often the cause of the bulbs rotting. Keep the plants rather drier at the roots for a few days, and let the atmospheric moisture in the houses be less than usual. Allow the plants plenty of sunshine and fresh air, and leave the ventilators open a little at night. Let the plants be closely examined every day, and if these signs of injury are noticed in the outer sheaths of the new growths, the sheaths should be slit open from top to bottom and the excess of moisture thus allowed to escape.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Gathering and storing Apples.—These operations should be supervised by an experienced man, as any carelessness either in selecting the fruit or in handling it will have unsatisfactory results. In a large number of instances late-keeping varieties of Apples and Pears are gathered before they are in a fit condition. The later these varieties are left to hang upon the trees, the better will they keep afterwards. Much of the shrivelling noticed in late Apples and Pears in the spring is the result of the fruits having been gathered too early, or of their being stored in too dry an atmosphere. A few degrees of frost will do them no harm, as is proved by the fact that any fruits overlooked at gathering time frequently keep in a good condition on the trees until well into the winter. The latest keeping Apples, therefore, being allowed to remain upon the trees until the last moment, should be given extra care in storing. This applies to such culinary varieties, for instance, as Newton Wonder, Bramley's Seedling, Lane's Prince Albert, Northern Greening, Sandringham and Dumelow's Seedling (Wellington); and such dessert varieties as Ashmead's Colonel, Sturmer Pippin, King of Tompkins County, Lord Hindlip, Reinette du Canada, and Court pendu-plat. The greatest care should be taken in the handling of the fruits in order that they may not be bruised, and every fruit that is not perfect, in this and other respects, should be put aside for present consumption. Assuming that the operations are carried out in the manner I have described, the fruits of the latest varieties may be stored in fairly thick layers. In fact, they are the better for this, and space will thereby be economised. When the earlier varieties have been used, the later fruits may be set out more thinly. In cases where the fruit room is insufficient, there need not be any hesitation in storing late Apples in a cool outhouse or shed until a space can be found for them in the proper room. Where there is room enough in the fruit room, a few of the best fruits of each variety should be set out on a bench or table, labelling them and stating the date of gathering. These will be of interest to visitors, and the fruits may be readily examined from time to time so as to determine when each variety comes to its best condition. Any straw or other material used in the fruit room must be perfectly sweet. I prefer to use kitchen paper, this being clean and capable of being renewed easily. Hay or straw is apt to become musty, and taint the fruit. Regarding the atmosphere of the fruit room, it may be pointed out that excessive dryness is more harmful than damp conditions. A cool, dark room, with atmospheric conditions similar to those generally found in a good cellar is an ideal place for preserving fruits. Indeed, there are few fruit rooms that are better than a good cellar for the purpose.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Pineapples.—Plants of the Queen variety intended for supplying fruits next season will require very careful treatment until they are placed in their fruiting quarters. Gradually reduce the atmospheric temperature and induce the plants to rest until the end of the year. Each plant should be carefully examined before applying moisture, as there will be no need for anything like the former quantity of water at the roots, but on no account allow the soil to become too dry. Keep the atmosphere in the house drier, and discontinue syringing except on fine mornings. The night temperature may fall to 65°, and even lower on very cold nights. During the day it may be allowed to rise to 75° or 80° by the action of the sun, but air must be freely admitted whenever weather conditions will permit. Where the bottom heat can be regulated by hot-water pipes, it should be kept at about 70° but this must not be allowed to fluctuate, otherwise some of the plants may produce their fruits prematurely. Suckers must now be more carefully watered. During the autumn and winter months it will be better to keep the roots on the dry side, taking care, of course, not to carry this to extremes. The plants must not be crowded together in plunging them, as they require to be exposed to all the light

possible. For the same reason the glass in the roof of the house must be washed as often as necessary to keep it perfectly clean. Plants now ripening fruits will be better if placed in a house by themselves, where the atmosphere can be kept warm and dry. The later plants in a moister atmosphere may then be encouraged to swell their fruits. The atmospheric temperature at night in this house must not fall below 70°. During the day, and in sunny weather, it may rise to 80° or 85° if a little air is admitted at the top of the house on such occasions.

Peach and Nectarine trees.—If the young shoots on the trees in the earliest house are sufficiently matured, they will be now shedding their leaves. In such circumstances a few Birch twigs may be drawn lightly over the trees to dislodge the leaves. On no account must these be drawn in the reverse way to that in which the buds are growing, neither must they be used until it has been determined that the leaves are ready to fall. If there is the least evidence of immature shoots, no effort must be spared to get them thoroughly ripened before starting the trees into growth, and it may be necessary to have a little heat in the water pipes. Directly the leaves have all fallen from the trees the operations of pruning, cleaning, and training can be commenced. Assuming that the surplus shoots were removed from the trees directly the crop was gathered, all the pruning that will be needed now will consist in the removal of a few of the older, barer branches, in cases where these can be spared. The trees must be loosened from the trellis, the house and trellis thoroughly cleansed with soapy water, and the trees carefully washed with a mixture of soft soap and sulphur in water. For cleansing the young shoots, only a soft brush must be employed, one that will not damage the buds. When all this has been done, and the trees are again trained, the operator should resist the temptation to overcrowd the shoots, and he should endeavour to train most of the fruiting shoots on the upper side of the main branches. Following the completion of the training, remove 2 or 3 inches of the surface soil from the border by means of a fork, and in place of this apply a top-dressing consisting of fresh loam, with liberal quantities of lime rubble and wood-ashes mixed with it.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

The stove.—Now that the growing season of such plants as Allamanda, Bougainvillea, Codieum, Clerodendron, &c., is nearly over, the structure containing them should be thoroughly cleansed and the plants rearranged so that each plant will be well exposed to the light. As the aim of the gardener should be to get the growth already made well ripened, manure will no longer be required, and the amount of water given should be reduced gradually. By the time winter sets in the deciduous subjects should be left dry at the root, but care must be taken not to allow the evergreen plants to suffer from want of water. The growths of perennial climbers should be thinned, and, if not already done, seeds of the annual kinds should be saved. Very little shading will now be required, and unless the blinds are used to conserve the heat of the houses during cold winter nights, they may be taken down any dry day and stored for the winter.

Roses.—All the pot plants should now be turned out of their pots to see that the drainage is in good order, and at the same time any plants which require repotting should receive this attention. Roses thrive in a tenacious loam, with some bonemeal and sifted horse-droppings added. The plants to be repotted should have the balls of soil slightly reduced. The potting must be firmly done, and the plants placed on a bed of cinders, plunging the late kinds to the rims of the pots so that they may not be broken by frosts. Those plants which do not require repotting should have their surface soil removed and be lightly top-dressed.

Cinerarias.—The most forward plants should now be placed into 6 inch pots, in which they will flower. A suitable compost is one consisting of two-thirds loam and one-third leaf soil and dried cow manure in equal quantities, with the addition of a little bonemeal and sand. The plants should be grown in as cool conditions as possible, syringing the foliage on fine days. A

look-out must be kept for the disfiguring leaf-miner; as a precautionary measure syringe the foliage with a solution of soft soap or quassia chips, which will render the foliage distasteful to the fly.

Calceolarias.—There must be no delay in pricking off the seedlings; the larger plants may be potted direct into thumbs, treating them similarly to the Cinerarias, but using a less rich soil.

Pelargoniums.—The "Zonals" for winter flowering should now be placed in a heated brick pit or a carefully ventilated greenhouse. The plants should be kept as near to the glass as possible, and grown in a fairly dry atmosphere.

Caladiums.—These plants should be grouped in the coolest part of the stove to mature their tubers. Gradually reduce the amount of water given, and throughout the winter keep them on the dry side, but at no time allow the soil to become dust dry, or many tubers will be lost through dry-rot. A temperature of from 55° to 60° Fahr. is as low as Caladiums can be safely subjected to during the winter.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aidenham House, Elstree, Hertfordshire.

Preparing against frost.—Up to the time of writing, the weather has kept wonderfully open, but owing to want of sunshine vegetation is in a very gross and unripened state. Frosts may now occur any night or morning, and therefore every preparation should be made to guard against preventable injury therefrom. French and Runner Beans have yielded splendid returns, and the plants in many cases are still in full bearing. The Dwarf or French Beans which were sown in the open for fruiting late should be protected by placing a temporary framework over a part of this crop, and any spare lights may be placed thereon. These should be further covered with mats at night when severe frosts are likely to occur. The warmth obtained by the use of the glass will do much to improve the quality of the produce, and good crops may be expected until the end of the present month. The pods of runners should be kept closely picked, and if the ends are placed in a little water and kept in a cool place these will continue good for at least a fortnight provided the water is changed occasionally. Marrows should be treated in the same way, and very late plantings will produce fruits for some time yet, if lights can be placed over them. Continue to remove to specially prepared frames Endive, Lettuce, autumn-sown Cauliflowers, and Parsley. Parsley is such an important crop that every care should be taken to make provision for a continuous supply throughout the winter. Late sowings pricked into cold frames near to the glass, at a distance of 3 inches from plant to plant, and 6 inches between the rows, will give the best results. Plant them very firmly, apply a good dressing of soot, and then a thorough watering. A double row also may be planted at the foot of a south or west wall or building, where some slight protection can be afforded in the event of severe weather. Early plants which have made much growth should have all the old foliage removed. Give a good dressing of soot; stir the surface soil with the Dutch hoe.

Mushrooms.—Continue to prepare fresh beds in the Mushroom shed as the old ones become exhausted. The new beds will do much to stimulate those that are in bearing. Endeavour to maintain a moist, even temperature of about 55°, but in no case should it exceed 60°. Fire-heat should not be employed under any circumstances at this season, or the quality of the produce will be poor and the beds will quickly become exhausted.

Turnip.—These have done exceedingly well throughout the summer, the season having been an ideal one for this crop. Attend to the thinning of late sowings and keep the hoe constantly at work between the rows and plants. Soot is one of the finest stimulants to this crop, and an application once in every ten days is not too frequent; on very poor ground a frequent slight application of vegetable manure will be very beneficial. Lift the roots as soon as they become of sufficient size and store them in ashes or sand, but avoid placing them together in too great a bulk.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, OCTOBER 11—
United Hort. Ben. & Prov. Soc. Com. meet.

TUESDAY, OCTOBER 12—
Roy. Hort. Soc. Coms. meet. Affiliated Societies Fruit Competition. Conference of Horticultural Mutual Improvement Societies at 4 p.m. Lecture at 3 p.m. by Mr. Thomas H. Mawson, on "Some Gardens of the later Renaissance." British Gard. Assoc. Ex. Council meet.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—50.6°.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, October 6 (6 P.M.): Max. 60°; Min. 44°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, October 7 (10 A.M.): Bar. 30.0; Temp. 60°; Weather—Bright sunshine.

PROVINCES.—Wednesday, October 6: Max. 56° Bury St. Edmunds; Min. 48° Yorkshire.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY—
Climbing Plants, Ornamental Shrubs, Trees, &c., at the Royal Gardens, Hampton Court, by order of Mr. J. Naylor, by Protheroe & Morris, at 12.

TUESDAY AND WEDNESDAY—
Annual Sale of well-grown Nursery Stock, at the Sunningdale Nurseries, Windlesham, Surrey, by Protheroe & Morris, at 12.30.

WEDNESDAY—
Azaleas and Bays, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

WEDNESDAY, THURSDAY, AND FRIDAY—
Sale of well-grown Nursery Stock, at The Nurseries, South Woodford, by order of Mr. John Fraser, by Protheroe & Morris, at 11.

FRIDAY—
Imported and Established Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Thanks to Aiton's *Hortus Kewensis*, a record, though but an imperfect one, exists of Banks's services to horticulture by way of the importation of seeds and living plants from various parts of the world. Unfortunately, no distinction is made in Aiton's work between the plants introduced by Banks personally and those sent home by his collectors and friends. In yet other respects, the results of his activity are not as widely known as they deserve to be; for he was something more than a patron of botany and horticulture, and an almost perpetual President of the Royal Society.

Many individual pioneers in discovery and invention have been forgotten, or neglected, by posterity, partly through their deeds having been overshadowed by those of numerous immediate followers, or even contemporaries, and partly from a want of appreciation by the public of the value and importance of first steps in regions previously unexplored. This was for many years the fate of Banks, as far as the generality of men is concerned. It is true that among horticulturists Banks is remembered as one of the first members of the Royal Horticultural Society, and his name is commemorated by the Banksian Medal, instituted after his death in 1820, and awarded from time to time by the Floral, Orchid, and Narcissus Committees.

Recently, however, the publication of his *Journal of the Voyage of the "Endeavour,"* edited by Sir Joseph Hooker, and of the *Illustrations of Australian Plants*, edited by Mr. James Britten, have done much to rehabilitate his fame as a great pioneer of science and colonisation. Now, a highly appreciative volume on *The Father of Australia**—fittingly enough from the pen of a member of the Commonwealth, Mr. J. H. Maiden—provides a final vindication of Banks's title to a place in imperial history. The careless hand of chance casts the shroud of oblivion at hazard. Forms of animal and vegetable life may undergo extinction,

but it is now enshrined in the history which Mr. Maiden has written and will be perpetuated in the memorial which he hopes to establish. These, indeed, are the explicit objects for which Mr. Maiden has written the life of Sir Joseph Banks—to disseminate information concerning his services to mankind and to obtain funds for the purpose of erecting a memorial. The volume has been printed at the public expense, and it is hoped that the proceeds of the sale will considerably augment the Memorial Fund, which has been already started. The book consists of a chronological series of extracts from published and un-

[By courtesy of the Royal Horticultural Society.]

SIR JOSEPH BANKS, BART. 1743—1820.

published documents, suitably illustrated from authentic sources, and connected by notes and explanations which make it into a continuous narrative. Mr. Maiden, who is no stranger in this country, has spared no pains in his task, and has, in leaving Banks, as it were, to tell his own story, edited a romance so attractive that the reader is loth to lay down the volume till the end of the adventurous story is reached. Prominence is given to Banks's great and persistent efforts in introducing useful plants into the colony, and in securing for cultivation at Kew seeds and living plants of the highly characteristic flora of the new country. In this connection it is interesting to read

* *Sir Joseph Banks, The Father of Australia*. By J. H. Maiden, Director of the Botanic Gardens, Sydney. 8vo., pp. xxvi. + 244, with 64 illustrations. Sydney: W. A. Gullick, Government Printer. London: Kegan, Paul & Co. 1909.

Sutton's report to Sir Joseph Banks, dated December 28, 1800, on the results of his attempts to introduce certain useful plants into the colony. It runs: "I do myself the honour of writing to you an account of what plants I have been able to take alive to New South Wales:—One Olive; six Black Mulberries; six White ditto; four Willows; 18 Chily Strawberries; two Walnuts; two Spanish Chestnuts; two Oakes; four Pomgranites; two Plantains; Mint; and the following sorts of vines—Tokay, White Fontinac, White Muscadine, Black Fontinac, Constantia, and Muscat of Alexandria. It is with painful concern I inform you, sir, that I have not been able to bring the Hops and many other valuable plants that I had on board": no mean achievement when it is remembered that, owing to a variety of causes, the plants were about a twelvemonth aboard ship, and that these were the days before Wardian cases were invented.

Mr. Maiden's account of events in the early days of Australian settlement and exploration is not limited to the part taken by Banks. It embraces particulars of many other prominent personalities, including Robert Brown, who was naturalist to Flinders's expedition, 1801-1805.

We hope that Mr. Maiden's admirable efforts on behalf of the memorial to Banks will meet with the most ample success.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees of this Society will take place on Tuesday, the 12th inst. At the 3 o'clock meeting of Fellows, a lecture on "Some Gardens of the Later Renaissance," will be delivered by Mr. THOMAS H. MAWSON.

—In regard to the Spring Bulb Show, 1910, the Council inform us that (subject to their general rules) the following prizes presented to them by Messrs. ROBT. P. KER & SONS have been accepted:—Class 12 (amateurs): Twelve pots of *Amaryllis* (*Hippeastrum*); each pot must contain one bulb only, and not more than one pot of any one variety can be included; size of pots optional; prizes, £3, £2, £1.

COMPETITION FOR NEW APPLES AND PEARS.—At the fortnightly meeting of the Royal Horticultural Society, to be held on Tuesday, the 26th inst., special prizes are offered for varieties of Apples and Pears introduced to commerce since 1892. Nine of these classes are for Apples and four for Pears. They are divided between amateur and trade exhibitors, five of the Apple and two of the Pear classes being for nurserymen. Amateur competitors will be given money prizes, but trade exhibitors will receive medals, the most important being the Society's Silver-gilt Knightian Medal offered for 12 dishes of Apples of distinct varieties. As a guide to intending exhibitors, we give the following list of the more important varieties of Apples and Pears put into commerce since 1892, with the names of the distributors, raisers, or the exhibitor who secured an award for the variety. We do not suppose the list is complete, and, therefore, shall welcome any additions our readers may send for publication in the next issue. Further, in the case of *Gabalva Pippin*, the variety was grown locally by the late Mr. Andrew Pettigrew, at Cardiff Castle, for a number of years before it was brought before the notice of fruit-growers. Whether or not such varieties may be included in the competition is not perfectly clear, but we may suppose they may, if it cannot be proved they were in general commerce:—**APPLES:** Norfolk Beauty (W. Allan); Allington Pippin,

Christmas Pearmain, Hambling's Apple (Geo. Bunyard & Co.); Atalanta, Anmorel (J. Cheal & Sons); Rival (Clibran's); William Crump (W. Crump); Star of Devon (J. Garland); Ballenora Pippin, Ard Cairn Russet (Baylor Hartland); Charles Ross, The Houblon (W. Horne & Sons); Goodwood Pippin (Parker); Stanway Seedling (T. H. Kettle); King's Acre Bountiful, King's Acre Pippin (King's Acre Nurseries); Royal Late Cooking (Owen Thomas); Coronation (Lyne); Hector MacDonald, Winter Quarrenden (J. R. Pearson & Sons); Early Rivers, Rivers' Early Peach, Thomas Rivers, St. Martin's, Prince Edward (Thomas Rivers & Son); King Edward VII. (W. B. Rowe & Sons); Encore, Mrs. Phillimore (Charles Ross); Fenn's Wonder (T. Simpson); Diamond Jubilee (A. J. Thomas); Feltham Beauty, H. Ballantine, Langley Pippin, Middle Green, Marshall Oyama, Mr. L. de Rothschild, Mr. John Seden, Rev. W. Wilks, The Langley, Veitch's Scarlet (James Veitch & Sons, Ltd.); Lord Hindlip (J. Watkins). **PEARS:** Blickling, Santa Claus (Geo. Bunyard & Co.); Beurré Naghan (J. Cheal & Sons); Conference, Marquis, Red October, St. Edmund, St. Luke, Parrot (Thomas Rivers & Sons); General Wauchope (Chas. Ross); Charles Ernest (Jas. Veitch & Sons, Ltd.).

HORTICULTURAL CLUB.—The house dinners of the club will be resumed on Tuesday, the 12th inst., at 6 p.m., at the Hotel Windsor. Mr. H. INGO TRIGGS, A.R.I.B.A., will give a lecture on "Italian Gardens," illustrated with lantern slides and plans.

ROYAL GARDENERS' ORPHAN FUND.—The treasurer of the Royal Gardeners' Orphan Fund acknowledges the receipt of £5 left from her small estate by the late MRS. ANNE CLAYTON, wife of Mr. H. J. CLAYTON, Wharf Bank, Ulleskelf, and formerly of Grimston Park Gardens, Tadcaster, "in remembrance of her husband's early connection with the fund."

WINTER SPRAYING.—The Rev. W. WILKS, M.A., Secretary of the Royal Horticultural Society, writes as follows:—"Now that the time for winter spraying of fruit trees is drawing upon us again, may I call the attention of fruit-growers and amateurs to the report of the conference on Spraying Fruit Trees held in the hall of this Society on October 16, 1908, and which may now be obtained in book form? The work deals with the methods of spraying for both entomological and fungal pests, and gives information respecting washes, spraying machinery, &c. It forms the latest collated information on the subject, and may be had at the offices of the Royal Horticultural Society, Vincent Square, Westminster, price 1s."

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The 23rd annual dinner of the above society will be held at the Waldorf Hotel, Aldwych, W.C., on Thursday, October 28, at 6.30 p.m. J. B. SLADE, Esq. (of Messrs. Protheroe & Morris), will occupy the chair.

PHARMACY'S DEBT TO BOTANY.—The following extract is taken from an inaugural address delivered by Prof. ALEXANDER TSCHIRCH at a recent meeting of the Pharmaceutical Society and published in the Society's *Journal*:—"So far I have spoken chiefly of the problems of pharmacology and of the closely connected pharmacology-physiology. But are we standing on safe ground if the botanical origin of the drug is not known? To pharmacology-pharmacology will always owe an indelible debt for providing it with a sure basis for work. It is especially here in London that attempts have been made to determine the botanical origin of all those drugs, the derivation of which was not definitely

known; where HANBURY often devoted himself to such problems and where HOLMES has worthily maintained the tradition; London, which, botanically speaking, is a suburb of Kew, in whose herbaria, gardens, and museums immense botanical treasures are piled; London, which possesses in the Museum of the Pharmaceutical Society a wonderful collection of drugs; London, with its wharves at which the ships of every nation discharge their cargoes, and with its immense warehouses which permit of a deep insight into the commerce in drugs, to feel the pulse of which is important to every pharmacologist. Many pharmacology-botanical problems also slumber in the lap of pharmacology. Although lately progress, especially in pharmacology-anatomy, has been made chiefly on theoretical and purely scientific lines, as, for instance, the study of the anatomical and morphological development of medicinal plants to which for the last twenty years, in conjunction with numerous pupils, I have devoted much attention, nevertheless comparative pharmacology-anatomy has brought to light many facts directly available for practice. I will allude only to the microscopical analysis of powdered drugs. This branch, which has been fostered here in London, by GREENISH, enables the pharmacist to protect himself from fraud, and has become a worthy companion of that most important branch of pharmacology, the chemical assay of drugs. Another question of eminent practical importance is that of the injurious pests of cultivated medicinal plants and of drugs. I have termed this branch of pharmacology pharmacology-pathology. Very little work has as yet been accomplished in this field. Botanists have given us some information with regard to the pests that attack living medicinal plants, but up to the present no one has systematically devoted himself to the subject, with the exception of the practical men in the great cultivating districts of South California, where there are plantations of Citrus several square kilometres in extent and a Peach garden of 19 square kilometres. There great attention is paid to these pests, and means of combating them (as, for instance, the scale insects of the Citrus) are extensively practised. The cultivators know that attention in this respect brings its abundant reward, and that neglect is followed by severe damage. Of no less importance is a knowledge of the pests that attack drugs. To be able to combat one pest alone its conditions of life must be known. How many drugs are not destroyed in the warehouses, drug houses, and pharmacies by the attacks of insects? How often does not vanilla become mouldy and unsaleable? A systematic study of these pests, whether of animal or vegetable nature, and of the means of resisting them, is one of the problems of the pharmacology of the future, and one which must result in great gain for the practical pharmacist."

A NEW ENEMY TO THE STRAWBERRY.—In some parts of Germany the Strawberry plants have been attacked for the first time by a beetle, *Anthonomus rubi*, which is not unknown to cultivators of Raspberries and Brambles as the Raspberry flower piercer. The eggs of the beetle are to be found in the flowers, and it is an easy matter to find evidences of the injury done by the beetles. The pierced flowers wither and fall to the ground. From the eggs arise caterpillars which feed on the tissues of the flowers. At a later date, the caterpillars become chrysalids, which remain in the earth till the following spring, when they develop as beetles, and at once begin their destructive work. The best means at present known for destroying them consist in searching the plants before and during the flowering season, and stripping off the creatures into a sack. The removal of the blooms that have been pierced helps to lessen the number of the insects.

DISTRIBUTION OF PLANTS.—It is announced that the Commissioners of His Majesty's Works and Public Buildings intend to distribute this autumn, among the working classes and the poor inhabitants of London, the surplus bedding-out plants in Hyde and Regent's Parks, and in the Pleasure Gardens, Hampton Court. If those interested will make application to the superintendent of the park nearest to their respective parishes or to the superintendent of Hampton Court Gardens, they will receive early intimation of the number of plants that can be allotted to each applicant, and of the time and manner of their distribution. Any costs of carriage must be borne by the recipients.

LÆLIO-CATTLEYA × JASON (CATTLEYA HARDYANA × LÆLIA LATONA).—Mr. WILKINSON, gr. to G. W. JESSOP, Esq., Cliffe Cottage, Rawdon, Leeds, calls our attention to the fact that the name was recorded from material supplied by him before the recording of the L.-C. Jason (L.-C. Massangeana × C. Dowiana aurea), reported in the *Gardeners' Chronicle*, August 21, 1909, p. 136, in reference to a plant shown by Lt.-Col. HOLFORD. Therefore, by right of priority, Mr. JESSOP's name must be retained. Lt.-Col. HOLFORD has changed the name of his plant to L.-C. pactolus.

FLOWERS FROM JOHANNESBURG.—Mr. JAS. HALL sends from his garden in Johannesburg pressed fresh-gathered flowers of Violets and Bunch Primroses of very fine quality, the Violets especially being very large and still fragrant. Mr. HALL says: "Such flowers are obtainable for several months, and Roses are even more prolific and lasting here than in Great Britain. Our spring is in August. Frost has not been so severe this winter as it has been sometimes, yet some mornings during the past fortnight ice half-an-inch thick has been on the still water in the tanks in exposed situations. I may say that all the leaves have fallen from the deciduous trees, Roses, &c. I have all my Roses pruned. Vines, and other plants requiring pruning, if pruned after the end of July, bleed seriously and suffer in consequence. Those who do not understand how to manage our red, gritty soil complain that it is 'very poor.' But one only needs to know how to work it—such is my experience, but the secret of working it has only been gained after thirty years of constant application. In the natural red ground I grow all my best produce, whether in pots, tins, or the open ground. Even Ferns thrive in it, especially our native representatives of *Adiantum Capillus-Veneris*, which may be grown as large as *A. Farleyense* occasionally, under favourable conditions. By the way, what a remarkable plant *Adiantum Capillus-Veneris* is! The species in some form is found almost all over the world. I do not know what you call the South African form, but it is so much larger and better than the European type, that I believe it has a different specific name in gardens. Our form is much nearer to the Japanese type, which, I think, is called 'Mariesii,' than it is to the British wild plant. These speculations call lots of things to the mind of an old rambler, and the mention of the Japanese affinity reminds me of an old friend submitting to me specimens of *Cyrtomium* collected on the Boschberg, and which seems to still further connect the flora of these widely separated countries. But to return to floral flowering plants, I think gardeners in the Old Country would be much surprised to see that for flowers we depend largely on the garden plants grown in Great Britain, and to see the perfection attained here with Carnations, Stocks, Violets, Primroses, Dahlias, Chrysanthemums, and all the popular flowers of British gardens.

We get British seeds. I would like to say a word to intending colonists, no matter where they may be intending to pitch. Do not turn up your nose at 'hungry' or supposed unproductive soils. I have had much to do with such, where high-class, unthoughtful gardeners have failed, and my experience has been that 'hungry' soil, properly manured, both by substantial manure and liquid during the season of growth, is the best you can have. For example, take that sandy stretch from Ostend to Brussels. What region is more productive? But the produce depends on the man and his methods more than on the soil, which is anything but fertile." It may be added that on Tuesday, August 17, after the above letter was written, there occurred a heavy snowstorm at Johannesburg. Much damage was done to ornamental trees, many of them being broken down under the weight of snow.

THE HASTENING OF GERMINATION.—The germination of seeds may be hastened by various means. Soaking in hot water has been employed for this purpose often and successfully. According to the *Agricultural News of the West Indies*, vii., 1908, dilute chlorine water is efficacious. Seeds of various kinds treated with dilute chlorine water and placed in sunshine germinate in six hours; but the seeds must be washed in ordinary water immediately the radicles appear, otherwise the seedlings are injured. Other agents mentioned in the article are very dilute alkaline solutions and formic acid (1 part in 5,000 of water). A contribution on the allied subject of the stimulation of refractory seeds to germinate is made by M. J. AYMARD, *Fils.*, and published in the *Annuaire de la Societe d'Horticulture de l'Hérault*. M. AYMARD finds that old seeds may be caused to germinate by steeping them for 10 hours in water at about 66°, to which calcium chloride has been added at the rate of 30 to 40 grains per pint of water. The most marked results were obtained with old seed of *Viola cornuta*; treated seed giving a germination of 60 per cent., while untreated seed failed to germinate.

NYMPHÆAS AT DARMSTADT.—Mons. H. HENKEL informs us that amongst the many new Nymphaeas now flowering in his nurseries at Darmstadt is a white, night-flowering, new species of the Lotus type from Australia. It resembles *N. Zeukeri* from West Africa. There is also flowering a new, blue species from Uganda. Amongst hybrids a dark red hybrid of *N. purpurea*, a dark blue hybrid of a new form of *N. Holtzei*, and a soft blue hybrid of *ampla* var. *speciosa*, are flowering. A blue Nymphaea, hardy at least in Northern Italy, is also in flower, together with many others.

PUBLICATIONS RECEIVED.—*Fruit Ranching in British Columbia*. By J. T. Bealby. (London: Adam and Charles Black.)—*The Book of Nature Study*. Edited by Bretland Farmer, D.Sc., F.R.S. (Vol. V.) (London: The Caxton Publishing Co., Stray Street, W.C.)—*The Journal of the British Gardeners' Association*. (October.)—*Trees and Shrubs of the British Isles*. By C. S. Cooper and W. Percival Westell, F.L.S. (Part 12) (London: J. M. Dent & Co., 29 & 30, Bedford Street, W.C.) Price 1s.—*The British Year-Book of Agriculture and Agricultural Who's Who, 1909-10*. Published by Messrs. Vinton & Co., Ltd., 8, Breams Buildings, Chancery Lane, E.C. Price 5s. net.—*Pruning* (Illustrated). A compendium of outdoor work, written by a practical fruit grower for fruit growers, with special supplement for small holders. Published by The Lockwood Press, 1, Mitre Court, Fleet Street, E.C. Price 1s. net.

FLORISTS' FLOWERS.

GLADIOLUS.

The results of hybridising are very marked in *Gladiolus*, especially in the section which flowers in late summer and autumn. Three distinct races were originally raised, and for a time the varieties were sold as one or other of these, namely, *gandavensis*, *Lemoinei*, and *Nancyanus*. During recent years, however, the three sections have been intercrossed so freely that any attempt to classify them is almost hopeless. The *gandavensis* section was the first raised. Louis Van Houtte gives the parentage as *G. psittacinus* and *G. cardinalis*, while Dean Herbert, who also raised some of the early hybrids, names *G. oppositiflorus* as the second parent. The name of Kellway, of Langport, looms large in the history of this section, the firm having made a speciality of *Gladioli* for at least 50 years.

The *Lemoinei* section is the result of crossing *G. purpureo-auratus* with the best of the *gandavensis* varieties. This race is named in compliment to M. Lemoine, of Nancy, who raised the first of them in 1875. A few years later he introduced the third section *Nancyanus*, the result of crossing *G. Saundersii* with his *Lemoinei* race. Under the name of *Childsii*, varieties similar to *Nancyanus* were distributed in America. These are said to have been raised by Max Leichtlin and sold by him to an American firm. The parentage is given as *G. Saundersii* and varieties of *gandavensis*.

At the present time Mr. H. H. Groff, of Simcoe, Ontario, Canada, is distributing a strain popularly known as Groff's hybrids. In the breeding of this race Mr. Groff claims to have used the best varieties he could obtain of all three sections, *gandavensis*, *Lemoinei*, and *Nancyanus*, including *Childsii*. This strain is not remarkable so much for the size of the individual flowers as for their great diversity of colours, which include yellow and blue, and for the height of the spikes, which are 5 feet to 6 feet, with 30 or more flowers. Another remarkable point about this strain is the exceedingly low price of the bulbs. This, no doubt, is the result of growing tens of thousands of bulbs from seeds in a soil and climate exactly suited to their requirements.

A commendable method adopted by some English nurserymen is to offer the bulbs according to colour of flowers, instead of making a catalogue of several hundred named varieties. In his autumn and spring catalogue, 1908-9, Mr. Groff lists only five named varieties amongst the thousand of bulbs offered. The colours are divided into five groups, as follow:—

Dark hybrids, including cerise, crimson, purple, red, scarlet, and violet.

Light hybrids, including white, cream, pink, flesh, light rose, and pale yellow, with more or less darker markings in the throat.

New yellow hybrids.—These undoubtedly are Mr. Groff's greatest success with *Gladioli*. For the past six weeks a bed of *Kniphofias*, amongst which a hundred of these bulbs were planted, has been an object of great admiration in the Royal Gardens, Kew. These will supply a long-felt want, for in the past good yellows in quantity have been unknown. The colour is a yellow, not a rich golden-yellow but a much more decided yellow than the so-called yellow Sweet Pea. In some of the flowers there are only faint coloured lines, while in others the blotches are very distinct. The majority of the spikes at Kew were between 5 feet and 6 feet in height, many of them producing one or two side spikes. In some spikes the flowers had the hooded characteristics of the *Lemoinei* section, while others resembled *gandavensis*.

Blue and purple shades.—These also are a great advance on those previously offered in any quantity. A companion bed to the one

containing the yellow varieties at Kew contains 100 bulbs of these shades. The tints include lilac, heliotrope, clematis-blue, and purples with the usual varied markings in the throat. Many of the spikes are a great advance on the variety Baron Jules Hulot, one of the best-known purples. Some of the spikes have the hooded Lemoinei flowers. Mr. Groff claims to have used the species *G. papilio* to obtain these shades of colour.

Four of the five named varieties offered in Mr. Groff's catalogue flowered at Kew: Blue Jay, a

NOTES FROM A "FRENCH" GARDEN.

Our first batch of Lettuce Little Black Gott is now coming through the ground. We are still sowing batches of different varieties, it being important that the plants shall become fit for transplanting at various dates. We have now prepared the ground and set the cloches in position for pricking-off the plants, and shall start this operation as soon as the cotyledons (seed leaves) are developed. The plants will be lifted carefully and the tips of the roots pinched

may be picked out in the frames if no cloche is available, putting 280 or 300 under each light.

We are now picking out in frames the Cauliflowers raised in September. Two barrow loads of well-decayed manure were put under each light. We plant 240 to 250 Cauliflowers to each light. The last row of plants is set 6 inches from the bottom board to prevent the Cauliflowers in it from getting drawn. We keep the lights closed for two or three days until the plants become established in their new quarters. After this period ventilation is given day and night except in case of frost.

The Ox heart Cabbages have been pricked out and the ground for their final quarters is being prepared by manuring it heavily and digging it.

Now that the crops have been cleared from the old manure beds, we break them up as fine as possible and set the decayed manure in ridges 15 feet apart (measurement taken from each ridge). This manure, which will be used as soil in the ensuing year, will be broken up again within two or three weeks.

In gardens where the soil is of a heavy nature, as in our case, it is advantageous to drain thoroughly the space allotted to the hot-beds. The beds have to be heavily watered, which is apt to make the soil sour and soggy and prevent the manure from decaying; moreover they are only exposed to the air for a short period, and this in the rainiest season of the year.

In places near to a town where clinkers can be procured conveniently, a good layer of these would drain the ground sufficiently. In other places the space must be thoroughly drained with pipes. *P. Aquatias.*

TRADE NOTES.

DISSOLUTION OF PARTNERSHIP.

THE partnership between Alfred Watkins and Chas. David McKay, carrying on business as Watkins & Simpson, at 12, Tavistock Street, Covent Garden; 13, Exeter Street; Mercer Avenue, Long Acre, London; and at Evesham, in the county of Worcester, was dissolved on May 10, 1909. Mr. Alfred Watkins will continue the business alone as Watkins & Simpson in the same manner as heretofore.

Mr. C. D. McKay has entered the service of Messrs. Cooper, Taber & Co., Ltd., seed merchants, 90 and 92, Southwark Street, London, S.E., in which firm he has obtained shares.

Mr. H. SCHUSTER.

We are informed that Mr. H. Schuster, for many years traveller for Messrs. Linden et Cie., Brussels, has been appointed to represent the "Etablissement Charles Madoux-Brassine," Avenue de la Chasse Royale, Auderghem, Bruxelles, Orchid growers and importers.

APPLE REV. W. WILKS.

In the collection of fruit trees in pots shown by Messrs. Jas. Veitch & Sons, Ltd., at the last meeting of the Royal Horticultural Society (see p. 257), an outstanding feature was a number of maiden trees of this fine culinary Apple. The tiny trees each bore several large fruits, two of which are shown in fig. 112. The variety was granted an Award of Merit at the meeting held on September 20, 1904, and was first figured in *Gardeners' Chronicle*, October 8, 1904. It was raised from Peasgood's Nonesuch crossed with Ribston Pippin. The tree is a strong grower and a free cropper. The flesh is white, juicy and pleasantly flavoured. The skin is yellowish-green spotted with brown and scarlet.

[Photograph by John Gregory.]

FIG. 112.—FRUITS OF APPLE REV. W. WILKS ON A MAIDEN TREE, AS EXHIBITED BY MESSRS. JAS. VEITCH AND SONS, LTD., ON THE 28TH ULT.

great advance in the blue shades and a strong grower; Afterglow, salmon, shaded fawn, with violet-blue markings in the throat; Dawn, pinkish-salmon, shaded white, claret markings on the petals, sturdy habit; La Luna, creamy-white, changing to white with age, brown markings in the throat; and Peace, a white variety, pale lilac markings inside the flower, which with age also appear on the edges of the petals. [See *Gardeners' Chronicle* Supplementary Illustration, March 30, 1907.] A.

off with the fingers to cause the development of laterals. Where there are plenty of cloches, not more than 24 plants need be put into each cloche, but if the quantity is limited we put as many as 30 in each cloche. The Lettuces are always set at the least 1 inch within the edge of the bell-glass to prevent the leaves, later in the season, from touching the glass in frosty weather. The beds must be inspected early in the morning to catch any slugs found inside the cloches. The Passion or Palatine Lettuces

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

PROPOSED MEMORIAL TO PETER BARR (see pp. 232 and 234).—Mr. John Wright's suggestion of a form of memorial of the late Mr. Barr for the benefit of the Royal Gardeners' Orphan Fund should appeal strongly to a wide circle of readers. It does seem, however, having regard to Mr. Barr's special association with the Daffodil, that it is a movement which should be promoted by the Narcissus Committee of the Royal Horticultural Society. Could not the chairman, Mr. H. B. May, convene a special meeting of that Committee? Mr. Wright suggests the creation of a memorial in perpetuity. That, presumably, means the raising of a sum sufficiently large to enable the interests accruing from Three Per Cent. Consols to provide an orphan pension of £15 per year. To do that and allow a small margin to meet office expenses, a sum of some £450 would be needed. If so much can be raised, well and good. If not, then some previous examples might be followed, and the memorial made terminable when the sum raised is exhausted. In addition, the Narcissus Committee could easily have an excellent memorial of their old "King" by having his photograph enlarged to full size, and, with an inscription, hung in the room in which that body held their meetings. *V. M. H.*

—There surely can be no better way of instituting a permanent memorial of Peter Barr than the one Mr. Wright suggests, namely, through the Royal Gardeners' Orphan Fund. The writer well remembers Mr. Barr as one of those who laid the foundation stone of the fund in 1837. I am aware that these are times when money is not easy to get for such objects, but I think a good sum could be raised for the object in question, and shall be glad to give my own mite. *H. J. C.*

A FINE SPECIMEN OF CUPRESSUS MACROCARPA.—The following particulars relate to a tree of *Cupressus macrocarpa* growing in the Marquis of Lansdowne's garden at Derrew, Kenmare, Ireland:—The tree was planted 46 years ago, and is 59 feet in height. The extreme spread of branches measures 66 feet, while the trunk is 12 feet 9 inches in circumference at a distance of 3 feet above the ground level. It would be interesting to know whether any larger trees of this species exist in the British Isles. *William Holbrow.*

GLADSTONE PEA.—With so many varieties of Peas in cultivation, it is difficult to appraise the merit of one over another, but Gladstone is certainly a most reliable, late cropping variety. The pods are well filled and they are generally produced in pairs. The flavour is excellent. My late sowing was made on June 21, and now, at Michaelmas, the plants are giving us many gatherings, the cold, showery weather evidently suiting the plants, as no trace of mildew can be seen. This variety and Autocrat are the two best late Peas here. *J. Mayne, Bickton, October 1.* [A dish of Peas received from Mr. Mayne perfectly bears out his description of this variety.—Eds.]

THE FIRST NATIONAL DAHLIA EXHIBITION.—On a recent occasion, when certain members of the National Dahlia Society met at Mr. Arthur Turner's nursery at Slough, Mr. Turner handed to each of his guests a document of exceeding interest in the form of a copy of the schedule of classes and prizes offered at the first National Dahlia Show held in this country. This was in 1853, and by a coincidence the days of the show were September 23 and 24, Thursday and Friday, just as these days and dates fell this year. The place of the show was the old St. James' Hall, a building which also served for the first National Rose Show. It is interesting to note as showing how custom varies to-day as compared with that in 1853, that the classes were then limited almost exclusively to the large Show and Fancy flowers, no other section being in that day required. Next to these large flowers the oldest section is doubtless the Pompon or Bouquet, but no provision having been made for them in 1853 leads one to the conclusion that they had not fully emerged from the transition stage into

that of a recognised section. There is at the end of the schedule one class for Bedding Dahlias, evidently the dwarf, compact habited section having large flowers, such as were those once known as Crystal Palace bedders. There is such a section to-day, and Mr. Turner has in his catalogue about 12 varieties, but it is doubtful whether one of these can equal for garden value the best of the Pompons. Cactus and single Dahlias were not popular in 1853. So far have Dahlias developed. Even the shows and fancies have much improved in habit since then, being now much dwarfier. A comparison of this schedule which was compiled 51 years ago with that of the present National Dahlia Society is indeed interesting. *A. D.*

BORDERS FOR VINES (see pp. 193, 220).—I know there is much difference of opinion among cultivators as to the value of a combination of inside and outside borders as against having the roots entirely within theinery. I have had good results from such a combination of rooting space, but am forced to the conclusion that if the roots are confined within theinery they are much better under control. Therefore, better results are obtained with such varieties as Mrs. Pince, Muscat Hamburgh and Duke of Buccleuch, for examples, not forgetting that highly-flavoured Grape Lady Hastings. The opponent to the wholly inside border argues that it is all very well if you have careful assistants who supply moisture to the roots when they require it, but if there is a chance that they may suffer from want of attention, an out-of-door rooting medium is a distinct gain, because the roots obtain under mere natural conditions that moisture denied them in an entirely artificial border indoors. I am confident that early Grapes, say those ripened in May, are more easily managed in an inside border than in one where the roots are exposed to rains in the early spring, when the roots require warm conditions. Again, during heavy August rains, so common in recent years, an entirely inside border does much to prevent the splitting of the berries of Madresfield Court, an evil which this Grape is addicted to in some localities and under some conditions. Mr. Shingler, who has probably staged the finest specimens, from a colour point of view, of Mrs. Pince during the last ten years, is a firm adherent of inside border culture for this Grape, and the late Mr. Meredith, at Garston, near Liverpool, as far back as 1875, produced the first perfect examples of this Grape from an inside border. Many poorly-coloured examples are the result of a cold rooting medium, which is detrimental to the production of rich bloom. In a like manner also does a too deep border act against the welfare of the vines. From 2 feet to 3 feet in depth, with sufficient drainage to maintain porosity of the soil, is all that is necessary. Liberal supplies of moisture are absolutely necessary at certain stages of growth, but water stagnation about the roots is an evil, and one most common in excessively deep borders. *E. Molyneux.*

ENDURANCE OF POTATO VARIETIES.—The exact date is not given, yet presumably nearly 100 years have elapsed since Mr. John Sheriff prepared his paper on the "Curle Disorder in Potatoes" for the Royal Caledonian Horticultural Society, and from which Mr. D. W. Thomson gives a quotation (see p. 202). The varieties of Potatoes then in commerce were few, and all were great seed producers. It did not apparently occur to growers at that time to gather the flowers, as the exhausting effects of seed production were then imperfectly understood. Much later, such varieties as Shadstock Beauty, American Purple, and even Reading Russet, still widely grown, were great seed bearers, simply because the flowers produced pollen in abundance. Mr. Fenn's other seedling, Woodstocke Kidney, was also a free pollen producer, but International Kidney, raised from the same seed capsule, did not produce any pollen. Woodstocke Kidney in time went out of cultivation, not for lack of quality but simply because it was not a sufficiently heavy cropper. International Kidney produced tubers in abundance, and to-day it is one of the heaviest croppers of early market Potatoes, being known by the name of Jersey Fluke, a distinct variety that was raised 40 years ago. Magnum Bonum, a heavy cropping Potato, has been in existence 40 years;

this variety seldom or never produced seeds naturally. Magnum Bonum is still a fine cropping Potato. All the famous varieties of the Up-to-Date type, and indeed all great cropping varieties, produce few or no seed apples. Potatoes are now much longer lived because of this. How long have Early Rose and Beauty of Hebron been with us, and how good they still are? Neither produces fruits. The old Ashleaf Kidney, probably the most ancient and well-preserved of all our varieties, is still in cultivation, and as I have seen it in Surrey, as good as ever, but it is a non-fruiter. Mr. Sheriff seems to have attributed "curl" to the prevalence of seed apple production in Potatoes. But we have seen the curl very badly on varieties that never produce fruit. The remedy, as Scotchmen found, is change of seed, and now in the south because it is so much the rule to obtain seed tubers from distant districts, curl is rarely seen. I do not think that what Mr. Sheriff wrote was prophetic, but rather that it indicated less knowledge than we have to-day. *A. D.*

MONTBRETIA.—I herewith send flowers of 19 varieties of *Montbretia*. America has dark orange-yellow coloured flowers, with red centre; it is very free-flowering and quite distinct. Prometheus (see fig. in *Gardeners' Chronicle*, September 29, 1906, p. 223) is an extra large flower of a rich orange colour, with petals of great substance. Armeau d'Or is a perfectly formed flower, measuring often over 3 inches across; it is orange-coloured, with a large maroon ring round a yellow centre. Brilliant is well named, being scarlet with maroon blotches; the flowers are of good form. Le Pactole produces large spikes and flowers of a bright golden-yellow colour. Messidor is a light yellow or straw colour, has large branching spikes, and is perhaps the nearest approach to white yet seen in *Montbretias*. Among the 60 varieties that have flowered with me this season Vesuvius is the richest coloured; it is a beautiful reddish-scarlet, with golden-yellow centre. This new variety, when better known, is sure to become a great favourite. Martagon is a charming variety, a shade of dark orange, with brown-red centre. M. Jacquesau has large red and yellow flowers. Perhaps the most remarkable of all is Tragedy; it produces large flowers of a deep orange colour, with a velvety ring of rich blood-red shade, quite distinct from any other variety. Amongst the others, Hereward is a grand yellow variety, and is probably already well known to many readers as one of the best of those raised by Mr. Davison. I plant my *Montbretia* bulbs in late autumn on well-manured soil. For two months past the flowers have made a brilliant display. *Michael Cuthbertson, Rothesay.*

SOCIETIES.

ROYAL HORTICULTURAL
Scientific Committee.

SEPTEMBER 23.—*Present:* Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the Chair); Messrs. A. W. Hill, W. Cuthbertson, J. Fraser, J. T. Bennett-Poë, W. Hales, E. M. Holmes, R. Hooper Pearson, and F. J. Chittenden (hon. sec.).

Prunus sp.—Mr. A. W. HILL, F.L.S., stated that the plant shown at the last meeting under the name of *Prunus Chapronii* proved to be a form of *P. cerasifera*.

Giant Puffball.—From C. C. PAINE, Esq., of Haverstock Hill, N.W., came a specimen of the giant Puffball (*Lycoperdon bovista*), having a circumference of 38½ inches.

Museum preparations.—Dr. VOELCKER showed a human heart set up as a museum preparation, which without dissection showed the whole of its structure. The liquid in which it was preserved was a mixture of various ethers, &c., and portions were rendered transparent owing to the refractive index of the liquid being the same as that of the material preserved. The discovery of this preservative was due to Dr. SPATTERHOLZ, and it promises to be of great use in preparing museum specimens.

Forms of Impatiens Roylei.—Mr. E. A. BOWLES showed a white-flowered form of *Impatiens Roylei*, which has been called var. *pallida*. It is rather smaller than the type, and has paler, narrower leaves. He also showed a

variegated form which had appeared in his garden. The seedling had shown the variegation, and it had been maintained throughout the life of the plant.

Linaria maroccana sport.—Mr. BOWLES also showed a sport of *Linaria maroccana* with the corolla split to the base and without spurs, which had occurred in his garden. The flowers failed to produce seed, the ovary being absent.

Narcissus Tagetta var.—He also showed leaves of a form of *Narcissus Tagetta*, which had persisted until the present time. They were quite green and healthy-looking, and about 18 inches in length.

Furcate inflorescence in Typha (see fig. 113).—Mr. R. HOOPER PEARSON exhibited a specimen of *Typha angustifolia*, received from Lord AVEBURY, in whose garden at High Elms, in Kent, the plant was growing. The stem showed a slight fasciation, and it bore at the top four inflorescences as shown in the figure. Fasciation appears to be very uncommon in the genus.

Solanine in Solanum nigrum.—*Solanum nigrum* is included amongst poisonous plants in works of toxicology, but cases of poisoning by it are rare, and relate chiefly to children; but its active principle, solanine, undoubtedly possesses poisonous properties in large doses. Solanine was originally discovered by DESFOSSÉS, of Besançon in 1821, in the berries of *Solanum nigrum*; and to it and to atropine possessing mydriatic properties its physiological effects are believed to be due. Solanine also occurs in young sprouts of the Potato, in Tomatos, and other species of *Solanum*. *S. nigrum* contains about 0.5 per cent. of solanine. Mature healthy Potatos are said to contain none, but KASSNER separated 30 to 50 milligrammes from 150 grammes of diseased Potatos. ORFILA found that the extract of *Solanum nigrum* had a very feeble effect as a poison, but rabbits are killed by doses of 0.1 grain of solanine per kilogramme of weight of the animal. The symptoms commence in 10 minutes, with apathy, low temperature, and slow breathing; convulsions set in before death, and the pupils become dilated. Dogs are not easily affected by it, as it is usually rejected by vomiting. BLYTH, in *Poisons: Their Effects and Detection*, p. 398, remarks: "Poisoning in all recorded cases (i.e., in cases of accidental poisoning of human beings) has not been by the pure alkaloid solanine, but by the berries of different species of *Solanum*. The symptoms, in about 20 cases, have varied so greatly, that the most opposite phenomena have been described as the effects of poisoning." The recorded cases of poisoning by the berries of *S. nigrum* are not numerous, and have usually occurred in children. The death of three children is recorded by HIRTZ, *Gaz. Med. de Strasbourg*, in 1842, and other cases by MAURAY, *Gaz. des Hôp.*, 1869, J. B. MONTAINE, *Chim. Méd.*, 1862, and by MANNERS, *Ed. Med. Jour.*, 1867. The facts concerning cases of poisoning by the berries of *S. nigrum* require confirmation. Even the statement concerning the poisonous action of solanine and its dose need careful revision, for it is highly probable that much of the solanine used by investigators has been impure, and may have contained decomposition products, since solanine is easily split up by various reagents. Doses of more than quarter-grain, to commence with, would be considered unsafe for medicinal purposes. An excellent summary of what is known of its physiological action will be found in DUPUY, *Des Alcaloides*, pp. 503-521, and in the *United States Dispensatory*, 1907 (19th ed.), pp. 1,654-5. Reference may also be made to *Kobert Lehrbuch der Intoxikationen*, pp. 759 and 1,057, regarding the recorded cases of presumed poisoning by solanine in Potatos. With reference to the use of the berries of *Solanum nigrum* as food: first, it is quite possible that in a luxuriant, cultivated form of the plant the amount of solanine might be reduced considerably, and the fruit prove edible. Secondly, the fruit, when boiled, especially in the presence of vegetable acids, might be less likely to produce unpleasant symptoms than the raw fruit, since the decomposition of solanine might take place, and solandine, which is usually set free, is reported to be non-irritant. Thirdly, the berries have no doubt been largely eaten in the United States, and, so far as I am aware, no dangerous results have followed. Fourthly, some persons are unusually sensitive to the alkaloids of belladonna, and it is quite possible that

cases of idiosyncrasy may occur with regard to solanine. That solanine itself can produce distinct physiological action there can be no doubt, but how far the symptoms attributed to it are due to pure solanine has not yet been proved. Fifthly, it is also possible that, as in the Potato, the percentage of solanine present in *Solanum nigrum* may vary according to the age and condition of the fruit, whether ripe or unripe, and to other circumstances of difference in season as regards light and heat. But there is no need apparently to add a fruit of such doubtful utility, and so lacking in good qualities to the list of more palatable fruits already in the market.

FIG. 113.—FASCIATION IN *TYPHA ANGUSTIFOLIA*, FROM SPECIMENS SUPPLIED BY LORD AVEBURY.

Hybrid Willows.—Mr. J. FRASER, F.L.S., showed six hybrid forms of Willow, recorded in British floras and other botanical works as *Salix ambigua*. Most authorities are agreed that *S. ambigua* is a hybrid between *Salix aurita* and *S. repens*. No two of the forms are exactly alike, but four of them approach *S. aurita* more closely than the other parent. He explained this by the fact that the parents in the wild state are extremely variable, and consequently one might expect the hybrids to be equally variable. Two of the forms approached more nearly to *S. repens* in shape, variation, and character of the hairs. While the leaves of the six forms showed affinity with one or other parent, the catkins were most

nearly like those of *S. repens* in size and other particulars. All of the above he preferred to name by using the names of the parents, namely, *Salix aurita* × *repens*. He also showed another hybrid named *Salix cinerea* × *repens*, with forms of the supposed parents most nearly like them.

NATIONAL CHRYSANTHEMUM.

OCTOBER 6.—Instead of the usual early exhibition of this Society a conference was arranged this season to take place on the above date at the Essex Hall, Strand. Concurrently with the conference there was a small exhibition from some of the trade growers, who exhibited groups of Chrysanthemums with Perennial Asters, Dahlias and other seasonable flowers. Prizes were offered by Messrs. W. Wells & Co. for six vases of early single Chrysanthemums. The Floral Committee granted Certificates of Merit to three novelties, all large-flowered Japanese varieties.

THE CONFERENCE.

At the afternoon session the chair was occupied by Mr. Thomas Bevan (Chairman of Executive Committee). The proceedings were opened by Mr. C. H. Curtis with a discourse on the treatment of the Chrysanthemum as an annual plant. Following this, a paper was read by Mr. W. Wells on the "History of the Early Flowering Single Chrysanthemum." Mr. Wells stated that the advent of the early-flowering single Chrysanthemum may be said to have commenced with the variety Mabel Goacher. This variety was sent out in the spring of 1902; it had pure white florets with a blush on the reverse side. It flowered profusely during August and September, being, each season, the first single white variety to flower out-of-doors. Mabel Goacher was originally catalogued with the early double varieties; in 1904 the essayist crossed the variety with Miss Rose and Bertha Jinks, but none of the progeny gave promise of any improvement on Mabel Goacher. Later, another batch of seedlings was raised, and many of these were selected for distribution. Several of the best varieties have three or four rows of florets, and many would regard these as semi-double, but they have a greater value than those with merely one row, because, when packed for a journey, they do not show injury so readily as the others. In 1907 Mr. Wells raised large quantities of seedling plants, and, as early-flowering Chrysanthemums can be satisfactorily treated as annuals, as many as 15,000 plants were planted for this purpose. The following autumn (1908), being favourable for seed saving, he obtained six gallons of seeds. Referring to their treatment as annuals, Mr. Wells said that, if seeds were sown in spring, the plants will all flower the same year, but their period of flowering varies greatly and extends from August to November or until there is severe frost. Cuttings of single Chrysanthemums should not be taken until March, when they will root quickly and soon develop into good plants. They should be planted 15 inches apart either way. The plants commence flowering in July, but the early flower-buds should be removed, as the hot sun of August destroys the colours and they are not so bright as later blooms on the same plants.

LATE MARKET CHRYSANTHEMUMS.

The subject of "Late Market Chrysanthemums" formed the title of a paper by Mr. J. B. Riding.

The essayist stated that an ideal market variety is one that produces flowers of a clear decided colour on stiff, erect stems. The blooms must possess lasting qualities, and the plant should have a good constitution. In order to secure late Chrysanthemums, a long season of growth is essential, therefore, the cuttings should be rooted early in the season, as late-rooted plants make soft, sappy growth in most years, and produce weakly, thin-stemmed flowers that are of little use. If the plants are pinched when about 6 inches high, or even less, this will lay the foundation of a plant large enough for all purposes, but this pinching should be done when the shoot is quite soft, so that it will break into growth freely. Before the young plants become stunted or starved, they can be placed in their flowering pots, and, assuming the pots employed are 16's, then three plants in each will produce a splendid bush in the following autumn. Light and air are

essential, therefore the plants should be allowed ample room throughout the summer months, and not only during the summer, but right up to their flowering period. When it is remembered that these Chrysanthemums are at least 10 or 12 weeks under glass before they bloom, it will be obvious how important it is that they should not be crowded.

The following late varieties were recommended by Mr. Riding for market purposes:—(White): Camell's Late Prolific, Mrs. Thompson, Queen of the Exe, Princess Victoria, Heston White, Madame R. Oberthur, Snowdriit, and Mdlle. T. Panckoucke. (Yellow): Golden Mrs. Thompson, Market Gold, Allman's Yellow, Mrs. G. Beech, True Gold, and Negoya. (Crimson): Violet Lady Beaumont, W. A. Crossley, and Matthew Hodgson. (Bronze): Taxedo and Lerd Brook. (Pink): A. J. Balfour, Mdlle. L. Charvet, Winter Cheer, and Framfield Pink.

CHRYSANTHEMUMS FOR CUT FLOWERS.

The next paper was on "The Best Chrysanthemums for Cut Flowers," by Mr. Percy A. Cragg. The following varieties were said to furnish good sprays of flowers on long stems:—Pink Marie Masse, with its spots; Horace Martin or Elstob Yellow (the latter a slight improvement), Crimson Masse, Red Masse, Mrs. Bailey (white), Holme's White, and Ralph Curtis (creamy-white). Nina Blick, a lovely red-bronze flowered variety, should be kept well watered, for if allowed to become dry at the roots the flowers go a dingy brown. Carrie, a good yellow Chrysanthemum, is not such a favourite as Horace Martin. Goacher's Crimson should be cut back the last week in July. Roi des Blancs is the best of all white Chrysanthemums for decorative purposes, although it does not grow so freely as some others. Polly is quite the best of all the early varieties; it is a lovely bronze shade. Charles Jolly is a pink variety that does well if rooted in the first week of April; if rooted before then it flowers too late. All these are September bloomers, continuing into October.

Among October-flowering varieties, the following were recommended:—Touchwood Bronze, a very good spray flower; Mrs. Cragg (old gold), Etoile d'Or (yellow), Le Pactole (bronze), Bouquet Rose (rose), Source d'Or and its sports, and Mrs. Scott (white). It is better not to propagate any of these before the end of March or even the beginning of April, and the plants should not be stopped or they will flower too late.

For disbudded blooms cut from out-of-doors the following give good results:—All the Masse varieties mentioned, if cut back the last week in July, and the shoots that come up from the bottom disbudded, furnish blooms 5 inches across, with stems 2 feet long. White and Yellow Mme. Desgrange, if cuttings can be obtained of good stock; in hot, dry seasons it may be found that the stems become too hard, and that the flowers wilt when cut; but if the ends are scraped and split up a little way, and put at once into water, no further trouble will be experienced. Nina Blick is specially good in wet seasons. Nelly Blake, a bronze seedling from Mme. Desgrange, is also good if grown well. Members of the Source d'Or family are admirable on some soils, but not on heavy land.

Some varieties need protection from damp, and then they give good returns. These include Mrs. Scott, Le Pactole, Mrs. Cragg, Old Gold, and Etoile d'Or.

Amongst Japanese and incurved varieties the following were recommended:—La Triumphant, which, although rather subject to mildew, and to damping in wet weather, crops well, the blooms lasting fresh for a long time when cut; Miss Olive Dunsday, Mr. F. McNiece, Gracieuse, a lovely incurved Japanese which, if kept cold and grown well, is the best pink of all; and Poit Revine a December variety, which is in flower about the same time as Mme. Louise Charvet. The pink sport from Princess Victoria is of fair colour and sells readily. Framfield Pink, and its sport Winter Cheer, are in season at Christmas, and will last until February.

Of bronze-flowered varieties *Hortus Tolosanus*, Lady Lennard, Mikado and Bronze Princess Victoria may be enumerated.

Red varieties are not numerous. Market Red and T. Humphreys are excellent for flowering the end of October and the beginning of November; Exmouth Crimson continues the succession until Matthew Hodgson is ready in December.

Of White kinds, Money-maker, Mrs. Roots,

Miss A. Byron, Mrs. J. Thompson, Mrs. Judson, Mdlle. T. Panckoucke, and Princess Victoria are all good varieties. Then, last of all, for districts free from fog, there are Heston White and White Framfield, which is more vigorous than its parent.

Of yellow varieties, starting with the October bloomers, Yellow La Triumphant is very good. The next reliable variety, at the end of October, is Embleme Poitevine, which can be had in flower till mid-December. Le Peyvon, Nagoya, Golden Mrs. Thompson and Golden Victoria are also to be recommended.

The first single-flowered variety to bloom is Mary Richardson. Following closely are Reine des Roses and Rosie Bell. The Pagram family, white, pink and bronze, blooming in early November, are exceedingly good, whether disbudded or grown naturally in sprays. Gaiety is a very fine bronze, and Kitty Bourne is the best yellow. The following are also good: Sylvia (bronze), Mrs. Roberts (pink), Irene Cragg (white), Sir George Bullough (yellow), Delicatissima (pinkish-fawn), and Elizabeth, Phillis and Evelyn, all pink kinds.

The concluding paper was on "The Best Chrysanthemum from an 'Esthetic Point of View,'" by Mr. D. B. Crane. He advocated the claims of the Single, Pompon, Anemone-flowered, thread petalled and other small-flowered types.

THE EXHIBITION.

FIRST-CLASS CERTIFICATES

were awarded to the following varieties:—

White Queen (Japanese).—A rather large bloom, with drooping creamy-white flowers. The centre is composed of rather thin florets, which is a fault. Shown by Mr. MARTIN SILSBURY, Shanklin, Isle of Wight.

Empress (Japanese).—A promising exhibition variety of lemon-yellow or canary colour. It is a deep bloom with plenty of substance, and will probably be seen at the November shows this year.

Tom Edwards (Japanese).—A rich, yellow variety of the incurved Japanese section, a promising variety for early decorative purposes.

NON-COMPETITIVE EXHIBITS.

Mr. NORMAN DAVIS, Framfield, Surrey, staged a group of large exhibition varieties, interspersed with vases of Michaelmas Daisies. In the exhibit were several good blooms of the two novelties which received the Society's Certificate of Merit. (Silver-gilt Medal.) Mr. W. J. GODFREY, Exmouth, showed blooms of exhibition varieties. (Silver Medal.) Messrs. W. WELLS & Co., Merstham, Surrey, exhibited a collection of single Chrysanthemums; also about 5½ gallons of seed of these varieties. (Silver Medal.) Mr. J. B. RIDING, The Nurseries, Chingford, exhibited border Chrysanthemums, Perennial Asters, and Dahlias. (Silver Medal.) Mr. J. H. WITTY, Rose Nursery, Swains Lane, Highgate, showed vases of early-flowering border Chrysanthemums. (Bronze Medal.) Mr. FRANK BRAZIER, nurseryman, Caterham, Surrey, showed a group of decorative Chrysanthemums intermingled with Michaelmas Daisies and other seasonable garden flowers. (Silver Medal.)

COMPETITIVE CLASS.

Messrs. Wells's prizes were won by Mr. C. PAYNE, Sandhills Gardens, Betchworth, Surrey; Mr. E. F. HAWES, Royal Botanic Gardens, and Mr. W. NEWTON, Little Heathwood, Potters Bar, in this order.

BRITISH GARDENERS' ASSOCIATION.

A PUBLIC meeting of gardeners will be held on Wednesday, October 15, at 7.30 p.m., at Pitt's Restaurant, Kew Green, Surrey, when the aims and objects of the British Gardeners' Association will be explained by Mr. John Weathers, general secretary, and other members of the Association. Mr. D. Campbell, head gardener at The Priory, Roehampton, will preside. Discussion is invited.

The next meeting of the London branch will be held at Carr's Restaurant, 264, Strand, W.C. (near the Law Courts), on Thursday, the 14th inst., at 8 p.m., when a paper will be read by Mr. C. Hill on "Roses for Town Gardens." The chair will be taken by Mr. E. F. Hawes. All professional gardeners are invited to attend, whether members of the B.G.A. or not.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending October 6.

The first warm week since the middle of August.—After the first day the temperature continued high during the daytime, and with the exception of the last night the nights were also more or less warm for the time of year. On the five warmest days the highest reading in the thermometer screen ranged between 64° and 66°, and on the warmest night the exposed thermometer did not fall below 53°—a very high reading for October. In fact, in the previous two months on only one night was such a high temperature registered by the same thermometer. The ground has now become quite warm, being 4° warmer than is reasonable, both at 1 foot and 2 feet deep. Rain fell on all but one day, and to the total depth of three-quarters of an inch. During the week 3½ gallons of rain-water have come through both the percolation gauges. The sun shone on an average for only 1½ hour a day, which is less than half the average duration for the beginning of October. The first few days of the week were calm, but since then the wind has been at times rather high. The mean amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by 9 per cent.

SEPTEMBER.

Exceptionally cold, sunless, and humid, with an unusually frequent rainfall.—In only two Septembers in the last 23 years has the mean temperature been as low. The days also have only in the same two Septembers been as cold. The night temperatures were below the average, but in no way exceptionally low for the month. The highest temperature in the thermometer screen was 70°—the lowest maximum reading in September for 13 years. The lowest temperature registered by the exposed thermometer was 29°, which is only about the average extreme minimum for the month. Rain fell on as many as 18 days, but to the total depth of only 2 inches—½ an inch below the September mean. The sun shone on an average for 3½ hours a day, which is 1½ hour a day short of the usual duration for the month—making this the most sunless September for 13 years. The winds were as a rule light, and in the windiest hour the mean velocity only amounted to 15 miles—direction west. Only once before in the last 23 years, and that was in 1896, was the amount of moisture in the air at 3 p.m. as great.

THE SUMMER RAINFALL.

During the summer half of the present drainage year ending October, 10½ inches of rain fell, which is 2½ inches in excess of the average rainfall for the same six months in the last 53 years. April, June, July and August were all more or less wet. September, on the other hand, proved rather dry, while there was an average fall of rain in May. The only wetter summer-half of the year in recent years was that of 1903. E. M., *Isckhamstead*, October 6, 1909.

GARDENING APPOINTMENTS.

(Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.)

- Mr. A. C. PARSONS, for nearly 4 years Gardener to G. ARNOLD, Esq., Sandlea, Hatch, as Gardener to Mrs. HOLT, Waratah, Chislehurst.
- Mr. W. GUNSTON, for the past 18 months in the nursery of Messrs. B. LADHAMS, LTD., Southampton, and previously Gardener to Mrs. TAYLOR, Chipchase Castle, Wark-on-Tyne, Northumberland, as Gardener to VIOLET, Lady BEAUMONT, Slindon House, Arundel, Sussex.
- Mr. W. GARWOOD, for the past 2 years and 5 months Gardener to W. P. THOMPSON, Esq., Rock Edge, Birkenhead Park, as Gardener to ALFRED W. N. BURDER, Esq., Belcombe Court, Bradford-on-Avon.
- Mr. J. BAINEs, for 6 years Gardener to Mrs. WRAY HUNT, West Mador, Ruddington, Notts., as Gardener to the Hon. EVANS-FREERE, of Bisbrook Hall, Uppingham.
- Mr. E. GRIFFIN, for the past 8½ years in the gardens at Heythorpe Park, Chipping Norton, as Gardener to Colonel MALCOLM LITTLE, Dunsmore, near Rugby, Warwickshire. (Thanks for 2s. received for R.G.O.F. box.)
- Mr. J. STEVENS, for the past 9 years and 10 months Gardener to the late Sir H. M. HAWLEY, Bart., Tumbly Lawn, Boston, as Gardener to Dr. J. NEWSEAD, West Ashby Manor, Horncastle. (Thanks for contribution to R.G.O.F. box.)
- Mr. E. FENIGSON, for the past 5 years Foreman at Bella-dun Gardens, Beaulieu, as Gardener to W. MACGURE, Esq., Springfield House, Inverness.
- Mr. W. ANSELL, for 6 years Second Gardener at Titsey Place Gardens, Limpshold, Surrey, as Gardener to J. W. FIELD, Esq., Southsea House, Dorking, Surrey.
- Mr. J. H. PUCKERING, as Gardener to R. WOODWARD, Esq., Arley Castle, Bewdley, Worcestershire.
- Mr. LEWIS CHILVERS, for nearly 3 years Gardener to Princess ALEXIS DOLGOROETZ, Nashdom, Hitcham Vale, and previously nearly 4 years Foreman at Dripton, as Gardener to Miss NEVE, Osborne Lodge, Cranbrook, Kent.
- Mr. E. R. BEAMIS, for the past 20 months at Shiplake Court Gardens, Henley-on-Thames, as Gardener to Lord BRAYE, Stanford Hall, Swinsford, near Rugby.
- Mr. R. PEERLESS, for some years Foreman at Brookwood Asylum, as Gardener at the Surrey County Asylum, Netherne, Merstham.
- Mr. H. GAZELL, for the past 3 years in the Pleasure Grounds, Boston House, Brentford, as Gardener to Capt. MIDDLETON, Frogs Hall, near Dunmow, Essex.
- Mr. J. W. SLEIGHTHOLM, late Gardener at Cliff Ridge, Gt. Ayton, R.S.O., as Gardener to THOS. PRIESTLEY, Esq., Bank Top House, Bradford, Yorks.
- Mr. T. WHITING, for 3 years Foreman at Shotover, Wheatley, Oxford, as Gardener to Mrs. MILLER, at the same address, in succession to Mr. J. BROADFOOT, who has retired. (Thanks for contribution to R.G.O.F. box.)

MARKETS.

COVENT GARDEN, October 6.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices. Includes items like Asters, Carnations, Dahlias, Enchiridiums, and various lilies.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their prices. Includes items like Adiantum, Agrostis, Asparagus, and various ferns.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various plants in pots and their prices. Includes items like Ampelopsis, Aralia, Aspidistra, and various cacti.

Plants in Pots, &c.: Average Wholesale Prices (Contd.).

Table listing various plants in pots (continued) and their prices. Includes items like Marguerites, Pelargoniums, and Selaginella.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices. Includes items like Apples, Bananas, Damsons, Figs, Grapes, and various berries.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices. Includes items like Artichokes, Beans, Cabbages, Carrots, and various leafy greens.

Table listing various potatoes and their prices. Includes items like Bedfords, British Queens, Epicure, and various other varieties.

COVENT GARDEN FLOWER MARKET.

There has been a revival of trade during the past week, owing chiefly to the demand for flowers and plants for Harvest Festivals. Lilliums have made considerably advanced prices; Callas also have sold well. Plants of Solanum capsicastrum are seen, and, though the plants are not large, they are well berried. Cyclamen and Cinerarias also may be purchased, but these plants are not so well flowered as we may expect them later. Chrysanthemums form the leading feature amongst flowering plants. Plants of the variety Mme. De-terange with about eight to ten blooms are worth 30s. per dozen. Le Pactole with fewer flowers make the same price, but there are many of the Mme. Marie Masse varieties from the open ground which are sold at from 4s. to 6s. per dozen. If the nurserymen would grow fewer plants and cultivate them so as to obtain the highest quality specimens, they would find them more profitable than larger quantities of inferior ones. There is always a demand for cheap plants, but those of the best quality are sold first. Ericas are not selling very readily. E. gracilis is well flowered, the blooms being of a good colour. E. gracilis nivalis remains true to character, in fact I think the blooms are whiter than when the plant was introduced. The stock plants have to be carefully selected, for some revert to the type: I have recently seen specimens with one or more shoots which have reverted to the normal colour. I have not yet this season seen well-flowered E. hymenalis in the market, but at a nursery a fortnight ago I noted plants with flowers just opening. Asters are still good, but it would be difficult to quote uniform prices; their value varies considerably. Some market growers cultivate Michaelmas Daisies well in pots. Wallflowers and other hardy subjects are already seen. Conifers, climbers and other hardy trees and shrubs may also be purchased in the market.

CUT FLOWERS.

The supplies are uncertain and the advance in prices of most things last week may be sustained. Much depends on the weather. Even Chrysanthemums are scarcer, but a little more sunshine will soon make a difference in the supply. Carnations are adversely affected by the dull weather; it not only makes a great difference to immediate supplies, but the buds for later flowering do not develop. Roses are fairly plentiful except blooms of extra good quality. Most hardy flowers are damaged by the wet weather. Autumnal foliage is a feature, but with many plants the colours are not so good as in a dry autumn. The increasing use of hardy foliage by the florists has materially reduced the value of that grown under glass. A. H., Covent Garden, October 6, 1909.

DEBATING SOCIETIES.

WARGRAVE AND DISTRICT GARDENERS.—The first meeting of the winter session was held on Wednesday, September 22, when the hon. secretary, Mr. H. Coleby, lectured on "Plants and their Means of Defence." He showed that plants have their enemies, and to be able to survive they must defend themselves against attack. Certain methods employed by different plants, both native and exotic, to protect themselves were referred to. Diagrams were used to illustrate the lecturer's remarks.

BRISTOL AND DISTRICT GARDENERS.—A successful meeting was held on September 30. Dr. Shingleton Smith presided over a large attendance of the members. Mr. J. C. House, Westbury-on-Trym, gave a lecture upon "The Hardy Flower Garden all the Year Round." The lecturer explained the meaning of the words "perennial" and "herbaceous." Mr. House recommended the early autumn months as the most suitable time for making a new flower garden, and the early winter months for renovating old ones. The lecturer gave an outline of a colour scheme, naming scarlet for the centre, other shades, such as purple, followed with cream and white, and then orange, gradually leading up to scarlet. Delphiniums and Pyrethrums were named as being unsafe to plant between September and February, but most other subjects, including Moon Daisies, Asters, Helianthus, Eryngiums, Peppies and Aconitums, may be planted in the winter months. Mr. House staged a bank of hardy flowers, for which he was awarded a special certificate. H. H.

READING GARDENERS' ASSOCIATION.—The meetings of this flourishing association were resumed on Monday, September 27. The president (Mr. Alderman Parfitt) occupied the chair. In celebration of the "coming-of-age" of the association it was decided to hold a non-competitive exhibition of fruit, flowers and vegetables in the small Town Hall, Reading, on Wednesday, November 17. Mr. Wilson read a paper on "Experiences and Observations on Fruit Growing during 1909." Seven new members were elected.

LOUGHBOROUGH GARDENERS.—The annual meeting and dinner of the Loughborough and District Gardeners' Mutual Improvement Association was held recently. Mr. J. T. Smith presided. The balance-sheet showed that the total receipts for the year were £232s. The expenditure was £10 10s. The thirteenth annual report showed that the County Council had granted the society a series of three lectures, Mr. J. Smith, of the Midland College, Kingston, again being the lecturer. The president had again offered prizes for essays, and the report of the judges of these essays was very favourable. The exhibition of Sweet Peas took place in July. The annual outing was an unqualified success, the Duke's Lodge Hotel. The committee was re-elected, with the substitution of Mr. L. Watkins for Mr. Pawlett. Mr. J. T. Smith was re-elected chairman, and Mr. P. Roberts vice-chairman. Mr. McVinish was again elected hon. treasurer, and Mr. J. Reynolds hon. secretary.

CATALOGUES RECEIVED.

GEORGE BUNYARD & Co., LTD., The Royal Nurseries, Maidstone, Kent—Fruit Trees and Roses.
 D. PRIOR & SON, Colchester—Roses.
 THE LIVERPOOL ORCHID & NURSERY CO. (COWAN'S), LTD., Gateacre Nurseries, Gateacre, near Liverpool—Ornamental Shrubs and Trees, Roses, Fruit Trees, &c.
 W. KNIGHT & SONS, Park Nurseries, Heathfield, Sussex—Nursery Stock.
 CHARLES TURNER, Royal Nurseries, Slough—Auriculas, Carnations, Picotees, Pinks, &c.; Roses.
 R. WALLACE & Co., Colchester—Lilies, Hardy Plants, Bulbs.
 DICKSON & ROBINSON, Manchester—Bulbs.
 JAMES VEITCH & SONS, LTD., Royal Exotic Nursery, King's Road, Chelsea—Roses.
 JOHN PEED & SON, Roupell Park Nurseries, West Norwood—Chrysanthemums; Trees, Shrubs, Hardy Climbers, &c.
 JOHN MCKERCHAR, 35, Giesbach Road, Upper Holloway, London—Lithums and other Bulbous Plants; Garden Sundries.
 ELISHA HICKS, Twyford, Berks.—Roses.

FOREIGN.

M. LEENDERS & Co., Steil-Tegelen, Holland—Roses.
 TRANSON BROTHERS & D. D'ARVESSE (Barbier & Co., Successors), 16, Route d'Ohvet, Orleans, France—Nursery List.
 HAAGE & SCHMIDT, Erfurt, Germany—Novelties in Flowers (Seeds).
 L. SPATH, Baumschulenweg, b. Berlin, Germany—Fruit Trees, Roses, Trees, Shrubs, &c.

Editors and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the *Publisher*; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the *Editors*. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

BEECH TREES WITH WHITE SPOTS: *A. E. S.* The white patches which you take to be a fungus are insects allied to the common mealy bug. The pest generally confines itself to the stem and main branches. If, therefore, you scrub these with some strong insecticide such as caustic alkali wash you will rid the trees of them. If you defer the work of applying the caustic wash until a little later the trees will be bare of foliage and you will then be able to see better what you are doing. Caustic alkali wash is a corrosive substance, therefore gloves should be worn by the operator to protect the hands. The wash should be made as follows:—Caustic soda (10 per cent.), 1 lb.; potassium carbonate (80 per cent.), 1 lb.; soft soap (10 ounces); water, 10 gallons. The soda and potash should be dissolved in water, and the soap, having been previously dissolved in hot water, added to the solution, afterwards making up the quantity to 10 gallons.

CELERY DISEASED: *W. W.* The foliage is destroyed by a fungus—*Septoria Petroselinii*. The infected parts should be gathered and burned or buried deeply. It would be advisable not to grow Celery or Parsley on the land bearing an infected crop for a year or two.

CLUBBING IN CABBAGES: *W. E. W.* This trouble results from a fungus—*Plasmiodiophora brassicae*. This pest infests all kinds of plants of the Brassica or Cabbage family, therefore such weeds as Shepherds' Purse, Charlock, and Hedge Mustard should be rigorously exterminated. The young plants are most liable to infection, and it is a good plan to dip the roots of the seedlings in a puddle formed of thick mud, soot, and a little sulphur, before planting them out in the beds. It has been found that quicklime is a good cure for clubbing, if applied at the rate of 35 bushels of lime per acre.

EARLY VINERY: *J. W. G.* We have seen Muscat of Alexandria and Black Hamburg Grapes do well in the same vinery, but it is not advisable to plant them together unless it is specially desired. The Muscat of Alexandria requires a very warm, moist atmosphere, whereas the Black Hamburgs succeed fairly well under cooler conditions. But Black Hamburg is largely employed as a variety for early forcing, indeed it is one of the best Grapes for the purpose. Other varieties recommended for

early forcing are Madresfield Court, Duke of Buccleuch, Royal Muscadine, and Foster's Seedling. You will find full particulars as to the making of vine borders in an article by Mr. Ward in the issue for September 18, p. 193.

EUCOMIS PUNCTATA: *C. Pattison.* We suspect that after potting your bulbs you started them too quickly into growth. *Eucomis* is not a delicate subject, but may often be found growing quite freely in sheltered spots out-of-doors. After the plants have been potted water should be afforded very sparingly. The rotting was probably caused by excess of moisture. If you will read the remarks to *Kensington* on the culture of *Vallotas* and *Nerines* in the issue for September 25, p. 224, you will find much information that will help if you applied to the *Eucomis*.

FRUIT TREES INFESTED WITH MOSS AND LICHENS: *F. De V. W.* The best plan to rid your trees of these growths is to apply a caustic alkali wash, such as is recommended above to *A. E. S.* for Beech trees. The best time to carry out this work is in February or March, or even later, if it can be deferred without risk of injuring the expanding buds. If two sprayings are necessary, November is a suitable time for the first one and the end of March for the second.

GARDENERS' NOTICE: *G. B.* The usual practice is for a head gardener to receive or to give a month's notice to terminate an engagement.

GLADIOLUS: *Amateur.* The corms you mention were purchased in the ordinary way. For further information see p. 250. You should have no difficulty in flowering the corms the first year if purchased from a reliable firm; while if planted in good loamy soil, they should increase in vigour instead of deteriorating the second year.

GRAPES: *L. & L. W.* We cannot advise you as to the reason of your Grapes cracking and decaying unless you send specimens for examination. We do not think the bluebottle flies have caused the mischief, but they would be quite ready to attack the berries directly the skin was broken.

GRAPES WITH BROWN MARKINGS: *J. P.* There is no disease present on your Grapes; the trouble is caused by some external injury. You will find the principal reasons why Grapes become thus disfigured, described in the issue for September 11, p. 192, in reply to *A. H. H.*

"HA-HA" OR SUNKEN FENCE: *W. H. B.* In an ordinary way a wall about 4 feet in height is ample for excluding sheep and cows from the garden, but in the case of horses much will depend upon the character of the animals themselves. It is quite possible, however, to so arrange the base of the trench that horses would not attempt to mount the wall or fence. The trench may be anything between 10 feet and 15 feet in width, and the bank being made from the field level at an easy gradient, should afterwards be fanned at an angle of about 40° or 45°. The bank or slope, rounded at the summit, should first resemble a section of an arc and not be allowed to take on an acute or straight line angle, so arranging matters that the lower portion for a space of 3 feet from the wall approaches the level. In this way the barrier becomes more effective. The stability of the wall is a matter of importance, and its strength must be gauged by the character of the soil. In the case of wet or badly-drained soils, drain pipes should be inserted at the base and again at 1 foot high.

Kew: *Tunncliffe.*—Write to the Curator, Royal Botanic Gardens, Kew. He will send you an application form.

NAMES OF FRUITS: *J. C. B.* Plum Pond's Seedling.—*G. Bottram.* 1, Williams's Bon Chrétien; 3, Chaumontelle; 4, Brockworth Park; 5, Emile d'Heyst; 6, Marie Benoist; 7, Marie Louise.—*S. B. H.* 1 and 3, Dutch Codlin; 2 and 4, Catshead; 5, Norfolk Beaufin; Pears; 1, Louise Bonne de Jersey; 2, Marie Louise; 3, Louise Bonne de Jersey; 4, Gansel's Bergamot.—*A. Butler.* 1, Lord Suffield; 2, Kerry Pippin; 3, Doyenné de Meroche; 4, Potts's Seedling; 5, not recognised; 6, Passe Colmar.

NAMES OF PLANTS: *A. C. H.* *Aerides suavisimum* and *Cypripedium oeranthum* (*Harristanum* × *insigne*).—*St. Mary Church* (no letter

received). 1, *Pinus Laricio*; 2, *Picea excelsa* var.; 3, *Pinus sylvestris*; 4, *Pseudotsuga Douglasii*; 5, *Cedrus atlantica*; 6, *Cedrus Libani*.—*H. D. McC.* 1, *Laburnum alpinum*; 2, perhaps *Broussonetia* sp. (send larger specimen); 3, *Pyrus lobata*; 4, *Populus balsamifera*; 5, not found; 6, *Ligustrum lucidum*.—*W. Curtis.* *Alonsoa Warscewiczii*.—*J. C. B.* 1, *Cestrum elegans*; 2, *Coronilla varia*; 3, *Monarda didyma*; 4, *Helium autumnale* var. *cupreum*.—*F. Fay.* *Chrysanthemum Parthenium* var. *flor. pleno*.—*Veronica.* 1, *Acalypha Mosaica*; 2, *Dracæna Guilfoylei*; 3, *D. ornata*; 4 and 9, *D. ferrea variegata*; 5, *D. metallica*; 6, *D. albo-rosea*; 7, *D. amabilis*; 8, *D. excelsa*; 10, *D. fragrans*. These *Dracænas* are now known as *Cordylines*. 12, *Datura Stramonium*.—*J. E. T.* 1, *Muehlenbeckia complexa*; 2, *Salvia coccinea*; 3, *Linaria purpurea*.—*T. C. C.* 1, *Cyrtomium falcatum*; 2, *Polystichum angulare*; 3, *Selaginella Wildenowii*; *Chlorophytum elatum variegatum*; 5, *Strobilanthes Dyeriana*; 6, *Begonia Evansiana* (*discolor*).—*R. O.* 1, *Odontoglossum blandum*; 2, *Maxillaria tenuifolia*; 3, *Oncidium pubes*; 4, *Pleurothallis Grobyi*; 5, *Bulbophyllum Careyana*; 6, *Cochlioda sanguinea*.—*J. D. R.* 1, *Begonia Evansiana* (*discolor*); 2, *B. nitida*; 3, *B. fuchsoides*; 4, *B. argyrostigma*; 5, *B. Mme. Anna Low*; 6, *Dracæna fragrans*; 7, *D. marginata*; 8, *D. intermedia*.—*W. T. G. L.* 1, *Weigela hortensis*; 2, *Forsythia viridissima*; 3, *Cotoneaster frigidula*; 4, *Spiræa ariaefolia*; 5, *Spiræa Lindleyana*; 6, *Agapanthus umbellatus* var. *minor variegatus*.—*J. L.* *Lastrea rigida* (a British species).

OAK LEAVES MILDEWED: *L.* Mildew has been common on Oak leaves this season. The pest is *Erysiphe guttata*. Powdered sulphur is a good remedy, but in the case of large trees you can do nothing to combat the disease.

PEARS CRACKING: *G. E. F.* The Pears are badly attacked by a fungus—*Fusicladium pirinum*; a similar fungus also attacks the Apple. Spray the diseased trees with dilute Bordeaux mixture in the spring, when the buds are commencing to expand, again when the blossoms are falling, and a third time when the fruits have set. It will also be advisable to spray the trees during the winter with a solution of sulphate of iron.

PRIZE FOR A TABLE DECORATION: *Disqualified.* In a class for a table decoration the prizes are not only awarded for the quality of the flowers but also for the skill shown in arranging them. This last consideration is usually the more important one. If, therefore, the arrangement is left to a third person, we think the committee is justified in disqualifying the exhibit.

VINE ROOFS UNHEALTHY: *W. M. M.* The roots are free from fungus disease, but are injured by the sourness of the soil. Slaked lime is the best corrective for sourness. Keep the surface soil open so that air can enter, and with a little mulching a new growth of surface rootlets will be secured.

VIOLETS: *C. F. B.* You do not say whether you prefer single or double varieties, therefore, as the treatment for the two types is similar, we will give the names of two varieties of each. The best single kinds are *La France* and *Princess of Wales*, and the best double varieties *Marie Louise* and *Mrs. J. J. Astor*. They can be grown successfully in pots in a cool house, and this method would be the best for your purpose. The present is a suitable time for potting them up for flowering in winter and spring. Procure plants that have been specially grown and prepared for winter blooming and they will commence to flower almost at once. It is important, for the successful cultivation of Violets under glass, to remember that they require a free circulation of air at all times. The plants should be placed on shelves or stages, as near to the glass as possible, and they must never be allowed to suffer from dryness at the root.

JOHN MORTIMER AND THE ART OF HUSBANDRY.

DURING a considerable part of the eighteenth century the name of John Mortimer and his book on the art of husbandry* bulked large in horticulture. Philip Miller's *Gardeners' and Florists' Dictionary* of 1724 provides evidence of the extent to which that gardener was indebted to Mortimer in the compilation of this, his first book; and all through Dr. Johnson's dictionary Mortimer is quoted for words connected with husbandry, gardening, brewing, and kindred matters. In Johnson's *History of English Gardening* it is recorded that Mortimer was a retired London merchant who, in 1693, having purchased the estate of Filiois, in Essex, put into practice there his theories relating to agriculture and other rural pursuits. Later, the name of the estate was changed to Toppingo Hall, and Mr. Johnson relates how, in 1829, Cedars of Lebanon of large size, which Mortimer had raised from seeds derived from cones imported from Syria, were still thriving. From other sources we learn that he was a native of Somersetshire, and that his paternal estate had been destroyed by inundations. Mortimer

was thrice married, and it is supposed that his first wife, Dorothy Cromwell, was a daughter of Richard and a grand-daughter of Oliver Cromwell, the Protector.

As appears from the many editions which were published, Mortimer's book had a great success. It first appeared in 1707, again in 1708, 1709, 1712, 1714, 1716, in Dublin in 1721, and the latest edition, by his grandson, in 1761. In 1727 a translation was published in Sweden.

The first portion is entirely devoted to agriculture, and part of the second to brewing and other matters unconnected with horticulture. Such interesting subjects as current prices, wages, &c., enhance the value of the book to the general reader. The several parts are cleverly arranged, and the matter condensed in a manner uncommon for the period. Accuracy is most painfully lacking in the part devoted to the garden, many plants being described more than once under different names, and in some instances under different sections. It is, in a word, a plain, undemonstrative treatise, and present-day readers will search its pages in vain for fine writing like that of Lawson, for the quips and loving remarks of Parkinson, the classical allusions of Evelyn, or the unique comparisons of Ralph Austen.

The purely horticultural part of the book runs to about 240 pages and embraces in separate sections vegetables, shrubs, the greenhouse, flowers and fruit. Taking them seriatim and the more interesting points in each, we may note that the author strongly recommended that all ground should be trenched, the top spit to be turned into the bottom and the under spit transferred to the surface, objectors to the practice being reminded that ground trenched in autumn became so mellowed by exposure during winter and enriched by manure applied in spring that it was quite fertile at that season. Another point he argued was the need of rotation in cropping, and among other remarks of a general nature mention may be made of that advising the reductions of buds and shoots, and the lifting of bulbs immediately subsequent to withering of foliage. In the article on Artichokes, of which three kinds were cultivated, the desirability of leaving only two or three "slips" to each plant is recorded. Broad Beans were to be sown in rows 3 feet apart and the pods when ready "cut off with a knife." Late Cauliflowers were to be lifted and "set" in a greenhouse to yield a supply during winter, and Hotspur Peas were said to be ready to use in May from sowings in early autumn, while the Sugar Pea, which is being largely cultivated at the present time, was strongly recommended. The seeds of Peas were by some cultivators dibbled single in rows. From all this it is apparent that there were gardeners 200 years ago who knew their business.

Besides crops usual in kitchen gardens at the present day a large number of others long ago suppressed are also mentioned, and it is curious in this connection to find double Violets among them, these and Lavender having been requisitioned as edging plants. Roses also appear in this section, and such fruits as Currants, Gooseberries, Strawberries, and Raspberries. The close clipping of Gooseberries is condemned, and the utility of what appears to have been the common practice of bundling together strong and weak canes is pointed out. The chapter descriptive of shrubs calls for no comment, but that portion in which greenhouse subjects are treated must briefly be referred to, because it proves that greenhouses which at that time were structures for the preservation of greens (Evergreens) during winter were not at all uncommon. Mortimer passes in rapid review several

kinds of greenhouse more or less adapted to the purpose: the sunk pit protected with wooden shutters, and others, including the most expensive, the walls of which were lined with Dutch tiles and lighted by means of glass casements. Heating was effected in all sorts of ways:—by charcoal in pans, by fires lit in holes in the floor, by "fire hung up," by "trils made under the floor to convey warmth from the stoves made on the backside of the house." Those conversant with the essayists of that period will remember the description of a greenhouse, which reads rather like that of a winter garden, and which appeared in the *Tattler* of June 1, 1710, fully confirming Mortimer's statements. Both are alike also in the list of tender exotics, inasmuch as each is ludicrously brief. Mortimer's comprises *Solanum Capsicastrum*, Citrons, *Phoenix dactylifera*, Lemons, Oranges, Capsicums, Pomegranates, the Pine Apple and the Tulip tree! But in other sections mention is made of plants, e.g., Cannas, *Cyclamens*, *Ramonda pyreniaca*, *Opuntias*, tender *Jasmines* and *Passifloras*, which were to be preserved over winter in the greenhouse.

Concerning the flower garden the author chronicles no advance on previous writers. He seems to have been ignorant of the magnificent gardens which had been, and at that time were being, laid out on the great estates. His idea for a flower garden was a "long square" lying close to the house with a principal walk in the middle leading from the most frequented room in the house. It was to be fenced with a brick wall in preference to any other, but if a "quick" fence were adopted, then Holly was the best. The "inward" quarters were to be divided by clipped hedges of Codlins, Cherries, Plums, Quinces, *Cratægus pyracantha*, &c., no doubt on account of their blossoms, but partly also for their fruit. "Greens" cut in "chequer-work" are also noted. The best walks for winter were "reckoned those paved with broad stones," of which at present we are seeing so much. "Walks of grass are much to be preferred in summer," of which also there are many modern examples, but in addition to these several other kinds of walks are described. Incidentally we learn that the flowers were arranged in beds bordered with wooden rails. Anemones, Auriculas, of which "the double sort is the most rare and the Windsor Auricula the most splendid," Gillyflowers, which were carefully disbudbed to one or two blooms, Pinks, in which the China Pink is included, and which have always been regarded as first cultivated by Fairchild about the year 1713, the "double Pheasant-eye" named here also for the first time, *Ranunculus*, Stocks and Tulips were the chief plants cultivated; and of other plants mentioned none were novelties at that period. *Bacchus-bole* and *Dorothea* are two which Miller quotes in 1724, but they were strange to him. Not improbably they are merely names of some florists' flowers, the latter almost certainly a Carnation, and perhaps also the first-named.

There yet remains to examine the section devoted to fruits, the culture of which would appear to have given the author the greatest pleasure. In certain matters, as in dwarfing trees, he is less advanced than some of his predecessors, but many remarks point him out as a careful experimentalist. For example, he trained some of his orchard trees "fan-fashion," or, as we now term it, as open bushes. One of the causes of sterility in Apples he considered to be dryness at the root at the time of blossoming, and as one means of inducing a condition of fruitfulness, summer pruning is recommended. An interesting descriptive catalogue of fruits is given. Of Apples quite 120 sorts are noted. It is amazing to read that the Golden Pippin was "the best of Apples for cyder, eating, and baking." Of very old varieties

*Title of 1st Edition. *The Whole Art of Husbandry, or the Way of Managing and Improving of Land*. Being a complete collection of what has been written on the subject, either by ancient or modern authors, with many additions of new experiments and improvements not treated of by others, to which is added The Countryman's Kalender. London: Printed by I. H. for H. Mortlock, at the Phoenix, and L. Robinson, at the Golden Lion, in St. Paul's Churchyard, MDCCVII.

note may be made of the Golden Rennet, the Leather Coat, which is here said to be "an extraordinary good bearer," which I do not find to be the case. There is also the Bartlet, the John Apple, indissolubly associated with Sir John Falstaff; Queenings, and Pomewater, this latter constantly cropping up in old literature. It is here "indifferent and long lasting"; earlier, it was soon past; the Margaret, the Jennetin, the Codling, the Cat's Head, Fillets (Violets), and the Short Start (Court Pendu). The Devonshire Quarrington was then new, and the King Apple of that period was early and so cannot be identical with Warner's King, as has been supposed. Several have synonyms. Of Pears about 140 names are noted. Mortimer introduced several French varieties, but his nomenclature is almost beyond recognition. "Bœvre" does duty for beurré, and for Virgoulee we have "Virgo, lair." The "Early Susan," "little bigger than a Cherry," was the first to ripen, and he mentions several Katherines, of which the red was the best, and this was the commonest, too—"as red as is a Katherine Pear." Some 50 Peaches are named, of which "the Ricket Peach hath lately gained the reputation of being the best"—this probably a seedling of Ricket's, a nurseryman of Hogsdon. "Malacotounes," we are told, are "Apples with cotton on them!" At this period they were not much valued. Salway, it may be mentioned, is a modern Malacoton. A short Husbandman's Kalender of 40 pages completes the book. This Kalender is arranged in the manner usual during a very long period, and contains nothing out of the common, though in the list of fruits in use and of plants in flower are some not mentioned in the body of the book. R. P. Brotherston.

ORCHID NOTES AND GLEANINGS.

CATTLEYA IRIS KING EDWARD VII.

CATTLEYA Iris, a beautiful hybrid between *C. bicolor* and *C. Dowiana aurea*, raised by Messrs. Charlesworth & Co. some years ago, has proved to be one of the most varying of hybrid Cattleyas. All the forms are handsome, but some few exceed the rest in size and colour. One of the best varieties is that known as King Edward VII., illustrated in fig. 114. The photograph was taken from a flower in the collection of H. S. Goodson, Esq., Fairlawn, West Hill, Putney. The petals are very broad and indicate strongly the influence of *C. Dowiana*. Both sepals and petals are of the colour of old gold, with a slight rose shade. The side lobes of the lip, much shorter than the fleshy, white column, are cream-white, tinged and veined with pale rose, the broad front lobe being magenta rose, with red veining from the base to the centre.

CATTLEYA GASKELIANA "DELIGHT."

This charming white Cattleya was a special favourite with the late Marquis de Wavrin, who was a keen collector of distinct forms of large-flowered Cattleyas, and one of the best authorities on their respective merits. The flowers are about 7 inches across, and of a clear, silvery-white colour, the base of the lip having white lines on a chrome-yellow ground, and, in front, a marbled blotch of Parma Violet colour—a very uncommon tint for Cattleya Gaskelliana. A three-flowered inflorescence, taken from a plant acquired when the Wavrin collection was distributed, is sent by Francis Wellesley, Esq., Westfield Common, Woking.

LÆLIO-CATTLEYA WALTER GOTT.

A PRETTY new hybrid, between Cattleya bicolor and Lælio-Cattleya Bletchleyensis (*C. Warszewiczii* × *L. tenebrosa*), has flowered with Messrs. Sander & Sons, St. Albans, and has been named after Mr. Gott, who has charge of their Orchid-raising department. As with all the hybrids of *C. bicolor*, the influence of that parent is clearly shown, but the introduction of *L. C. Bletchleyensis* has resulted in a very pretty

flower. The sepals and petals are bronzy-yellow, the lip deep magenta in front, with a cream-white base. Being of hybrid parentage on one side, the batch raised will no doubt give many distinct varieties.

NOTICES OF BOOKS.

* THE BOOK OF NATURE STUDY.

THIS volume maintains the high standard set in those already published. In the earlier chap-

Sprengel, the pioneer of investigations into the relations between flowers and insects.

A chapter is devoted to the Scotch Fir, special attention being paid to features of biological interest, and this section of the book concludes with a few general notes on pollination and the dispersal of seeds, with a brief scheme of classification, indicating the systematic position of the types described. Good Scots will rejoice to find the Ling (*Calluna vulgaris*) described as Heather, while the two common species of *Erica* are referred to as Heaths.

FIG. 114.—CATTLEYA × IRIS "KING EDWARD VII."

ters, Dr. Lang continues to deal in an interesting way with the life histories of various common flowering plants, many of which are illustrated by excellent coloured plates. Parasites, such as the Dodder, and insectivorous plants, like the Sundew and Butterworts, come in for a share of attention, as does also the Willow Herb, with its curious pollination mechanism, first described by

* Edited by Bretland Farmer, D.Sc., F.R.S. Vol. iv. (The Caxton Press.)

Ferns, mosses, fungi, and lichens have been treated in a special section, illustrated by a number of good photographs. Those of the lichens are particularly clear, and show structural details clearly enough for purposes of identification.

The concluding chapter constitutes an introduction to the study of Ecology—a novel feature in a work of this kind. The author deals with woodland vegetation, referring more especially

to the common plant-associations characteristic of commons, heaths, and moors. A useful feature is the bibliography at the end of each section.

TROPICAL CULTURES.

THE Belgian Ministère des Colonies has issued recently two handbooks on the cultivation of economic plants in the Belgian Congo, which may prove of service to British cultivators in adjoining territories.* The first, on rubber-yielding plants, treats of *Landolphia*, *Funtumia* and other genera belonging to the Apocynaceæ; of *Hevea brasiliensis*; of *Ficus elastica* and other species of *Ficus*; of *Castilleja elastica* and *C. Tunu*; and of *Manihot Glaziovii*. Full particulars are given of each operation, from propagation, by seed or otherwise, to the collecting, preparing and packing of the rubber. Much of the contents consists of the results of experiments in relation to growth, yield, and quality of latex, as determined by soil, climate and other factors. There are a good many illustrations of individual trees and of plantations, with particulars of size and age. The experiments have been carried on in various distant places, but chiefly in the Botanic Garden at Eala, on the river Congo, at the Equator.

The second work is on the cultivation of the Coffee and Cocoa, from which we learn that, owing to over-production of the former, prices are not remunerative. Africa is the home of the genus *Coffea*, of which about a score of species are known, and, apart from the familiar *C. arabica* and *C. liberica*, which furnish practically all the Coffee of commerce, experiments have been made with *C. Arnoldiana*, *C. aruwimiensis*, *C. Dewevrei*, *C. Royauxii*, *C. canephora* var. *sankuruensis* and var. *kouilouensis*, and *C. congensis* var. *Chalotii*. For the results we refer to the original source.

HARDY HEATHS.

(Continued from page 241.)

E. MACKAYI.—A profuse autumn-flowering species found in Spain and in Galway, Ireland. Intermediate between *E. ciliaris* and *E. Tetralix*, it is considered to be a natural hybrid of these two species. Synonyms used in some nurseries and gardens are *E. Mackaiana* and *E. Tetralix* var. *Mackayana*. The small leaves are dark green above, nearly white beneath. The flower-heads are somewhat umbellate, purplish-pink, deeper in colour than *E. Tetralix*, which the flowers most resemble.

E. MEDITERRANEA.—This Heath is a native of South-west France, Spain, and Ireland, in Galway and Mayo. It is without doubt the best of our taller-growing, spring-flowering Heaths. Here and there a few tips were damaged by the severe weather last winter, but it is a hardier species than *E. arborea*, *E. australis*, and *E. lusitanica*. This is a grand plant for naturalising in the more open places in the woodland. The colour of the flowers—reddish pink, with prominent black anthers—makes it one of the best species to plant for effect in a setting of the varied shades of green of trees. From March to May the bushes, 4 feet to 5 feet in height, are covered with blossoms. Wild specimens of this height have been found on mountain bogs in Ireland, while under very favourable conditions specimens sometimes attain a height of 12 or more feet. In cultivation there are two forms, one having much richer coloured blossoms than the other. The white variety *alba* differs chiefly in the colour of the flowers, being similar to the type in stature. Var. *glauca* is a low-growing plant, with glaucous-green foliage; var. *liberica* is found in Ireland; var. *nana* is a dwarf, compact

plant, and var. *hybrida* a natural hybrid between *E. carnea* and *E. mediterranea*. This is truly a very valuable plant, for at the present time (September) it is covered with buds almost on the point of opening, while in winter, and especially in February and March, the reddish flowers are delightful, even though they may have been covered with snow for several weeks or have been subjected to as much as 20° of frost.

E. MULTIFLORA.—A native of South-west Europe, and, according to Nicholson's *Dic-*

FIG. 115.—FASCIATION IN LILIUM DALMATIUM.
(From a photograph supplied by Mr. Elwes.)

tionary of Gardening, introduced into this country from France in 1731. The name multiflora, is particularly appropriate for this plant, as both mature specimens, 2 feet in height, and young plants, 4 inches high, are covered with blossoms. These are white, disposed in racemose corymbs, the brown anthers being prominent. It is an autumn and

early-winter flowering species. A synonym is *E. peduncularis*, J. and C. Presl.

E. SCOPARIA.—This species is found in the Western Mediterranean region. It is a tall, slender-growing species, but of little value in gardens, the flowers, which are produced in late summer, being greenish in colour. Synonyms are *E. arborea*, Hort., and *E. virgulata*, Wendl.

E. STRICTA.—Synonyms for *E. stricta* are:—*E. Corsica*, D.C., *E. multicaulis*, Salish., *E. pendula*, Wendl., *E. ramulosa*, Viv., and *E. terminalis*, in the *Botanical Magazine*. The plant forms a pretty bush, 6 feet in height, covered in July and August with purplish-red flowers, nearly every growth terminating with an umbel of a dozen or more blossoms. It is a native of South-western Europe, and was introduced into this country in 1756.

E. TETRALIX.—This is known as the "Cross-leaved Heath," the leaves being arranged on the stems in whorls of fours in the form of a cross. The greyish-green hue of the foliage and the drooping pink, wax-like flowers give the plants a choice-looking appearance. It flowers during July and August, averaging a foot in height. *E. Tetralix* is abundant on moors and bogs in Britain and North and Western Europe to Russia. A number of forms have been given varietal names. *Alba*, as the name denotes, has white flowers; var. *Lawsoniana* is similar in colour to the type, but more compact and smaller growing; there is also less of the greyish tint on the foliage. Var. *mollis* has white flowers and distinct greyish leaves. Var. *Stuartii* is smaller-growing than the type, while the ground-colour of the corolla near the base is white. Var. *rubra* is richer in colour.

E. VAGANS.—This Heath is popularly known as the "Cornish Heath," being a common wild plant in that county; it is also a native of South-western Europe. It flowers from July to September, attaining a height of 12 inches to 2 feet, and has light purple blossoms. There are three distinct forms or varieties in addition to the type—var. *alba*, white; var. *grandiflora*, an improved *E. vagans*; and var. *rubra*, rose-coloured. The stamens in this species and the varieties are prominent, extending outside the corolla, not with the anthers pressed against the style, a characteristic of most of the species, the other notable exceptions being *E. mediterranea* and *E. multiflora*. A. O.

(To be continued.)

FASCIATION IN LILIUM DALMATIUM.

THE specimen of a fasciated stem of *Lilium dalmaticum* (see Fig. 115) has been reproduced from a photograph sent by Mr. H. J. Elwes. Fasciation is one of the commonest abnormalities in plants, but it is peculiarly prevalent in *Liliums* when grown under high culture. Specimens of *L. auratum*, for instance, are sent to us every season in plenty, some examples bearing an extraordinary number of flowers. We do not remember, however, a similar instance in *L. dalmaticum*, although, in Masters' *Teratology*, *L. Martagon* is included in the list of species in which fasciation had occurred in some degree. Mr. Elwes' specimen bore as many as 366 flowers and buds, of which about one-half did not open. With respect to *L. dalmaticum*, Mr. Elwes now states that he thinks this Lily should be considered as a distinct species, notwithstanding that in his own Monograph of the genus, and by other writers, it has been treated as a variety of *L. Martagon*. *L. dalmaticum* is much more robust in growth. Some of the batch of seedlings from which the fasciated stem was cut were more than 6 feet in height. The dense, woolly pubescence of the buds, though, like the flowers, variable in colour, distinguishes the plant from any form of *L. Martagon* known to Mr. Elwes.

A STRAWBERRY CENSUS.

THE Strawberry crop is not less important in private gardens than in commercial establishments. It is such a generally popular dessert fruit that we suppose there are few gardens of any pretension in this country where anxious consideration is not given to the culture of the plant. In the greater number, provision is made not only for the cultivation of Strawberries out-of-doors but also for forcing them in glasshouses for the prolongation of the season of ripe fruits. Such is the importance of the crop that it becomes necessary for those engaged in cultivation to take every means in their power to ascertain which varieties are best suited for their particular requirements. It may be admitted at once that the qualities desired in a Strawberry grown solely for domestic purposes are not identical with those required in the fruit raised for the supply of the general public. If a variety has the quality of good flavour in a marked degree, but lacks vigour of habit and free-cropping qualities, or, if it has fruits which have not the necessary texture and solidity of flesh to enable them to remain good after being carried long distances, it is scarcely one that will commend itself to commercial gardeners. At the same time, if these latter characteristics can be obtained in a variety which also possesses the most estimable quality, namely, that of flavour, there is every reason why it should be as popular in the commercial gardens and markets as in private establishments.

From time to time letters are addressed to us on this question of variety. In some cases the writers relate their experience in the case of a particular kind; in others, they ask for advice in the important matter of selection. For these reasons it appeared to us that a census of Strawberries would be interesting and instructive, and, therefore, occasion was taken during the past season, when writing to a number of correspondents in relation to the hardy fruit crops, to address to these same correspondents certain questions respecting Strawberries. Nearly 200 cultivators were good enough to send us the information required. The correspondents were, for the greater part, head gardeners in private establishments, but the list also included many market-gardeners, nurserymen and amateur fruit-growers. The compilers of the returns were asked to name the best early, the best mid-season, and the best late fruiting varieties; also, the best varieties for forcing, the best varieties from the point of view of flavour and the best varieties introduced since 1900. In each case it was the best three that were asked for. The results clearly show the extraordinary popularity of Royal Sovereign, which is cultivated in many gardens to the exclusion of all other varieties, it being used alike for cultivation out-of-doors and for forcing in the houses. Whether this is a wise policy is doubtful. Not only is there greater interest when more variety is cultivated, but, owing to the idiosyncracies of varieties, to their late or early-blooming characters, and to their general habit, some are likely to succeed in particular seasons when certain others fail. In the task of maintaining a supply as long as possible it is equally important that at least a selection of the known varieties should be cultivated. Nevertheless, in many cases correspondents named that variety alone instead of enumerating three, therefore, in order to give the variety the place it should occupy in the census, in such cases the one return was counted three times, this method, of course, being extended to all varieties returned in a similar manner. We know that in a census of this kind the results merely indicate what varieties are grown and appreciated most commonly rather than an exact determination as to which are really the better sorts. Some of the newer varieties would probably have figured more prominently in the lists if they were more widely distributed. However, it is satisfactory that in several cases they are mentioned. The Laxton, for instance, which has been in cultivation only

a few years, occupies the third position in the voting for early-fruited varieties. A large number of varieties were mentioned, over and above those shown in the tables, it having been deemed expedient to omit all those which gained but one vote. There were 15 of such varieties in the first table, namely, that for the best early Strawberries.

There have been occasional complaints during the past few years that the habit of certain varieties, such, for instance, as Royal Sovereign, has shown deterioration, and, in our own columns the writer of an article three years ago maintained that it had become necessary to find a substitute for this variety in commercial gardens. Without entering, at the moment, into the general question of deterioration of varieties, it may be said without hesitation that Strawberries, like most other plants, may be kept in the greatest vigour for the longest period by obtaining fresh stock occasionally from a distance, just as it has been found necessary to get fresh seed tubers in the case of Potatoes.

It will be generally conceded that modern Strawberries excel the older sorts in many im-

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Oncidium Kramerianum and *O. Papilio*.—A light position in the Cattleya house is suitable for plants of the butterfly Orchids, *Oncidium Kramerianum* and *O. Papilio*. They may be grown in shallow pans or baskets, with just a thin layer of compost to root in. The flower-stems of these plants will continue to send out flowers for a long period, for each flower as it fades is succeeded by another. But those who wish to have strong plants and good flowers, should remove the flower-spikes after they have produced three or four blooms. Afford the plants plenty of water at all times.

Oncidium.—In the cool house the Brazilian *Oncidiums*, such as *O. Forbesii*, *O. crispum*, and *O. varicosum* are now developing their flower-spikes, and strong, well-rooted plants may be allowed to bloom, but in the case of small and weakly plants the spikes should be removed as soon as they appear. These plants produce strong, many-branched flower spikes within a few

which includes *D. thyrsiflorum*, *D. densiflorum*, *D. Griffithianum*, *D. Bronckartianum*, and *D. Farmeri*, that have finished their growth, may also be removed from their growing quarters to a cooler and better ventilated atmosphere, but they should not be kept quite so dry at the root as those of the *D. nobile* section. *D. suavissimum* and *D. chrysotoxum* thrive and bloom very well if kept in the growing house; they merely require sufficient water to keep the pseudo-bulbs and the leaves fresh and plump. The deciduous *D. aureum* (*heterocarpum*) will soon be pushing out flower-buds from the pseudo-bulbs formed last year, but the plants should be allowed to remain in the resting house till the buds have about half developed, at which time they will need more warmth to assist their expansion.

Deciduous Calanthes.—Plants of the *C. Veitchii* and *C. vestita* section are now showing their flower-spikes from the base of the new bulbs, and it is important that each plant be given additional space. To meet this requirement we fill up the space recently occupied by the deciduous *Dendrobiums* with the largest and most forward of the plants, elevating them well up to the roof glass, and so arranged that every plant obtains its full share of sunlight, shading after this date being unnecessary. The extra light will invigorate and solidify the bulbs and counteract spot in the leaves. The smaller plants that remain in their growing quarters are rearranged and treated likewise. The bulbs, though considerably advanced, still require plenty of water at the root, and at each alternate watering weak liquid cow manure may be applied, but it should be discontinued when the leaves begin to change colour. After that stage a moderate amount of clear rain-water should be afforded until all the flowers are expanded, when water should be gradually withheld. *Calanthes* of the *C. Regneri* section that are now in full growth will also require extra sunlight, which will cause the soil to dry up quickly and necessitate the application of more water to the roots. If treated in the same manner as the others were when in full growth, these plants should make large, plump, pseudo-bulbs and commence to open their flowers soon after those of the *C. Veitchii* section are over.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Late Grapes.—The latest varieties should now be perfectly ripened, and the chief object is to keep them in good condition for as long a period as possible. The atmospheric temperature at night should not be less than 50°. During bright, genial weather it may rise during the day to 70°, or even 75°, provided the ventilators are open at the top and bottom of the house on such occasions. Whenever there is evidence of moisture in the outdoor atmosphere the front ventilators must be kept closed. Unless water is absolutely necessary to the roots it should be withheld, and even when moisture is called for it should not be applied in excessive quantities, nor should it be used at a temperature much less than 60°. Such water may only be given on fine mornings when air can be admitted to prevent moisture condensing on the fruits; after the watering has been done a layer of clean straw should be placed over the borders. Remove all lateral growths in order that air may circulate freely about the leaves, as this will also prevent moisture condensing on the fruits. The common practice of placing flowering plants in vineries where ripe fruit is still hanging is injurious to the Grapes and vines, and, although the crowding inevitable at this particular season of the year is a matter not easily dealt with, plants should only be put in late fruiting vineries as a very last resource. In cases where such houses have to be brought into requisition for the purpose, some discrimination should be made as to the kind of plant which is selected and the situation given them in the vinery. For instance, plants requiring much water are to be rejected, and such plants as are placed in the house should be arranged on shelves as far away from the Grapes as possible. Carelessness in these matters is the frequent cause of deterioration in fruit-tree borders, the results of which are to be seen in mildew, shanking, and imperfectly finished fruit.

Planting Peach trees.—This operation may be done during autumn or winter, but if it can be

FIG. 116.—NEW PERPETUAL-FRUITING STRAWBERRY ATKIN'S CONTINUITY. (See also p. 237.)
(Received an Award of Merit at R.H.S. meeting on September 28.)

portant characteristics, but particularly in size of fruit and heavy cropping. We have no hesitation in saying that whilst these qualities in themselves have given general satisfaction, it is nevertheless desirable that even greater efforts should be made to develop good flavour, such, for instance, as is found in British Queen.

In the perpetual-fruited varieties there appears to be the promise of considerable improvement. Two varieties of this section, recently distinguished by the Royal Horticultural Society's Award of Merit, have shown marked superiority, both in size and flavour, and these may be expected to still further prolong the season of first-class Strawberries, which, at the best, is very short. We give illustrations, from drawings by Mr. Worthington Smith, of these varieties, Atkins' Continuity and Laxton's Perpetual. Further tables will be published in the next issue.

months after being imported, and the plants quickly exhaust themselves if allowed to retain these spikes for too long a time. Plants that are only semi-established or badly rooted, if allowed to develop such spikes, gradually but surely dwindle away, notwithstanding that everything is done for them as regards care and cultivation. Therefore, cut the spikes immediately the flowers are fully expanded and place them in water, where they will remain fresh for a considerable period. While these plants are developing their flower-spikes, they should not be allowed to get very dry, or the flower-buds may drop off and the spikes will be useless. Plants of *O. concolor* that have made up their new pseudo-bulbs will not require anything like so much water as they needed during the growing period, but they must not be kept so dry as to cause them to shrivel.

Dendrobium.—The *Dendrobiums* must now be often examined, and any plants that have made up their growths should be removed to the resting house. Plants of the evergreen section,

done during the present month or early in November the trees may be expected to make fresh roots before they break into growth in spring. Do not make such borders too large for their purpose. A border 4 feet wide and 2 or 2½ feet deep will provide sufficient rooting space for several years. Prepare a sloping base of concrete, and on this place a 1 foot layer of brickbats; this will provide ample drainage. The soil should not be of too rich a character. Very rich loam would be all the better for having some common garden soil and plenty of old mortar rubble mixed with it. A richer compost may be added in later years when the trees are carrying crops of fruit. Make the border in layers and ram each layer of soil firmly as the work proceeds. Do not keep the trees out of the ground for a longer time than is necessary, and

nails and shreds, and the walls so battered by frequent nailing that it is scarcely possible to find a square inch free from holes. A tree may be trained to wires in less than one-third the time than would be required to fix it by nailing; moreover, the holes in the wall caused by nailing afford breeding places for insects, and the shreds that are used also shield these pests. Therefore not only from the time-saving point of view, but also that of cleanliness, wiring is to be preferred. When once the wall has been wired it will last in a perfect condition for some years. The trees can be cut each year from the wires, pruned, cleaned, and retrained with greater ease than in the case of nailing. I have heard of damage resulting to the shoots of trees from the use of galvanised wire, but have never seen an instance,

on shelves or in drawers in the fruit-room, where they will keep in good condition for another week or two, thus prolonging the season of these choice dessert fruits. The fruits should be picked whilst quite dry, and any that are bruised or damaged should be rejected, as their presence would soon cause decay in the store.

General work.—If fruit-tree planting is contemplated on a considerable scale, it will be advisable to visit some of the best fruit-tree nurseries in order that the trees may be seen and a selection made of those best suited to meet the requirements. If it is impossible to make such a visit and the gardener has any doubt upon the best varieties obtainable for any particular purpose it will be well for him to leave the selection in the hands of the nurseryman, who can usually be relied upon in such matters. In any case there should be no delay in placing the order for the trees, it being desirable that planting should be done while there is still time for the trees to make some root growth before winter.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslée, Sussex.

Begonia.—It is quite time to lift Begonias from the flower-beds. For the present and until the foliage dies down the tubers may be stored in boxes; later the soil should be shaken from the tubers and the latter stored in a cool place which is secure from frost.

Canna.—Examine the Cannas before the flowers are passed and see that the colours and varieties are properly labelled. Any that have appeared inferior had best be thrown away. When the Cannas have been taken up they should be treated much in the same way as Begonias, but it is not good practice to store them under a greenhouse stage where there is drip or much moisture of any kind.

Planting.—As these and other beds become cleared of their summer occupants, they should be deeply dug and manured, as was recommended in last week's issue. At the time of writing, the weather is very favourable for planting of any kind, therefore the opportunity should be taken to get out the Wallflowers, Forget-Me-Nots, Thrift, Pansies, Arabis, and other spring-flowering species. Be careful to plant them firmly so that they will not be loosened by the wind. It may be desirable to plant some of the beds with dwarf evergreen shrubs, for when a good selection of these is made and the plants are well arranged they have a very good effect. Such plants include Cupressus, Aucuba, Skimmia, Ligustrum, Veronica, Buxus, Taxus, Juniperus, and Viburnum. These small shrubs require to be planted rather close together and, if put in sufficiently early, they make a few roots, which suffice to keep them in good condition for several years. Any kind of tree and shrub can be planted at this season in beds, borders, shrubberies, or other positions in the pleasure grounds.

Camellia.—The Camellia may be planted in partially exposed conditions or against south and west walls. The best varieties for out-of-door culture are those which start into growth late in the season, and consequently flower late. *C. japonica anemoniflora* is one of the most useful varieties. *C. Donkelaaris* is a first-rate grower; it flowers profusely and is one of the most beautiful Camellias. Camellias do not require a soil composed exclusively of peat, but on the contrary they do best in a mixture of peat, leaf-mould and loam. Until the plants get established they require a little shelter, and the roots being susceptible to injury from frost, some light material should be placed over them during the spring.

Rhododendron.—Rhododendrons may be planted or replanted at any time of the year when the plants are not in actual growth, but probably October is the best of all times for this work. Rhododendrons should be planted rather more closely together than is the usual practice, in order that they may shade each other's roots from the sun. Plant them shallowly, but firmly. They require a mulching for the first year after planting to protect them from frost during winter and heat during summer. A thin mulch frequently renewed is better than a permanent, thicker covering. It is desirable to plant a few less formal habited shrubs with Rhododendrons, as by doing this a

FIG. 117.—NEW PERPETUAL-FRUITING STRAWBERRY LAXTON'S PERPETUAL.

(Received an Award of Merit at R.H.S. meeting on September 14.)

in planting them keep the roots near the surface of the border. Apply a good watering immediately after the planting is done, and syringe the trees twice each day for a week or so until they have recovered from the check.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Wired walls for fruit trees.—It behoves every gardener to take advantage of all labour-saving devices, wherefore I strongly recommend that all walls used for fruit-tree training should be wired. In many gardens there may be seen walls on which every tree has to be secured by means of

and am inclined to think that they are uncommonly rare. But anyone who fears this can prevent it by giving to the wires a coat of paint. Indeed, this practice is to be recommended, for it preserves the wire against the weather. Raddineurs, holdfasts and eyes are procurable at very moderate prices from ironmongers and sundriesmen, and the actual wiring can be done by any intelligent workman. The distance which should be allowed between the wires depends upon the tree that is cultivated, but as a general rule 6 inches is a convenient width, this being suitable for Peaches, Cherries and Plums.

Late Plums.—Dessert Plums, like Coe's Golden Drop, should be gathered and laid thinly

longer season of flowers is enjoyed, and the Rhododendrons themselves certainly succeed better. Considerable care should be exercised in planting Rhododendrons, for the plants should not be of all one size, neither should the beds be planted in the same style. In the grouping of colours, too, there is much room for the exercise of care and taste. Among some of the most interesting plants that will grow well and appear to good effect amongst Rhododendrons are Erica, Andromeda, Kalmia, Magnolia, Ledum, Bambusa, Arundinaria, and the section of Rhododendrons generally known in gardens as Azaleas. Many of the taller-growing species of Liliun succeed admirably in Rhododendron beds and serve to make them bright in late summer when the Rhododendrons have passed out of flower.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Seakale.—The weather during the past season has been favourable to this crop, although in many localities the crowns will be later than usual in ripening. To assist this process as much as possible all decayed foliage and any that is commencing to lose colour should be removed by cutting to within an inch of the base. In early districts the plants will be sufficiently advanced for some of the crowns to be lifted for forcing. The roots should be cut away from the main stem and reserved for planting again, putting them for the present in sand. Later, when there is bad weather, they may be tied into bunches of suitable lengths. Seakale will start to grow much more freely when forced if the crowns can be rested for a week or two after lifting and before they are placed in forcing conditions. If Seakale is required exceptionally early in the season it is better to use retarded grounds for the earliest crop. Seakale usually requires from three to four weeks after it is placed in a dark corner of the Mushroom house or cellar.

Rhubarb.—Suitable varieties, which have been specially grown for forcing in a warm position in the open, should, after all the foliage is removed from them, be lifted, leaving the roots intact as far as possible and allowing them to rest for a period on the surface of the ground under a north wall, covering them with a little long litter. The warmer end of the Mushroom house should be set apart for the Rhubarb. After removal to the Mushroom house the roots should be covered with ordinary soil and the crowns and surroundings damped twice daily with tepid water.

Globe Artichokes.—If these have been given proper attention they are probably still yielding good supplies of "chokes." In the event of frost, any which are not fully developed should be protected slightly, and others which are fit to cut should be taken off with about 8 inches of stem attached. They should be afterwards placed in a little water and stood in a cool place. By cutting off a small portion of the stem on every third day, the "chokes" may be kept in a good condition for a considerable period. The best varieties are more tender and more likely to be injured by severe weather than the ordinary kinds; therefore it is necessary to take some strong suckers at this season of the year and pot them up singly into 7 and 8-inch pots so that they may be given some protection, such as a cold frame, during the winter months.

Cucumbers.—It will be more difficult every day for many gardeners, who have not the best means at their disposal, to maintain a proper supply of Cucumbers. The glass of the Cucumber house must be kept scrupulously clean, so that every ray of sunshine may reach the plants. Maintain an atmospheric temperature of 65° to 70°, varying a little with the climatic conditions. Damp the interior walls and paths several times each day and again the last thing at night.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Cyclamen.—The earliest plants will now be showing their flower-buds, and may be given frequent doses of weak manure water. Place the plants in a good position in a light, well-ventilated house. Unless it is intended to save seed from them, the flowers should be removed as soon as they show signs of fading, to encourage the plants to produce a succession. Seedlings raised

during the present autumn are ready to be pricked off; the largest may be potted singly into thumb-pots, using a light, porous compost such as one composed of equal parts sifted loam and leaf soil, with plenty of silver sand. Press the soil firmly, and place the young plants near to the light in an atmospheric temperature of 55°, shading them for the first few days from direct sunlight. Cyclamen should be lightly fumigated to check the spread of aphid and thrip. Should red spider appear, sponge the leaves with soft soapy water.

Fuchsia.—Cuttings of soft, young growths should be inserted to furnish shapely young plants to bloom next summer. As soon as the cuttings are rooted, pot them singly into small pots and keep the plants steadily growing in an intermediate degree of heat. If the plants are well-grown, and allowed ample room for development, they will form pyramidal plants without stopping the leading shoot. Whilst not neglecting the newer varieties, we find that the old free-blooming Rose of Castile and the large-flowered Phenomenal are indispensable. Gradually reduce the amount of water afforded the large plants which have finished flowering, so as to encourage thorough ripening of the wood. For a time before storing them in their winter quarters these plants may be stood out-of-doors in a sunny position.

Ferns.—*Adiantum cuneatum* and other Ferns grown to provide fronds for cutting must now be exposed to more light and freer ventilation to harden them, or the fronds when cut will wither quickly. Throughout the winter the other Ferns should be kept slightly drier than has hitherto

FIG. 118.—STRAWBERRY GIVON'S LATE PROLIFIC.

This variety gained the highest number of votes in the census for late varieties. See p. 260.

been the case, both as regards atmospheric moisture and water at the root. The present will probably be found a convenient time to overhaul the Ferneries, cleansing the plants and their receptacles, removing faded fronds, and generally rearranging them.

Anthurium.—Now that these plants have completed their growth they may be moved to a slightly lower temperature, where they should have drier surroundings, and be given less water at the root, but they must at no time be allowed to become dry. The fine-folliaged kinds must be kept quite free from draughts.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of City Parks, Cardiff.

Private trading concerns in public parks.—In many of the larger public parks in this country it is no unusual thing to find private firms catering for the comfort or amusement of visitors. The provision of refreshments, musical entertainments, and numerous kinds of games; the hiring out of chairs and boats and the letting of fishing rights are oftentimes in the hands of contractors who, paying highly for the privilege, very naturally endeavour to make a considerable profit out of them. While it must be conceded that the practice of letting these rights for a given period to the highest bidder is one which saves the responsible officials much worry and anxiety, it

is after all a system which ought never to be tolerated in public parks. With the exception of the sale of refreshments, which it would be difficult—although not impossible—for a public authority to deal directly with, all the other matters previously alluded to could be managed in the interests of the general community much better by a parks department than by a private trading company. One of the tenets in every park official's management creed should be that on no account ought any private firm to be allowed to make a profit out of the amusements and recreation of the people when the facilities for doing so have been created and made possible by the previous expenditure of public money. Any profits from this source should be made—where possible—by the public authority, and spent again in the interests of the whole community. Whatever a contractor may pay for any park monopoly has to be paid again by the public, as well as the profit every contractor strives to make over and above, so that in the long run it is much better for the department to manage its own affairs and deal directly with the public. In addition to the financial advantages of this arrangement, there are others worthy of consideration. The presence of outside interests in a park not infrequently gives rise to much unpleasantness between visitors and the contractors and the latter and the governing body itself, and it is often found that the managing committee cannot deal with its own affairs in such a way as it feels most advantageous. A case illustrating this point was recently brought to my notice, which is worth noting. In one of the provincial towns, advantage was taken last winter of the services of the unemployed to make various improvements in, and around the edges of, a large lake. For this purpose it was necessary to lower the water, and it remained out for about three months. Although this happened in the depth of winter—at a period when few if any persons ever made use of pleasure boats—and notwithstanding that the alterations undertaken improved the boating facilities, the boating contractor applied to have a quarter's rent refunded to him on account of his being unable to make use of the lake for that period! Unless agreements are most carefully drawn up to cover all possible contingencies it is not at all difficult for a parks department to have considerable trouble and annoyance from those having what are practically vested interests in parks. Many municipal authorities are now doing away with these "outside interests" in their public grounds and are utilising all money-making concerns for the full benefit of the ratepayers.

THE APIARY.

The honey harvest in Aberdeenshire.—It has now become apparent that the honey harvest of 1909 in Aberdeenshire will be as disastrous as that experienced in 1907. Granted that a little honey may still be gathered from the Heather-clad hills, it cannot do more, in many cases, than help to pay the heavy expenses necessary for preparing the apiaries for the coming winter. The old-fashioned straw hives are still the great favourites with those who keep bees on a small scale, and a number of the stocks in these have died during the summer, while it is feared many more will be lost where heavy swarming prevailed, owing to want of stores and to queenlessness. Great care ought to be exercised by apiarists at this time to see that every stock goes into winter quarters with ample stores of food and a fertile queen. Many apiarists had a splendid and remunerative season last year, simply from the fact that they paid due attention to their stocks at the close of the disastrous season of 1907. One can easily understand the cause of the poor results this year. The season has been too cold and sunless except for a very brief period of warm weather during the early days of August. Very little honey was gathered from Clover this season. During the heat wave experienced in August, however, the bees obtained a considerable quantity from Charlock, which was then in full bloom. A good harvest was expected from the Heather this year, but the prolonged spell of cold, cheerless weather upset all calculations. Hopeless, however, as the outlook may seem at the end of an unproductive season, apiarists have the cheering reflection that two bad years seldom follow each other. It is rare for there to be two bad years in succession.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

THURSDAY, OCTOBER 21—
Brighton and Sussex Hort. Soc. lecture.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—49°0'.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, October 13 (6 P.M.): Max. 61°; Min. 56°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, October 14 (10 A.M.): Bar. 30.0; Temp. 56°; Weather—Bright sunshine.

PROVINCES.—Wednesday, October 13: Max. 56° Bury St. Edmunds; Min. 46° Durham.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY—
Fruit Trees, Roses, &c., at The Nurseries, Downham, Norfolk, by order of Messrs. Bird & Vallance, by Protheroe & Morris, at 12.

TUESDAY—
Sale of Nursery Stock at The Nurseries, Bellingham, near Catford, by order of Messrs. J. Laing & Sons, by Protheroe & Morris, at 12.30.

TUESDAY AND WEDNESDAY—
Sale of Nursery Stock at the Shortlands Nurseries, Ash, Surrey, by order of Mr. H. Sleet, by Protheroe & Morris, at 12.

WEDNESDAY—
1,448 cases Japanese Liliums, at 1; Azaleas and Bays, at 5; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

WEDNESDAY AND THURSDAY—
Sale of Fruit Trees, &c., at The Nurseries, Churchdown, near Gloucester, at 11.30.

FRIDAY—
Sale of Fruit Trees, &c., at Pitville Nursery, Cheltenham, by order of Messrs. Heath & Son, by Protheroe & Morris, at 11.30.

THURSDAY AND FRIDAY—
Sale of Nursery Stock, at Womersley Nurseries, Sharnley Green, near Guildford, by order of Mr. W. Virgo, by Protheroe & Morris, at 12.

FRIDAY—
Sale of a portion of the Chillingham Collection of Orchids, at Protheroe & Morris' rooms, at 1.

At the annual meeting of the Systematic British Association, which has just taken place at Winnipeg,

the presidential chair of the botanical section was occupied by Lieut.-Colonel Prain, the distinguished Director of Kew. He selected for his address the subject of systematic botany, and adduced arguments to vindicate the importance of this branch of botanical science. The subject is one which will appeal with irresistible force to horticulturists, for they know that systematic botany plays a fundamental part in the science of horticulture. Without it no orderly grouping of plants would be possible. Unaided by the results of the systematist's patient labours, the difficulties of the gardener would be increased enormously. To remember the Latin names of his manifold plants may be laborious, but to re-

member the plants without these names would be impossible. The tacit recognition of this indebtedness has led to the establishment of close and sympathetic relations between horticulture and systematic botany. Unfortunately, whilst the systematist and horticulturist have pursued the paths of knowledge hand in hand, there has grown up of recent years a certain coldness in the relations between botanists labouring in other fields and those devoting themselves to the work of classification. Nor is this altogether a matter of surprise. A hundred years ago botany was, to all intents and purposes, merely systematic botany. The microscope was a rarity, the minute structure of plants was just beginning to be unravelled, and vegetable physiology, in spite of the epoch-making work of early pioneers, was not a subject of general study. Then came rapid developments. Quickened by the idea of evolution, morphology made enormous strides. With progress in chemistry, the experimental study of the modes of life and work of plants found itself established on secure foundations. Morphology and physiology, like the proud sisters, came to look askance on the drudgery of the systematist Cinderella.

Dazzled by the promise of brilliant discovery offered by the new branches of botany, the student of the science neglected too often to become acquainted with the plants themselves. The vice of the age, as far as education is concerned—precocious specialisation—intruded itself, and students became experts in a part of botany before becoming acquainted with the science as a whole. Were this vicious practice reformed, less would be heard about lack of harmony between physiologist and systematist, and less also about the disappointing results of education generally. Sir George Paget years ago summed up the subject of specialisation by the comment: "You may be deep without being narrow." No harm can come of specialisation if the general education on which it should be based has been sound. It is the rule in Nature and in society. By specialisation the higher plants are distinguished from the lower, and the more highly developed societies from the more primitive.

However, signs are not wanting that the unphilial attitude referred to above is giving place to a more natural and cordial affection, and Lieut.-Colonel Prain's dignified exposition of the methods and objects of the systematist should do much to encourage its development. How important it is that there should be a perfect understanding between all groups of botanists may be seen from an inspection of the state of affairs which obtains at the present time in zoology. A student may pass through an exacting university course in zoology without learning more than a smattering of animal physiology. That is, he learns much about the names of animals, their relations with one another, and their gross and minute structure, but little about their modes of life. The divorce between zoology and animal physiology is well-nigh complete and wholly disastrous.

Animal physiology has come to mean, in England, human physiology with an occasional appeal to the rabbit and the frog. The general physiology of animals is not a subject of study in this country, and the amount

of investigation into the subject is, therefore, inadequate. It would be equally disastrous to botany if a like permanent alienation of physiologist from systematist were to occur. Happily, the danger of such a misfortune is decreasing. The new branch of botany known as ecology, which deals with plants in relation with one another and with their environment, stretches out one hand to the systematist, the other to the physiologist, and, though at present its grip may not, by reason of its youth, be very powerful, there is no doubt that it is firm enough to serve to keep in close formation the ranks of all workers in every branch of the science. Not only have physiologists to remember that botanical science owes a deep debt of gratitude to the systematists, whose labours have given to this country a prominent position with respect to systematic botany, but also that the greatest British botanists have been, without exception, systematists.

The horticulturist is grateful to systematist and physiologist alike, but, whilst to the former it is for favours received, to the latter it is in no small measure due to a lively sense of favours to come. He recognises the intricacy of the problems with which the physiologist deals, and he understands that it is not till these problems have been thoroughly thrashed out and adequate solutions to them obtained in the laboratory that the contribution of the physiologist to horticulture is likely to be considerable. He foresees a danger in the habit of physiologists in generalising from the results of experiments confined to single kinds of plants, and is, therefore, disposed to join with the systematist in urging them to pay more heed to the diversity of material available for his investigations.

PRESENTATION.—Mr. C. A. Caw, late secretary of the Handsworth Horticultural Society, on the eve of his departure to Canada, was recently presented with a purse of gold and an illuminated address by the members of the society. The presentation was made by the president Mr. WALTER G. GRIFFITH, who referred to the valuable services Mr. CAW had rendered to the society.

ORCHID SALE.—On the 8th inst. a portion of the collection of Cyripediums formed by G. SHORLAND BALL, Esq., Burton, Westmoreland, and known as the "Under Fell" collection, was sold by Mr. HAROLD MORRIS at Messrs. PROTHEROE & MORRIS'S Rooms, Cheapside, London. The plants offered were good, healthy specimens, and reflected great credit on Mr. HERDMAN, the grower. Cyripedium Gaston Bulteel var. Edward VII., two lots, realised 32 guineas each; C. Germaine Opoix Westfield variety, 70 guineas, and C. Thalia Mrs. Francis Wellesley, 50 and 21 guineas each; C. insigne "Francis Wellesley" was bought by its original owner for 20 guineas; C. Aeson giganteum sold for 40 guineas; C. Earl of Tankerville for 15 and 20 guineas each; C. The King (bellatulum x seligerum majus), 21 guineas; C. Empress Alexandra, 20 guineas; C. F. K. Sander var. King Haakon, 21 guineas; C. Hindeanum, 16 guineas; C. F. K. Sander, original variety, 21 guineas, and other kinds 15 to 20 guineas. Cyripediums of equal merit to these mentioned failed to realise as high prices because they are already in collections. On the whole, it was the best Orchid sale in the present autumn, and it proved that the best Cyripediums still possess great value. There were 250 lots, and the total sum realised at the sale was £1,000.

A MUNICIPAL FLOWER SHOW.—The Battersea Borough Council have, for the sixth year in succession, arranged competitions for the best-kept gardens, &c., on their tenement estates, with a view to encouraging the cultivation of flowers. The Latchmere and Town Hall estates include 351 houses and tenements. The Battersea and Wandsworth Amateur Chrysanthemum and Horticultural Society undertook to make the necessary arrangements, and the competitions were arranged for upstairs window-sill gardens, indoor window gardens, and (a) centre, (b) gardens nearest houses. The total number of entries was 45. The prizes and certificates were presented to the winners on Thursday last, the 15th inst.

LEEDS PAXTON SOCIETY.—The growers of Sweet Peas in various parts, who helped the committee of this society with contributions of flowers on the occasion of their first show, held at Headingley, Leeds, on August 7, will be pleased to learn that the exhibition resulted in a net profit of £7 in aid of the Royal Gardeners' Orphan Fund.

NEW APPLES AND PEARS.—Mr. CHARLES ROSS, who has raised so many of the best modern Apples, writes us from Henley-in-Arden as follows:—In addition to the list of Apples and Pears given in the last issue (see p. 249) and put into commerce since 1892 are the following Apples: Paroquet (R.H.S. Award of Merit), Opal (R.H.S. Award of Merit), Bella (R.H.S. Award of Merit), Ruddy and Redwing. Paroquet and Encore were sent out by Messrs. J. CHEAL & SONS. I may mention that I gave to the late Dr. MASTERS samples of Rival, The Houblon, Paroquet and Charles Ross to test their flavour, and, in a letter received from him, he said, "We consider that Paroquet is the best of the four." We have also learned from other sources that Apples James Grieve and President Roosevelt, and Pears Marguerite Marillat and R. D. Blackmore should be added to the list of varieties distributed since 1892.

THE CONGO FLORA.—Under the title of *Sylloge Floræ Congolanae*, Professor DURAND, assisted by Miss HELENE DURAND, has compiled an enumeration, with full geographical particulars, of all the flowering plants known to occur in the Congo Free State up to the end of 1908, and comparisons with the numbers given in publications which appeared in 1896 and 1900 respectively. The enumeration, which is preceded by a short historical sketch and some tabulated statistics, is according to the classification of Bentham and Hooker's *Genera Plantarum*, with some slight modifications in the way of additional newly-constituted families, such as the Scytopetalaceæ and the Dichapetalaceæ, the latter a new name for the Chailletaceæ, and, as in some former publications, the terminations of the family names are uniform throughout. Thus we have Leguminosaceæ, Umbelliferaceæ, Compositaceæ, and Labiataceæ. This is simple and convenient, and leaves nothing to memory, and it is far preferable to the varying terminations employed by some botanists. Another simplification we should like to see is the use of lower-case initial letters for all specific names, whether personal or otherwise, as in most zoological works, in the *Botany of the "Challenger" Expedition*, and in the *Biologia Centrali-Americana*. But this is a digression. For geographical purposes the Congo is divided by DURAND into 16 districts, four of which are again divided into zones, which, however, are not defined in this work, and no map is given, and no particulars of area or altitudes. But, taking in the irregularities of the boundaries, the Congo State extends through about 20 degrees of

equatorial longitude, and 18 of latitude, and is, perhaps, about equal to $12^{\circ} \times 12^{\circ}$, or, roughly, 800,000 square miles in area. Within this area there are elevations up to at least 13,000 feet, so that there is a temperate zone of vegetation. The present census of plants for this area is 3,546 species of phanerogamia or flowering plants, belonging to 991 genera, and 131 families. As to species, this is probably less than half of the number actually existing. The temperate element is very small, but it includes such familiar genera as *Thalictrum*, *Ranunculus*, *Delphinium*, *Nasturtium*, *Viola*, *Cerastium*, *Hypericum*, *Geranium*, *Trifolium*, and *Rubus*. Among characteristic African genera especially numerous in species are *Cola*, 22 species; *Ochna*, 13; *Ouatea* (*Gomphia*), 21; *Crotalaria*, 34; *Indigofera*, 26; *Combretum*, 37; *Dissotis*, 25; *Vernonia*, 42; *Clerodendron*, 25; *Eulophia*, 16; *Lisoechilus*, 15; *Polystachya*, 18; *Angracum*, 18; and *Listrostachys*, 19 species. The families most numerous represented are: Leguminosaceæ, 415 species; Rubiaceæ, 299; Compositaceæ, 148; Apocynaceæ, 122; Acanthaceæ, 119; Euphorbiaceæ, 144; Orchidaceæ, 152; Cyperaceæ, 139; and Gramineæ, 132 species. The Apocynaceæ are, perhaps, the most important economically, on account of the large number of rubber-yielding members. Thus *Landolphia* is represented by 14 species; *Clitandra* by 11; *Carpodinus* by 14; and *Funtumia* by three species. *Strophanthus* numbers 12 species. The entire absence of Lauraceæ is noteworthy, and the presence of only one member of the Gesneraceæ, a species of *Streptocarpus*, is a surprise. Palms number only 15 species, belonging to seven genera, namely, *Phoenix* *Calamus*, *Raphia* (including *R. vinifera*), *Oncocalamus*, *Eremospatha*, *Borassus* and *Elæcis*. The Cocoa-nut Palm is cultivated, or naturalised, in various spots on the lower Congo. On the other hand, Professor DURAND states that he has no satisfactory evidence of the existence of the Doum Palm genus *Hyphæne* within the state. He says *H. guineensis* Sch. and Thonn., and *H. vintriosa*, Kirk, are recorded, the former from the Island of Mateba by Ed. DUPONT, and the latter from the "Congo" by H. JOHNSTON, but he considers that these localities require confirmation. From the general distribution of the genus *Hyphæne*, its absence from the Congo is almost inexplicable.

PELARGONIUM ECHINATUM.—Mr. E. J. ALLARD writes from the Cambridge Botanic Garden stating that he made a slip in the note on this species published last week. *P. echinatum* is a native of the Cape, but not of Australia.

KENSINGTON GARDENS.

(See Supplementary Illustration.)

KENSINGTON GARDENS, together with Hyde Park, originally constituted the Manor of Hyde. The manor was Church property, but during the reign of Henry VIII. the lands were appropriated by the Crown, and for several hundred years afterwards they formed a Royal hunting ground. During the reign of George II., the park was divided into two portions, the part now known as Kensington Gardens being separated for the purpose of forming suitable pleasure grounds and gardens to the Royal Palace at Kensington. Although both Hyde Park and Kensington Gardens are under the care of the same superintendent, who has also the management of the adjacent Green and St. James's Parks, as well as numerous squares and small gardens, the public regulations in force differ in the two places. For example, Kensington Gardens are closed soon after sunset, but in Hyde Park the public is admitted until midnight; also, in the latter place

order is maintained by the police, whereas in Kensington Gardens this duty is performed by park constables. Hyde Park is probably unique amongst public parks in containing a police-station, the members of which are wholly employed in maintaining order within the park. Within the last five or six years a new police-station has been erected, and its complement consists of 56 officials, of all ranks, from inspector to constable, five of whom are mounted men.

Until recent years most of the plants employed in furnishing the flower-beds of the public parks already mentioned were raised in Kensington Gardens, in what was known as the frame ground. At one time when the use of bedding plants in these parks was much smaller than it now is, this nursery was sufficient for the needs, but in recent years it has proved inadequate. Hundreds of thousands of plants were raised annually, but in a make-shift manner. It was not surprising that plants raised in this cramped area did well, for they could not be coddled, but, on the contrary, were exposed to hardening influences when protection could not be found for them. But now the old glasshouses and frames have been done away with, and on part of the site stands the charming sunken garden which forms the subject of our Supplementary Illustration. It was designed by Mr. J. A. Gardiner, the present superintendent, and embraces, roughly, a little less than one acre. Originally the ground sloped from the Bayswater to the Kensington side, and many thousand loads of soil were needed to level the ground. This part of the work, together with much of the necessary digging, was done by the unemployed. The scheme includes a central water-basin, which is planted with white and blue-flowered *Nymphæas*, and also clumps of the common yellow *Water Iris*. Down the middle of the pond are arranged three old leaden tanks, these being planted with *Aponogeton distachyon*, the Cape Pond Weed. By the margin of the water will be noticed stone vases, in which, in summer-time, specimens of *Agapanthus umbellatus* are planted. The broad paving of flagstones around the tank has *Sedums*, *Saxifragas*, *Arenaria*, and similar subjects between the crevices. Next are three broad terraces, each with a dwarf retaining wall. The terraces have a grass walk along the front, and at the back a broad border planted with a great variety of subjects. Although so recently formed, the garden has appeared very beautiful during the past season, especially during July and August. The beds contain *Pæonies*, *Roses*, *Montbretias*, *Gladioli*, *Kniphofias*, *Gazanias*, *Fuchsias*, *Viaria spectabilis*, *Marguerites*, *Violas*, *Sedum spectabile*, *Antirrhinums*, *Agrostemmas*, *Nicotinas*, *Tagetes*, *Godetias*, and many other plants. The garden is entered by four gateways, and at the corners of the steps are vases with examples of topiary work, some being Box cut in the form of birds. Around the outskirts, where alone the public is admitted, is a pergola or archway formed of Limes. Our picture shows the framework on which the young trees are being trained. The building seen at the back of the garden is Kensington Palace. Although not shown in our picture, there is a magnificent Orangery facing the sunken garden, from which it is separated by a lawn, which was also a part of the frame ground. The Orangery was built in 1705, during Queen Anne's reign, from designs by Sir Christopher Wren. This building has been put in order, although at one time it was used as a place of storage for the thousand and one odd things that are found in a nursery ground.

On the broad stone terrace in front of the Orangery have been placed eight old leaden tanks similar to those in the pond. These are planted with *Agapanthus* and *Hydrangeas*. The tanks themselves are very handsome, and bear dates of the 18th century. The new frame ground has been formed in the centre of Hyde Park, and is up-to-date in every detail.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

COSMOS.—I can fully endorse the remarks of C. (p. 234) about the usefulness of the annual Cosmos as a "cut flower" plant. The long stem and finely cut, palmate foliage that springs from each pair of flowering branchlets renders the Cosmos a most suitable and effective cut flower subject for the embellishment of rooms. When inserted loosely in fair-sized vases and glasses, heliotrope, magenta, white, and carmine colours being mixed, they are very effective, and keep fresh for a long time in water. The foliage of the varieties bearing coloured flowers is more graceful and finely cut than the leaves of those bearing white flowers. The flowers are stated by your correspondent to be 2 to 4 inches in diameter; but the new variety, Lady Lennox, is said to produce Orchid-like flowers of great beauty, and 6 to 8 inches in diameter! The Cosmos is a very robust grower, and, in good ground, attains to large dimensions within eight to ten weeks from the time of planting out early in June. They are quite as strong-growing as the Dahlia in favourable soil and conditions, the individual plants attaining to a height and diameter of quite 3 feet. Our plants

has bloomed regularly during previous summers, but has never been more than an ordinary specimen, rather poor than otherwise. To the very rainy season may be attributed some of its luxuriance; but other Hollyhocks close by are not finer than usual. Here and there may be one reaching 9 feet, but that is all. An interesting feature in this tall one is that it is exceedingly straight and erect as a flagstaff. One would like to know if such tall ones are frequent, and what is considered the average height of Hollyhocks. *Catherine C. Hopley.*

STEPHANOTIS FLORIBUNDA.—In the gardens here there is at the present time a plant of this fragrant stove climber in full flower. This is the second time the plant has flowered this year. The first time of flowering was in June. Each time it has been one mass of flower. It also has three fruits now in course of development, the largest being about the size of a small Coconut, and still swelling. The plant is in a large square tub, and covers a roof space of 21 feet by 9 feet. It is fed liberally with farmyard liquid manure during the growing season. *J. S. Higgins, Ryg Gardens, Corwen, N. Wales.*

THOMAS ANDREW KNIGHT AND DETERIORATION OF APPLES.—Mr. T. A. Knight over a century ago promulgated the theory that varie-

recently and which exhibit none of the symptoms of decay apparent in their fellows. It would be interesting to learn if this is an isolated case and due to local climatic conditions, just as all our Codlins were simultaneously affected with red spider a few years ago! However it may be, the circumstance indicates that the position held by Mr. Knight is at least plausible. Of course there are other parallels in the vagaries of Apples, such, for instance, as trees of one variety being sterile for a series of years and simultaneously regaining fruitfulness without any apparent cause. I have noted this in Cox's Pomona, Claygate Pearmain, and Red Astrachan, and for several years Ecklinville Seedling here has remained in a nearly sterile condition, though otherwise perfectly healthy. *R. P. Brotherton.*

BORDERS FOR VINES.—I am of the same opinion as Mr. E. Molyneux (see page 252). It has often occurred to me, in respect to early vineries especially, the practice of having outside and inside borders must be wrong, inasmuch as the roots in the outside borders must be growing in a much colder temperature (early in the year, when the vines are being forced) than the roots inside enjoy. The effect on the plants cannot be good. In respect to depth, the borders should not be more than 2 feet deep. *Wilmot H. Yates, Rothfield Park Gardens, Alton, Hants.*

I believe that better results can be obtained from vines restricted to inside borders only than are generally got from borders which are partly inside and partly outside. Of course, in gardens where there are plenty of spare frame lights that could be utilised for the purpose of covering the borders to protect them from unseasonable weather in spring and autumn, the evil might, to a certain extent, be prevented. As to varieties, including those already mentioned by Mr. Molyneux, that are better for the purely inside treatment, the variety Madresfield Court shows it more than any, for, where its roots are allowed to extend to an outside border, the berries have a greater tendency to crack. Mrs. Pearson and Golden Queen are also varieties that succeed better entirely inside the house. The depth mentioned by Mr. Molyneux and Mr. H. W. Ward, in his excellent article on the making of fruit-tree borders, in the issue for September 18, is ample. *Wm. Turner, Fonthill House Gardens.*

SOCIETIES.

ROYAL HORTICULTURAL.

OCTOBER 12.—Another fine exhibition was seen at the meeting held in the Society's Hall, Westminster, on this date. The building was filled with exhibits, both the annexes being utilised, which necessitated all the Committees meeting in the upper rooms. Displays of fruits and vegetables were again a feature, and nothing finer has been seen at these shows than the collection of vegetables from Lord Aldenham's gardens, or the fruits shown by the affiliated societies and trade growers. No award was made to a novelty by this Committee, but one Gold and several Silver-gilt Medals were awarded in this section.

Exhibits before the FLORAL COMMITTEE were also meritorious, especially the collection of Nephentes shown by Messrs. JAS. VEITCH & SONS, and a group of Ivies shown by Mr. L. R. RUSSELL. Both these exhibits were awarded Gold Medals. This Committee granted five Awards of Merit to novelties.

As is usual at the autumn shows, Orchids were not so numerous, although there were several interesting collections and many novelties. The ORCHID COMMITTEE granted one First-class Certificate and four Awards of Merit.

At the 3 o'clock meeting in the lecture-room, a lecture on "Some Gardens of the Later Renaissance" was delivered by Mr. Thomas H. Mawson.

A conference of the Horticultural Mutual Improvement Societies affiliated with the Royal Horticultural Society took place at 4 o'clock.

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. C. T. Drury, H. B. May, E. H. Bowles, A. Kingsmill, Jno. Green, Jas. Walker, C. R. Fielder, G. Reuthe, W. J. Bean, R. C. Notcutt, W. Howe, J. F. McLeod, J. Jennings, C. Dixon, Jas. Douglas, E. T. Cook, Arthur Turner, Herbert

FIG. 119.—STRAWBERRY "WATERLOO," SECOND IN THE CENSUS FOR LATE VARIETIES. (See p. 260.)

were raised from seed sown in heat early in February, the seedlings being pricked out 3 inches apart in shallow boxes filled with fairly rich soil that was passed through a $\frac{1}{4}$ -inch meshed sieve. In due time the plants were hardened off, and they were transplanted in June at about 3 feet apart in the row. When planted in a row, a string should be placed on either side at a distance of about 1 foot from the plants, and the string entwined round a few sticks inserted in the ground at intervals of 12 to 15 feet apart as a protection against winds. This should be done after the plants have become established, and as soon as they require support. *H. W. W. Essex.*

A TALL HOLLYHOCK.—In a small private garden at Kew there is a Hollyhock 12 feet 3 inches high at the time of writing (September 24). As there are still three or four buds at the extreme summit coming into bloom in the regular manner, the probability is that, weather permitting, it will gain another inch or two as these open. Nothing has been done to stimulate growth; the plant has been left to take its chance in a rather neglected border, among common Sunflowers and other hardy perennials. There is no adjacent tree to draw it upwards, but it is in an open space where it

period of Apples become worn out after a prolonged period of fruitfulness, and that the trees propagated from these during their period of decadence partook of their frailty, becoming diseased and decrepit at the same time. But whilst we have such acknowledged old Apples as Cats-head, Golden Reinette, Margaret, Jemmeting, and others in absolute vigour and fertility, it is obviously impossible to accept the deductions of that once well-known pomologist. At the same time Mr. Knight fought not without good grounds for his theories, and it may be interesting not only on account of the fact as a fact, but because it to some extent explains Mr. Knight's position, to record an example which is taking place under the eyes of the writer. A large proportion of the Apple trees here have been propagated by myself. There are many trees of Duchess of Oldenburgh, which along with the parent tree usually produced quantities of fine fruit. Of recent years the latter has become with each succeeding year more and more unhealthy, and, though it cropped abundantly, the fruit, like the growth, was, during the present year, imperfect and mostly worthless. This year more than ever nearly all the trees propagated by budding from the old one have approached with a startling nicety to the same condition, the only exceptions being a few which were cut over

J. Cutbush, H. J. Jones, Chas. E. Pearson, J. T. Bennett-Poe, Chas. E. Shea, W. P. Thomson, E. H. Jenkins, W. J. James, and R. Hooper Pearson.

Mr. L. R. RUSSELL, Richmond, Surrey, showed a magnificent group of ornamental Ivies, including arborescent forms of golden and silver varieties. The plants were splendidly grown, and set forth in as attractive a manner as is possible with such subjects. The more notable varieties were *Hedera elegantissima*, with silver variegations; *H. Helix aurea*; *H. digitata*, the finger-leaved Ivy; *Gold Cloud*, a magnificent golden-leaved form; *H. himalaica*; *H. minima*; *H. rhomboidea obovata*, a compact-growing plant; *H. Russelliana*, with pale green leaves; *H. Glynnii*; *H. conglomerata prostrata*; and *H. dentata*. Mr. RUSSELL also showed varieties of the elegant-leaved *Bertolonias* and *Sonerilas*. *Bertolonia Souvenir de Gand* has sage-green leaves and rosy-rose veining. (Gold Medal.)

Messrs. JAS. VEITCH & SONS, LTD., King's Road, Chelsea, showed varieties of *Nepenthes*, of which plants the firm possess a remarkable collection. They were examples of the highest culture, each plant being a perfect specimen. Among the more noticeable were *N. Amesiana*, with short, broad, brownish-coloured pitchers, having wide wings heavily margined with hairs. *N. Chelstonii excellens*, the very big pitchers being trained to stakes; *N. ampullaria vittata*, with clusters of tiny yellow pitchers at the base of the stem. The species is remarkable in that it bears leaves of two kinds, those borne above showing but slight indication of pitcher formation, whilst the basal leaves are completely modified to form pitchers. *N. picturata*, a very finely-coloured variety, especially on the rim, the pitchers are dark red, with green spots; *N. ventricosa*, curiously constricted in the centre of the pitcher, which is a dull yellow; *N. Dicksoniana*, one of the biggest shown, some of the pitchers being nearly 1 foot in length; *N. mixta*, an extra fine plant, with many pitchers; *N. Morganiae*, on which were counted nearly 50 pitchers; and the magnificent variety named after Sir W. T. Thistleton Dyer.

Messrs. VEITCH also showed a batch of hybrid *Rhododendrons* of the type known as *Javanico-jasminiflorum*, the plants being small but well flowered, and in a variety of colours. The species *R. jasminiflorum* has small white long-tubed flowers in trusses, the other parent, *R. javanicum*, has big orange-coloured flowers. The first cross resulted in the variety *Princess Royal*, with delicate pink petals. This crossed again with the species *jasminiflorum*, gave the blush variety known as *Princess Alexandra*. In the same group were *Nerines*, *Carnations* and the winter-flowering *Begonias Mrs. Heal* and *Elatior*. As a third group, Messrs. VEITCH showed plants of hardy *Fuchsias*. There were several tall pyramidal plants of *F. macrostemma*, a free-flowering variety, and much smaller plants of *F. Riccartonii Elysee*, a very decorative variety and quite hardy. (Gold Medal.)

Messrs. T. S. WARE, LTD., made a brilliant show with blooms of tuberous-rooted *Begonias*, having them in batches of white, yellow, rose, red, crimson and other shades. Varieties of border *Asters* added greatly to the decorative effect of the group. (Silver-gilt Banksian Medal.)

A fine group of Ferns was staged by Lady TATE, Streatham Common (gr. Mr. W. Howe). The plants were mostly large specimens, with smaller plants—principally of the newer varieties of *Nephrolepis exaltata* between. Amongst the more notable were *Nephrolepis cordifolia*, *Adiantum Veitchii*, *Nephrolepis exaltata* (a fine specimen), *Adiantum cardiochlena*, *Lomaria platyptera*, *Davallia Mooreana*, *Platyceerium Willinkii*, *Dicksonia antarctica* and *Polypodium glaucum Mavi*. (Silver-gilt Flora Medal.)

Messrs. DAVID RUSSELL & SONS, Essex Nurseries, Brentwood, showed coniferous plants as goodly-trained specimens suitable for lawn or border planting. We noticed *Retinospora squarrosa*, *Taxus baccata elegans aurea*, *Cupressus Lawsoniana* in its numerous forms, *Cephalotaxus japonicus*, *Retinospora pisifera aurea* and many handsome *Abies*, *Pines*, *Cedars*, &c. (Silver Banksian Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Upper Holloway, showed varieties of large-flowered *Veronicas*, also the variegated-leaved form of *V. Andersonii*, a bank of the Scarlet *Carnations Elizabeth* and *Britannia* of the perpetual-blooming section, and a collection of *Scolo-*

pendrums, chiefly varieties of *S. crispum*, a few only of *P. aculeatum* and *P. angulosum* being included. It is difficult to enumerate the more beautiful amongst such handsome forms as *S. c. Robinsonii*, *S. c. fimbriatum cristatum*, *S. c. grande* (a broad-leaved form with beautifully crested margins); *S. c. fimbriatum* (rather darker in tint than the last), *S. c. Bowdenii* and others of the crested-leaved type. (Silver Flora Medal.)

Messrs. FRANK CANT & Co., Colchester, exhibited garden *Roses* in bunches, having fresh and well-coloured blooms of Hugh Dickson, *Souvenir de Maria de Zayas* (deep pink), *Lyon Rose*, *La Tosca*, *Trier*, *Ecarlate*, *Corallina*, *Edu Meyer*, *Perle von Godesberg*, *Lady Waterlow*, and other varieties. (Silver Flora Medal.)

Messrs. B. R. CANT & SONS, Colchester, showed bunches of *Roses*, including a seedling bedding variety named *Rose du Barri*. It is a large, single variety of a deep rose shade. Others including Hugh Dickson (the best of the red autumn *Roses*), *Claudian* (new), *Warrior*, *Safrano* and *Zephyrine Drouhin*, were noticed in good condition.

Messrs. R. HARKNESS & Co., Hitchin, made a very pretty display with *Roses*, which were shown in vases and *Bamboo epergues*. The taller epergues were furnished with blooms of one variety only, such as *Lady Ashtown*, *Viscountess Folkestone*, *Hugh Dickson*, *Betty*, *Mme. Ravary*, *Frau Karl Druschki* and *Mrs. John Laing*, whilst shorter bunches in vases formed a groundwork. (Silver Banksian Medal.)

A small collection of *Roses* was shown by Mr. W. LEGGETT, West Bergholt, Colchester, the exhibit including several specimen blooms in boxes, some, such as *Ulrich Brunner*, *Frau Karl Druschki*, *Mildred Grant*, *Capt. Hayward*, and *Mrs. G. W. Kershaw*, being very good. In vases at the back were well known garden varieties.

Messrs. STUART LOW & Co., Enfield, staged a few plants and blooms of perpetual-flowering *Carnations*, including *Rose Dore* and *Royal Purple* varieties.

Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley, staged varieties of single and *Cactus Dahlias*, vases of hardy flowers separating the boxes and forming a row at the back. The single *Dahlias* were especially attractive, such beautiful kinds as *Formosa*, *Naomi*, *Tighe*, *Sunrise*, *Rosebank Scarlet*, *Leander*, *Cardinal*, *Victory*, *Elaine*, *Eric*, *Alma*, and *Columbine* being noticed. Messrs. CHEAL also showed varieties of the small *Pompon-Cactus*-flowered *Dahlias*. (Silver-gilt Banksian Medal.)

Mr. J. T. WEST, Brentwood, exhibited varieties of *Pæony*-flowered *Dahlias*.

Messrs. CARTER, PAGE & Co., London Wall, London, again contributed a large exhibit of *Dahlias*, having good blooms of *Pompon*, *Cactus*, show, and other types attractively presented. (Silver-gilt Banksian Medal.)

Messrs. W. WELLS & Co., Merstham, Surrey, showed varieties of early-blooming *Chrysanthemums* of border and single kinds. (Bronze Flora Medal.)

Mr. H. J. JONES again displayed an attractive exhibit of *Michaelmas Daisies*, having many beautiful varieties in the best condition. (Silver Flora Medal.)

Messrs. GEO. BUNYARD & Co., LTD., Maidstone, showed, as a corner group, a collection of hardy flowers, amongst which were many border *Asters*, shown in large sheaves. In the front were vases of the rose-coloured variety of *Anemone japonica*, also *Gaillardias*, *Scabiosa caucasica*, *Kniphofias* in variety, *Physalis* with its brilliant calyces, and *Cimicifuga simplex*. (Bronze Flora Medal.)

Mr. FRANK BRAZIER, nurseryman, Caterham, Surrey, showed a large exhibit of perennial *Asters*, *Pentstemons*, decorative *Chrysanthemums*, *Phloxes*, *Kniphofias*, and other garden flowers. Amongst the *Phloxes* we noticed a fine orange-red flowered variety labelled *G. A. Ströhlein*. (Bronze Flora Medal.)

Messrs. W. CUTBUSH & SON, Highgate, London, showed seasonable hardy flowers, including *Pentstemons*, *Liliums*, *Michaelmas Daisies*, *Smilax*, the new *Potentilla Gibson's Scarlet*, *Delphinium Dwarf King*, *Anemone japonica*; also a batch of *Nerines* and several small plants of *Vallota purpurea*. Messrs. CUTBUSH also showed varieties of *Carnations*, tastefully arranged in tall and short vases, with small *Cocos Palms* inter-

persed. Such sterling kinds as *Enchantress*, *Victory*, *White Perfection*, *Afterglow*, and *Lady Nora* *Brassey* (purple) were represented by excellent blooms in large bunches. (Silver Flora Medal.)

Messrs. G. & A. CLARK, LTD., Dover, put up a display of autumn flowers from the open, including *Gala coronopifolia*, *Cimicifuga simplex*, *Pyrethrum*, of which the variety *John Malcolm* is rose-coloured, *Tricyrtis hirta niger*, *Lilium tigrinum*, *Asters* in variety, *Scabiosa*, *Phloxes*, and others. (Bronze Flora Medal.)

Messrs. BARR & SONS, King Street, Covent Garden, showed seasonable hardy flowers, including *Pentstemons*, border *Chrysanthemums*, *Helianthus argophyllus*, *Cimicifuga simplex*, *Colchicum autumnalis*, *C. speciosus*, and *Gladiolus primulinus*. The *Asters* were very bright and showy, especially the varieties of *A. Amellus*. (Bronze Banksian Medal.)

Mr. CLARENCE ELLIOTT, Six Hills Nursery, Stevenage, showed *Michaelmas Daisies*, having good bunches of most of the finer varieties. (Bronze Flora Medal.)

Mr. CHAS. TURNER, Slough, showed varieties of *Michaelmas Daisies* and flowering sprays of *Cimicifuga simplex*. (Bronze Flora Medal.)

Mr. R. C. NOTCUTT, The Nurseries, Woodbridge, exhibited *Michaelmas Daisies*, *Show Dahlias*, *Helianthus*, *Cimicifuga*, and other seasonable flowers. (Bronze Banksian Medal.)

Messrs. GUNN & SONS, Olton, near Birmingham, staged a pretty exhibit of *Viola cornuta* and bedding *Violas*. They were arranged in fancy baskets, *Viola cornuta* being exceptionally well shown. (Bronze Banksian Medal.)

A golden-leaved variety of *Smilax*—*Myrsiphyllum asparagoides*—was shown by Messrs. TOM ROCHFORD & Co., Nurserymen, Broxbourne and Covent Garden. It was as vigorous in growth as the green form which was exhibited at the same time.

The Misses HOPKINS, Mere Gardens, Shepperton-on-Thames exhibited *Michaelmas Daisies* and other border perennials. (Bronze Banksian Medal.)

The Misses ALLEN BROWN, Violet Nurseries, Henfield, showed *Violas*, including the varieties *Marie Louise*, *Princess of Wales*, and *J. J. Aster*, the last-named being a shade of lilac.

AWARDS OF MERIT.

Aster Lustræ.—This is a variety of *Michaelmas Daisy* raised by the Hon. VICARY GIBBS (gr. Mr. E. Beckett). The flowers are $\frac{1}{4}$ inch across, semi-double, and a rich mauve in colour. The plant grows $\frac{3}{2}$ to 4 feet high.

Chrysanthemum White Queen.—A first-rate, white, Japanese flower, with smooth, reflexed florets of moderate width. Shown by Mr. SILSBURY.

Chrysanthemum Mary Farnsworth.—This is a large Japanese variety, with broad, reflexed florets, which have spoon-shaped tips. The colour is buff, but there are sufficient indications in the flower that later buds will develop some red colour. Shown by Mr. H. STREDWICK.

Rose Claudius.—This is one of the most fragrant *Roses*. It was shown as a Hybrid Tea variety, but one could easily imagine it to be a Hybrid Perpetual. The colour is pinky-red. The variety was awarded the National Rose Society's Gold Medal this season (see p. 222). Shown by Messrs. B. R. CANT & SONS.

Streptocarpus.—A strain of large-flowered *Streptocarpus*, shown by the Hon. VICARY GIBBS (gr. Mr. E. Beckett), was given an Award of Merit. The colours were very pleasing.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, W. Boxall, J. Forster Alcock, F. Sander, Stuart Low, E. J. Hanbury, A. A. McBean, C. Cookson, W. Waters Butler, Arthur Dye, R. G. Thwaites, W. P. Bond, J. Cypher, W. H. Hatcher, H. G. Alexander, C. H. Curtis, H. A. Tracy, H. Ballantine, W. Bolton, Gurney Wilson, G. F. Moore, and Sir Jeremiah Colman, Bart.

Lieut. Col. G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander), showed six specimens of very handsome hybrids, which included the beautiful *Cypripedium Germaine Opex* Westfield variety, the very large and finely coloured

C. nitens Lecanum var. Hannibal, *C. nitens* Alportense, with a strong resemblance to *C. insigne* Harfield Hall, *C. Cynthia* (see Awards), *C. Gaston Bultel* King Edward VII., the handsome *Cattleya Heloisie* (Forbesii × Mossie Reineckiana), a pretty bluish-white flower marked with crimson on the lip; and *Cattleya Dirce* (Vulcan × Warszewiczii) with deep rose flowers, the front of the lip veined with rose-purple and showing the influence of *C. Schilleriana*.

Sir JEREMIAH COLMAN, Bart., Gatton Park, Reigate (gr. Mr. Collier), staged a small group, which included *Spathoglottis Colmani* aurea, with clear yellow flowers, and a *Dendrobium* and *Cirrhopetalum*, which secured awards.

H. S. GOODSON, Esq., Fairlawn, West Hill, Putney (gr. Mr. G. E. Day), was awarded a Silver Flora Medal for a group, the principal plant in which was the handsome white *Cattleya Hardyana* "The Baron," which was unanimously voted a First-class Certificate. The group contained a fine lot of *Laelio-Cattleyas*, *Odontoglossums*, and *Cypripediums*. Among those noted were *Odontoglossum Neptune*, a yellow, blotched hybrid of the *O. Harvengtense* class; *Anguloa uniflora* Tracy's variety, a fine wax-like white flower of the type known in gardens as *A. eburnea*; the yellow *Odontoglossum grande* Pittianum; *Cypripedium Chapmanii* superbum, with three large flowers and three buds; *Miltonia Bleuana* Our Queen, a white variety with rose markings at the base of the lip; *Cypripedium Mandia*, various *Masdevallias*, &c.

Baron Sir H. SCHRÖDER, The Dell, Egham (gr. Mr. H. Ballantine), again showed the remarkable *Cattleya Lamberhurst* hybrid (*citrina* × *intermedia*), for which he received a First-class Certificate on October 23, 1893—a very creditable instance of cultural skill.

Messrs. CHARLESWORTH & Co., Haywards Heath, were awarded a Silver Flora Medal for a group in which both species and hybrids were well represented. The hybrid *Odontoglossums*, *Laelio-Cattleyas*, and *Cattleyas* had with them some fine examples of the clear blue *Vanda corulea*, the rare, milk-white *Pescatorea Dayana*, the little scarlet *Laelia monophylla*, the white *Saccolabium violaceum* Harrisonianum, *Odontoglossum grande* aureum in two tints of yellow and with white lip, and the curious, fragrant *Angraecum imbricatum* with clusters of white flowers with fleshy, yellowish lip.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for a group, in the centre of which was a strong specimen of *Arachnanthe* (*Vanda*) *Lowii* superba, with a long, drooping spike of 29 dark, claret-barred flowers, and three of the large yellow basal blooms. With it were various *Laelio-Cattleyas*, including L.C. The Duchess, with coppery orange-coloured flowers, having a deep ruby lip with gold veins; *Cattleya* Lord Rothschild, and other *Cattleyas*; a noble specimen of their best type of *Vanda corulea*; a large and finely-flowered *Celogyne ocellata*, *C. speciosa* albens, &c.

Messrs. STUART LOW & Co., Bush Hill Park, secured a Silver Flora Medal for a bright group, which included many rare Orchids. The back was composed of Brazilian *Oncidium*s, with which were varieties of *Cattleya* *Adula*, *C. Venns*, and *C. Vulcan*, in front being a good plant of the true *Oncidium hamatochilum*. We also noticed *Celogyne speciosa*, with salmon-tinted labellum, without the blackish ridges of the type; the rare *Cirrhopetalum Mastersianum*, with an umbel of pretty copper-yellow flowers, &c.

Messrs. J. CYPHER & SONS, Cheltenham, were awarded a Silver Banksian Medal for a group, at one end of which were a selection of *Dendrobium Phalanopsis* Schröderianum, with varieties of *Masdevallia chimera* and *Miltonia vexillaria* Leopoldii, at the other end being a number of hybrid *Cattleyas*, principally hybrids of *C. Bowringiana*, and including *C. Mantinii inversa*, *C. M. nobilior*, and other showy varieties, the centre being of hybrid *Cypripediums*, with some fine *C. Fairieanum* and *C. Maudia* at the back.

F. MENTEITH OGILVIE, Esq., The Shrubbery, Oxford (gr. Mr. Balmforth), sent *Sophro-Cattleya* *Doris* Shrubbery variety, a fine dark-scarlet flower, with yellow at the base of the lip.

ED. ROBERSON, Esq., Oakdene, West Didsbury, Manchester (gr. Mr. W. C. Price), sent the perfectly-formed *Cypripedium Priam* (insigne *Chantinii* × *Niobe*), with a fine, circular, white, dorsal sepal with dotted purple lines, and which received a First class Certificate when shown by

Messrs Veitch, the raisers, on November 20, 1900.

H. T. PITT, Esq., Stamford Hill (gr. Mr. Thurgood), showed *Cattleya Newingtonensis* (Mrs. J. W. Whiteley × Harrisoniana).

J. FORSTER ALCOCK, Esq., Exhams, Northchurch, sent *Cypripedium* *Baron Schroder* New Hall Hey variety, a good dark form.

W. THOMPSON, Esq., Walton Grange, Stone (gr. Mr. Stevens), showed *Odontoglossum exultans* var. *Christopher* (crispum × excellens), a good pale yellow flower blotched with brown; and *Cypripedium* *Daisy Barclay* var. *Dunhamense*, white, closely lined and tinged with dark purple.

Monsieur MERTENS, Ghent, showed a selection of hybrid *Odontoglossums*.

Messrs. ARMSTRONG & BROWN, Tunbridge Wells, sent *Cattleya* *Lord Rothschild* *Orchidhurst* variety, with lavender-tinted sepals and petals, and rose-marbled lip with large orange disc; *Cattleya radiata* (*Dowiana aurea* × *Pittiana*), with greenish, cream-white sepals and petals, the broad front of the lip rosy-mauve, the base orange; and L.C. *Purple Empress* (L.C. Berthe Fournier × *C. Hardyana*).

Mr. CHAS. TURNER, Slough, sent two good specimens of *Laelia pumila*, one with rose-coloured, and the other with bluish-white, sepals and petals.

Mrs. NORMAN C. COOKSON, Oakwood, Wylam (gr. Mr. H. J. Chapman), sent the pale yellow and white *Cypripedium* *Sanaedera* and *C. Faire-Maude*. (See Awards).

R. BROOMAN-WHITE, Esq., Arddarroch, Garelochhead, N.B., sent a fine selection of grand flowers of *Odontoglossum crispum*, both the white and spotted forms, and which were taken from Mr. BROOMAN-WHITE'S *Odontoglossum* house, containing about 400 fine spikes. The plants were placed outdoors throughout the summer, and are in fine condition. *Sphagnum*-moss and *Hymenophyllum*s grow naturally around Mr. BROOMAN-WHITE'S property, and the air suits the *Odontoglossums* well.

Mr. A. W. JENSEN, Lindfield, Haywards Heath, sent a magnificent, large-flowered *Odontoglossum Harryanum* and a fine *O. crispum*.

Mr. JAS. DOUGLAS, Edenside, Great Bookham, sent a very fine dark *Laelio-Cattleya* *Gottoiana*.

Mr. E. V. LOW, Vale Bridge Nursery, Haywards Heath, showed the fine greenish-yellow and white *Cypripedium Rossettii*; *C. Germaine* *Opoix*, and *Odontoglossum Grande Pittianum*.

AWARDS.

FIRST-CLASS CERTIFICATE.

Cattleya Hardyana *The Baron* (*Dawiana aurea Warszewiczii* *Frau Malaine Beyrodt*), from H. S. GOODSON, Esq., Fairlawn, West Hill, Putney (gr. Mr. G. E. Day).—A superb *Cattleya* in size and shape equal to the best *C. Warszewiczii*, but with pure white sepals and petals, and large, deep ruby-crimson lip, with a light, yellow blotch on each side of the tube, and golden lines from the base.

AWARD OF MERIT.

Dendrobium turinnum Calvanii, from Sir JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. Collier).—A very beautiful variety, with clear white reflexed sepals, and erect, twisted, rose-pink petals, the shovel-shaped white lip being margined with rose. It is a strong-growing Philippine species.

Cirrhopetalum Fascinator, from Sir JEREMIAH COLMAN, Bart.—A very attractive species of the one-flowered section, and allied to *C. appendiculatum*, but larger and darker in colour. The dorsal sepal is pale green spotted with purple, and, like the petals, have a purple fringe. The united lateral sepals are 6 inches long, broad at the base, and tapering to a fine point, greenish white, blotched with claret-purple in the middle.

Cypripedium Cynthia (*Charlesianum* × *Charlesworthii*), from Lt.-Col. G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander).—A very fine *Cypripedium*, the square arrangement of its pure white dorsal sepal delicately marked with rosy-lilac, calling to mind the same feature in the remarkable *C. Lecanum* J. Gurney Fowler. The ground colour of the petals and lip is greenish, tinged and spotted with light purple.

Cypripedium Faire-Maude (*Fairieanum* × *Maudia*), from Mrs. NORMAN C. COOKSON, Oakwood, Wylam (gr. Mr. H. J. Chapman).—Resembling a large dark *C. Juno*, with a very fine dark rose-tinted and striped dorsal sepal.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the Chair), and Messrs. A. H. Pearson, J. Cheal, W. Bates, C. Foster, H. Somers Rivers, E. Beckett, W. Poupard, H. Parr, J. Lyne, J. Davis, O. Thomas, J. McIndoe, P. C. M. Veitch, A. R. Allan, J. Vert, W. Jeffries, W. Pope, G. Wythes, A. Dean, W. H. Divers, J. Harrison, G. Hobday, J. Gibson, T. D. Tuckett, G. Reynolds, W. Fyfe, and J. Jaques.

Apple Red Victoria was again placed before the Committee, and the members expressed a wish to see the cropping qualities tested at Wisley. A white Grape, said to be a sport from Black Hamburg, was found, on comparison with a bunch of Golden Queen from Wisley, to be that variety. A white perfumed Grape of no special merit was also shown.

Exhibits of fruit were unusually numerous and large. THE KING'S ACRE NURSERY Co., Hereford, again set up a very fine group of fruit trees in pots, and many dishes and baskets of picked fruit. Pear trees were very fine, including the varieties Charles Ernest, Josephine des Malines, Alexandre Lucas, and Beurré Bachelier. Of Apples there were superbly fruited specimens of King of Tompkins County, Gloria Mundi, Wealthy, Twenty Ounce, Jonathan, and Washington. Also superb gathered fruits of Royal Jubilee, Lord Grosvenor, Warner's King, Charles Ross, Cox's Pomona, Emperor Alexander, Norfolk Beauty, Peasgood's Nonesuch, and The Queen. Of Pears there were Pitmaston Duchess, Beurré Diel, Durondeau, Louise Bonne of Jersey, and Beurré Baltet. There were also Plums, Crabs, Peaches, Grapes, and Figs. (Silver-gilt Knightian Medal.)

Messrs. W. PAUL & SONS, Waltham Cross, sent a small collection of fruit trees in pots, including Grapes Appley Towers, Black Alicante, and Foster's Seedling. Also well-fruited Pear trees, including Beurré Clairgeau, Calebasse, Conference, Durondeau, Marguerite Marillat, and others, and several Apple and Fig trees. (Silver Banksian Medal.)

LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury Park, Acton (gr. Mr. G. Reynolds), exhibited forced fruit, having five medium-sized Queen Pineapples, 13 capital Melons, including Benheim Orange, His Eminence, and Gunton Scarlet; and eight dishes of Peaches, the varieties being Golden Eagle, Sea Eagle, Lady Palmerston, Albatros, Nectarine Princess of Wales, Early Rivers, and Gladstone. (Silver Knightian Medal.)

Lady TATE, Streatham Common (gr. Mr. W. Howe), showed a dozen good bunches of Black Alicante Grape cut from a vine carrying 80 bunches. (Silver Banksian Medal.)

Messrs. G. BUNYARD & Co., LTD., Maidstone, showed about 100 varieties of hardy fruits, the general quality being superb. Specially good were Pears Durondeau, Beurré Clairgeau, St. Luke, Verulam, Doyenné du Comice, Le Lectier, Alexandre Lucas, Doyenné Bonsoch, and Marie Benoist. Of Apples, Belle Dubois, Lord Derby, Cox's Pomona, Emperor Alexander, Warner's King, Stirling Castle, Lane's Prince Albert, Bountiful, Grenadier, and Peasgood's Nonesuch, were prominent kitchen varieties; whilst of dessert sorts, Ben's Red, Beauty of Stoke, Houbton, Hitchin Pippin, Col. Vaughan, Ribston Pippin, Cox's Orange Pippin, Lord Hindlip, Washington, Charles Ross, Gravenstein, Jas. Grieve, and Baumann's Red Reinette were noteworthy. There were also several dishes of Golden Eagle Peaches. (Silver-gilt Knightian Medal.)

Messrs. J. CHEAL & SONS, Crawley, filled a long table with a very representative collection, including of Apples Early Victoria, Duchess of Oldenberg, The Old Nanny, Jubilee, Encore (a fine new variety), Lane's Prince Albert, Grenadier, Hornmead Pearmain, Newton Wonder, Potts's Seedling, and Golden Spire. Amongst Pears were good fruits of Van Mons, Leon Le Clerc, Glou Moreau, Doyenné du Comice, Pitmaston Duchess, Durondeau, Beurré de Nagan (very fine), and others. The exhibit also embraced Plums, Crabs, and other fruits. (Silver-gilt Knightian Medal.)

Messrs. J. PEED & SONS, Norwood, had a good table of Apples and Pears. Of the latter, Pitmaston Duchess, Duchesse de Nemours, Beurré Diel, Conference, and Beurré Baltet père were excellent; as also were Apples New Hawthornden, Tyler's Kernel, Golden Spire, Warner's King, Gloria Mundi, Peasgood's Nonesuch, and Gascogne's Scarlet. (Silver Banksian Medal.)

Mr. R. C. NOTCUTT, Woodbridge, Suffolk, had an excellent collection of some 80 dishes of hardy fruits, including fine samples of Potts's Seedling, Charles Ross, Bismarck, Warner's King, Peasgood's Nonesuch, Bramley's Seedling, Dr. Harvey, Lord Derby, Lane's Prince Albert, The Queen, Allington Pippin, Royal Jubilee, Ribston Pippin, and other Apples; also numerous Pears and Crabs, the Dartmouth Crab being very rich in colour. (Silver Knightian Medal.)

M. PRICE, Esq., The Node, Welwyn, Herts. (gr. Mr. T. Pateman), exhibited a collection of well-grown fruits, including Grapes, Melons, Peaches, Apples and Pears. (Silver-gilt Banksian Medal.)

Messrs. STUART LOW & CO., Bush Hill Park, staged 40 dishes of excellent Apples and Pears. (Silver Banksian Medal.)

A Banksian Medal was awarded to a collection of preserved fruits and vegetables in bottles staged by Miss BRADLEY, Hollingbourne.

From the Society's gardens at Wisley were exhibited Grapes and Pears. The varieties of both were numerous, and proved very interesting from a comparative standpoint, the quality of the Grapes being very superior.

COMPETITIVE FRUIT CLASSES.

The largest competition was seen in the class for affiliated societies. It was for six cooking and six dessert Apples, and six Pears. The ROYAL JERSEY HORTICULTURAL SOCIETY had a fairly easy task in winning the 1st prize with fruits generally of large size and superbly finished. The Pears were Doyenné du Comice, Pittmaston Duchess, Glou Morecan, Beurré Spérfin, Duchesse d'Angoulême, and Emile d'Heyst. The dessert Apples were Chas. Ross, Cox's Orange Pippin, Christmas Pearmain, Cornish Gillyflower, and Egremont Russet. The cooking Apples were very fine; the varieties were Peasgood's Nonesuch, Lane's Prince Albert, Bismarck, Bramley's Seedling, The Queen, and Gascoyne's Seedling. The EAST ANGLIAN HORTICULTURAL SOCIETY (represented by Mr. Wallis, of Norwich) was awarded the 2nd prize.

There were five classes for Grapes, the chief one being for three varieties, three bunches of each variety. There was good competition, and the 1st prize was awarded to W. G. RAPHAEL, Esq., Englefield Green (gr. Mr. H. H. Brown), who had superbly-finished bunches of Lady Downe's, good Black Alicante, and Muscat of Alexandria. 2nd, J. MILLER, Esq., Radlett, Herts. (gr. Mr. J. Kidd), who showed Appley Towers, Mrs. Pince, and Black Alicante.

In the class for three bunches of one white Grape for flavour, Muscat of Alexandria was excluded. The apparent sole exhibitor was A. BENSON, Esq., Merstham, Surrey (gr. Mr. Cornish), who had well-finished bunches of Mrs. Pearson.

In the class for three bunches of any Black Grape, for flavour, the Dowager Lady HILLINGDON, Sevenoaks (gr. Mr. J. P'hitton), was placed 1st, the variety being Madresfield Court.

For three bunches of Muscat of Alexandria, Mr. CORNISH was 1st with capital samples, the berries being large and well finished. 2nd, the Earl of HARRINGTON, Elvaston Castle, with heavier bunches, rather under-thinned.

The trade growers' class for Grapes found no entry.

There were three classes for Plums. The first was for three dishes of dessert varieties. The varieties in the 1st prize collection were Coe's Golden Drop, Transparent Gage, and Guthrie's Late Gage, the exhibitor being J. T. CHARLESWORTH, Esq., Red Hill, Surrey (gr. Mr. J. W. Herbert). Mr. J. VERT, Audley End Gardens, Saffron Walden, was 2nd; but in the class for three dishes of cooking Plums, Mr. VERT won the premier place with very fine samples of Pond's Seedling, President, and Monarch. 2nd, Mr. HERRERT.

No exhibitor competed in the trade fruit classes, which is to be regretted.

VEGETABLES.

From Aldenham House Gardens, Elstree, the Hon. VICARY GIBBS (gr. Mr. E. Beckett), staged one of those superb collections of vegetables such as have so greatly helped to render these gardens famous. The collection furnished a table measuring 40 feet long, and included some 100 dishes. Many of the vegetables were staged on an erect background, especially fine being pyramids of Cauliflowers, also Celery, Leeks, Seakale, Beet,

Onions, Carrots, Lettuces, Turnips, Radishes, Brussels Sprouts, and on the table splendid Ailsa Craig and other Onions; King Edward, Purple Eye and other handsome Potatos; Autocrat and Gladstone Peas; Matchless and Favourite Carrots; Ham Green, The Hastings and Golden Queen Tomatos, with Marrows, Cucumbers, Chicory, Globe Artichokes, Mushrooms, and practically every other ordinary garden vegetable. (Gold Medal.)

Mr. R. W. GREEN, Wisbech, set up a collection of 50 dishes of Potatos, generally clean, medium-sized samples. Of white kinds were noticed Superlative, Factor, Gold Reef, General Roberts, Dalmeny Regent, Closeburn Castle, and Highlander; and of coloured varieties there were Edgcote Purple, Eightyfold, Lord Tennyson, and King Edward VII. (Bronze Knightian Medal.)

Messrs. G. MASSEY & SONS, Spalding, showed an interesting collection of round and long Beets, short and long Carrots, also Seakale Beets. All, whether diverse or not, had on them the names of the vendors of the seed stocks, so that the exhibit had a certain educational value. (Silver Banksian Medal.)

CONFERENCE OF MUTUAL IMPROVEMENT SOCIETIES.

THE societies affiliated and in union with the Royal Horticultural Society held their annual conference on Tuesday last, at the Royal Horticultural Hall, Westminster. The meeting was held at 4 o'clock in the lecture-room, about 50 persons being present. The chair was taken by H. B. MAY, Esq. The business was to discuss various suggestions put forward by one or other of the societies. The first one considered was a proposal that the affiliated societies should organise meetings at a convenient centre in their respective counties, prior to these annual conferences, to consider and formulate subjects for discussion. It was suggested that these county meetings should be arranged under the auspices of the parent society, perhaps in the largest town in the county. At the same time it might be possible to hold a big county show, the various societies contributing. One speaker suggested that this should be undertaken by the Royal Horticultural Society; the same speaker thought it necessary that the affiliated societies should have a representative on the Council of the R.H.S. Mr. Bound doubted if the scheme would work well, as only 50 members from the 230 affiliated societies, each of which was entitled to send three delegates, had attended the conference, notwithstanding there was a most interesting show in the large hall below. The Chairman, as representing the Council of the R.H.S., stated that the initiative must come from the societies themselves, and that when they had formulated a practicable scheme they might rely on the sympathy and help of the parent society.

The next subject for discussion related to the horticultural competitions. This subject was advanced at the last conference in a very lengthy paper, and the feeling of the meeting was that to restrict a grower to a piece of ground of stated area for growing, say, Turnips or Carrots for an exhibition, was impracticable. The proposition met with no support.

The Chairman answered the next question. It was: "Is it possible for the R.H.S. to obtain hooks for daughter societies at cheap rates?" Mr. May said the R.H.S. had no privilege itself in this matter, therefore it could not possibly extend such a concession to the affiliated societies.

An interesting debate took place on the question of how to make the local meetings more attractive and helpful to young men. The Croydon delegates stated that out of 150 members they had only 14 young gardeners. The Croydon society had offered inducements in the way of prizes for essays, but this policy failed, as only two young men had competed. Several members spoke as to the difficulty of inducing journeymen and improvers to attend the meetings, and football and cricket were blamed as the counter attractions. It was argued that much of the trouble resulted because the young men were not made sufficiently welcome and that the head gardeners associated together. Mr. Geo. Gordon suggested that they should make their meetings attractive by employing lantern slides at the lectures. They should endeavour to bring to the meeting men who were eminent in the gardening world, as good lecturers were almost

sure to draw good audiences. It was also desirable to impart scientific knowledge at these meetings. Mr. Gordon instanced a course of lectures at which only about eight attended, but when the lecturer changed his subject to one of a more scientific character the average was increased to 80. Another speaker said it was advisable to give the young men minor posts in the management of the society. In their particular branch they had done this, and one young man acted as reporter of the meetings, another as assistant to the librarian, and so on. The Chairman stated that he knew the difficulty of inducing young men to attend, but much good might be done if the head gardener gave the matter personal interest. Some remarkable results were quoted during a discussion on educating the older schoolboys and ex-schoolboys in horticulture. The Highgate delegates stated their society provided classes for juvenile exhibitors. They gave away to boys 700 plants, and of these 500 were staged at their show.

The produce exhibited by these boys compared favourably with that shown by allotment holders. Work in this direction was also instanced at Preston and at Egham. In the latter place, 4,000 pots of cuttings and 1,000 pots of seeds were distributed to juveniles, and of these 3,000 were returned at the annual show.

The work done by the County Councils and School Authorities in the matters of teaching gardening and school gardens was approved.

The final question of what constitutes a professional, amateur, and cottage gardener respectively, was the subject of much debate. It was generally recognised that a definition of these terms that would fit every district was impossible, therefore each society should be guided in the matter by the locality, and status of its members. In every case, however, the definition should be published in the schedule that all competitors may know the rules.

SCOTTISH HORTICULTURAL.

OCTOBER 5.—The monthly meeting of this association was held at 5, St. Andrew Square, Edinburgh, on this date. The president, Mr. Whytock, occupied the chair, and there was an attendance of more than 100 members. A paper, illustrated by lantern views, was read by Mr. W. Smith, of Holyrood Palace Gardens, Edinburgh, on "Ornamental Trees and Shrubs." Effective grouping was the chief point of Mr. Smith's paper, and it proved very instructive.

Mr. SMELLIE, Busby, staged a collection of early-flowering Chrysanthemums, including several new varieties. Three of these, Hecuba, Galatea and Andrew Hoggan, were each awarded the Society's First-class Certificate.

A fine collection of new single Chrysanthemums was staged by Mr. A. THOMSON, Dean Gardens, Edinburgh, and two of these, Lizzie Douglas and Fortune's Favourite, were each awarded a First-class Certificate.

Messrs. DOBBIE & CO., Rothesay, also exhibited early-flowering Chrysanthemums and Cactus, "Collette," and other Dahlias. A First-class Certificate was awarded to a single Dahlia named Nimrod.

Amongst other exhibits of interest were fruits of the Burbank and other Plums, including several varieties of Gages raised by the exhibitor's father, from Mr. CHARLES WEBSTER, Gordon Castle, Fochabers; the new Apple Red Victoria, shown by Messrs. JAMES GRIEVE & SONS, Redbraes, Edinburgh; double Primroses of the second generation, produced from a blue variety crossed with double-flowered varieties, giving in the first generation all singles which, when selfed, produced singles and doubles in the second generation, were shown by Mr. P. MURRAY THOMSON, Cockbridge, Malsgate, Cumberland.

It was announced that the paper for the meeting on November 2 would be by Miss Burton, New Saughton Hall Gardens, Polton, the subject being "Begonias."

Six new members were elected.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

OCTOBER 11.—The quarterly meeting of this society was held at the Horticultural Hall, Vincent Square, Westminster, S.W., on this date. Mr. C. H. CURTIS occupied the chair. The death certificate of Mr. James Swingle was produced,

and the amount standing to his credit, viz., £30 4s. 1d., was ordered to be paid to his widow. Mr. Swingler's membership had lapsed since 1892. The sick pay for the month amounted to £34 10s. The usual quarterly grants from the benevolent fund were passed for payment. The annual dinner, as already announced, will be held at the Waldorf Hotel on the 28th inst. at 6.30 p.m., when it is hoped that as many members and friends as possible will attend. J. B. Slade, Esq. (of Messrs. Protheroe & Morris), will preside.

NATIONAL SWEET PEA

The results of the deliberations of the Floral Committee of this Society during the past season have been prepared for publication in the Society's *Annual*. In the meantime, we are requested to print the following details:—

CLASSIFICATION OF SWEET PEAS FOR 1910.

The following is an up-to-date selection of varieties in commerce, drawn up by the Floral Committee:—

WHITE.	PINK.
Etta Dyke Nora Unwin *Dorothy Eckford	Countess Spencer *Prima Donna
CRIMSON AND SCARLET	CREAM PINK
The King *King Edward *Queen Alexandra	Constance Oliver Mrs. H. Bell *Queen of Spain
ROSE AND CARMINE	ORANGE SHADES.
John Ingman Marjorie Willis *Prince of Wales	Helen Lewis St. George *Miss Willmott
YELLOW AND BUFF.	LAVENDER.
Clara Curtis *James Grieve	Frank Dolly Mrs. C. Foster *Lady G. Hamilton
BLUE.	VIOLET AND PURPLE
A. J. Cook *Lord Nelson	Rosie Adams *Duke of Westminster
BLUSH.	MAGENTA
Mrs. Hardcastle Sykes	Menie Christie
CERISE.	STRIPED AND FLAKED.
Christie Unwin. *Coccinea	(Purple and Blue.) *Prince Olaf
MAUVE.	FANCY
The Marquis *Mrs. Walter Wright	*Sybil Eckford
MAROON AND BRONZE	BICOLOR.
*Black Knight *Hannah Dale	Mrs. Andrew Ireland *Jeannie Gordon
PICOTEE EDGED	MARBLED.
Elsie Herbert Mrs. C. W. Breadmore	*Helen Pierce
STRIPED AND FLAKED. (Red and Rose.)	
Aurora Spencer Yanko *Jessie Cuthbertson	

An asterisk denotes a variety that is NOT waved.

TOO MUCH-ALIKE VARIETIES

The following varieties have been bracketed as too-much-alike. Not more than one of the bracketed varieties shall be shown on the same stand at any exhibition of the National Sweet Pea Society.

WHITE.	ROSE AND CARMINE.
Etta Dyke Paradise White Purity Snowflake White Spencer White Waved	E. J. Castle George Herbert John Ingman Mrs. W. King Paradise Carmine Phyllis Unwin Rosie Sydenham Rosy Morn Spencer Carmine
CRIMSON AND SCARLET.	YELLOW AND BUFF.
(Miss L. F. Drayson Queen Alexandra Scarlet (Baker's))	Harold James Grieve Mrs. Collier Mrs. A. Malcolm Yellow Hammer Clara Curtis Paradise Cream Primrose Paradise Primrose Spencer Primrose Waved Winged Juliana Waved Cream (Malcolm's)
Dodwell F. Browne King Alfonso King Edward Spencer Paradise Crimson Rosie Gilbert Sunproof Crimson Sunproof King Alfonso (The King (Dublin))	BLUE.
ROSE AND CARMINE.	Flora Norton Miss Philbrick
Albert Gilbert Lady Farren Marjorie Willis Rosahnd Splendour Spencer	

BLUE.	LAVENDER.
(Anglian Blue Flora Norton Spencer Kathleen McGowan Zephyr Mid-Blue Zoe)	(Giant Lavender (Stark) Lady Grisel Hamilton Lavender George Herbert Masterpiece Mrs. Chas. Foster Mrs. Walter Carter Countess of Radnor Lady Grisel Spencer)
BLUSH	MAGENTA.
(Beauty (Bolton's) Bobby K Countess of Northbrook Florence Morse Spencer Lorna Doone Mrs. Hardcastle Sykes Princess Victoria Blush Spencer Lady Althorp Mrs. F. G. Baker Paradise Regained Sankey Spencer Constance Oliver Doris Usher Nell Gwynne)	(Menie Christie Mrs. Charles Mander)
PINK	MAUVE.
(Countess Spencer Enchantress Paradise Pink Pearl)	(Ida Townsend Fennant Spencer The Marquis)
CREAM PINK	MAROON AND BRONZE.
A. B. Bantock Earl of Plymouth Holdfast Belle Kitty Lea Mrs. Hugh Jackson Mrs. Henry Bell Mrs. Reutzahn Spencer Queen (Sutton's) Romani Romani	(Anna Lumley Black Knight Spencer Douglas Unwin Maroon Paradise May Gerhold Nubian Othello Spencer)
ORANGE	PICOTEE EDGED
(Dazzler Edna Unwin Gordon Ankenell Ruly St. George Earl Spencer Nancy Perkin)	(Dainty Spencer Distinction Elsie Herbert E. J. Deal Lady Althorp Improved Winifred Deal Mrs. Townsend Phenomenal Evelyn Hemus Mabel Cole Mrs. C. W. Breadmore)

VARIETIES TO BE EXCLUDED FROM FUTURE TRIALS.

(Her Majesty Splendour Duke of Sutherland Monarch Lottie Eckford Maid of Honour Ivy Miller Stanley Boreatton Lord Rosebery Cyril Breadmore Mrs. Felton Dora Cewper Devonshire Cream Ceres Yellow Dorothy Eckford Captain of the Blues Bolton's Blue)	(New Countess Princess May Modesty Duchess of Sutherland Sensation Countess of Aberdeen Miss Bostock Pride of St. Albans Olive Bolton Codsall Rose Gorgeous Miss B. Whiley Mildred Ward Countess of Lathom Coral Gem Pink Gem Vera Jeffrey)
---	---

Obituary.

ROBERT GORDON RAE.—The death of Mr. Robert Gordon Rae, for more than 25 years superintendent of Dundee Western Cemetery, occurred on October 2. Mr. Rae was a member of a well-known Aberdeenshire family. In the early fifties he commenced his apprenticeship as a gardener at Haddo House, Aberdeenshire. Ultimately he became head gardener to the Earl of Eglinton, in Ayrshire. From thence, in 1872, he received the appointment of superintendent of Craigton Cemetery, near Glasgow, and laid out the grounds there. He remained at Craigton 11 years, and afterwards removed to Dundee to take up the position he held at the time of his death.

STEPHEN TRESSEDER.—We regret to record the death of Mr. Stephen Treseder at Cardiff, on the 9th inst., in his seventy-sixth year. Mr. Treseder was a Cornishman, and a native of Truro. At an early age he went to Australia and New Zealand. In these colonies he resided for 14 years, spending a part of the time at the gold diggings. In 1870 he returned home, settling at Cardiff, where he commenced the nursery business which has since developed into the firm of Messrs. S. Treseder & Son, Rose growers. Mr. Treseder was well known throughout the

counties of Glamorgan and Monmouthshire. Those who had the privilege of being intimately acquainted with him will long remember him for his geniality and kindheartedness, and his strict probity in all business dealings. He leaves a widow and two sons, the elder of whom, Mr. W. Arthur Treseder, has carried on the business since his father's retirement six years ago.

J. S. GRANT.—We regret to announce the death, on September 10, after a few days' illness, of Mr. James Sinclair Grant, gardener to Mr. H. M. Arderne, of The Hill, Claremont, Cape Colony. Mr. Grant was formerly gardener to the late Mr. Rhodes, at Groot Schuur. He was an expert grower of Orchids, being formerly in the employ of Messrs. Sander & Sons, St. Albans. From St. Albans he went to the Municipal Gardens, Cape Town, and thence to Groot Schuur. On the Saturday preceding his death he complained of feeling unwell from a cold, which rapidly developed into inflammation, succeeded by pneumonia. Mr. Grant was only 33 years of age, and his death is greatly regretted. He leaves a widow and two young children. The funeral took place at Maitland Cemetery. Mr. Grant was a native of Lismore, Co. Waterford.

HIPPOLYTE MILLET.—This well-known Belgian horticulturist died recently at Tirmont. In 1843 M. Millet took a prominent part in the organisation of the Agricultural Committee of Tirmont. At that early date, a knowledge of Belgian horticulture and arboriculture was the possession of only a privileged few. M. Millet organised and took part in horticultural lectures for 60 years, during which time he greatly encouraged the taste for arboriculture and a love of plants and fruits. From 1851 he presided at the lectures which, from the first, were provided free, owing to the support obtained locally, but eventually were taken over by the State. Only two months ago M. Millet celebrated his 60th year of teaching, and his pupils and old students took that opportunity to make him a presentation in testimony of their esteem and affection.

SCOTLAND.

THE PERSIAN PLUM.

PRUNUS PISSARDI flowers freely and even luxuriantly in Scotland, but its fruiting is a rare achievement in our somewhat trying and capricious climate. In my own garden, where it has shelter from every wind, with the exception of the north-eastern blasts, it blossoms abundantly, and even makes an endeavour occasionally to set its fruit. Its efforts in this direction, however, have hitherto been in vain. I have therefore been much interested to learn from Mr. Brodie of Brodie that *Prunus Pissardi* has fruited for the first time this season in the gardens of Brodie Castle, near Forres, in Elginshire, where the Almond tree (whose flowering shoots were adequately ripened by the sunlight of last summer) is also bearing fruit this season to a considerable extent. I may remark, incidentally, that the Almond has developed some of its fruit to the full size here this season, for the first time for 12 years. Only once have I had the gratification of seeing the oval and dark shining fruit of *Prunus Pissardi*, and that was in a sheltered place behind the private flower garden at Lochinch Castle, the residence of the Earl of Stair. Some years ago, in this journal, Mr. S. Arnott, of Maxwelltown Road, Dumfries, stated that the Persian Plum had fruited to a considerable extent at St. Mary's Isle, in Kirkcudbrightshire. I have written this communication in the hope that *Prunus Pissardi*, which is one of the most ornamental of all flowering trees, producing a luxuriance of blossoms in early April, and scarlet-blossomed chocolate shoots during the summer and autumn months, may be cultivated more extensively. *David R. Williamson.*

MARKETS.

COVENT GARDEN, October 13.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—[Ensl.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing cut flowers and their prices, including Asters, Carnations, American (var.), second size, small, per doz. bunches, "Malmansons," Catleyas, Coreopsis, Dahlias, Eucharis grandiflora, Gaillardias, Gardenias, Gladiolus, Gypsophila elegans, Heather, Lapageria alba, Lithium auratum, Lycium, Lily of the Valley, etc.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing cut foliage and their prices, including Adiantum cucullatum, Agrostis, Asparagus plumosus, Berberis, Croton leaves, Cycas leaves, Ferns, Grasses (hardy), Hardy foliage (various), Ivy-leaves, Moss, Myrtle, Physalis, Smilax, etc.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing plants in pots and their prices, including Ampelopsis, Aralia, Araucaria excelsa, Aspidistra, Asparagus plumosus, Asters, Bouvardias, Campanula, Chrysanthemums, Clematis, Cocos, Crotons, Cyclamen, Cyperus alternifolius, etc.

Plants in Pots, &c.: Average Wholesale Prices (Contd.).

Table listing plants in pots (continued), including Marquerites, Pelargoniums, Selaginella, Solariums, Spiraea japonica, etc.

Fruit: Average Wholesale Prices.

Table listing fruits and their prices, including Apples (English), Bananas, Damsons, Figs, Grape Fruit, Grapes, Lemons, Limes, Melons, Peaches, Pears, etc.

Vegetables: Average Wholesale Prices.

Table listing vegetables and their prices, including Artichokes, Beans, Beetroot, Cabbages, Cardoons, Carrots, Cauliflowers, Celery, Chicory, Cucumbers, Endive, Horseradish, Lettuces, Marrows, Mushrooms, Onions, Parsley, Peas, Potatoes, Radishes, Spinach, Stachys, Tomatoes, Turnips, etc.

REMARKS.—Home-grown Peaches and Nectarines are finished for the season, but some very good samples of these fruits are arriving from France, and these are selling freely. Italian Figs are scarcer and a little firmer in prices. The English Grape trade is slow. Newtown Pippin Apples are arriving in good condition and selling well. English Tomatoes are dearer. Large English Walnuts meet with a fair demand. Trade in vegetables and fruits is, generally, quiet. E. H. K., Covent Garden, Wednesday, October 13, 1909.

Table listing potatoes and their prices, including Bedfords, British Queen, Epicure, etc.

REMARKS.—Trade is not quite so good as last week. The stock of tubers in London is about the same. Edward J. Newbourn, Covent Garden and St. James, October 13, 1909.

COVENT GARDEN FLOWER MARKET.

In comparing the market trade in plants and flowers with what it was years ago, there are many alterations. Formerly only dwarf, compact plants were wanted; now the taller, loose growing specimens sell better. For example, Chrysanthemums from 2 1/2 to 3 feet high make much better prices than the dwarf ones, and this applies to most other subjects. By this I do not mean thin, drawn plants. There is, of course, some trade for those of smaller sizes, but the greatest demand is for large plants. Even for bedding-out purposes larger plants are wanted. Perhaps the greatest change is seen in the large plants of the Rambler Roses, but these have been rather too numerous during the past season. The largest plants fetch from £1 to £5 each, but these are exceptional figures; those worth from 5s. to 10s. each sell readily. Tall plants of Heliotropiums, Lantanas, &c., are likely to be in demand during the coming season. It is evident that good bedding plants are profitable, and if part of the stock is left over, it will pay to hold it in reserve for the following season; in the meantime the plants should not be crowded or given more warmth than is necessary to ward off frost. There is not much that is new to report. Several growers have started selling Solanums and Cyclamen. Plants of Erica gracilis and its white variety are both good. Begonia Gloire de Lorraine is well flowered. Bouvardias are seen, but they are not of the best quality. Foliage plants are more in demand. Araia Moseri seems to be quite taking the place of A. Sieboldii. Cupressus Bernandiana is another plant which is appreciated by florists. Araucaria excelsa may be had in all sizes and at cheaper prices than formerly. Ficus elastica seems to have gone out of favour, but good plants are seen, also Cyperus alternifolius.

CUT FLOWERS.

A week ago last Saturday almost everything of value was cleared out early, but it was not so last week. Liliums have sustained advanced prices, also Lily of the Valley. Violets are very plentiful; they are selling more freely. Callas—Richardia africana—are more in demand. Both Asters and Dahlias are plentiful, but early Chrysanthemums have a preference over all other border flowers. Gardenias, Stephanotis, Tuberoses, and other short-stemmed flowers have not been selling readily. Roses and Carnations have been over-plentiful. On Tuesday many good Roses were offered in the streets. Mme. Chateau, on long stems, sold for 1d. each, this being an indication of their value. A. H., Covent Garden, October 13, 1909.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

- List of gardening appointments including Mr. Wm. Wiggins, Mr. H. Hoggins, Mr. F. Oliver, Mr. A. Porter, Mr. David Thompson, Mr. W. Avey, Mr. W. Welch, Mr. F. T. Woodfield, Mr. James Kelly, Mr. G. S. Hatcher, Mr. F. Dale, Mr. W. Balcombe, Mr. Herbert Musker, Mr. Charles M. Hall, etc.

DEBATING SOCIETY.

DUNDEE HORTICULTURAL.—The first meeting of the Dundee Horticultural Society was held in the Technical Institute on October 6, the proceedings being devoted to a paper on "Lily of the Valley Chrysanthemums" by Mr. W. Lund, president, and etc. etc. The conference was opened with a short address by Mr. William Grant, F.R.H.S., and a means members subsequently took part in the discussion.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD OF THE weather throughout the British Islands, for the week ending October 9, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather was very variable, with frequent rain, interspersed, however, with fairly long intervals of bright sunshine. A thunderstorm occurred at Oxford on Sunday night, and at Llangamarch Wells on the early morning of Friday. Thunder alone was also observed at Yarmouth on Friday.

The temperature was above the average in all districts, the excess varying from 2° in Scotland N. to 3.8° in England E. and 4.2° in Ireland S. The highest of the maxima were generally recorded early in the week, and ranged from 70° in England N.E. to 61° in Scotland N. The lowest of the minima, which were mostly registered on the 6th or 9th, ranged from 30° in England S.W. and 33° in the Midland Counties and England S.E. to 41° in the English Channel. The lowest grass readings recorded were 25° at Cambridge, 26° at Hereford, Manchester, and Llangamarch Wells, 27° at Cirencester, and 29° at Greenwich and Kew.

The mean temperature of the sea.—The water was colder than during the corresponding period of last year on almost all parts of the coast. The actual means for the week ranged from about 59° on the east coast of England and at Newquay, to 55.2° at Port Erin, and to less than 51° at Kirkwall and Lerwick.

The rainfall was in excess of the average of the United Kingdom generally, but below it in Scotland E. and England N.E. and E. The excess was rather larger in the extreme south-east. As much as 1.63 inch fell at Prestwick on Sunday, and 1.05 inch at Fort William on Wednesday.

The bright sunshine did not differ much from the average over the kingdom generally, the values ranging from 29 per cent. of the possible duration in Ireland S., 37 per cent. in England E., and 36 per cent. in England S.E. to 21 per cent. in Scotland W. and Ireland N., and to 20 per cent. in Scotland N.

THE WEATHER IN WEST HERTS.

Week ending October 13.

Another warm and wet week.—The days have been only moderately warm, but the nights were as a rule more unseasonably warm. On the warmest night the exposed thermometer did not fall lower than 52°, which is about 16° higher than the average minimum in October. On the other hand, on the coldest night the same thermometer registered 2° of frost. The ground is now 3° warmer at 2 feet deep, and 5° warmer at 1 foot deep, than is seasonable. Rain has fallen on all but three days since the beginning of the month, and to the total depth of nearly 14 inch. The ground is now moist to some depth, as is shown by the fact that during the same period six gallons of rain water have come through the bare soil gauge, and five gallons through that on which short grass is growing. The sun shone on an average for nearly 4½ hours a day, which is about an hour a day longer than is usual at this period in October. The winds were as a rule rather high, but in no hour did the mean velocity exceed 15 miles—direction south. The average amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by five per cent. E. M., Berkhamsted, October 13, 1909.

SCHEDULES RECEIVED.

Highgate and District Chrysanthemum Society's 25th annual exhibition, to be held at the Alexandra Palace, Muswell Hill, N., on Wednesday and Thursday, October 27 and 28. Secretary, Mr. E. J. Fenwick, 31, Harborton Road, Archway Road, Highgate.

The 30th Chrysanthemum show of the Ancient Society of York Florists, to be held on November 17, 18, 19, at The Exhibition, York. Secretary, Mr. Geo. F. W. Oman, 38, Fetergate, York.

Bournemouth Horticultural Society's spring show, to be held on April 5 and 6, 1910. Secretary, Mr. C. W. Barrett, Lucerne, Fenton Road, West Southbourne, Bournemouth.

Forest Gate and Stratford Amateur Chrysanthemum Society's 18th annual exhibition, to be held in the Town Hall, Stratford, on November 4, 5, and 6. Secretary, Mr. A. J. Palmer, 19, Thorngrove Road, Upton Park, E.

Huntingdonshire Daffodil and Spring Flower Society's show, to be held at the Corn Exchange, Huntingdon, on Wednesday, April 20, 1910. Hon. secretary, Miss L. L. Linton, Strloe House, Buckden, Hunts.

Sheffield Chrysanthemum Society's exhibitions, to be held in the Corn Exchange, Sheffield, on Friday and Saturday, November 12 and 13. Secretary, Mr. C. Cook, City Road, Sheffield.

Farnham and District Horticultural and Chrysanthemum show, to be held in the Corn Exchange, Farnham, on Tuesday and Wednesday, November 9 and 10. Hon. secretary, Mr. G. E. Aldridge, Mossdale, St. Cross, Farnham.

Doncaster and District Chrysanthemum Society's 17th annual exhibition, to be held in the Corn Exchange, on Wednesday and Thursday, November 3 and 4. Hon. secretary, Mr. J. C. Mitchell, 11, High Street, Doncaster.

Newport (Mon) and District Chrysanthemum Society's 21st annual exhibition, to be held in the Gymnasium, Athletic Grounds, on Thursday, November 4. Secretary, Mr. H. Poole, 50, Somerset Road, Newport.

CATALOGUES RECEIVED.

THE YOKOHAMA NURSERY CO., LTD., Craven House, Kingsway, London, W.C.—Japanese Stove Lanterns
WATKINS & SIMONS, 12, Tavistock Street, Covent Garden, W.C.—Annals.
MANSELL & HATCHER, LTD. (formerly Moore Ltd.), Rawdon, Yorks.—Orchids.
TAYLOR BROS., Canterbury—Seeds, Bulbs, and Sundries.
JOHN JEFFERIES & SONS, Cirencester—Roses, Fruit, Forest and Ornamental Trees.

ANSWERS TO CORRESPONDENTS.

APPLES DECAYED: M. E. M. The fruits were in a condition of pulp when received, so that the trouble could not be determined.

A SINGLE PEA SEED IN MATCHBOX: C. Shaw. The seed is injured by the Pea Weevil, *Bruchus pisi*. The best method of destroying these pests is to fumigate with bisulphide of carbon (inflammable). If a small number of seeds only is infested, place them in an airtight box; put some bisulphide of carbon into a saucer, close the box, and allow it to remain for 48 hours.

BEGONIA GLOIRE DE LORRAINE: S. W. The leaves are not affected with Begonia mite, but the damage is the result of too much moisture and insufficient ventilation in the house in which they are growing. Place the plants well apart on the staging, and allow a little warmth to circulate in the hot-water pipes during dull days. Any decayed leaves should be picked off and burned.

CHESTERFIELD SHOW: S. B. We thank you for informing us that Messrs. R. W. Proctor & Sons gained the 1st prize at the show held at Chesterfield on September 7 and 8, for the best collection of Roses. Exigencies of space frequently prevent us referring to all the details at a local show. Our reporter at Chesterfield, therefore, sent us a general note, in which only a few of the competitive classes were mentioned.

FERN FRONDS WITH WHITE INSECT: J. C. M. We were unable to find any of the creatures on the specimens you sent. As fumigations have failed to destroy them, try dipping the plants in extract of quassia or some other safe insecticide, but do not use tobacco solutions, unless in a very weak form.

FERNS TURNING BROWN: H. M. The browning is due to the presence of eelworm (*Aphelenchus olivatus*). Dust the fronds with a mixture of flowers of sulphur and powdered tobacco when the surface is damp.

MENDELISM: R. K. Mendelism is the term applied to the method of study of heredity introduced by Mendel. The essential features of this method are (1) the tracing of the behaviour of individual characters in successive generations, and (2) the determination of the numerical results of breeding experiments by the use of large numbers of individual plants or animals. With respect to (1) it has been shown by Mendel and his successors that the various characters which make up an individual behave, except in certain comparatively rare cases, as independent units, and hence the laws of the inheritance of such characters may be determined experimentally by breeding. Further than this we cannot go in a brief note; but a good account of Mendelism may be found in *Mendelism*, a little book by R. C. Punnett, published by Macmillan & Bowes, Cambridge, of which book a new edition has been published recently.

MILDEW ON VINES: A. W. R. Mildew can be prevented by affording early-morning ventilation and spraying the vines with a solution of potassium sulphide when the foliage is young.

MUSCAT OF ALEXANDRIA GRAPES: A. Y. No disease is present in the berries.

NAMES OF FRUITS: I. O. W. 1, Royal Snow; 2, Red Astrachan; 3, Lady Derby.—*Only Two*. General Todleben.—*J. H. O.* 1, Vicar of Winkfield; 2, Williams' Bon Chrétien; 3, not recognised; 4, Beurré Hardy; 5, Red Doyenné; 6, Catillac; 7, Fondante du Panisai; 8, Forelle or Trout Pear; 9, decayed.—*J. Kidd*. PEARS—1, Beurré Capiaumont; 2, Durondeau; APPLES—1, Colonel Vaughan; 2, Lady Derby; 3, Scarlet Nonpareil; 4, Northern Greening; 5, French Crab; 6, Stirling Castle.—*Tresseder*. Fondante d'Automne.—*P. E.* 3, Jefferson; the others were decayed.—*Durfield*.

Common or round Damson.—*H. A. R.* 1, Jolly Beggar; 2, Tower of Glamis; 3, not recognised, most likely a local variety.—*A. G.* 1, Peasgood's Nonesuch; 2, Lady Henniker; 3, Warner's King; 4, Fondante d'Automne; 5, Leon le Clerc de Laval.—*W. G. D.* 1, Autumn Josephine; 2, Louise Bonne of Jersey; 3, Conseiller de la Cour; 4, Emile de Heyst; 5, Brockworth Park; 6, Jersey Gratioli.—*Murray*. 1, Scarlet Napoleon; 2, Winter Hawthornden; 3, Waltham Abbey Seedling; 4, Blenheim Pippin.—*C. W. Hook*. 1, Cellini; 2,

New Hawthornden; 3, Blenheim Pippin; Pear Louise Bonne of Jersey.—*E. E.* 1, Sturmer Pippin; 2, Margil; 3, Ribston Pippin; 4, Cellini; 5, Brown Beurre; 6, Beurré Hardy.—*H. T. Ireland*. 1, Beurré Diel; 2, Josephine de Malines; 3, Flemish Beauty; 4, Bramley's Seedling.—*V. R. D.* 1, Tower of Glamis; 2, Blenheim Pippin; 3, Summer Strawberry; 4 and 6, Warner's King; 5, Kerry Pippin.

NAMES OF PLANTS: W. C. P. Rhus Toxicodendron, the Poison Ivy. The plant is poisonous to the touch.—*J. Barnard*. Eucalyptus Gunnii.—*E. D.* 1, Linaria Cymbalaria; 2, Olearia Haastii; 3, Polygonum Brunonis; 4, Agrostemma coronaria; 5, Veronica Traversii.—*P. P.* 1, *Aerides odoratum*; 2, *Rhynchosistylis retusa*; 3, *Eria acervata*; 4, *Miltonia Clowesii*; 5, *Oncidium crispum*; 6, *Odontoglossum Lindlevianum*. W. F. Helixine Soleirolii.—*W. G.*, *Dumfries*. 1, *Gongora cassidea*; 2, *Veratrum nigrum*; 3, *Chlorophytum elatum variegatum*; 4, *Tsuga canadensis*.—*W. F.*, *Cobham*. 1, *Helenium autumnale*; 2, *Chrysanthemum uliginosum*; 3, *Helianthus rigidus*; 4, *Silphium laciniatum*; 5, *Solidago canadensis*.—*Veronica*. The Abutilon sent last week was *A. Thompsonii*.—*G. B. Cranfield*. *Rhamnus catharticus*—Buckthorn. We do not undertake to name varieties of Roses.—*A. P.* *Phallus impudicus* (Common Stinkhorn fungus).

RUNNER BEANS, &c.: W. S. The Beans, Strawberries and Violets are badly infested with red spider. No disease is present in either, nor is there in the Pear branches, which are decaying because of unsuitable surroundings or improper cultural conditions. The Apple is known as "glassy Apple," the cause of the complaint not being known.

SHANKING IN GRAPES: A. R., *Osborn Park*. This trouble may arise from one of many causes, but the most frequent one is a badly-made or impoverished border. If you suspect the trouble is at the roots, overhaul the border during the coming season, following the directions given by Mr. Ward in his article on the making of fruit tree and vine borders in the issue for September 13, p. 193. Anything that causes a check to the vine is liable to produce shanking in the Grapes; therefore, draughts or fluctuations of temperature must be avoided in theinery. Be careful not to overcrop the vines, and endeavour to obtain strong, well-ripened canes that will fruit well the following season.

SPOT ON MUSCAT OF ALEXANDRIA GRAPES: J. Parker. No disease is present in the berries, the injury being a superficial one. See reply to A. H. H. in the issue for September 11, p. 192.

SPRUCE FIRS WITH SWELLINGS: G. S. The swelling is the result of the attack of a species of *Chermes*. Cut off the diseased twigs and burn them.

WINTER WASH FOR FRUIT TREES: E. B. The formula recommended by Mr. Spencer Pickering in the article in *Gard. Chron.*, Feb. 16, 1907, is as follows:—Sulphate of iron or sulphate of copper 1½ lb., quicklime 6 oz., paraffin 5 pints, caustic soda 2 lbs., water 9½ gallons. Dissolve the sulphate of iron or copper in the water by suspending it in a bag of sacking over night; at the same time put the lime in a jar with enough water to not quite cover it. Next day, when the sulphate is dissolved and the lime slacked, add a little more water to the latter to make it into a milk, and pour it into the sulphate solution. Add the paraffin, and churn the mixture with a garden syringe. The soda may then be added, and then all mixed well together. It is best to powder the soda before dissolving it in the water. Mr. Pickering has since modified this wash for different purposes.

WORMS IN SOIL: Chas. Lewendon. The minute worms present in the sample of soil belong to the family Enchytraeidae. In relatively small numbers they are perfectly harmless, but a plague of them might perhaps retard the growth of the plants.

A MARKET FRUIT-GROWER'S YEAR.

ALTHOUGH we escaped some of the heavy storms of the first half of September, rain was measured on 17 days in the month, and the total reached 3.23 inches, a quantity considerably above the average. Moreover, the rainfall was so distributed over the month that two or more consecutive dry days were experienced on only three occasions, one of the three interludes being of five days' duration. The results of this wet weather in fruit plantations were not entirely bad, though the harm done was considerably greater than the good. The latter consisted in the swelling of late Apples and Pears, which have grown to greater size on the average than they promised to be at the end of August. Late Plums were also swollen by the abundant moisture in the soil; but, on the other hand, the wet weather caused splitting among some varieties, and interfered with the picking, besides doing harm in one particular to be noticed presently. Also on the bad side of the account is the rampant growth of weeds. Where horse cultivation was possible, as in young plantations, frequent operations up and down and across the intervals between trees and bushes and hand-

hoeing around them kept the land tolerably clean; but where hand-hoeing alone was practicable, weeds were re-set by the rains after nearly every day's work. In one case a plantation, hoed thrice each time at a cost of 13s. per acre, is now nearly as green as ever, and the intention to hoe a fourth time has been given up, since, under the continued unfavourable circumstances, it would be a waste of money. It is intended to try early digging with forks, to bury the weeds instead. As there is no Couch Grass, burying in such an autumn as this is the best course to pursue. Hindrance to the raising of the Potato crop and the spread of disease are other disadvantages consequent upon the wetness of the month. Further, the prices of Plums are less than probably they would have been in fine weather, both because of the restriction of the demand and of the presence of large quantities of wet or otherwise damaged fruit in the markets.

Brown Rot.

This season is the worst I have ever known for the prevalence of brown rot in Plums, although the disease has been less common among Apples than it was last year. Pond's Seedling Plum has been particularly punished by this disease in my plantations. Instead of ripening healthily, a great number of Plums began to rot before they were fit to be gathered, and probably the loss is fully 5 per cent. of a heavy crop. A thorough campaign against this disease in Plums and Cherries (also badly affected) will be necessary next season. Possibly, spraying with lime and sulphur-wash, contemplated for all kinds of fruit trees just before the buds burst next spring, will check brown rot to some extent; but subsequent sprayings with Bordeaux mixture will also be necessary. It has never been clear to me why potassium sulphide, a weaker fungicide than the Bordeaux mixture, is recommended for brown rot, while the latter is prescribed for scab.

PRICES FOR APPLES.

While dessert Apples, in consequence of their scarcity, sold well in September, there was a reduction in the prices of cooking Apples for a time. The preponderance of small Apples in the markets caused this class of fruit to be extremely cheap, and this is not surprising; but, as large fruit is scarce, about a penny a pound after the deduction of commission can hardly be regarded as a satisfactory return to the grower for well-graded "firsts," to say nothing of rail charges, market tolls, or portorage. If any reader will refer to the Board of Agriculture list of prices for the last week of September, he will see that only the first of Warner's King and a few other very large Apples made over a penny a pound gross in London, Birmingham, Bristol, or Evesham, and 6d. per bushel must be deducted for commission alone. Where there are facilities for storing, it will probably pay to hold back all good keeping Apples for a month or two, although the waste from rotting may be considerable. Growers are often blamed for marketing their Apples immediately after picking, and there is no doubt that the extent to which this plan is pursued glutted the markets in September and October. But any critic who could realise the large amount of storage-space that is required for all the late Apples on a large fruit

farm would cease to be surprised at the reluctance of growers to build the large storing rooms required; and the loss from storing under any but the best conditions is too heavy to allow of any advantage in holding back the fruit.

A RESULT OF APHIS ATTACK.

To a considerable extent the preponderance of small Apples is the result of one of the worst and most persistent attacks of aphis ever known. One of the many confident mentors of the fruit-grower stated a few days ago that, where spraying was done at the beginning of the aphis attacks, the trees were preserved from damage. My trees were sprayed before there was any considerable open foliage for the pest to attack, and repeatedly later on; but fresh infestations occurred again and again up to quite the end of August, and thousands of trusses of fruit were spoiled by the pest, the Apples being dwarfed beyond recovery. On one large fruit farm visited this season there was an extraordinary degree of immunity from aphis attack, attributed, rightly or wrongly, to spraying with lime and sulphur just before the buds burst. The assumption is that a great many mother queens were killed by this mixture; but this needs verification. It seems more likely that the coating of the trees with lime and sulphur acted as a deterrent to the insects. That, however, is only another conjecture. Still, the plan is worth trying, as there is no doubt that the destruction of the earliest, mother queen aphides is the great desideratum.

GREASE-BANDING.

Just now there is great competition among sellers of insecticides to sell to fruit-growers the requisites for grease-banding Apple trees, and they and many writers strongly recommend the practice. But, does it pay? To me it appears that the answer to this question must be in the negative. In the first place, the expense for grease, bands, string, and labour must be a large item, though I have never seen an account of its amount, and the greasing must be repeated at least once, if not twice, during the winter. Here I have 303 trees to the acre. In one plantation there are bush trees, branching out close to the ground, so that each of several branches per tree would need to be grease-banded. Elsewhere my trees are on short stems, and staked, so that the stakes as well as the trees would have to be treated. In the former case about a thousand grease-bands to the acre would be needed; in the latter over six hundred. Greasing three times would be 3,000 applications per acre in the first case, and over 1,800 in the second. And when all this work had been done at a serious expense for materials and labour, what would be achieved? The destruction of a portion only of the winter and other wingless female moths, for it is well known that some get or are carried on to the trees, in spite of the grease-bands. Against the damage done by the caterpillars of winged female moths the operation would be almost useless, although some of them might be caught. The great point against grease-banding, then, is this—that the necessity of spraying would not be reduced in the slightest degree by the operation, for the reason indicated above. Then why not trust to spraying exclusively, and

save the great trouble and expense of greasing-banding?

PREPARING FOR FRUIT-PLANTING.

Frequent falls of rain have hindered the ploughing and subsoiling of a field of 6½ acres to be planted with Apples and Black Currants shortly. Shelter trees were planted three years ago along the outsides where they are needed, in anticipation of what is about to be done this autumn or winter, so that the Apple trees will be protected from gales in their young stage, an advantage not gained when shelter trees are planted simultaneously with the fruit-planting. Nearly all the trees required and the whole of the bushes have been raised on the place. The trees are to be trained in bush shape on stems 3 feet high, to allow of horse cultivation between them for a good many years. *A Southern Grower.*

LILIUM AURATUM.

THE illustration in fig. 120 shows a batch of this Lily in Lady Marcus Beresford's gardens at Bishopsgate, Englefield Green, Surrey. The plants are of the variety known as platyphyllum, one of the finest of the numerous kinds of *L. auratum*. The photograph was obligingly sent by the gardener, Mr. E. Markham, who gives the following particulars:—The photograph was taken on September 8. The Lilies are cultivated in a bed of Rhododendron (*Azalea*) molle, the Lilies being planted in clumps. The plants produced about 120 flower-spikes, and each carried on an average 24 blooms. Several individual spikes had 31 flowers, and one had 46. Many of the inflorescences were from 10 to 12 feet high, and when at their best were a most pleasing sight. The bulbs were planted at a depth of about 14 inches in a well-drained, sandy loam, the site, until three years ago, forming part of the park. Other varieties of Lilies which succeed fairly well at Bishopsgate include *L. Henryi*, *L. Leichtlinii*, *L. dauricum*, *L. elegans atrosanguineum*, *L. pardalinum*, *L. speciosum magnificum*, *L. tigrinum*, *L. auratum rubro-vittatum*, and *L. Brownii*.

NEW GARDEN WORMS.

ONE of the problems which has to be solved in relation to our garden worms may be stated thus:—Plants, introduced from foreign lands, may be accompanied by mould bearing little worms or their cocoons. In many cases these imported eggs and annelids die shortly after their introduction; in other instances, they may live out their usual term, but leave no successors; while, in the case of a third series, the introduced species may become permanently established. Thus, we often find *Perichæta* in botanic gardens, but it has so far never been known to perpetuate the race in England. On the other hand, such worms as *Eisenia veneta*, *Rosa*, may be foreign importations, and may become so thoroughly established that they not only propagate freely, but develop along new lines.

With a view to obtaining light on these questions, I am investigating the worm-fauna of botanic gardens, along with that of market gardens which grow no imported plants. When I visited Chelsea recently, I arranged with the curator for a supply of material, and I am describing in this article a worm received from him on October 2, which has not yet, so far as I am aware, been described in any English journal, though recorded in these pages in 1905.

The name by which the worm has generally been known heretofore is *Allolobophora icterica*. It was first described by Savigny, in 1826, as *Enterion ictericum*, the specific name having re-

ference to the jaundiced appearance of the living animal. In 1837, Dugès called it *Lumbricus ictericus*, retaining the specific name, but changing the generic. In 1886, Dr. Rosa put it in a new genus, and called it *Allolobophora icterica*. In more recent years the genus *Allolobophora* has been revised, but the details are only of interest to specialists, and I will retain in this description the name which is best known.

There has been a good deal of difference in the descriptions which scientific men have given of the species, and especially in relation to the position of the girdle and its attendant glands. These may be best understood if I tabulate the results, using for the purpose the form of a fraction. The numbers above the line denote the segments which constitute the girdle, while those below the line show where the tubercula pubertatis are situated. The worm is evidently a variable one, like *Allolobophora (Eisenia) veneta*, recently described in these pages. The following

ments (33-44), but in my specimens 9 to 11 segments (33, 34-42, 44). *Tubercula pubertatis*, according to Savigny, covering 8 segments (36-44)*; in my examples, 7 or 8 (35-41, 42), in a continuous band. Male aperture with cushion or swelling on segment 15. First dorsal pore between 6 and 7, from which a straw-coloured liquid is emitted." (From the Italian edition of *Revisiione dei Lumbricidi*, pp. 52-3.) I omit the internal characters, as they can only be studied by means of careful dissection; and since Rosa's and Savigny's worms agree in all external points, we may assume, with Rosa, that they are one and the same. Ribaucourt has studied the species and reconciled the differences.

A very full and careful description of this species is supplied by Dr. Ribaucourt, who, in 1896, published in French a very valuable study of the annelids of Switzerland, where it is frequently to be found. It is not necessary to translate his account, but I may supplement that

FIG. 120.—LILIUM AURATUM FLOWERING IN LADY MARCUS BERESFORD'S GARDEN.

are the principal enumerations by our authorities on annelids:—

Savigny, 1826	35-44
			36-44
Dugès, 1837	33-44
			(36-44)
Rosa, 1893	33, 34-42, 44
			35-41, 42
Ribaucourt, 1896	33, 35-44
			35, 36-41, 44
Friend, 1909	33-44
			36-42 (44)

It should be noted that Dugès drew his conclusions from the study of Savigny's material, and does not give the segments on which the tubercula occur, or accepts Savigny's enumeration.

Rosa describes the worm in the following terms:—"Length, 6-8 cm.; diameter, 5 mm.; segments, 140-190. Form, cylindrical. Colour, pallid, with a yellowish tinge, owing to the coloured liquid within showing through. Setae strictly paired. Prostomium cutting the first third of the peristomium. Girdle, according to Savigny, covering 10 segments (35-44), according to Dugès, who used Savigny's material, 12 seg-

ments. Ribaucourt calls attention to the diminished diameter of the body where the male pores are found, to the attenuated form of the segments behind this point, and the greater size of those in front. As a rule, the girdle in the Swiss examples extends from 35 to 44, but it occasionally begins somewhat more in advance, while the tubercula cover 36 to 44, with certain variations. The dorsal pores are not seen (as in *Allolobophora rosea*) on the clitellum of the adult; but while the worm is still young and the girdle is in process of formation, they may be readily observed. This latter remark I am able personally to confirm.

It is of importance to ask where the worm is to be found, as its known distribution may throw light on the question whether or not it is indigenous with us. Savigny found it in the neighbourhood of Paris, and Rosa at Valenciennes. Ribaucourt collected it freely at Gennevilliers (*Bulletin Scientifique*, 1900). It is, therefore, a well-known French species. Rosa has found it in the Piedmontese Alps, and Ribaucourt has collected it at Berne, in the Jura, and in large

* This would make 9 segments. H. F.

numbers "dans les Alpes valaisannes." In September, 1905, I discovered it at Cambridge, and now it is known to occur at the Physic Garden, Chelsea. There is no reason why it should not be found elsewhere in Great Britain.

When living, the worm might easily be mistaken for some of the forms of the green worm (*Allo:* chlorotica), which it resembles in emitting large quantities of yellow liquid. It has, however, a mottled appearance, especially in the hinder part of the body; and, when placed in alcohol, it does not curl into a ring as the green worm does. This is a point of some importance, since it reveals a difference in the arrangement of the muscles, and, therefore, of the habits of life. It is, in fact, very desirable that we should possess a series of accurate delineations, showing all the worms of this country, first in their living condition, and then as they appear when prepared for preservation, without any attempt to straighten them well cut. *Hilberic Friend, St. Asaph, Malvern.*

NOTICES OF BOOKS.

* THE MAKING OF GARDENS.

AMONG the recent additions to garden literature bearing upon the subject of garden design is this little volume of a hundred pages by Sir George Sitwell. It is entitled *An Essay on the Making of Gardens*, and is a study, based on old Italian gardens, of the principles involved in garden design.

The title is perhaps inapt, for those who take up the book with the object of seeking guidance in the practical details of making a garden will be disappointed. Such details the author touches upon but lightly, and in a way that would scarcely be helpful to those engaged upon the difficult task of creating artistic gardens.

But it does not pretend to teach the actual planning of gardens, and therefore stands on a different plane from the many books that have been written of late years on garden design. It may be best described as a thoughtful and delightful study of the principles that should guide a maker of gardens based upon the models of the famous great Italian gardens of the Renaissance. The bulk of the essay is a record of the impressions made upon the author during a long and intimate acquaintance with these classic gardens. He points out in a charming way the subtle beauty of their design which cursory visitors probably overlook. He describes in poetic language the intricacies and beauties of the design, the charm of the architectural features that embellish the gardens, the buildings, the fountains, sculpture and gates, all of which combine to render the famous gardens of Italy unique.

He dwells now and again upon the charming floral effects one continually meets with even in neglected gardens, where a sense of sadness steals over one on contemplating the contrast of former magnificence and the present-day air of neglect, solitude and melancholy. With this book as a companion one may wander through old gardens and appreciate beauties that without such a guide would probably be passed by.

The aim of the author is to uphold the principles of garden design as exemplified in Italian gardens, for which he has such a keen appreciation. He advocates very forcibly the application of these same principles to garden design in England. He opens his essay with a brief review of the history of the art of garden design or landscape gardening in Europe and particularly in England.

He discourses upon the faults and follies of the "landscape school" from the days of Capability Brown and his followers, and belauds the virtues of the "formalist school" to such an

extent that he declares himself a "formalist." Yet throughout the essay there runs a vein of appreciation of natural effects unembellished by the builder's art, that one is drawn to the conclusion that the author is a disciple of both schools—the "landscape" and the "formal"—a combination that should characterise every true artist in garden making, an art which is not and never can be governed by any fixed rules.

Here is a passage in the essay which exemplifies the views of the author on this particular point and shows also that he recognises the difficulty of conforming garden design to set rules of straight lines and symmetry. "But the first aim of the designer will always be to consult the genius of the place, to catch the music of the landscape and concentrate it by fitting foregrounds and the concealment of defects, whether it be the blue distance seen between the links of a low chain of hills, the shadowy gulf of a deep river-valley, or the green velvet of a wooded plain."

Such are the principles of the true "landscape" school in dealing with broad landscape in park and garden, and upon such principles was founded the distinct style known as English landscape gardening, renowned throughout Europe and of which happily we have still abundant examples.

The early practitioners of this style have of late been much maligned, and the form of invective applied to them has become familiar, but it must be remembered that the formalist was previously the object of satire, so that the battle of the "styles" is not merely a present-day theme. This and other recent books of a kindred character will no doubt do much to encourage the revival of formal gardening in this country. Towards this revival there has been a decided tendency of late years, due chiefly to the attention architects now give to the garden about the house. Another cause of the change in taste is the revulsion of feeling from the commonplace and meaningless style of laying out gardens practised during the past half century by those who, under the style of "landscapists," abhor all symmetry in design, have no thought for the beauty and dignity of straight lines and whose efforts result in the insipid effects one sees in most gardens laid out during the Victorian period.

Whether Italian gardening so appropriate to the sunny south and so unsuited to our English life and climate will ever take a firm hold here remains to be seen. A thoughtful combination of the regular and irregular in garden design seems to be the rational style, and those who wish to practise it will find much in this book to guide them in producing satisfactory results. *W. G.*

* FRUIT PRESERVING.

UNDER existing conditions soft fruits are generally consigned to commission agents in large centres of industry. They are placed on the market at one time, with the result that it becomes glutted. With the extension of small holdings as the outcome of the Act of 1907, and the consequent increase in fruit growing, these drawbacks, if not remedied, will be still further increased, and the benefits of the Small Holdings Act lessened.

One of the means for meeting the difficulty is to convert a large proportion of the fruit into a preserve, either in the form of jam or jelly, or bottled in a whole condition. We are therefore pleased to note the recent publication of this work. The authoress deals with the whole subject in a thoroughly practical manner, having had considerable experience in the matters about which she writes.

In the Introduction, by G. Cadogan Rothery, care, cleanliness, uniformity, and a high standard of quality are insisted upon as the main points to be observed in the effort to make fruit-preserving a financial success. Care must be

exercised in the selection and handling of fruit. Rigorous cleanliness must be observed in picking, storing, and preserving. In this connection we are pleased to note a vigorous protest entered against the employment of the dirtiest—simplest because it is the cheapest—class of labour for picking fruit, as is the rule at present. Second-rate fruit should never be mixed with first-rate, but both ought to be kept separate and sold distinctly. In addition to these points, co-operation in the making of preserves, and in the marketing of them, is strongly recommended. Few persons who have had any insight into the practical and business side of jam-making and fruit-bottling will disagree with any of these important *dicta*.

Every reader, however, will not be in agreement with the authoress when she makes the following statements:—"The cultivated Apple comes from the wild Crab, and a Crab stock is the best for grafting purposes. . . . Next to the wild Crab the small, hardy, green type affords the finest jelly, both in colour and appearance." Fruit-growers will question this irrelevant statement as to the Crab stock, while housewives, who have used the Siberian Crab for preserving purposes, might deny first place to the wild Crab which is, in every way, inferior to the beautiful Siberian Crab, so commonly used for decorative purposes in pleasure-grounds.

We confess to feeling somewhat nervous regarding the suggested use of sulphuric acid as a means of retaining the colour of Peaches and Apricots during the process of preserving. The fewer chemicals of this description used in the preparation of food the fewer accidents will happen, and the better will the food be for manufacturer and consumer alike.

Nevertheless, *Successful Jam Making* is an admirable treatise on this important subject, and the general directions may be followed implicitly. *A. A.*

* YEAR BOOK OF AGRICULTURE.

WE can cordially commend this useful reference book to all who are interested in agriculture. The work consists of 630 pages and is divided into 11 parts. The subject-matter of the several parts is as follows:—

Part I.—Societies and institutions.—The principal horticultural societies are included in the list, though we note the omission in chapter 14, "Benevolent, &c., Societies," of reference to the Royal Gardeners' Orphan Fund and to the Gardeners' Royal Benevolent Institution.

Part II. deals with "county agricultural information," and gives concise information not only with respect to crops and live stock, but also concerning agricultural education in the several counties, scholarships, local facilities for analysis and advice for farmers, &c. The information shows that, whilst steady progress is being made in the direction of organised education in agriculture, much remains to be done before this country can compare in this respect with the most enlightened foreign states, or even with the younger states of the Empire. In Part III, agricultural education and research is dealt with from the rational point of view. The sums granted for these purposes in England and Ireland are instructive and indeed amazing. We should like to know by what process of reasoning a justification can be advanced for the fact that whereas the Department for Agriculture and Technical Instruction for Ireland made for 1907-8 grants of upwards of £144,000, the grants made by the English Board amounted to about £12,000. The palty sum, given to the various agricultural institutions, in no case exceeding £1,250, accounts for the fact that the work carried on by these institutions is of limited extent and value. Part IV. deals with diseases of animals. Orders of the Board of Agriculture with respect to plant diseases, such as Gooseberry mildew, are dealt

* *An Essay on the Making of Gardens*, by Sir George Sitwell, Bart. (London: John Murray.) 1909.

* *Successful Jam Making and Fruit Bottling*, by Miss Lucy H. Yates. 2s. 6d. net. (Messrs. Robman, Ltd., 129, Shaftesbury Avenue, W.C.)

* *The British Year Book of Agriculture and Agricultural Works*, 1909-10. (Norton & Co., Ltd.) 6s. net.

with in Part VIII., devoted to agricultural statistics, law and general information.

Part V. provides information on the importation and exportation of animals, whilst in Part VI lists are given of the leading agricultural publications. Information concerning markets, sales and prices is given in Part VII. Colonial agriculture is dealt with in Part IX. Shows in Part X.; whilst Part XI. is devoted to an agricultural "Who's Who" and contains biographical references to some 2,500 persons "officially and prominently connected with agriculture."

CULTURAL MEMORANDA.

RAISING NEW VARIETIES OF THE STRAWBERRY.

STRAWBERRY raisers have of late years forgotten the supreme matter of flavour in the pursuit of large size in the fruit and great productiveness of the plant, together with other excellencies, such as freedom from attack from mildew and from injury by frost. Taking the last point first, we have gained but little by putting stress on height of the fruit-stalk. We have made the flowers more liable to injury from late frosts if less liable to injury from slugs and from damp. Strawberry flowers, when short-stalked, are, to a great extent, protected by the leaves of the plant, and they may easily be raised from the soil and thus rendered comparatively safe from slugs and the splashing with earth during heavy rain by litter placed lightly round the plants. Varieties should be sought as parents for crossing among well-flavoured Strawberries that have the character of being proof against mildew in most kinds of soil, viz., *Auguste Nicaise*, a compact-growing habit, large fruit, of a crimson colour, and a good bearer which forces well. Dr. Hogg has large fruits with the *British Queen* flavour, but the plant is far hardier and a better bearer than the latter variety is in many places. *Elton Pine*, if not exactly a pleasant eating Strawberry, is a hardy, prolific, and strong-growing plant, and might be instrumental in breeding a mildew-resisting variety, and one with other desirable properties. The conical fruit has much firmness, fine colour, and is excellent as a preserve. *Filbert Pine* might be employed as the seed parent in this case, or *James Veitch*, which has a rather sweet, flat flavour, but is large, of good form, with red, solid pulp, and the plant vigorous and hardy. *La Grosse Sucrée*, an early-fruiting variety, one of the best forcing Strawberries, would make a good parent, say, with *l'President*, a large, handsome-fruited variety, with a firm flesh and moderately high flavour. *Carolina*, and the *Scarlet* or *Virginian*, and the *Chilian* species (*Fragaria chiliensis*) might be used in forming a new race. Pure, the *Chilian* species, is too tender for our climate, *vide* *British Queen*, which is one of its descendants, the result of a cross with a cultivated variety.

Cross-fertilisation should be carried on in a cold frame, as then the flowers are more easily protected from the visits of bees and other winged insects. The seeds should be pared thinly from the ripe fruits, and then rubbed in silver sand in a fine, dry cloth, in order to separate them from the adherent pulp, and should either be sown forthwith in seed-pans, or kept, when dry, in small corked bottles till early spring, and then sown. The best place for the seed-pans is a shelf in a glasshouse having a temperature between 60°-70° Fahr., and, on germination, they should be transplanted in a greenhouse, until the seedlings are ready to be pricked off in May or June in the open ground, or into boxes placed out-of-doors.

The private gardener is required to cultivate the finest-flavoured varieties, but the ordinary man, without a garden, seldom, if ever, partakes in this country of a first-class Strawberry, for the reason that he must rely on the market grower, who, naturally, grows the most prolific varieties, without a great regard to flavour. P. M.

SCOTLAND.

HARDY FLOWERS AT KIRKCONNELL.

THE first week in October is not perhaps the best time to visit the garden of Colonel Maxwell-Witham, near Newabbey, especially as the garden lies low and near the river, and is, therefore, frequently injured by September frosts. But, nevertheless, the *Colchicums* or *Meadow Saffrons* were looking beautiful. In addition to the double and single varieties of *C. autumnale*, there were some very fine groups of *C. speciosum* in different varieties, *C. s. rubrum*, and a few clumps of the still scarce white variety *C. s. album* were just appearing. There were also *C. Bornmulleri*, *C. Bivonæ*, and a few others. *Crocus speciosus*, *C. pulchellus* and other autumn species were not yet in full bloom.

Pentstemons in named varieties have been a feature at Kirkconnell for many years, but this

the plants were giving a fresh display of bloom. *Polygonum baldschuanicum*, which covers an old tree in one of the borders, was just over. Some really good plants of *Veronica longifolia subserilis* were very fine, and *Kniphofia nobilis* and others imparted an agreeable brightness to the garden. *Chelone obliqua* was also in flower, and the tall *Napea dioica*, although not so good as a short time ago, was still giving many of its small, white, mallow-like blooms. The pretty little *Malvastrum lateritium*, also known as *Malva lateritia*, was still bearing some of its neat brick-red blossoms on its dwarf, rather trailing branches. Lilies were nearly over, but there was a long line of *L. tigrinum Fortunei*, together with plants of the double *Tiger Lily*, and an unusually fine single variety, better than any other form of *L. tigrinum* in the garden. A brilliant display was made by large beds of *Lobelia Queen Victoria*, which, however, is scarcely hardy here.

FIG. 121.—NEW DESSERT APPLE "ST. EVERARD."

season they have not done so well as usual, and a change of position is contemplated. The collection includes many new varieties of great beauty. Perennial Sunflowers were well represented, *Helianthus* *Miss Mellish*, *multiflorus*, *maximus*, *tomentosus*, with some of the double varieties, such as *Soleil d'Or* and *Globe d'Or*, looked very well in the long borders. There were large clumps of *Antholyza paniculata*, quite hardy here, and masses of *Anemone japonica* in various colours and varieties. Bold-looking, though coarse in its way, was *Silphium perfoliatum*, a big yellow Composite which I think is better suited for the wild garden than for the herbaceous border. Quite a number of *Montbretias* are grown, and the smaller flowered varieties are so pretty that they have been retained, notwithstanding that the newer sorts are cultivated by their side. The collection of double *Daisies*, one of the best in the kingdom, proved of interest, as

An unusually fine plant of *Morina longifolia* was superb with its Thistle-like leaves and its singular spikes of flower, while in another border the choicer *M. Wallichiana* was not yet over. *Chrysanthemums* of the *C. maximum* group were numerous. S. A.

APPLE ST. EVERARD.

THIS new variety (see fig. 121) received a First-class Certificate from the Fruit and Vegetable Committee of the Royal Horticultural Society on September 23. It is a seedling from Cox's Orange Pippin crossed with Margil. The flesh is richly flavoured and the variety ranks as a first-class dessert Apple. The fruits are of medium size, round in shape, like its first-named parent, but with the stripes of Margil. It was shown by Messrs. Jas. Veitch & Sons, Ltd.

THE BULB GARDEN.

MERITS OF DEEP AND SHALLOW PLANTING.

I HAVE been asked on several occasions whether I have noticed a certain degeneracy, as indicated by loss of vigour and stature, in some of the more robust-growing Daffodils, for instance, Emperor and Sir Watkin, but particularly Emperor. My reply to the enquiries has been to the effect that, in instances where I have noticed any great loss of vigour or of stature, the bulbs had been grown on too dry a soil, or planted from time to time at too little a depth. Shallow planting is, indeed, a sure cause of shortened growth, whether the bulb be the most diminutive or the largest. At the same time, however, shallow planting has, to some degree at least, become a sort of necessary evil, particularly from

out in a lateral direction. This flattened character is increased proportionately as the bulbs become more deeply buried in the earth, and anyone accustomed to shallow-ground bulbs would hardly recognise them as the same variety after two years. Vigour of growth and stature are as much affected by the annual lifting of the bulbs, and, together, annual lifting and shallow planting are responsible for much of the reduced stature of which complaints are made. But there is still another, and a very fruitful—if avoidable—cause of diminished stature, and this is unnecessarily late planting. Too frequently the planting season is delayed till the last moment, and the bulbs, drying day by day in the bulb shops and warehouses, lose much vitality. Again, no sort of consideration is given to those types of Daffodils which have perpetual, or nearly perpetual, root action. If some of these are left for five minutes out of the soil it is four minutes too long, which

of sickness. But even in their case, the bulbs should not be more than six weeks out of the earth. A bulb in the store-room may exhibit no signs of root development even in November, but its growth, compared with a bulb of the same variety planted early in September, would be a long way behind, and it would form a bulb proportionately weaker for the following year.

As to permanently planted stocks, their vigour may remain unchanged, even after being undisturbed for a score of years, though overcrowding would cause fewer flowers to be produced. I have in mind an instance of Emperor and Empress planted in wet, clayey ground, Emperor attaining to more than 3 feet high at flowering time.

As to the depth of planting bulbous subjects generally, the operator may more frequently err on the side of shallow planting than in the reverse direction, while of recent years a method of planting has sprung up which gauges the cor-

[Photograph by H. N. King.]

FIG. 122.—VIEW OF PORTION OF SIR FRANK CRISP'S ROCK-GARDEN AT FRIAR PARK, SHOWING THE MATTERHORN.

the commercial point of view, and in more than one direction. The commercial bulb-grower has to consider two important matters, viz., the extra cost of labour as between deep and shallow planting when lifting time arrives, and the apparent quality—shapeliness and compactness more particularly—of the bulbs.

Now it is well known to the bulb specialist that the compactly-formed, decanter-shaped, short-necked bulb is the invariable product of shallow planting, and that this apparently well-finished type of bulb is favoured by the purchaser and merchant alike; indeed, such bulbs are usually referred to as "very fine, clean-grown samples," or in equally complimentary phrase. On the contrary, deep planting is not conducive to this shapely outline of form, and, instead, the bulbs, when left a year or two undisturbed, lose their rotundity, and acquire a more flattened form, the tunics of the bulbs spreading

is true of all the Poeticus race. Some other types of Daffodil are possessed of roots of a distinctly fleshy and enduring character, which, if retained on the bulbs, even when the latter are out of the soil, rarely perish. The well-known Emperor and Horsfieldii are typical, while not a few of the Incomparabilis varieties show the same characteristic. All these are benefited by being left more or less permanently in the soil, or if they are moved as a matter of necessity, they should be returned to the soil as quickly as possible. The varieties that suffer least from a long rest out of ground are those of the white-flowered class, and such as Golden Spur and Obvallaris, and others, which lose the entire set of root fibres each year. Some of these, indeed, show signs of deterioration when left in the soil all the year through, and in a year of much moisture and sunlessness, like the present, the succeeding year's growth will display signs

of root depth by the size of the bulb to be planted, this often enough being most variable and entirely dependent on the method of its production.

A Snowdrop or a Snowflake may have buried itself to a depth of 18 inches in the soil, or have been accidentally turned in at that depth, and great strength both of leaf and flower is the result. This is true of the majority of bulbs, whether they be Snowdrops, Lilies, or Daffodils. But what the gardener who desires to plant deeply should see to is that there is a good depth of rich soil below the planting level. The mistake that is being made to-day is that the gardener, in these matters of bulb planting, is far too closely imitating the action of the dealer who grows for commercial purposes, and who plants his bulbs at given depths for a specific reason or purpose. Many of the strong-growing Daffodils would be all the stronger if planted 6 or 8 inches deep, and not one of them need be nearer the

surface than 4 or 5 inches. Curiously enough, such deeply-planted bulbs, when established, are not later, but decidedly earlier in their appearing above the soil than those which are planted less deeply. *E. H. Jenkins.*

COLCHICUM SPECIOSUM.

WHEN all is said and done, there is nothing among the autumn-flowering Colchicums or "Meadow Saffrons" to compare with the varieties of *C. speciosum*, whether for attractiveness in the border, or for that perfect form and regular finish which one is wont to associate with the best of English Tulips. That there are species with larger flowers is well known, for such are *C. giganteum*, *C. Sibthorpii* and *C. Bornmülleri*. But, as an accompaniment to their greater size, there is irregularity of flower and lack of refinement. Their greatest garden attribute—and it is no small one—is their showy effect. But the few varieties of *C. speciosum* possess all these qualities and others, for, whilst their colours are more decisive or pure in tone, the flowers are perfect in form and regularity of outline. *Colchicum speciosum* is a somewhat variable species from Asia Minor, the colours ranging between rose and purple. The plant is strong, vigorous and free-flowering, the leafage in spring and early summer being as handsome as the flowers in autumn are effective. To these good attributes must be added an accommodating nature rarely found in any plant, so accommodating, in fact, that the plants may be lifted in full flower and replanted without injuring their prospects of future growth or flowering another year. Moreover, the lifting of a plant in flower scarcely affects its seed bearing. They flower in September and October, and afford grand effects when planted in free groups or colonies in a woodland, on grassy banks or slopes, in the larger rock-garden, or in the forefront of a well-kept shrubbery border. The corms are large, and, as they increase freely in number, it is necessary that the plants should be given ample room to develop. This is the more important because of the large size of the handsome shining leaves; for where the bulbs are crowded the leaves cannot properly develop. When planted for grouping in the woodland, the corms should not be placed at a less distance than 18 inches apart. They require to be planted 5 or 6 inches deep in rich, loamy soil. In such conditions the plants bear blossoms 9 inches and occasionally 12 inches in height. Collected plants are variable in colour, as apart from the best form of the typical plant there is one named *C. s. atro-rubens*, which is of a very deep purplish red colour. A greatly-increased interest has been given to *C. speciosum* by the recent introduction of the pure white form known as *alba*. *E. H. Jenkins.*

FOREIGN CORRESPONDENCE.

NOTES FROM LA MORTOLA.

DURING last winter and spring the garden of La Mortola was visited by 7,295 persons on public days. Sometimes more than 400 persons came on Monday or Friday afternoons from the neighbouring towns, chiefly from Mentone and Bordighera. Besides this large number of visitors—tourists to the Riviera—many botanists and horticulturists came to the garden for purposes of study. Prof. Warming, Director of the Botanic Gardens in Copenhagen, remained a fortnight, and he was followed by Prof. Dr. O. von Kirchner, Director of the Botanic Garden at Hohenheim, who worked for nearly a month on floral biology. Prof. Strasburger, of Bonn, is one of our most regular and enthusiastic visitors every spring. Mr. D. E. Hutchins, Chief Conservator of Forests in Nairobi, was here in May; and also Dr. Aaronsohn from Haifa, who is about to establish a large agricultural experimental station in Palestine. America sent us Dr. Rehder, the dendrologist, from the Arnold Arboretum in Massachusetts, who visited the garden in order to study the trees and shrubs. Among the

visitors are many gardeners from England, France, Germany, &c., mostly clever young men, who come with their cameras and notebooks.

The distribution of seeds has been gradually increasing. In 1930 we sent out 6,378 packets; in 1901, 7,857; in 1902, 9,351; and so on till we reached 13,085 packets in 1908. Seeds were sent to almost every part of the world, chiefly to botanical gardens, and also agricultural and forestry establishments in the British Colonies. Consequently, the influx of seeds in exchange has also largely increased, and many new trees and shrubs have been tried.

The most important addition to the garden has been the last collection made by Mr. Wilson, in China, which he undertook for the Arnold Arboretum, for Miss Willmott and La Mortola. Among the new plants collected by Mr. Wilson are a great number of good and interesting things. Many of the young plants have been planted out in nursery beds, and some are flowering. Among them, climbers are especially numerous. At the present moment Dr. Brumthaler, of Vienna, is travelling in South Africa, and has undertaken to collect plants and seeds for this garden. Cape plants do extremely well at La Mortola, and, once they have taken root, need little further care. Besides, most of them blossom during the winter or spring, and are much admired on account of their bright and showy flowers.

A new catalogue of the garden is in preparation. The first was published in 1889, the last in 1897. The new catalogue will not only contain the names, but also notes on the more remarkable plants. *A. B.*

The Week's Work.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

The Alpine garden.—Species and varieties of *Dianthus* may be planted at the present season. Sunny positions should be selected, and they should be planted in clumps. If six to twelve plants, such as are taken from 3-inch pots, are grouped together, they will produce a good colour effect. Some of the best *Dianthus*es include *D. alpinus*, which has red flowers an inch in diameter; *D. arenarius*, white; *D. cæsius* (the Cheddar pink), a pretty, tufted plant with pink flowers; *D. fimbriatus*, with white flowers and fringed petals; *D. annulatus*, white and crimson; *D. neglectus*, a miniature plant with bright carmine flowers; and many others. If the soil is not very porous, it will be well to mix with it some sand, gravel chippings, or sandstone. *Androsace Chumbyi* and *A. sarmentosa* being easily injured by damp, should be protected by having a square of glass or small handlight placed over them to keep off the rains. *A. lanuginosa* is perhaps the best growing species. It succeeds well in a position where the growths may hang over the rocks, but it must not be exposed to the north. *A. Leitchii* will succeed under similar conditions to *A. lanuginosa*. It is useful to have a stock of such plants as these in cold frames, keeping them fairly dry in winter, as many are apt to damp off in foggy weather. *Saxifragas* are most effective when planted in masses. Many other species may be planted in the Alpine garden at this season, especially if new work is being carried out. Since plants in established gardens become overgrown after a few years, it is necessary to replant the species. For this purpose young plants raised from cuttings are much better than pieces obtained by division. Therefore, as far as the frames will allow, a stock of all such plants should be maintained for this purpose. In all work connected with the rockery time should be taken to eradicate every weed that is seen; in cases where the roots of weeds are already underneath the cultivated plants it is advisable to entirely lift the plants for the purpose of getting every bit of weed root out of the soil. Following the work of cleansing and weeding, a top-dressing should be applied, using a compost of loam, leaf-mould, and granite chippings, first screening all these materials through a sieve with $\frac{1}{2}$ -inch mesh. Make this top-dressing as firm as possible, especially on sharp inclines. When all this has been done, the Alpine garden will appear tidy for the winter, and it will be

merely necessary to afford protection to plants in cases of severe frost. The *Sternbergias* will soon be showing their flowers; it will, therefore, be well to place a little soot and lime around them to prevent injury from slugs.

Climbing plants.—The present is a good season to plant such climbers as *Wistaria*, *Solanum*, *Hedera*, *Lonicera*, *Buddleia*, *Polygonum*, *Azara*, and *Abutilon*. *A. vexillarium* and *A. vitifolium* passed safely through last winter out-of-doors here. *Jasminum primulinum* requires a warm wall, as it is scarcely hardy. *Vitis Henryana* is an excellent plant for covering the trunks of trees; the leaves are most brilliantly coloured this autumn. *Akebia quinata*, *Aristolochia Sipbo*, *Berberidopsis corallina*, *Jasminum nudiflorum*, *Lonicera tragophylla*, *Wistaria multijuga*, *Ceanothus*, *Chimonanthus*, *Lepedeza bicolor* (*Desmodium penduliflorum*), *Escallonia*, *Forstia suspensa*, *Fremontia*, *Grevillea*, *Myrtus communis*, *Pittosporum*, *Olea fragrans*, *Actinidia chinensis*, *Clematis montana* and the variety *rubens*; are choice plants that may be planted in various positions. Before planting, the soil should be deeply dug and some manure and new soil added. Every plant should be given a permanent label bearing its botanical name.

Pits and frames.—Remove the lights on all fine and dry days, tilting them as high as possible during wet days. Carnations should now be kept on the dry side, and, if any fungus disease appears, the leaves on which it shows should be picked off and burned and the others dusted with flowers of sulphur.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Shrubs for forcing.—The many flowering shrubs, such as *Rhododendron* (*Azalea*) *molle*, and other species of *Rhododendron*; *Kalmia*, *Laburnum*, *Deutzia*, *Staphylea*, Japanese *Cherries*, *Xanthoceras sorbifolia*, &c., which are of value for early forcing, should now be given attention. Many of those forced several years ago having been cultivated for the last two summers in the reserve garden, have now set their flower buds, and are in a fit condition for again being forced. In gardens where quantities of shrubs are forced, especially in those establishments where the forced shrubs are cut for furnishing the vases with cut flowers, it will be necessary to purchase a quantity of fresh plants each year to supplement the home-grown supply. When forced plants are to be thrown away after their period of usefulness is over, the manner of potting is not of great importance; but in the case of those shrubs which may be forced many times, the potting should be done well, and good soil should be used. A peaty soil will be needed for the *Rhododendrons*, *Kalmias*, *Andromedas*, and similar genera; but a compost of about three parts loam and one part leaf-mould, with a little decayed manure and sand mixed with it, will be found generally suited to most other shrubs. After the plants are potted, plunge the pots to their rims in ashes, so that there will be no danger of them being broken by frost.

Forcing bulbs.—The bulbs of Roman Hyacinth and Paper White Narcissus, which were potted first, should now be rooted sufficiently to be safely forced. Remove them from the ash-bed, and place them in a frame for a short time until the foliage has become green, at first screening them from sunlight by shading with mats, but gradually reducing the covering. The bulbs may then be removed to the forcing pit, where they should at first be subjected to a temperature of about 50°, which subsequently should be increased gradually. Gradual forcing is desirable, because the best flowers are borne on plants which are not subjected to an excessive amount of artificial heat.

Gloriosa superba.—As this stove twiner finishes flowering the amount of water given should be gradually reduced until, by the time the foliage has matured, the soil is quite dry. The tubers are very brittle, therefore they are better wintered in the pots in which they have flowered. The pots should be stored in a place where the temperature will not fall below 60°.

Mignonette.—The plants which will flower during the winter should be moved from the cold frames and placed in a light, well-ventilated position in the greenhouse, or some similar structure where they will be safe from frosts.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Fluctuations in temperature.—At this season of the year cultivators should be prepared for the sudden falls in the temperature of the outside air, which occur frequently in the early morning hours, when there may be sharp frosts, although on the previous evening there was no reason to expect frost. On such occasions the temperature of the houses is almost sure to fall a few degrees below what is considered the proper standard. Therefore, no water must be afforded to any of the plants or any damping down done until the proper degree of heat has again been obtained. For several weeks to come the safest plan is to err a trifle on the warm side with the night temperatures in each department, this being particularly applicable to the East Indian house, which contains many rare and tender Orchids, which are easily injured permanently by low temperature, even though of short duration. As regards the Odontoglossum, or cool house, if the temperature is just a trifle warmer at night than usual, there is no fear of the plants being injured, provided that the ventilators have been judiciously used on all suitable occasions. On the contrary, as the majority of the plants are now making their new growths, they may suffer check if the temperature is low and the atmosphere damp for any length of time. A little fire-heat in the hot-water pipes, sufficient to make them just lukewarm to the hand, with extra ventilation, tends to prevent the points of the leaves of Odontoglossums from getting disfigured, and checks the dark-coloured fungus that attacks the underside of the leaves of *O. crispum* during autumn and winter. During October and November the atmospheric temperatures at night should be as follows:—*East Indian house*, 65° to 70°; *Cattleya and Mexican houses*, 60° to 65°; and *Intermediate house*, 55° to 60°, the higher degrees being employed when the external air is about 45° to 50°; when the thermometer outside is falling, and there are indications of frost, the lower figures are preferable. The Odontoglossum house should be kept at about 55°, or, in the event of cold weather, a few degrees less will do no harm. When attending to the fires the last thing at night, clean them out thoroughly, and, if the weather is likely to be cold, set them going for half an hour or so previous to banking them up. The dampers should be so arranged that there will be a fall of several degrees of heat in every department by morning. See that none of the plants are too near to the roof glass, particularly Phalenopsis Angraecum, Renanthera Lowii, Vandas, tall-growing Cattleyas, Lælias (especially *L. elegans* and others of that type), all of which are irreparably injured if they get in the least chilled. Whenever the foliage of these plants gets blackened some distance from their points, a check from cold or damp may be suspected. A plan which may be generally adopted is to lower the plants a foot or more from the roof glass. The *East Indian house* will still require to be moderately ventilated for a few hours in the middle of warm days. The *Cattleya and Mexican houses* should be well ventilated whenever the temperature of the external air is above 50°, and the cool house requires an abundance of air through the bottom ventilators when the outside air is above 45°. Remove all shadings from the north aspects and side lights. The roofs facing south, east and west will still require to be shaded during direct, bright sunshine.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Cucumbers.—The treatment of Cucumbers must now be very different to that given them during the summer months. In order to obtain a constant supply of fruits in late autumn and winter, very careful attention to cultural details is needed. Do not overcrop plants which are just commencing to fruit, as this would seriously weaken them. Cut the fruits before they become too large, and lay them in a cool store, where they will keep in good condition for a considerable time. When roots show themselves on the surface of the bed, apply small top-dressings of loam (from which the fine particles have been shaken out), decayed leaves and well-decomposed

horse manure. In order that the plants may be kept clean, they should be syringed occasionally with a weak solution of soft soap and sulphur. Young plants which it is hoped will supply a crop during winter must especially be preserved from attacks of red spider. Should this pest get established on the plants, it would do irreparable damage, as growth is now very slow. Train the shoots regularly over the trellis, stop them at the second or third leaf, and do not overcrowd them. Do not overfeed the plants, as excessive vigour is not conducive to fertility. There must not be too much moisture at the roots or in the atmosphere, or the plants may be attacked with Cucumber "spot." A little air should be admitted to the house before noon whenever the weather is favourable. The atmospheric temperature at night should not fall below 70°, unless the weather is very cold, when a further fall of 5° will be desirable.

Tomatos.—Plants which are showing signs of exhaustion should be thrown away after cutting off any fruits which are colouring. These fruits will ripen if placed on a shelf in a lateinery. The autumn-fruiting plants must be assisted to swell their fruits by occasional applications of liquid manure and some approved fertiliser. Remove the side shoots and cut away a portion of the leaves if they obstruct light and sun from the fruits. So far the weather has not been favourable for the setting of flowers on the winter-fruiting plants. The flowers must be pollinated every day at noon, and a free circulation of air encouraged during favourable weather. The top ventilators should never be quite closed. There must always be sufficient heat in the water pipes to prevent the temperature declining below 60°. An occasional light sprinkling of artificial manure will be of benefit now that the pots are becoming filled with roots. Later, a light surface dressing of loam, mortar rubble, and wood-ashes will assist the swelling of the fruits. A batch of plants may now be raised for fruiting early next season. A free-setting variety must be selected for this purpose. Winter Beauty, Sunrise and Dwarf Red may all be relied upon. Sow the seeds thinly in pans in a light compost, and always keep the plants growing near the glass in a minimum temperature of 55° or 60°, varying in accordance with the conditions out-of-doors.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Root-pruning.—In most gardens there are some fruit trees that appear in the best of health, make extremely strong growth, yet bear very little or no fruit. Such trees are proper subjects for root-pruning, and the present is the best time for the operation. If it is performed early in the autumn, the roots have time to recover from the check they suffer, and, as the soil is still warm, they start growing at once, thereby, in a measure, getting re-established before the severe weather. The object of root-pruning is, by cutting back the tap root and all strong, thong-like roots, to induce them to make a number of small, fibrous roots, which, being much nearer the surface, are more easily supplied with plant food. By the pruning the tree receives it is checked from making rampant growth in the following season, and its energies are therefore directed into developing fruit buds. Such a tree usually produces a good crop of fruit in the second season after the operation. In the case of very young trees that are growing too strongly and not bearing fruit, the best plan is to lift them entirely out of the ground, cutting the roots back, and replanting them. Use a sharp knife, and see that no mutilated portions of roots remain, as these set up decay. With older trees, transplanting is not advisable. In order to root-prune these, dig out a trench round the tree, and cut all roots found in the trench. Work away the soil from under the centre of the tree, in order to cut the tap root or any stray roots that may be getting down into the subsoil, as these must on no account be overlooked. It is best to do one half first, replacing the soil before disturbing the other section, or otherwise the tree may fall over. When old-established trees require this treatment, the operation must be extended over two seasons, for, if performed in one, the check would be likely to permanently cripple a large specimen. Such a tree should have a trench cut round one half now, leaving

the remaining portion to be treated in the following season. During root-pruning operations, it is seldom necessary to apply manure; but in some instances fresh loam with wood-ashes (lime rubble in the case of stone fruits) is beneficial. In all cases this work should be done when the soil is in a comparatively dry condition, that is, when it will not stick to the feet or tools, because it is necessary that the soil should be rammed quite firm when returning it to the trench, a loose, rich soil being often responsible for the very evils that cultivators try to counteract by root-pruning.

Quinces.—Examine these fruits, but do not pick them till quite ripe, which will be later than usual in most localities. Store the fruits in a cool, dry place, and they will become fit for use after a few weeks.

Medlars.—This fruit is sometimes appreciated, and is usually ready for picking at the end of October. Choose a dry day, as the rough surface of the fruit holds the moisture, which causes decay. Store them thinly, and examine them at intervals; they will be ready for use when quite soft.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Asparagus.—The Asparagus growths may now be cut down close to the ground by means of a pair of garden hedge shears. The ground should be cleared of all weeds and rubbish, and these, with the Asparagus growths, should be burnt on the smother fire. Any special variety of more than usual promise and bearing seed-pods should be saved for sowing early next spring. The growths containing these should be hung up in a dry, well-ventilated place for some time, after which the berries should be picked and the seeds cleaned and stored in a place of safety till sowing time.

Forcing Asparagus.—No kitchen-garden crop lends itself more readily to forcing than Asparagus, and few vegetables are more appreciated. Contrary to most vegetable roots, those of Asparagus should never be exposed to the air one moment longer than is necessary. As soon as possible after they are taken up they should be placed in the position in which they are to be forced, covering them immediately with earth. Or, if the roots have to be purchased and sent a distance, they should be carefully packed in damp moss. Directly they arrive they should be placed in position and covered. Just sufficient top and bottom heat should be provided to start the crowns into growth, either in a forcing house or on a bed of fermenting materials. The plants should receive a good watering, and, in fine weather, be damped over twice each day with tepid water.

Box edging.—This is still used extensively in many places for the edgings of kitchen-garden walks. Provided they are kept in good condition, they present a neat appearance, but involve a considerable amount of labour, not only in keeping the Box itself, but because weed-killer cannot be used on the paths when this form of edging is employed. However well the Box is treated, it requires replanting every now and again, and this work may be performed either now or in the spring, the present time for preference. The old plants should be pulled to pieces, and the top growth and root shortened. A certain amount of skill is required to do this work properly. In cases where the soil is unfavourable for the growth of Box, sufficient fresh material should be placed along either side of the plant to induce quick root action. In planting, the soil should be made thoroughly firm by well ramming. The best form of edging for kitchen gardens, in my opinion, are solid blue Staffordshire edging tiles. These should be set in sufficient concrete to keep them rigid, and they will then last for an indefinite period. They are neat and tidy in appearance, and the paths may be kept free from weeds by an annual dressing of one of the many preparations known as weed-killers.

Horseradish.—Part of the permanent bed of this crop should now be trenched over, and sufficient of the best roots taken up and laid in sand and ashes under a north wall. The small pieces should be cut into lengths and planted at regular distances on the same spot, working in a good dressing of farmyard manure. If this is done, the same site will serve for many years.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Illustrations. - The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, OCTOBER 25—
Nat. Chrys. Soc. Executive & Floral Coms. meet at Essex Hall, Strand.

TUESDAY, OCTOBER 26—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by the Rev. Prof. G. Henslow, on "Remarkable Instances of Plant Dispersion.")

WEDNESDAY, OCTOBER 27—
Croydon Chrys. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—47.6°.

ACTUAL TEMPERATURES:—

LONDON.—*Hednesday, October 20* (6 P.M.): Max. 60°. Min. 55°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, October 21 (10 A.M.): Bar. 30.0; Temp. 57°; *Weather*—Bright sunshine.

PROVINCES.—*Wednesday, October 20*: Max. 60° Bedfordshire; Min 50° North Ireland.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY—
Nursery Stock, at the Old Nursery, Wivelsfield Road, Haywards Heath, by Protheroe & Morris, at 12.

TUESDAY—
Unreserved Sale of Duplicate Orchids, at "Arcadia," Charrminster Road, Bournemouth, by order of C. H. Rolls, Esq., by Protheroe & Morris, at 1.30.

WEDNESDAY—
Roses at 1.30; Palms and Plants at 5, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

Nursery Stock at Hickmandias Nursery, Knockholt, Kent, by order of Mr. A. Waterman, by Protheroe & Morris, at 11.30.

THURSDAY AND FRIDAY—
Comers and other Nursery Stock, at Hollamby's Nurseries, Gloombridge, near Tunbridge Wells, by Protheroe & Morris, at 11.30.

FRIDAY—
Imported and Established Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Sterilisation of Soil.

Ever since it began to be realised that the soil is the home of a great number of minute organisms—bacteria and fungi—as well as of larger organisms like infusoria and eelworms, there have not been wanting experiments in which attempts were made to grow plants in soil which had been deprived of these living agencies. The results, however, that have been reported have been contradictory and difficult of explanation, and when also of late years certain gardeners began to use sterilised soil on a practical scale there has been a similar conflict of evidence as to the value of the treatment. The gardener has tried soil sterilisation, nearly always by heat, for various reasons; in the first place, he hoped to get rid of the seeds of weeds and the spores of the mosses and liverworts which encrust the surface of seed-pans whenever germination is long delayed; again, he hoped to kill off the spores of certain fungoid diseases which harbour in the soil, and the eelworms and similar organisms which often do so much harm to cultures under glass. Any process of sterilisation by heat, involving the heating of the soil, either wet or dry, to the temperature of boiling water, must be expensive, but whether it may prove to be commercially profitable or not, it is only very recently that we have learnt what sort of changes go on in the soil during the process

and have arrived at some understanding of the reasons for contradictory results mentioned above.

The experimental investigation of the subject began with the discovery, in which several men shared, that soil which has been heated to the temperature of boiling water will grow larger crops than the same soil which has not been treated. In this country Russell and Darbishire carried out a long series of such experiments, and showed that the heated soil will produce double the yield of the untreated soil and that the beneficial effect persists as far as four crops after the original heating. All the plants they tried were benefited, except the leguminous species, and all kinds of soils behaved in the same way. Moreover, not only did the gross weight of the crop increase, but on analysis it proved to be richer in such essentials of plant-food materials as nitrogen and phosphoric acid, so that the crop grown on the soil after heating actually contained about four times as much nitrogen as that grown upon the soil which had not been heated. Various explanations of the action were put forward, mostly depending upon changes which were supposed to have been set up in the bacterial flora of the soil; but Pickering, as the result of his experiments, suggested that in the main the action was due to the splitting up of the organic matter (humus) of the soil by the heating. He showed that the germination of seeds is retarded in soil that has been heated, and that the retardation is greater the higher the temperature to which the heating is pushed; he also showed that the soil after heating actually contained more nitrogen compounds in a soluble state. Hence he concluded that the heating had split off from the humus soluble nitrogen compounds which are injurious to germination, but which later will serve as food for the growing plant. Pickering's results are undoubtedly correct, in that ammonia and other soluble nitrogen compounds are split off from the humus by the heating; but some work which has just been published by Russell and Hutchinson, of the Rothamsted Laboratory, shows that this is only part of the story, the increase in fertility of the heated soil being chiefly due to a rearrangement of the living organisms inhabiting the soil. In the first place, it can be shown that heating to the temperature of boiling water for ten hours or so does not sterilise the soil; certain groups of organisms are killed off entirely, but others which exist in the form of spores resist the heat, and as soon as the soil cools down again begin to develop and multiply with great rapidity. For example, the bacteria bringing about nitrification are wiped out entirely, but most of the other groups retain some representatives, especially that class which take the complex organic matter of the soil and break it down into ammonia and kindred compounds. In one of the Rothamsted arable soils used in the experiments the normal number of bacteria in the soil before treatment was about 5,000,000 per gramme; immediately after heating the number had fallen to 60 per gramme, but then followed a very rapid rise; in a fortnight the original 5,000,000 had been reached and a month or five weeks afterwards the number had risen to 26,000,000 per gramme. Step by step with this increase in the number of bacteria in the soil came a

similar increase in the rate of production of ammonia, i.e., of a soluble nitrogen compound on which the plant could feed. It was thus demonstrated that, in the soil that had been heated, the increased crop is due to the greater amount of ammonia which becomes available for the plant, and that this increase in the ammonia is brought about by the larger number of bacteria, chiefly splitters-off of ammonia, which get a footing in the soil. Various experiments, which need not here be detailed, also demonstrated that the increase in numbers of the bacteria is not due to any stimulus derived from the heating, but to the removal of some factor which is at work in ordinary soil keeping down the numbers of bacteria. This new and unknown factor turns out to be the presence in ordinary soil of large non-bacterial organisms like amoebæ and infusoria, which habitually feed upon the bacteria, and thus, by keeping their numbers down, establish a certain numerical equilibrium between themselves and the bacteria. These higher organisms are wholly destroyed by the heating or other sterilisation methods, whereas the bacteria are only partially exterminated and afterwards develop to a much greater extent than before, because they have the field to themselves. With this increase in the number of bacteria goes an increased production of soluble plant food from the insoluble reserves in the soil and a corresponding increase in crop. With certain differences these results are repeated when other methods of sterilising the soil are adopted; if, for example, the soil in a dry state is exposed for some hours to the vapour of chloroform, carbon bisulphide, toluene or other volatile antiseptic, there is a similar rearrangement of the organisms of the soil and a similar increase in its fertility, though not to so great a degree.

We are now in a position to sum up the changes which take place in soil when it is subjected to one of these so-called "sterilisation" processes:—

(1) Seeds of weeds, mosses, liverworts, &c., are killed. Fungi and their spores are also destroyed. It is found, however, at Rothamsted that the soil is very susceptible to re-infection when it is afterwards exposed in pots. Occasionally it becomes covered with moulds, and the usual green algæ rapidly cover the surface with a mat.

(2) The texture of heavy soils is distinctly improved.

(3) The heating gives rise to substances, of which ammonia is probably the chief, harmful to germination. This harmful effect will be less marked if the soil is stored for a time after the heating.

(4) All organisms of an order higher than bacteria are killed off; the soil, for example, is rendered clean of eelworms, at the same time certain organisms which normally limit the number of bacteria in the soil are destroyed.

(5) Thus provided with a clear field, the ammonia-producing bacteria increase rapidly and there is a correspondingly greater production of plant food from the soil and manure, followed by an increase of crop. Certain groups of bacteria are killed off, e.g., those which convert ammonia into nitrates; hence plants which only take in their nitrogen as nitrates do not show increased growth on the sterilised soil; only those plants (actually the

majority) which can utilise indifferently ammonia or nitrates are benefited. Even in their case it is possible to see that they are feeding upon ammonia and not upon the nitrates they obtain from normal soil, e.g., the cereals are shorter in the straw than would be expected from the richness in nitrogen. Nor is it always possible to re-inoculate the soil with the nitrification organisms, heat-sterilisation seeming to produce some substance which inhibits the nitrification bacteria.

Space does not permit of a discussion of the results of greenhouse practice with sterilised soils in the light of these conclusions, but they will be found to illuminate much that has been obscure and contradictory in the reports. At any rate, it is clear that it is impossible to lay down the law beforehand as to whether "sterilisation" of soil will or will not be beneficial in a particular case. Experiment alone can show which of the numerous factors will be involved. Similarly, though a number of applications to practice suggest themselves, it would be unwise to discuss them until more experimental work is forthcoming.

FRIAR PARK.—Our Supplementary Illustration depicts a "Japanese" scene in the gardens at Friar Park. Friar Park is known, at least by name, to most horticulturists, and especially to those who are interested in rock and Alpine gardening, for it contains one of the most remarkable rockeries in the world. This rockery has been often referred to in the *Gardeners' Chronicle*, and in the issue for October 28, 1899, a full, illustrated description of the gardens and rockery was given. Since that time several features of interest have been added, the most important being a representation, built to scale, of the famous peak (see fig. 122) of the Matterhorn. How realistic the effect is may be judged by reference to our illustration. The mountain top appears clothed in snow, the effect being obtained by the use of some alabaster. Appropriate plants are disposed at suitable spots, and the visitor can easily imagine himself to be in the midst of the Alps. Some idea of the extent and design of the rockery may be obtained from the fact that no fewer than 7,000 tons of stone have been used in its construction, whilst it is furnished with 4,000 distinct plants. The scene depicted in the Supplementary Illustration, with the stone lantern, Wistaria, Bamboos, and jutting rockwork reflected in the water pool, will no doubt be a familiar one next season to those who visit the forthcoming Japanese exhibition. Further details concerning Friar Park Gardens will be found in our issue for August 3, 1907.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees of this Society will be held on Tuesday, the 26th inst. At 3 o'clock p.m. there will be a lecture on "Remarkable Instances of Plant Dispersion," by Rev. Professor G. HENSLOW, V.M.H.

GRAPES AND PEARS FROM WISLEY.—At the last meeting of the Royal Horticultural Society there was shown a very interesting collection of Grapes and Pears from the Society's gardens at Wisley. There were 32 bunches of Grapes and some 60 dishes and varieties of Pears. The latter were not presented as exhibition samples grown under glass or on walls or cordons, but were from bush and pyramid trees, grown on the sandy hillside of the Wisley Gardens. Therefore, they fairly represented what those varieties on similar soil and conditions would usually produce. Much allowance had to be made for the

lack of sunshine which has so much checked the development of outdoor fruits this season. Still, the fruits were very clean and of excellent dessert size. The varieties of Grapes were Golden Queen, Muscat of Alexandria, Cannon Hall Muscat, White Nice, Mrs. Pearson, Syrian, Lady Hutt, and Trebbiano among white varieties; and Lady Downe's, Black Prince, Prince of Wales, Gros Colmar, Gros Maroc, Barbarossa, Black Alicante, and West St. Peter's of black varieties. Just a few amongst the many Pears seen were Durondeau, Gros Calebasse, Baltet Père, Beurré Clairgeau, Beurré Diel, and Princess, all of these being excellent fruits. A very interesting feature in connection with these Pears was the testing of them for flavour, as against one another and also against the same varieties grown under much more favourable conditions.

TRIALS AT WISLEY.—We are informed that trials of the following fruits, flowers and vegetables will be made at Wisley during 1910-11:—Autumn-fruiting Strawberries (20 runners of each must be sent); early-flowering outdoor Chrysanthemums (two plants of each to be sent in April); Clematis (two plants of each early in April); Gladioli, early, mid-season and late (four bulbs of each to be sent early in February); Rhododendrons, early, mid-season and late (two plants of each in February or March); Potatoes: each variety must be labelled as being early, mid-season or late. Twenty tubers of each to be sent by February. Also, experiments with Ashleaf Potatoes of all forms (20 tubers) secured from as many sources as possible, under different soils and climatic conditions. Salads of all kinds and varieties ($\frac{1}{2}$ ounce of each to be sent early in February); Peas (half-pint of each, early in February); Spinach ($\frac{1}{2}$ ounce to be sent early in February). Everything sent for trial must be named, and the name and address of the sender attached.

APPOINTMENTS.—We learn from the *Kew Bulletin* that Mr. J. W. GALLAGHER, mycologist to the Agricultural Department of the Federated Malay States, has been appointed Director of the Department in succession to Mr. J. B. CARRUTHERS, who has been transferred to Trinidad. Mr. J. W. CAMPBELL, formerly Superintendent of Experimental Plantations in the Federated Malay States, has been appointed Assistant Director, Agricultural Department, Federated Malay States.

LEGACY FOR A GARDENER.—Under the will of the late Mr. GEORGE MOSS, Oak Villa, Beulah Hill, Upper Norwood, his gardener becomes entitled to the sum of £300. Mr. Moss directed in his will that each servant of 10 years service should receive the amount stated, and the gardener is included, although his services were only requisitioned on four days each week.

NERINE APPENDICULATA, BAKER.—An inflorescence of this pretty and distinct Nerine is sent by Mr. F. W. MOORE, Curator of the Royal Botanic Gardens, Glasnevin. It is the second of the species with a rudimentary corona, the first being *N. pancratioides*, described by Mr. J. G. BAKER in the *Gardeners' Chronicle*, November 14, 1891, p. 576, and which has the segments of the white flowers not crimped. *N. appendiculata* was described by Mr. BAKER in the *Gardeners' Chronicle*, September 22, 1894, p. 336. Both are Natal plants having ovoid bulbs furnished with narrow, linear, bright green leaves, and an inflorescence about 15 inches in height. The specimen of *N. appendiculata* sent has an umbel of nine flowers, the segments of which are equally arranged, crisped, and reflexed at the tips, pale rosy lilac with a central purple line. Good distinguishing features are the downy pedicels and ovaries, and the mem-

braneous strap-like processes which surround the anther filaments at the base, forming a rudimentary corona. The anthers are purplish in the early stage. It has some resemblance to *N. flexuosa*, but in the different arrangement of the perianth segments and the other characteristics mentioned it is botanically very widely separated from that species. As a garden plant it has only moderate merit. Like many other Nerines, it flowers in late autumn, grows throughout our winter, and requires to be rested dry during the heat of the summer.

PRODUCE OF HOPS.—The Agricultural Returns of Great Britain, issued by the Board of Agriculture (October 12, 1909) indicate how disastrous, with respect to yield, the present year has been for the Hop grower of this country. Whilst the acreage under Hops in 1909 was but little less than last year (32,529, as against 38,921), the estimated total produce is less than half, viz., 214,484 cwts. (as compared with 470,761 in the preceding year) which gives for this year an average yield per acre of 6.59 cwts., as compared with 12.10 in 1908. The yield continues highest in Mid-Kent and the Weald, where it is 8.6 cwts. per acre, as against 12.14 last year, and is lowest in Hereford, 3 cwts. per acre, as against 9.8 of 1908. It remains to be seen whether enhanced prices will make up for poor yield; if not, the Hop grower is to be commiserated on the miserable returns, which are, of course, attributable to the weather obtaining during the past growing period—we will not call it summer.

"THE BRITISH FERN GAZETTE."—We have received a copy of the first issue of this journal, devoted exclusively to British Ferns. It contains articles on "Our Native Ferns," "The Life History of a Fern," "Wild Sports in British Ferns," "Pernum Fern Finds," and illustrations of *Polystichum aculeatum pulcherrimum*. The whole of the matter in this issue is contributed by the Editor, Mr. C. T. DRUERY, V.M.H., but readers are promised contributions from various Fern enthusiasts in the December issue. Probably some readers will be all the better pleased that the first issue is contributed by the Editor, as Mr. DRUERY is so well qualified to discuss British Fern topics. We recommend the journal to all interested in Ferns. It is supplied free to members of the British Pteridological Society. The secretary is Mr. G. Whitwell, Serpentine Cottage, Kendal, Westmoreland, and the subscription 5s. yearly.

CARL POSER, for some years assistant in the Botanical Garden at Breslau, has been appointed to the head gardener's post at the experiment station for plant physiology at the Botanical Garden, Dresden.

BRITISH FUNGI.—During the past 20 years a very considerable number of species belonging to the higher fungi have been added to the British list, mainly owing to the unceasing activity of the mycological section of the Yorkshire Naturalists' Union. This has necessitated the appearance of a concise list of British species brought up-to-date. We are grateful to Dr. COOKE for having undertaken this tedious but extremely useful work, as, tempered by his vast experience, it is free from those modern flights of fancy concerning names which deface and render useless so many mycological works of the present day. The catalogue* can be carried in the pocket, and the list is printed on one side of the paper only, an arrangement which makes it easy to tick off the species as they are met with in the field.

* *Catalogue and Field Book of British Basidiomycetes up to end of 1905*, by M. C. Cooke. (Wheldon & Co., 38, Great Queen Street.) Price 2s. 6d. net.

PROFESSOR DR. LUDWIG WITTMACK celebrated his 70th birthday on September 26. Dr. WITTMACK, apart from his professorship of botany, is well known in gardening circles. He was general secretary of the Berlin Horticultural Society for 30 years, and as such edited the organ of that society, which several times altered its title. He took it over as the *Garten-zeitung*, and later the *Deutsche Garten-zeitung*, &c. Numerous treatises on garden subjects from Dr. WITTMACK's pen have appeared in the various publications, among others the last edition of the *Illustrierten Gartenbau Lexikon*.

THE CONTROL OF THRIPS.—In the series of papers on *Deciduous Fruit Insects and Insecticides*, Bulletin No. 80, Part IV., deals with the Pear thrip and its control. Although this pest—*Euthrips pyri* Daniel—occurs only in the central part of California, we give the results of

tated violently and sprayed under pressure of 125 to 150 lbs. into other barrels. This stock solution is diluted before use with 24 gallons of water to each gallon of solution.

TRAFALGAR DAY.—On 21st inst. the Nelson Column in Trafalgar Square was again decorated in commemoration of this great sea fight, and for the 11th consecutive year the work was done for the Navy League by Messrs. BELLGROVES, LTD., Holly Lodge Gardens, Grove Park, Chiswick. Festoons of Laurel (*Cerasus Laurocerasus*), bunches of autumn-tinted Oak, with groups of flowering plants and foliage, composed the main features of the scheme. At the base of the column were four shields bearing quotations from Lord TENNYSON's and RUDYARD KIPLING's poems, whilst attached to the column were the Union Jack and St. Andrew's, St. Patrick's, and St. George's Crosses.

each season. It is said that they can be sold here at 6d. each, but unless they can be placed on the market at a cheaper rate, they will scarcely succeed in competing with outdoor Peaches grown in this country. The fruit which we had the opportunity of tasting from the recent consignment was the variety known as Crawford, a free-stoned, yellow-fleshed fruit. Judged after being subjected to cold storage, it is not nearly so good as the average English Peach, being less juicy, indifferent in flavour, and rather tough. It is stated that the same variety if eaten in Canada is excellent; indeed, a representative of the Ontario Government described it as being far superior to the very best Peaches grown in English hothouses.

PUBLICATIONS RECEIVED.—*The Estate Magazine* (October), a supplement to *The Country Gentlemen's Estate Book*. Edited by William Broonhall. Price 6d.—*General Abstracts showing the Acreage under Crops and the Numbers and Descriptions of Live Stock*. Printed for His Majesty's Stationery Office. Price 2d.—*The Orchid Review* (October). (Marshall Bros., Ltd.) Price 6d.

FIG. 123.—STRAWBERRY "DR. HOGG," FIFTH IN THE CENSUS OF BEST FLAVOURED VARIETIES.

the experiments conducted by Mr. DUDLEY MOULTON and published in the above paper, since they may be of service in the combating of other thrips. From an extensive series of trials of various kinds of spray-fluid, Mr. MOULTON comes to the conclusion that though tobacco-leaf extract, one part to 50 of water, is very successful, a yet more penetrating, and hence more efficacious, material consists of making up the tobacco-leaf extract with an oil instead of with water only. The oil spray is forced more easily than the water spray into the buds and penetrates more readily the oily covering of the animals themselves. The oil spray recommended is prepared as follows: Distillate oil emulsion, $1\frac{1}{2}$ to 2 per cent. solution; black-leaf tobacco extract, one part to 60 parts of water. The distillate oil emulsion is prepared as follows: Hot water, 12 gallons; white oil or fish-oil soap, 50 lbs.; distillate oil (28 per cent. Baume), 20 gallons. The soap is first dissolved in a kettleful of boiling water, removed to the spray tank where the oil is added; then the mixture is agi-

AFFORESTATION IN ITALY.—It is interesting to observe that Great Britain is not the only European country in which the afforestation question is exciting attention. According to the *Estate Magazine* IX., No. 10, October, 1909, the Italian Minister, Signor BERTOLINI, is about to ask Parliament for an annual grant of £100,000 for the purpose of tree planting. In justification of this proposal it is pointed out that where not so long ago woodland abounded there are now bare land, regions subject to flood, marshes and malaria, and, moreover, that the same sum which it is proposed to devote to planting is expended at present in protection against floods.

PEACHES FROM ONTARIO.—The first consignment of Peaches from Ontario arrived last week. The shipment was in the nature of an experiment, and the fruit arrived in very satisfactory condition. The fruit growers in Ontario hope it will be possible to find a sale here for a considerable quantity of Peaches in September

* TREES NOTED IN DEVONSHIRE.

STRETE RALEGH.—Amongst other interesting trees growing at Strete Raleigh, the S. Devon estate of Mr. H. Inbert-Terry, the following are specially noticeable on account of their size and rarity: *Larix Griffithii*, *Tsuga Brunoniana*, and *Saxegothea conspicua*. It is considered that these particular examples are some of the original introductions to the British Isles, and that they found their way to Strete Raleigh at the time of the dispersal of the stock of the Exeter nurseries, when the old Veitchian firm dissolved partnership. Of the two first-mentioned species single examples only are found, but of the *Saxegothea*, two specimens exist. All four are growing on sloping ground near the top of a hill, at an elevation of 500 feet, but they are sheltered by other trees from the north and east. The ground is rich and is kept continually moist by means of a spring, the water from which percolates through the ground thereabouts. This, with the natural humidity of the atmosphere and mild climate, appears to provide ideal conditions for these trees, for all are somewhat tender and averse to a hot, dry soil and a dry atmosphere.

The specimen of *Larix Griffithii* is about 45 feet high with a girth of 7 feet at 3 feet from the ground. Himalayan travellers describe the species as a tree growing 40 to 60 feet in height, at an altitude of 8,000 to 12,000 feet in the forests of the inner ranges of the Eastern Himalaya (E. Nepal, Sikkim and Bhotan). It also occurs in Tibet at an altitude of from 9,000 to 13,500 feet. Plate XXI. in *Hooker's Himalayan Plants* gives a good idea of the tree and of the beauty of the half-developed cones. The chief peculiarities of the species are its long, pendulous branches and large cones with prominent scales and bracts which are remarkable for their long reflexed tips. The cones are several times larger than those of other species, being $2\frac{1}{2}$ to 3 inches in length. When young they are purple in colour. As the Strete Raleigh tree is coning profusely this year, it formed a conspicuous object in June. Though introduced as long ago as 1850, very few good specimens are to be found in the country.

Tsuga Brunoniana is also a Himalayan tree and is found in the same forests as *Larix Griffithii*. It attains its largest dimensions in the Lachen Valley, where Sir J. D. Hooker measured a specimen 120 feet high, with a girth of 28 feet (*Gardeners' Chronicle*, July 17, 1886, p. 73). Under cultivation its trunk is not single, but branched at a few feet above

* W. Dallimore in the *Kew Bulletin*, No. 9, 1909.

NOTES FROM A "FRENCH" GARDEN.

THE pricking off of the Cabbage and Cos Lettuces is proceeding as fast as the weather permits. Plants of "Little Black Gott" are now well established in their new quarters. They require no ventilation before the end of November, and this is only required to harden them in case of frosty weather. The varieties Passion, Palatine, and all the Cos Lettuces can be afforded ventilation early in November if the plants are progressing favourably. If more plants are required, another batch of seeds should be inserted; it will be found advantageous to make a small hot-bed for the purpose and to sow the seeds very thinly under the cloches. Those planted late in September are doing well; the cloches are covered with mats at night-time, as the ground is damp and cold.

Cauliflowers transplanted early this month have developed three leaves; the lights are kept open day and night to harden the plants and to save transplanting again in December.

Onions planted three weeks ago are fully established and will now withstand frost.

The ground allotted for the cold growing of Lettuces Passion and Palatine next January has been well manured and dug; it should be in fine condition at Christmas, when we shall set the frames and lights in position. This system of growing Lettuces has always given a good financial result, and the crop is ready in April and early May, when there is generally a dearth of Lettuces. It is advantageous to the grower, as it enables him to use the frames and lights afterwards for a very early batch of Melons. Half of the manure required for the making of the hot-beds in January has been collected, and stacked in a heap 12 feet by 40 feet, with three apertures in the centre for the escape of the gases from fermentation. This manure will dry, and then, when mixed with fresh material, the result will be a more lasting heat than where fresh manure is wholly employed. The surplus of the decayed manure from the old beds is also stacked in small heaps to prevent fresh fermentation. It will be used for cold frames and the rearing of young plants next season. *P. Aquinas.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

PLANTS HARDY AT WESTON-SUPER-MARE.—

The following list of plants growing all through the year in the gardens of Mr. J. Jackson-Barstow, J.P., The Lodge, Weston-super-Mare, will show the mildness of the winters in this Somersetshire town. *Fuchsia Riccartonii*; *Carpenteria californica*, a fine specimen, planted about seven years ago; *Phormium tenax*; *Osmonthus fragrans*; *Myrtles*, both double and single-flowered kinds; *Choisya ternata*; *Aloysia citriodora*; *Eupatorium fragrans*, a fine plant, has been out-of-doors without protection for five years; *Olearia stellulata*; *Cistus ladaniferus*; *Fabiana imbricata*; *Jasminum revolutum*; *Aralia Sieboldii*; *Eucomis punctata*; *Staphylea colchica*; *Indigofera floribunda*; *Pittosporum Tobira*; *Ceanothus Veitchii*; *C. Gloire de Versailles*; *Macartney Rose*; *Solanum jasminoides*; *Passiflora cœrulea*; *Banksian Rose*; *Abelia rupestris*, specimens 5 to 6 feet high and as much through, covered in flower; *Salvia coccinea*; *Pomegranates*, both single and double varieties; *Chimonanthus fragrans*; *Olearia macrodonta*; *Magnolia grandiflora* Exmouth variety; *Escallonia montevidensis*; *E. macrantha*; *Skimmia japonica*; *Chamaerops excelsa*; *Hydrangea paniculata* and *H. hortensis*; *Arundinaria Metake*; *Mesembryanthemum turbinatum*; *Caryopteris Mastacanthus*; *Cupressus macrocarpa*; *Laurus nobilis*; *Agapanthus umbellatus*; *Elaeagnus*; *Enonymus japonicus* varieties; *Rhododendrons* in variety; and *Viburnum Tinus*. All these are planted in the open, without any protection. *Wm. Brooks, White Cross Nursery, Weston-super-Mare.*

TALL HOLLYHOCKS (see p. 266).—At the time of writing, October 19, I have several plants of double Hollyhock growing at the back of the herbaceous border in a rather exposed position. Six plants have attained the height of 14 feet 6 inches, and are now in flower, and several more are 13 feet 6 inches. Hollyhocks have grown unusually high this season, which is, no doubt, attributable to the excessive rainfall. I may add that two plants of Jerusalem Artichoke I measured were 16 feet 4 inches, and in many instances varieties of Peas, which generally grow 6 feet, are 8 feet high this season. *B. R. Squelch, Court House Gardens, Ruspur, Sussex.*

CUPRESSUS MACROCARPA.—On p. 252 one of your correspondents gave particulars of the girth, spread of branches, and height of a specimen of *Cupressus macrocarpa* now growing on his property, and asked for information from others to compare with that which he gave. I requested my gardener to measure a specimen of this Conifer, now growing in my garden, which tree was planted by my father about 50 years ago, along with many other varieties of Conifers, most of which are now very fine specimens. His figures are:—Girth, 10 feet 9 inches; spread, 54 feet; and height, 61 feet. It will be noted that my tree is less in spread and girth, but rather taller than that described on p. 252. I may say that this tree is surrounded closely by other Conifers,

FIG. 124.—STRAWBERRY "REWARD," THIRD IN THE CENSUS OF NEW VARIETIES.

so that it has not had as good a chance of increasing in size as it would have had were it standing alone. *O. O. Wrigley, Wansfell, Windermere.*

RESULTS OF PLANTING TREES AND SHRUBS

ON POOR SOIL.—About 40 years ago when this institution was built, a considerable amount of ground had to be made up to form the carriage drive leading to the front entrance, the soil used for this purpose consisting chiefly of sand and gravel. When finished, this formed a sloping bank, falling to the level of the vegetable garden, which is about 60 feet below the level of the present carriage drive. On the top of the bank, and skirting the drive, a Holly hedge was planted without any preparation being made for the plants. This hedge is now kept clipped to the height of 4 feet, and makes a good growth each year. Following the planting of the hedge, the bank was planted over with Broom, which does very well, and when the grass began to get a good hold, it was decided to have the Broom taken up and to plant trees and shrubs of an ornamental character. As the ground was not prepared in any way to receive the plants, it is astonishing how well the following species have succeeded. *Ribes sanguinea* grows well and flowers splendidly. Lilacs, both blue and white, make very little sucker

growth, but they bloom freely. Syringas make plenty of new wood, and, with attention to pruning, are a mass of bloom every summer. *Berberis aquifolium* was planted beneath the trees, and it is all that could be desired, producing a wealth of yellow blossom every year. *Aucuba japonica* and *A. japonica variegata* make a good show, having been planted beneath the larger trees, and where they get more light than the *Berberis*, which has been used for the denser parts. Respecting *Rhododendrons*, I wish particularly to state that these plants were planted in decayed leaf-mould and garden soil, and that they are now doing as well, or better, than many planted in peat, or a mixture of peat and loam. *Laburnum*, *Chestnut*, *Sycamore*, *Lime*, *Austrian Pine*, *Weeping Elm*, and *Purple Beech* are all doing well, especially the *Elm* and *Beech*, these being beautiful specimens. The flowering *Cherry* was planted, but is now making a very poor show, and is evidently not a suitable subject for a poor soil. Two *Pear* trees were planted at the foot of the bank. They are about 40 feet high, are never pruned, and bear good crops of fruit. The variety is *Catillac*. *Thos. Francis, Head Gardener, The Walsall and West Bromwich District Schools.*

PROTECTING OUTSIDE VINE BORDERS.—I have cut ripe Grapes in March from vines growing exclusively in an outside border. In the following May I have cut a succession crop from vines

growing exclusively in an outside border. From these same vines I cut ripe Grapes a month earlier in the following year, but this was because the condition of the vines admitted of them being forced into growth a few weeks earlier than in the previous year. Towards the end of November the outside border had the top 2 inches of the loose surface soil removed and the border picked over with a digging fork. Then a top-dressing of prepared soil was applied to a depth of about 3 inches. On this was laid a similar depth of short manure, which was again covered 18 to 24 inches deep with fermenting stable dung and freshly collected tree leaves, consisting of three parts of the latter to one part of the former. These materials had been thrown together in a heap a fortnight previously and turned over twice during the interval. Some stable litter was placed over all to prevent the leaves being blown about by the wind. The house was closed for forcing early in December. The warmth imparted to the surface of the borders by the fermenting materials caused the roots to push upwards into the covering of prepared soil and the 3-inch deep coating of short manure with the most satisfactory results. In severe weather during the winter the fermenting materials were renewed once or twice.

Early in May rather more than a half of the bulk of the covering of dung and leaves was removed, so as to allow of the full benefit of the sun's rays reaching the border. The autumnal examination of the borders always revealed a network of young fibrous roots in the surface-dressing of prepared soil and short manure laid on in the previous November, this being conclusive proof of the efficacy of the covering of fermenting materials. No reader of the *Gardeners' Chronicle* whose vines are growing in outside borders, and who is anxious to cut Grapes from the plants as early in the year as possible, need have any fear in covering his borders in the manner described above on the supposition that the roots might get burnt by the heat generated by the fermenting material. I know as a fact that many gardeners entertained this idea years ago, but there was no real foundation for the supposition. *H. W. Ward.*

UNCOMMON VEGETABLES.—A seed firm has intimated their intention to offer prizes at the exhibition of the National Vegetable Society next year, for what are known as uncommon vegetables, and it is greatly to be hoped that that intention will be realised. In all vegetable competitions certain kinds of vegetables are prominent

and are repeated over many classes. That such kinds will be strongly in evidence at the show may be taken for granted. These include Cauliflowers, Carrots, Celery, Leeks, Beets, Potatoes, Tomatoes, Peas, Beans, Onions, Parsnips, Turnips, Marrows, Cucumbers, and Brussels Sprouts. That these are all products of the highest importance in the vegetable garden there can be no doubt, but there are others worthy of cultivation and consumption, and which therefore deserve to be brought more prominently before the public. Such, for instance, include Chinese Artichokes (*Stachys tuberifera*), Aubergines, Capsicums and Chillies, Celeriac, Chicory or Witloof, Couve Tronchuda, Butter Beans, Yellow Turnips, Green Corn Cobs or Maize, Salsafy, Scorzonera, Kohl-Rabi, Sugar Peas, Finocchio or Florence Fennel, Long Winter Radish, Lentils, &c. A collection of these vegetables, excluding all common kinds, should have great interest. There is the need also for wide diffusion of information as to the best methods of serving these vegetables to the table. *A. D.*

A LARGE HYDRANGEA.

THE plant of *Hydrangea hortensis* illustrated in fig. 125 is growing in a Devon garden belonging to Dr. G. B. Longstaff, Patney Heath, who sends the following particulars:—*Hydrangea hortensis* grows with great luxuriance in North Devon. A specimen in my garden at Morteohoe, moved some years ago to a round bed on the lawn, has grown with remarkable symmetry, and I enclose a photograph taken on October 7. The shrub had then been in flower for two months. The aspect is south, with shelter on the north, but *Hydrangeas* stand exposure to the west and south-west gales in a remarkable manner, even on the top of the cliff. The flowers are green or white on first opening, turning blue or pink. As far as I can judge, rich soil and moisture favour the blue colour, poor soil and drought the pink. But both colours are commonly seen on one plant, and this is so in the case of my specimen. Trusses of *Hydrangea* blossoms may be cut throughout October and November, and even into the new year, when the autumn is mild. Indeed, I know no shrub that so well repays cultivation. Nevertheless, plants, after disturbance, often take several years before they grow freely again. During the last rigorous winter, when so many plants perished, *Selaginella Kraussiana* var. *area*, which had been taken from my hot-house and planted on the rockery here, survived the cold. It has not only lived, but flourished. It has, however, reverted to the green type.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

OCTOBER 12.—*Present*: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the Chair), Dr. A. B. Rendle, Messrs. E. M. Holmes, J. T. Bennett-Poë, W. Fawcett, A. Worsley, J. Fraser, J. W. Odell, and F. J. Chittenden (hon. secretary).

Fasciation in Tropæolum.—Mr. J. W. ODELL showed a specimen of *Tropæolum tuberosum* with a very broadly fasciated stem. He found that when grown in heavy soil this plant very frequently showed fasciation.

Eucalyptus with intumescence.—Mr. WORSLEY showed leaves of young plants of *Eucalyptus pulverulenta* having small wart-like growths upon the surface. This condition somewhat resembles that shown by vines at times, and is due to excess of moisture in the air.

Datura Stramonium.—Mr. E. M. HOLMES showed a plant of the Thorn-apple with slightly pubescent foliage, which had been attacked by aphides in great numbers, so that the fruit had, owing to their presence, assumed a very unusual appearance.

Spirally-twisted Gentian, Ac.—Mr. CHITTENDEN showed a spirally-twisted stem of *Gentiana asclepiadea* from Wisley, and bearing the numerous leaves in a loose spiral round the stem. He also showed regular (peloric) flowers from the apex of the stem of *Pentstemon* similar in character to those often formed in the peloric Foxglove. The flowers usually had two

or three ovaries, and twice or thrice the usual number of stamens.

Malformation in Rubus.—Mr. J. FRASER, referred to a specimen of *Rubus rhamnifolius* which he had exhibited last year with a shortened inflorescence, and which had died since. He showed further specimens from other bushes, however, and remarked upon them as follows:—(1) *Rubus rhamnifolius* plants dying owing to some injury caused to the roots. The flower branches or panicles are exceedingly short, and throwing out roots at the base or at the top bud in an endeavour to form new stools there. (2) *R. carpinifolius* in the same condition. These conditions may possibly be due to the attack of nematode worms. (3) *R. nitidus* var. *opacus*. Flowering stems dying like those already mentioned. The terminal flower-buds have been galled by *Phytoptus* sp., and the flowers have been arrested in growth, while the sepals have undergone phylloidy. The short flowering branches have very much reduced, reflexed leaves, the petioles of which are filled with starch granules in excess, and the inflorescence in

COZE, Althorp Gardens, Northampton, being a close 2nd; his Leeks, Celery, Parsnips, and Carrots were grand.

The class for a collection of eight kinds, open to amateurs and allotment holders, brought together no fewer than 51 collections. Twelve prizes were offered. Mr. T. JONES, of Ruabon, just managed to win with one of the finest collections ever set up by an amateur. 2nd, Mr. T. H. PUGH, Stone Street, Newtown, Montgomery. 3rd, Mr. W. H. JONES, Bryn Street, Newtown, Montgomery. So close were these three exhibits that only half a point, after most careful judging, divided them.

Eight prizes were offered for three specimens of Leamington Giant Onion, and here again the entries were numerous, hundreds of bulbs being staged. The 1st prize was well won by Mr. S. J. BAKER, The Gardens, Weir House, Exeter, with perfect specimens. Mr. T. AVERY was a very close 2nd.

Another class was provided for amateurs and allotment holders for three specimens of the same variety, and the competition was again very

FIG. 125.—SPECIMEN PLANT OF *HYDRANGEA HORTENSIS* FLOWERING IN NORTH DEVONSHIRE.

a condition to form new rooting stools. (4) *R. mucronatus* var. *nudicaulis* with patches of dense, velvety hairs on the stems and leaves caused by *Phytoptus* sp.

Carbolic acid as a fungicide.—A letter was read from Mr. KITLEY, of the Oldfield Nurseries, Bath, recounting the results of experiments carried out with Tomatoes in which the fungi causing "sleepy disease" and other diseases were prevented from developing by watering the soil with a solution of one teaspoonful of carbolic acid to four gallons of water at intervals.

VEGETABLE SHOW AT LEAMINGTON.

OCTOBER 9.—An exhibition of vegetables was held in the Winter Hall, Leamington, on the above date, for prizes offered by Messrs. Rogers & Co. Exhibitors entered from all parts of the country, and some of the best vegetables seen this season were staged.

For a collection of nine distinct kinds of vegetables, Potatoes excluded, Mr. J. HUNSON, of Leicester, won the 1st prize, showing Celery, Cauliflowers, Leeks, Onions, Brussels Sprouts, Tomatoes, Turnips, Beet, and Parsnips, Mr. S.

keen. Six prizes were offered in this class. Mr. T. JONES won the 1st prize with three extremely well-developed specimens.

Prizes were also offered for Leeks, Celery, Beet, and Carrots, and in each case the number of entries was large and the produce excellent. *E.*

HORTICULTURAL CLUB.

ITALIAN GARDENS.

OCTOBER 12.—The autumn and winter session of this club opened with the usual monthly dinner at the Hotel Windsor on the above date, when Mr. E. White took the chair in the absence of the president, Sir E. T. D. Llewellyn, Bart.

Mr. H. Inigo Triggs, A.R.L.B.A., author of *Italian Gardens* and other works on garden planning, gave a lecture on "Italian Gardens," illustrating the subject by a number of lantern slides, showing the architectural plans of the most noted gardens in Italy, and views of the finished gardens. At the outset, he pointed out that the Italians have always regarded the garden from an opposite point of view from that of English landscape gardeners. In Italy, it is the architectural aspect which is

mainly—if not entirely—considered. The gardens have been planned by famous artists and architects entirely as harmonised extensions of the palaces to which they are adjuncts. The cultivation of plants was a secondary object; vegetation was looked upon as calculated to enhance the architectural effect by forming suitable backgrounds or relieving the eye in the foreground by more or less formalised foliage-plants. To the lover of flowers and foliage for their own sake, the strictly Italian gardens were hardly gardens at all. Despite this fact, however, the views presented on the screen proved by no means unattractive. Although opinions might differ when the lecturer deprecated the use in landscapes of varied kinds of trees massed together, considering that a few kinds afforded a better foliage effect, the effect of tall, steeple-like Cypress and solid-looking Stone Pines as backgrounds was harmonious, though somewhat sombre. A curious effect was produced on the mind when a slide was exhibited showing an elaborately formal plan of a palace and its gardens, a mere skeleton of geometrical figures, followed in the next few slides by most beautiful views, each one a fraction of the whole, therefore giving a vivid idea of what the artist and architect must have foreseen when preparing the plan. In view of the utterly opposed ideas involved in Italian and English gardening, the lecturer strongly deprecated the introduction of the Italian system here. The conditions were so very different. These magnificent gardens were planned and carried out in an age and in a country when and where Art was at its zenith while horticulture was in its infancy. The number of plants available for ornamental culture were then very few; the climate of Italy was by no means so congenial to growth as was generally imagined, the winters being often so severe that Oranges and Lemons and other tender vegetation had to be protected, while grass lawns, which form so grateful a feature in British gardens, were impossible in Italy, owing to lack of sufficient moisture. The value of a study of the Italian style consisted in its salutary effect, where, as in Italy, it is desirable to make architectural adjuncts outside harmonise with the style of the edifice itself; to merely formalise without such an object is a mistake. In Italy the gardens of note numbered only about 200; whilst in this country they were so numerous, so beautiful, and so diversified as to constitute an inexhaustible fund of blended sylvan and architectural charm, such as no other country in the world could boast.

BRITISH GARDENERS' ASSOCIATION. (LONDON BRANCH.)

OCTOBER 14—The monthly meeting of the London branch was held at Carr's Restaurant, Strand, on this date, Mr. E. F. Hawes occupying the chair. The sub-committee, which was appointed to collect information upon the conditions of employment which obtained in the public parks and gardens of the Metropolis, presented their report. Many injustices and inequalities had been brought to light as a result of the committee's investigations into the hours of labour and remuneration. The chairman read a circular letter drawn up by the executive council which is to be sent to all prospective candidates for the forthcoming Borough and County Council elections.

The object of the circular is to ascertain the views of candidates with regard to a programme submitted. The committee aims at a standard minimum rate of pay for gardeners of 30s. per week.

The chairman thought the time was now ripe for a co-operation to induce the Government to recognise the growing importance of horticulture as a great national industry. He will give a paper dealing with this subject at the next meeting.

The amalgamation of the Richmond branch was next discussed. Mr. Tidy, who represented this branch, said it was the wish of the members to unite with the London branch on the grounds that the two branches were so close together that it was incurring needless expense to hold meetings at both places.

Mr. Frogbrook objected to this proposal; he thought it advantageous for recruiting purposes to have a number of branches, and that some members of the Richmond branch might not wish to incur the expense of coming to London.

The chairman pointed out that the matter had already been discussed at Richmond, and that it was proposed, in the event of an amalgamation, to open a branch a little further from London than Richmond, possibly at Twickenham. The matter was referred to the executive council.

A paper on "Roses for Town Gardens" by Mr. A. C. Hill was read by the chairman. Mr. Hill has been a successful grower and exhibitor of Roses for the past 14 years. In the discussion which followed, Mr. Morrell outlined the system of Rose growing so successfully carried out in Hyde Park. *J. Cockram, Hon. Sec.*

A SIMPLE LAWN RAKE.

THE lawn leaf-rake (see fig. 126), of which I enclose a drawing, does its work admirably and clears a lawn of leaves and other litter in less than half the time required when a broom is used. The implement is very light. In working, the movement is the reverse of that with a broom, as the rake is thrown forward and is afterwards drawn towards the workman, the length of the handle enabling a wide sweep to be taken. The top piece prevents any leaves escaping. The bottom edge of the rake is bevelled (this is essential), and it is also notched to form blunt teeth. These cause the rake to sink into the grass without in any way injuring it and

FIG. 126.—A LAWN RAKE.

A, front view showing the blunt teeth notched 1 inch deep;
B, section showing the bevelled tooth edge.

to draw with it any leaves that may be damp or that are lying flat. Any carpenter can make it for a few shillings. Several of my friends have had one made according to my model and are very pleased with it. The handles are best procured from the manufacturers of wood hay rakes and are 7 feet long. The rake and board at the top are made of half-inch planed Beech wood, and are either nailed or screwed together. The bands are of hoop-iron to give strength. *Henry Adams,*

ENQUIRY.

DAHLIA.—We have in bloom in 6½-inch pots a dwarf Cactus Dahlia with flowers like those of Mrs. Carter Page, the disbudded blooms measuring 15 inches in circumference. From the soil to the top of the tallest bloom is less than 12 inches in height. Every plant keeps true although planted out as other Dahlias. Is there such a variety in commerce? *W. F.*

TRADE NOTICE.

WILLIAM BULL & SONS.

The partnership formerly existing between William Bull and Edward Bull, trading as William Bull & Sons, King's Road, Chelsea, has been dissolved by mutual consent owing to the ill-health of Mr. William Bull. The business will in future be carried on under the same name as heretofore by Mr. Edward Bull.

DEBATING SOCIETIES.

BATH GARDENERS'.—This society held its fortnightly meeting on Monday, October 11. Mr. W. S. Parrott presided over a crowded meeting. A paper on "Orchids" was read by Mr. J. S. Franks. The essayist said that the raising of seedlings was the most interesting of all the branches of Orchid culture. The cultural treatment of these plants was fully dealt with by Mr. Franks, who said that the principal requirements of Orchids are a free circulation of air; without draughts, and an abundance of light, although shading from the direct rays of the sun is necessary.

BRISTOL AND DISTRICT GARDENERS'.—A largely attended meeting, presided over by Dr. Shaw, was held on October 14 at St. John's Parish Rooms. The lecturer was Mr. Shackleton, of Forde Abbey, Chard, who gave a discourse upon "Sweet Peas." With respect to the position for Sweet Peas, the lecturer said one partly shaded from midday sun was the best. The Sweet Pea delights in a fairly heavy brown loam, and the ground should be deeply trenched, placing animal manure in layers, also mixing with the soil, as the work proceeds, dissolved bones, soot, and superphosphate. The seeds should be sown in mid-February in 5-inch pots, sowing five or six seeds in each, and placing the pots in a cold frame. As a stimulant sulphate of ammonia may be applied at intervals.

READING GARDENERS'.—A largely attended meeting of this society was held in the Abbey Hall, Reading, on October 12, the chairman, Mr. A. F. Bailey, presiding. The lecturer for the evening was Mr. J. Goatley, gardener to Lord Northcliffe, Sutton Place, Guildford, his subject being "Herbaceous Borders." In July last the members of the association visited Sutton Place, and the herbaceous borders and extensive wild garden attracted much attention. Mr. Goatley gave advice on such details as the best position for the border, its preparation, time of planting, harmonious blending of colours, avoidance of formalism, the dangers of overcrowding, and the necessity of careful and proper labelling. To young gardeners he advised the noting in a book of such particulars as the height, duration, time of flowering and other features of any perennials which might come under their care. Mr. Goatley strongly advocated the planting of bulb in the herbaceous border, by this means the flowering period is extended for quite two months. At the business part of the proceedings several new members were elected.

STIRLING AND DISTRICT HORTICULTURAL.—The monthly meeting of this association was held on October 12. Mr. Geo. Petrie occupied the chair. The lecturer for the evening was Mr. Jas. Boyd, gardener to Sir Allan Seton-Steuart, Bart., of Touch. The subject was "Vegetables." The kinds discussed upon were Potatoes, Leeks, Onions, Celery, Peas, and Cauliflower. After giving the history of these vegetables the lecturer described in detail the proper methods of cultivating them.

SALISBURY AND DISTRICT GARDENERS'.—A meeting of this society was held on the 13th inst. Mr. S. W. Tucker, Longford Castle Gardens, presided over a fairly good attendance. A lecture on the "Cultivation of the Sweet Pea for Exhibition and General Purposes" was given by Mr. Usher. The lecturer dealt with the preparation of the soil and the different methods of cultivating the Sweet Pea, advising the use of shade for certain varieties. Mr. Usher gave a comprehensive list of varieties. *J. Y.*

CHISLEHURST GARDENERS'.—The annual meeting of this society was held at the Park Road Hall, Chislehurst, on Tuesday evening, October 5. The president, Mr. J. Lyne, presided. The chairman said that the association had been in existence for 19 years. They started in a small way, but now there were between 70 and 80 members. The 19th annual report stated that the 32 meetings held during the year had been successful. The sum of £16 10s. had been subscribed to the Royal Gardeners' Orphan Fund during the year. The Cray Valley Hospital had received the amount of £3, the half-profits of the autumn flower show. The income for the year had amounted to £8 13s. 7½d., and the expenditure to £10 0s. 9d. This deficiency is owing to the falling off of member subscriptions and to extra expenses. The officials were re-elected and the new committee appointed.

GARDENING APPOINTMENTS.

(Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.)

- Mr. H. J. KING, for the past 26 years Gardener to the late Mr. HART STEWELL, Esq., Ferney Hall, Ealop, as Gardener to Sir WM. HONSMAN, Cotton Hall, Whitechurch, Salop.
- Mr. T. PREECE, for the past 3 years Foreman at Heathfield Gardens, Addington, Croydon, as Gardener to E. JOHNSTON, Esq., Mendell, Bromborough, Cheshire.
- Mr. FRANK NOYCE, who for the past 7 years was Gardener and Bailiff to ALBERT G. SANDEMAN, Esq., Presdales, Ware, has been appointed (through Mr. H. W. WARD, of Rayleigh), to fill a similar position to TONMAN MORTLEY, Esq., Bangors Park, Iver, Bucks.
- Mr. C. CAPP, for the past 13 years Gardener to F. E. HOLLOND, Esq., Satis House, Yoxford, Suffolk, as Gardener to the same gentleman at Lerston Old Abbey, Saxmundham.
- Mr. EDWIN SIMS, Foreman at Holly Lodge for the past 11 years, has been appointed Gardener to W. BURDETT-COUTTS, Esq., M.P., in succession to Mr. J. WILLARD, who is shortly resigning. (Thanks for 6s. received for R.G.O.F. Box.)
- Mr. C. L. CAWRELL, for the past 24 years Foreman in the Gardens at Grantley Hall, Ripon, Yorkshire, as Gardener to F. STRAKER, Esq., Angerton, near Morpeth, Northumberland.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending October 16, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather.—The general condition was again very unsettled; rain fell almost daily (often in large quantities), and intervals of sunshine were mostly brief. Thunder and lightning, or lightning singly, were experienced in some parts of Ireland, Scotland and the north of England early in the week, and a thunderstorm occurred at Hull at midnight on Saturday.

The temperature continued above the average, the excess amounting to about 5° in England E. and the Midland Counties. The highest of the maxima were registered at most stations between the 10th and 12th; in England E., N.E., and N.W., and also in the Midland Counties the thermometer rose to 66°, while in the other districts the readings ranged from 65° in England S.E., S.W., and the English Channel to 60° in Scotland N. The lowest of the minima, which occurred generally on the 13th or 14th, ranged from 33° in Ireland N. and 35° or 36° in several other parts of the kingdom to 41° in England N.E. and to 43° in the English Channel. The lowest grass readings reported were 23° at Cambridge, 25° at Cirencester, 28° at Markeat Castle, 29° at Kew, Greenwich and Sheffield, and 30° at Llangamarch Wells, Crathes and Balmoral. The rainfall exceeded the normal in all districts except England E., the excess being very large in Scotland, Ireland, and the west and south of England. Falls of an inch or more in 24 hours were very numerous and were experienced over a large area in Great Britain—generally on the 12th, 13th, or 14th, but in a few western localities on the 15th. Among the largest daily measurements recorded were 1.4 inch at Douglas and Holyhead, 1.5 inch at Dunfermlie, and 1.8 inch at Aspatria on the 12th, 1 inch at Gordon Castle and Balmoral, and 1.2 inch at Leith on the 13th, 1 inch at Bettws-y-Coed, 1.1 inch at Pollalloch, 1.4 inch at Fort William, and 1.9 inch at Laude on the 14th, and 1.1 inch at Llangamarch Wells, 1.4 inch at Clifton, and 2.2 inches at Arlington on the 15th. Heavy falls were recorded at many places along the south coast, both on the 15th and 16th; at Southampton the aggregate amount for the two days was 1.5 inch and at Westbourne 1.7 inch. The bright sunshine was less than the average in most districts, the percentage of the possible amount of duration ranging from 33 in the Midland Counties and 31 in England N.E. to 21 in Ireland S., and to 15 in Scotland N. and W.

THE WEATHER IN WEST HERTS.

Week ending October 20.

St. Luke's little summer.—Since the month began the days have been with one exception more or less warm. The night temperatures have been also with three exceptions high, and some of them exceptionally high, for the time of year. On the warmest night of the past week the exposed thermometer never fell below 50°, which is with one exception the highest minimum reading registered by that thermometer during the last 23 years. The ground is still very warm, being 3° warmer at 2 feet deep, and 5° warmer at 1 foot deep, than is seasonable. Rain has fallen on all but five days this month, and to the total depth of 2½ inches. During the same period nearly 11 gallons of rainwater has come through the bare soil percolation gauge, and 9½ gallons through that on which short grass is growing. Although two days proved altogether unless the sun shone on an average during the week for three hours a day, or for about the usual duration at this time of the year. The winds were again as a rule rather high, but in no hour did the mean velocity exceed 13 miles. The average amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by 8 per cent. E. M., Berkhamsted, October 20, 1909.

CATALOGUES RECEIVED.

- WHITELEG & PAGE, The Nurseries, Chislehurst, Kent.— Hardy Herbaceous and Border Plants, Alpine and Rock Plants, Fruit and Ornamental Trees and Shrubs, Bulbs.

MARKETS.

COVENT GARDEN, October 20.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Cut Flowers, &c.: Average Wholesale Prices.

Table with columns for flower types (Asters, Azaleas, Carnations, etc.), quantities (per dozen, per bunch, etc.), and prices (s.d., s.).

Cut Foliage, &c.: Average Wholesale Prices.

Table with columns for foliage types (Adiantum, Agrostis, Ivy-leaves, etc.), quantities (per dozen, per bunch, etc.), and prices (s.d., s.).

Plants in Pots, &c.: Average Wholesale Prices.

Table with columns for plant types (Ampelopsis, Aralia, Begonia, etc.), quantities (per dozen, per pot, etc.), and prices (s.d., s.).

Fruit: Average Wholesale Prices.

Table with columns for fruit types (Apples, Bananas, Grapes, Lemons, etc.), quantities (per bushel, per case, etc.), and prices (s.d., s.).

Vegetables: Average Wholesale Prices.

Table with columns for vegetable types (Artichokes, Beans, Beetroot, etc.), quantities (per dozen, per bushel, etc.), and prices (s.d., s.).

REMARKS.—English Tomatoes are a short supply and dealer. Foreign Tomatoes are arriving in a good condition and are selling freely at 10s. per bundle of four boxes, each box averaging about 14 or 16 lbs. Cucumbers are firm in price but they do not meet with a good demand. Home-grown Beans are making good prices. Blackberries are a poor trade, and very plentiful. Grapes are selling well, good samples making fair prices. Pears are a poor trade, there being little or no demand for them. Apples are selling freely. Good Cox's Orange Pippin Apples, packed in trays of about two dozen fruit, sell readily, especially those of the highest grade; small fruits of this variety are very plentiful. Pineapples are a little firmer in prices. West Indian Claret-coloured Bananas arrived yesterday and made good prices. French Plums are arriving in very limited quantities, and Damsons are practically finished. There is a good demand for French Walnuts which are now arriving in large quantities. Almeria Grapes are selling freely and consignments are increasing. Large shipments of Nova Scotian Apples and Californian Fruit will be sold at the end of this week. Trade generally is good. E. H. K., Covent Garden, Wednesday, October 20, 1909.

Potatoes.

Table with columns for potato varieties (Bedfords, British Queen, etc.), quantities (per cwt., per bushel, etc.), and prices (s.d., s.).

REMARKS.—Although there are large stocks of Potatoes in the London markets, tubers of the best quality are scarce. Trade otherwise is very quiet. Eds. J. Newbery, Covent Garden and St. Pancras, October 20, 1909.

COVENT GARDEN FLOWER MARKET.

Supplies are not so abundant, and the value of all good produce has advanced, except for Chrysanthemums cut from the open ground, of which there is quite a glut. Some are very good, but others have been disfigured by the rains. Chrysanthemums from under glass are very good, and white blooms have been making fair prices, some of special quality selling for as much as 5s. per dozen. The yellow and bronze varieties have not sold so well. Roses vary considerably; the best blooms have advanced in prices, those of the variety Mrs. J. Laing to 3s. per dozen. Liberty and Richmond also are in demand, but since white Chrysanthemums have been plentiful Roses have not sold so well. Carnations do not vary much. There are some good flowers of Souvenir de la Malmaison varieties which make from 6s. to 9s. per dozen, but the American varieties are not worth more than 2s. 6d. to 3s. per dozen, and many are sold at 1s. for this quantity. Blooms of Lilium longiflorum have been making rather better prices, but L. lancifolium (speciosum) is cheaper. Lily of the Valley is again very cheap, except the very finest spikes. Tuberoses are plentiful, also Gardenias, Stephanotis, and white Lapagerias. Michaelmas Daisies would sell better if greater care were taken when cutting and bunching them. Since the Harvest Festivals have past Dahlias scarcely pay for the trouble of cutting them. Late Asters also are of little value.

POT PLANTS.

Chrysanthemums may be had at prices ranging from 30s. to 6s. per dozen, and some for even less. Ericas have not been selling well, except the small plants; there is an increasing demand for well-flowered plants in thumb pots. I learn from the salesmen that *E. hymenalis* is not likely to flower well this season. *Begonia Gloire de Lorraine* is seen in well-flowered plants. There are several varieties which have originated as sports, but a selected stock of the original form is still the most desirable. Cyclamen are fairly good. On Saturday last I noticed plants of *C. cicutaria*; they were not equal to those seen in the spring, although fairly good. Solanums are well berried, but the plants are small. *Spiraea Queen Alexandra* varies in colour, but is well flowered. *Marguerites* are good. *Bouvardias* are not quite so well flowered as usual at this season. A few Zonal Pelargoniums are seen, chiefly of the variety *F. V. Raspail*. In foliage plants there is little that is fresh to record. Ferns, Palms, Aralias, Cyperus, *Ficus*, *Araucaria excelsa*, and *Aspidistras* are all of good quality. Hardy Shrubs are procurable in great variety, also climbing plants and various creepers. *A. H., Covent Garden, October 20, 1909.*

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

ADDRESSES: Brussels. *Revue de l'Horticulture Belge et Etrangère*, rue de Bruxelles, 154. Ghent: *La Tribune Horticole*, 43, Rue Vonck, Brussels. You will find addresses of Belgian nurserymen in the advertisement columns of these weekly journals.

BOUVARDIA SHOOTS UNHEALTHY: *F. W. B.* No disease is present. The trouble has evidently arisen from excess of moisture in the greenhouse.

BOWLING GREEN: *C. C.* The injury is caused by a minute fungus—*Chlorochytrium graminii*. Soak the ground at intervals of a fortnight with a solution of sulphate of iron, 1 lb. in 1½ gallon of water.

CALANTHE LEAVES DAMAGED: *F. W. I.* The foliage of the deciduous Calanthes decays and drops in the ordinary manner when the pseudobulbs are mature. The leaves sent seem to have been damaged either by cold or some other agency, which has brought about a premature collapse of the tissues. Calanthes which have been given strong doses of liquid manure are very apt to decay like those you send. If the growths are fully matured, restrict the water supply, in order that they may ripen.

CARNATIONS DISEASED: *H. G. C.* The rust is *Uromyces caryophyllinus*. Sponge the foliage with a solution of potassium sulphide. Badly diseased leaves should be removed. The red maggots follow the rust and feed on its spores.

CHRYSANTHEMUMS: *J. R.* The absence of sunshine this season has had much to do with the backward development of the flowers. The only thing to do is to give fire-heat and plenty of fresh air. Too much surface moisture prevents the proper development of Chrysanthemum flowers.

CHRYSANTHEMUMS UNHEALTHY: *E. P.* No disease is present, and the damage has not been caused by insects. The trouble must be due to improper cultural treatment.

CONSERVING FRUITS AND VEGETABLES: *A. D. C.*

You will find much useful information upon this subject in *The Art of Conserving*, by Viscountess Galway, also in a recently published work entitled, *Successful Jam Making and Fruit Bottling*, by Lucy H. Yates (see p. 275). The books can be obtained from our Publishing Department. Almost all the Horticultural Educational Institutions include fruit-preserving in the curriculum, and at Lady Warwick's School of Gardening a special feature is made of this subject. Write to Miss Bradley, Hellingbourne, formerly Principal, who will no doubt be pleased to give you information on the subject.

EMPLOYMENT IN KEW GARDENS: *V. C. H.* The training and experience you would receive in these Botanic Gardens should be of the greatest value to you in any branch of gardening you may afterwards take up. Those who pass through the term of two years at Kew find employment afterwards in many different walks of the profession, very few being actually employed in botanical gardens, as the opportunities are few.

GARDENER'S NOTICE: *A. T.* It is customary for head gardeners to receive or to give a month's notice on terminating an engagement, even though the wages are paid weekly.

HEDGE: *A. K.* There is no disease present on the shoots, but they are covered with algae and lichens. The growth of these lowly plants has been favoured by the drip from the Laburnum tree which overhangs the hedge. If you do not wish to replant the hedge spray the bushes with the winter wash recommended to *E. B.* in last week's issue, page 272.

MEALY BUG: *D. M.* You should state what species of plants are affected with this pest. Certain remedies are recommendable in some cases that could not be used conveniently in others.

MELON: *J. C. M.* There is no disease on the fruit. The splitting or cracking arises from unequal growth, due to imperfect regulation of heat and atmospheric moisture.

MOULD ON GRAPES: *W. B.* The mould is *Botrytis cinerea*, which only becomes a parasite when excess of moisture is present. Early morning ventilation will prevent the disease.

NAMES OF FRUITS: *Yellow Cardboard Box* (no letter). 1, decayed; 2, Fondante d'Cuernie; 3, Beurré Sterckmans; 4, Nouvelle Fulvie; 5, Reine des Tardives; 6, Hollandbury.—*J. Jones*. Ribston Pearmain.—*R. Jolly*. 1, Louise Bonne of Jersey; 2, Autumn Bergamot.—*R. Smith*. R.* Your Walnuts are already correctly named—*Juglans regia* and *Juglans nigra*.

NAMES OF PLANTS: *H. W.* *Cannabis sativa*.—*Rondbosch, Cape Town*. *Heliopsis laevis*.—*A. J.* *Prunella vulgaris*.—*Exhibitor*. *Dianthus Heddewigii* is generally an annual, but under certain conditions it may survive the winter.—*A. B. H.* 1, *Pentstemon campanulatus* var.; 2, *Erodium Manescavi*; 3, *Geranium Traversii* var. *elegans*; 4, *Symphy-*

andra Hofmannii; 5, *Campanula lactiflora*; 6, *Sollya heterophylla*; 7, *Geranium striatum*.—*Tom Martin*. 1, *Sidalcea* sp. (cannot name without flowers); 2, *Helleborus foetidus*; 3, *Helenium autumnale striatum*; 4, *Azara microphylla*; 5, *Spiraea filipendula*; 6, *Symphoricarpos orbiculatus variegatus*; 7, *Geranium* sp. (cannot name without flowers).—*W. A. D.* We do not undertake to name varieties of Roses.—*C. J.* 1, *Adiantum decorum*; 2, *Adiantum formosum*; 3, *Adiantum Capillus Veneris*; 4, *Selaginella Willdenovii*; 5, *Nephrolepis Todaeoides*; (thanks for one shilling, which has been placed in the Gardeners' Orphan Fund box).—*G. J. D.* 1, *Saponaria officinalis* fl. pl.; 2, *Arbutus Unedo*.—*J. F. S.* *Desfontainea spinosa*.—*W. E.* *Aranjia sericea* (syn. *Physianthus albens*); the other specimen cannot be named with certainty—send when in bloom.—*E. D. S.* *Helix Soleirolii*.—*H. O. R.* 1, *Sarcantus erinaceus*; 2, *Bulbophyllum hirtum*; 3, *Oncidium prae-textum*; 4, *Masdevallia nidifica*; 5, *Octomeria Loddigesii*; 6, *Pleurothallis* sp.—*F. W. I.* 1, *Acalypha musaica*; 2, *Acalypha marginata*; 3, *Hibiscus rosa sinensis*; 4, *Chlorophytum elatum variegatum*.—*W. J. W. & Co.* *Crinum Moorei*.—*H. S.* *Kenilworth*. 5, *Eranthemum pulchellum*; fruit next week.—*Urgent*. *Pteris serrulata*.—*Foreman*. 1, *Oncidium flexuosum*; 2, *Brassia verrucosa*; 3, *Stelis ophioglossoides*; 4, *Lycaste tricolor*.

PEARS SPLITTING: *Mrs. C.* The Pears are attacked by scab, caused by the fungus *Fusicladium primum*. During winter spray the trees with sulphate of iron, and again in the spring with Bordeaux mixture. The latter specific should be used when the buds are unfolding, again when the flowers are falling, and finally when the fruits have set.

PERNETTYA MUCRONATA: *J. P.* The flowers are hermaphrodite and not dioecious, as you suggest. The failure to set fruit may be due to more than one reason. Perhaps the plants have not recovered sufficiently from their disturbance, or the weather may have been unfavourable when they were in bloom. Next season tap the shoots when the plants are in flower, in order that the pollen may be dispersed.

RED SPIDER ON LIME TREES: *H. A.* The insects are true Acarids, known as "spinning mites," and are nearly related to the so-called Red Spider (*Tetranychus*). All the species of this genus spin a fine thread, and when the mites occur in large numbers the threads take the form of a dense web, as in your example. When these Acarids occur in large numbers, they cause injury to the foliage. We advise you, therefore, to destroy the webs with paraffin emulsion applied, if possible, with a stiff brush.

VIOLET CULTURE: *A. B.* As your soil is gravelly, the plants would not be so liable to damping as those grown on heavier land. It will be necessary for you to employ frames, as by their means you can have the plants entirely under control. In the issue of the *Gardeners' Chronicle* for April 11, 1908, p. 234, the details of successful Violet culture were described. Amongst the best varieties for your purpose are Princess of Wales, Marie Louise, Neapolitan, and White Comte de Brazza.

WALNUTS: *J. S. D.* No disease is present. Try the effect of an application of lime, preferably in the form of old mortar rubble.

WELCH FERN: *J. C. B.* The Fern is *Asplenium trichomanes*, or Maidenhair Spleenwort. It is easily raised from spores, produced in short lines on the back of the fronds. It is a common Fern in many places, and it can be got from any nurseryman dealing in hardy Ferns. No heat is required to raise sporelings. The spores should be scattered thinly on loam in small pots or plans, and covered with glass until growth is observed.

WONDERBERRY: *R. M.* You will find a note on the Wonderberry in the issue for March 27, 1909, p. 204.

AMERICAN HAWTHORNS.

SOME NEW ARBORESCENT SPECIES.

DURING the past ten years a large number of new species of *Cratægus* have been discovered and described in North America, from Texas to Quebec, and in the regions around the Great Lakes. In Western New York, Pennsylvania, and Southern Ontario, Canada, to the valley of the St. Lawrence, they are particularly abundant, and these regions perhaps contain a larger number of handsome, arborescent species than are to be found elsewhere in the United States. Most of the species have been described by Dr. C. S. Sargent, Director of the Arnold Arboretum, Harvard University.

The various species in the different groups are all relatively useful in the decoration of parks and gardens, showing much individuality in their branching habits, foliage, flowers and fruit. It is proposed to call attention, in the present contribution, to some distinctively handsome species in the group known as *Flabellate*. The species in this group are usually characterised by large, oblong, ovate, and more or less acutely and deeply lobed leaves; large, short-oblong, bright red fruits with succulent flesh; and

more or less villose or pubescent flowering and fruiting corymbs.

The following species have all been observed by the writer in the field:

CRATÆGUS ACCLIVIS, when fully developed, forms a slender tree 30 feet high, with a thin, very pale trunk, usually not more than 6 inches in diameter. The branches are upright, and form a thin, open, irregular head. The leaves are broadly ovate to ovate-oblong, and very deeply and coarsely toothed, truncate to subcordate at the base, 3 inches long, and 2½ inches wide. The five-stamened flowers with pink anthers blossom about May 25. The subglobose to short-oblong, bright red, large, conspicuous, hairy fruits, with coarsely and deeply serrate calyxlobes ripen about the middle of September. The type tree grows at the Lower Falls on the Genesee River at Rochester, N.Y., and is a common species on the banks of the Genesee River, and throughout Western New York and Ontario, Canada. *C. acclivis* is remarkable for the facts that its flowers have so few stamens (usually five), and that its fruits have as many as five nutlets.

C. AULICA occasionally grows to a tree 20 to 25 feet tall, with slightly spreading and mostly ascending branches, forming a round topped head with a trunk 10 to 12 inches in diameter; but is sometimes a tall, spreading shrub. The leaves are ovate acuminate, round at the base, sometimes subcordate, and are 3½ inches long and 2½ inches wide. It usually blooms from May 28 to June 5. The corymbs are from 15 to 18 flowered, and the flowers are borne on long, hairy pedicels, with eight to 10 stamens and red anthers. The drooping clusters of subglobose, lustrous, orange-red fruits ripen about October 1, and are about ¾ inch in diameter. The calyx cup is distinguished by a deep, wide cavity with persistent lobes incurved towards the centre. The type tree grows in Bracondale, a suburb on the north side of Toronto, Canada. It is quite abundant in the neighbourhood of Toronto, and at Belleville, on the Bay of Quinte, and elsewhere along the valley of the St. Lawrence. *Cratægus aulica* usually occurs in its best condition in open pastures in rich, heavy soil, and grows rapidly in cultivation. It is unusually handsome in October when covered with its brilliant fruits.

C. CONNIXIS sometimes forms a handsome tree 25 to 30 feet in height, with a trunk 10 inches in diameter. The branches are usually ascending, but in old trees they form an irregular, broad head. The ovate acuminate leaves, which are abruptly rounded at the base, are normally 3 inches long and 2 inches wide. They are frequently much more decidedly oblong, and in this respect the leaves bear a strong resemblance to those of *C. Holmesiana*, to which species the writer referred it previously. The five to eight-stamened flowers, with rose-coloured anthers, are borne on 10 to 12-flowered hairy corymbs and blossom about May 30. The handsome, short-oblong to subglobose, orange-red fruits, on drooping clusters, ripen about September 25. The type tree grows in the village of Chippewa, Ontario, about five miles south of Niagara Falls. It appears to be quite common on the banks of the Genesee River, in Western New York, in Monroe County.

C. CHIPPEWAENSIS forms a low branching tree, or an arborescent shrub 15 to 20 feet high, with spreading and ascending branches and an irregular, open topped head. The leaves are usually oval in outline, rounded at the base, 2¾ inches long and 2 inches wide. The 20-stamened flowers, with pink anthers, are borne on 12 to 15-flowered, hairy corymbs, and blossom about May 26. The crimson, oblong obovate fruits ripen about the end of September and soon fall. As the specific name indicates, this grows in the village of Chippewa, and, as far as I am aware, it has not been reported from any other locality.

C. DAYANA usually forms a small, low branching tree, from 15 to 18 feet high, with spreading horizontal branches, and a compact, shapely head. The leaves are very broadly ovate, slightly rounded at the base, and about 4½ inches long and 3½ inches wide. On vigorous shoots the leaves attain a large size, and they are perhaps larger than in any other *Cratægus* species with which the writer is familiar. The 20-stamened flowers, with pink anthers, borne on loosely branched 10 to 14-flowered hairy corymbs, blossom from May 15 to May 20. The obovate, lustrous crimson fruits, which frequently taper at the base on the pedicels, and which are quite large, ripen from the end of August to the middle of September and quickly fall. The type tree grows on the east side of the grounds where the Pan-American Exhibition was held at Buffalo, N.Y., and near to the entrance of Delaware Park. According to present indications this species does not appear to be widely distributed. Dr. Sargent named it in compliment to the late David Fisher Day, a Judge of the Supreme Court of New York State, who resided at Buffalo, and who published a catalogue of the flora of Erie County.

C. GLORIOSA frequently forms a tree 25 to 30 feet high, with slightly ascending branches and a broad, symmetrical head; but sometimes in old trees the head is irregular and open, the trunk 7 to 8 feet high, and 15 inches in diameter. The leaves are ovate, and usually rounded at the base, but occasionally inclined to be truncate, somewhat coriaceous and conspicuous with a marked convexity of surface, and normally 4 inches long and 3½ inches wide. The 7 to 10-stamened flowers, with blush-white anthers, are borne on lax, drooping, 10 to 15-flowered, slightly villose corymbs, and bloom about May 25. The large, lustrous, bright crimson, short-oblong fruits, much flattened at the apex, and tapering on the pedicel and usually displaying distinct mammillate processes adnate to the fruit-stalks at the insertion of the fruits, and with comparatively small calyx lobes, distinctly erect, ripens about the middle of September. The type tree grows on the north side of the City of Rochester, N.Y. It is distributed throughout the Genesee Valley to Buffalo, N.Y. The prominent, white flower clusters of *C. gloriosa* are very showy in spring, and when an adult tree is covered with its brilliant fruits in September, it is an object of unsurpassed beauty. *C. gloriosa* is one of the handsomest Hawthorns of North America for parks and gardens. *John Dunbar, Rochester, New York, U.S.A.*

(To be continued.)

THE ALPINE GARDEN.

LIME-LOVING PLANTS

MR. ARNOTT is so keen an observer of the likes and dislikes of Alpine plants, that anything he may say on this subject (see p. 246) is worthy of careful consideration. Experience shows, however, that a considerable proportion of lime is by no means essential to many supposed lime-loving plants; indeed, in some instances, it appears to be a hindrance to cultivation. As Mr. Arnott rightly observes, the Alpine Pinks and hardy Cyclamen are reputedly lime-loving, but we see them in better condition when planted in peat, loam and leaf-mould in about equal parts, and in very sandy soils adjacent to the red-sandstone rock, or in company with *Nephrodium felix-mas* and other Ferns beneath the shade of trees, where much lime is not found. Certain species of hardy Orchids are found growing chiefly in chalk, but in gardens when provided with a similar mixture they fail. *Helianthemums* grow wild on the chalk of Mickleham Downs in Surrey, and on the oolitic limestone of the Cotswolds, yet they grow more vigorously in common garden soils. The clear, golden yellow *Coronilla iberica* is, when seen in good condition, something all gardeners admire, and I have seen plants of it in two widely separated gardens this year under very opposite conditions. In the one it was growing in brick earth on a rockery made of Dartmoor granite; in the other it was on a rockery where the soil was loam over chalk. The plants in the former situation were in the fullest vigour, draping 4 feet or more of the granite rock with blossoms of the richest yellow, whilst those in the latter was so poor in colour as to be unattractive.

Of *Lithospermums*, *L. purpureo-caruleum* is a lime-loving plant, and rarely happy without it,

FIG. 127.—*SOLANUM NIGRUM* (FROM BRITISH WILD SPECIMENS).

FIG. 128.—MR. BURBANK'S "WONDERBERRY."

whilst *L. prostratum* is often a puzzle, whether growing in much lime or not. At Westwick, near Norwich, in a soil that may be regarded as an ideal, hardy heath soil, the plant is virtually a weed, its extending growths covering the ground by the yard; hence not lime, but some local influence must be causing the remarkable growth. The *Aubrietias* may be seen both draping many feet of a sandstone wall, and forming sheets of colour at the base of the same wall, in a soil of a sticky clay mixture. Some few years ago *Saxifraga Kolenatiana* failed to succeed, and, turning the plant out of its pot, I found the soil composed of nearly one half of chalk. The chalk having been shaken away, the plant was potted afresh in light, sandy loam, and a considerable improvement was observed. Greater success, however, was achieved when subsequently a portion of the stock was planted in nothing more than pit sand and fine gravel. Nearly 30 years ago, when using for potting the then famous Baustead loam, which was taken from chalk land, I was surprised to find that plants generally would not do well in the soil. My greatest surprise was caused by the growth of *Daphne odora* (*indica*) *rubra* and *D. o. alba*, which, usually seen in a yellow and sickly condition, almost at once developed a vigour like that of Laurels. *Daphnes* at that time were invariably potted in a peaty soil, hence this experience was the more striking.

My conclusions are that, while the grower of Alpines may safely regard a list of lime-loving plants as a serviceable basis to work upon, he must not regard lime as essential for any particular species of plants. There are so many other influences at work—altitude, water, environment and the like—that often enough the unorthodox way will be found in not a few instances to produce surprisingly good results. *E. H. Jenkins.*

SAXIFRAGA GRISEBACHII.

PROBABLY owing to the excess of moisture and little sun-heat experienced this year, some fine, mature rosettes of a good plant of this species are making a secondary growth, each being already elongated in its characteristic way to the extent of 1 inch or more. In extending to form the mature, or adult, rosette, the growth which proceeds from the central portion of the old rosette first assumes an erect column-like outline, the apical portion being recessed or

THE WONDERBERRY.

In the *Gardeners' Chronicle* for March 21 (p. 204) attention was called to the danger of accepting as a food-plant a form of *Solanum nigrum* which had been distributed by an American nurseryman under the name of "Wonderberry." Its origin was stated to be as follows:—

"This absolutely new species of berry plant (Wonderberry) is of great scientific interest, having been produced by the combination of two

they are nothing more than forms of *S. nigrum*, a cosmopolitan weed, generally considered to be poisonous. Assuming that Mr. Burbank had in his possession living examples of these two plants, it is extremely unlikely that as the result of crossing them he would obtain seedlings having all the good qualities attributed to the Wonderberry. *Solanum nigrum* is a very variable plant; there are greater differences between some of the forms of it than are evident in the two forms known as the British one and the so-called Wonderberry; for example, the Canadian form, known as Huckleberry,* is quite different from either of them, and yet it is *Solanum nigrum*. Questions of nomenclature and botanical differences do not, however, matter much when the food qualities of a plant are under consideration: the proof of the pudding is in the eating. The Wonderberry might be a form of *Solanum nigrum*, and yet have edible fruit good enough to be made into jams, &c. To test it, therefore, we grew this summer plants of the Wonderberry raised from seeds supplied by Mr. L. Childs, and by the side of them we also grew plants of the Canadian Huckleberry, and some of the common British form of *Solanum nigrum*. When the fruits were ripe, some of each were sent for examination to Dr. M. Greshoff, of Haarlem, one of the first authorities on vegetable poisons. His report, which will be published in full in the *Kew Bulletin*, is to the effect that all three forms contain poison (Solanin), the least poisonous being the British and the most poisonous the Wonderberry! Dr. Greshoff says that he cannot recommend the use of these fruits as food, because, although they may differ in the amount of poison they contain according to the conditions under which they may be grown, it will always be dangerous to eat them, and especially so for feeble children. Vegetable poisons vary in their effects upon different people; for example, the American poison Ivy, *Rhus Toxicodendron*, may be handled with impunity by many persons, including myself (I have rubbed its sap on my face without experiencing any ill effects), yet there are many who cannot touch the plant without suffering severe consequences. W. W.

FIG. 129.—SOLANUM NIGRUM (NORTH AMERICAN VAR. KNOWN AS THE HUCKLEBERRY).

cupped, and the entire circumference of the column furnished with linear, imbricated leaves, which finally form the flattish rosettes characteristic of this species. I am interested to know what is likely to happen in such a case, but fear very much that wet and frost may injure this second growth. Some other members of the genus are by no means in character this season, for, instead of being fully mature, with the promise of a good flowering, they appear as in June, when growth is natural. E. H. Jenkins.

very distinct wild species, *Solanum guineense* of West Africa and *Solanum villosum* of the West Coast of America. Neither of these wild species bears edible berries, but this new species bears the most delicious, wholesome and healthful berries in the utmost profusion and always come exactly true from seed." LEATHER BURBANK.

It is extraordinary that Mr. Burbank or any other gardener should have in cultivation these two *Solanums*, and still more so that he should think it worth while to cross them, seeing that

SCOTLAND.

ROSES IN SOUTH-WESTERN SCOTLAND.

Roses that are usually, but somewhat erroneously termed "perpetual," are in this mild and moist region of Scotland almost worthy of that name. At the present trying season of winds and rains, with occasional interludes of short-lived frost, I have many fine varieties in bloom, conspicuous among these being Margaret Dickson (flowering through old Apple trees, and above very high Hawthorn hedges at a height of 18 feet); Duchess of Albany, a dark-coloured, richly fragrant descendant from La France; Aimee Vibert and Mme. Georges Brunt, blooming, like their Irish contemporary, in a similar situation, at an almost equal elevation; Captain Hayward, a most valuable, late autumn-flowering variety, whose importance at this season can hardly be overestimated; J. B. Clark, whose plum-coloured aspect is highly distinctive; Frau Karl Druschki, the grandest of all pure white Roses, though it has but little fragrance; Caroline Testout, Lady Helen Stewart, the dark-shining Salamander, Mme. Pernet Ducher, Papa Gontier, and Bouquet d'Or. The Roses that succeed best in this district of Scotland are the Hybrid Perpetuals, Chinas, Polyanthas, Wichuraiana Hybrids, especially Hiawatha, Dorothy Perkins and Lady Gay; and, above all, as I have already indicated, the invaluable Hybrid Teas. In this region we have usually a superabundance of moisture in late autumn and early winter. By reason also of our peculiarly peninsular situation, with the sea lying to us at all seasons from the west the migrating

* The true Huckleberries are species of *Gaylussacia* (*Acornium*).

influences of the genial Gulf Stream, we enjoy, as a general rule, an enviable immunity from severe frost. Even when frost comes upon us with abnormal intensity, it is generally accompanied, and greatly mitigated—as it was last winter—by heavy falls of snow. This has not infrequently proved the salvation of the Austrian, Persian, and Penzance Briars, and the more delicate Teas.

Noisette Roses, in Southern Scotland, are not conspicuously successful; such tender varieties as Cloth of Gold and Marechal Niel needing almost invariably to be grown under glass. The most successful varieties, according to my experience, are Wm. Allen Richardson and its radiant derivative, Mme. Pierre Cochet; Aimée Vibert, which flowers much too late in my garden to be effective, Mme. Alfred Carrière, an almost pure white, sweetly fragrant and floriferous Hybrid Noisette, and Bouquet d'Or. Among Tea Roses, whose name is legion, those that succeed best are Catherine Mermet, Devonensis, Coralina, Anna Olivier, Melea (a magnificent lemon-coloured variety), Perle des Jardins, Molly Sherman Crawford, Souvenir de Stella Gray, Souvenir d'un Ami, and S. de S. A. Prince.

The most profuse bloomers among Hybrid Teas are Viscountess Folkestone, Cheshunt Hybrid, the first introduction of this race, still indispensable as a free-flowering Rose of aspiring habits; Caroline Testout, an enormous variety of remarkable vigour and great floriferousness; and Clara Watson; while other notable Hybrid Teas that succeed well in Southern Scotland are Gloire Lyonnaise, erroneously described as a pale yellow variety, for it is almost pure white; Bardou Job, profusely flowering with dark velvety petals, scarlet flashing through maroon; Marquis of Salisbury, with luminous, miniature, crimson flowers; Gustave Regis and Mme. Pernet Ducher, two of the most charming French Hybrid Teas. *David R. Williamson.*

NOTICES OF BOOKS.

* SPRING FLOWERS AT BELVOIR CASTLE.

IN this book Mr. W. H. Divers, the head gardener to his Grace the Duke of Rutland, has written a very interesting and readable volume of over 100 pages, excellently printed, and adorned with 32 photographic views from the author's camera. Although the gardens at Belvoir Castle, Grantham, have been famous for many years for their delightful displays of spring flowers, Mr. Divers does not confine himself to them, but writes also of the beautiful trees and shrubs—many of them of great historic interest—and of the kitchen garden. The author not only describes the best kinds of plants suitable for spring bedding, but also shows what splendid effects can be produced early in the year by judicious combinations of bulbous and other plants. Tulips, Daffodils, Hyacinths, Violas, Wallflowers, Forget-me-nots, Primroses, Polyanthus, White Arabis, Yellow Alyssum, Daisies, and many other plants are effectively used to make Belvoir Castle one of the most attractive gardens in the kingdom. This practice, as Mr. Divers tells us, was carried out by his predecessor, the late Mr. W. Ingram, when only very few gardeners in the kingdom attempted anything of the kind.

"Previously, flower-beds were for the most part bare of plants in winter time, or were, in some instances, covered with broken bricks, broken coals, and small white stones. Spring-bedding is a great improvement on this system, as the beds are covered with plants again as soon as the summer occupants are removed, and thus present a green appearance all the winter, with the addition of a number of flowers on many of the plants, whenever the weather is not too frosty."

Mr. Divers points out that level surfaces do not lend themselves so well to landscape effects as a wide range of variation in altitude and undulation, and insists that much may be done by artificial means to produce hills and hollows to be

* *Spring Flowers at Belvoir Castle*, by W. H. Divers. (London: Longmans, Green & Co.) Price 5s.

clothed with suitable plants, including trees and shrubs as well as perennials, herbaceous plants, and Alpines. The development of the garden at Belvoir has been the work of centuries, probably starting with Robert de Todeni, the founder of the estate, who came over from Normandy in 1066 with William the Conqueror. *J. H.*

* THE DOUM PALM.

WE lately presented our readers (p. 87 of the current volume) with some particulars of Dr. E. Beccari's monograph of the Palm genus Calamus. Of no less interest is his contribution to our knowledge of the Doum Palm, or, rather, Palms, published in a periodical not likely to come under the notice of many of our readers. It is commonly supposed that there is only one species of Doum Palm, namely *Hyphæne thebaica*, though it was known that there were several species of *Hyphæne*; but Dr. Beccari describes and figures about a dozen new species, and expresses the opinion that, taking the whole of Africa, the species are numerous, certainly exceeding 50. Preceding the descriptive part is an account of the products of the Doum Palms, all of which are very valuable, though the qualities of the fibre, fruit, and seed vary in different species. The species are spread over the whole of tropical and sub-tropical Africa, from mid-Egypt to Natal; some also occur in Senegal, in the west, and in the district of Bornu and also in the region of Lake Tchad in Central Africa. But, strange to say, as mentioned in our recent notice (p. 265) of Durand's *Flora of the Congo Free State*, the author had no reliable record of any species occurring within that vast area. However, there is a specimen in the Kew Herbarium named *H. thebaica*, from Gondokoro, British East Africa, close on the north-eastern boundary of the Congo, collected by M. T. Dawe. Outside Africa the genus *Hyphæne* is represented in India and Ceylon, and more numerous in Madagascar and Arabia. A very remarkable species exists in the last-named country, to which Dr. Beccari has given the provisional name of *H. reptans*. It is described by the collector as having a trunk only about a foot high, but already branched with the branches lying on the ground. It was collected by W. Lunt on Theodore Bent's expedition in 1894, and is preserved in the Kew Herbarium. At present the new species are mainly distinguished by the fruit, which varies greatly in shape and size. Some are Pear-shaped, others are broadest at the base or in the middle, whilst others, again, are oblong or almost spherical. In size the fruit varies from 1½ inch to 3½ inches in its greatest diameter.

† THE CULTIVATION AND PREPARATION OF PARA RUBBER.

TO Mr. W. H. Johnson belongs the distinction of having, some four years ago, written the first treatise devoted exclusively to Rubber. As might have been expected, when the rapid growth of the rubber industry and the excellence of Mr. Johnson's text-book were considered, the first edition was soon exhausted.

The present, second, edition has been thoroughly revised and extended to include a wider range of information. The statistics relating to rubber afford the raw material for a striking chapter in the romance of modern industry. From 1770, when Priestly recommended its use for erasing lead-pencil marks, till the twenties of last century, when Macintosh began to manufacture waterproofs, the use of rubber was remarkably limited. The extension of its employment dates from 1836, when Thomas Hancock discovered that crude rubber, cut up, pressed and heated, could be moulded

* *Le Palme dum of Hyphæne*, a più specialmente quello dell'Africa Italiana. Agricoltura Coloniale, Anno II., 1908, pp. 137-189. The Doum Palms or *Hyphæne*, and more particularly those of Italian Africa.

† *The Cultivation and Preparation of Para Rubber*, by W. H. Johnson, F.L.S. (London: Crosby, Lockwood & Son.) 7s. 6d.

into almost any shape, and when, in 1874, the method of vulcanising rubber by heating and treating it with sulphur was discovered.

From that date the imports of rubber into this country have increased enormously, and on the whole steadily, from about 150,000 cwts. in 1874 to 194,000 in 1886, 430,000 in 1896, and 600,000 in 1906.

It is a remarkable fact that, of the rubber consumed throughout the world in 1906, almost one-half was derived from rubber imported into this country. It is also noteworthy that more than half of the rubber used is Para rubber, that is, material derived from the latex of species of *Hevea*, and chiefly from that of *H. brasiliensis*. Now that so much capital and industry are being put into the cultivation of rubber-producing trees, it is interesting to note the attempts to produce rubber synthetically. Already various "rubber substitutes," manufactured from the seeds of Poppy, Rape, Flax, &c., are in use for mixing with crude rubber for special manufactures; but, so far, all attempts at the artificial manufacture of the genuine article have failed. He would be a rash man, however, and one ignorant of the wonderful fertility of resource of organic chemistry who predicts that synthetic rubber is an impossibility. The main reason why its manufacture is likely to prove difficult lies in the fact that rubber is not a single substance, but a mixture of complex compounds such as proteins, resins and caoutchouc. The significance to the tree of the latex from which crude rubber is prepared is doubtful. Most authorities regard it as a waste product of vegetable metabolism; but the author, having regard to its widespread distribution in plants, is inclined to think that it plays some part, albeit a small part, in the economy of plants. Mr. Johnson has given a most comprehensive account of the various processes connected with the cultivation and preparation of rubber, and brings out incidentally the prominent part—on which we have more than once insisted in these pages—played by British colonies, particularly by Ceylon and Malaya, in introducing rubber plants for cultivation.

From his estimates of cost it would appear that the cultivation of rubber is an extraordinarily profitable industry; but as to whether at the present prices of rubber shares it is a profitable investment the author is properly silent.

In conclusion, we would say that Mr. Johnson has written an admirable book, interesting not only to the expert but also to the layman who takes an intelligent interest in the progress of agriculture and of commerce.

* DUTCH BULBS AND GARDENS.

FEW could describe Dutch gardens and their bulbs in a more sympathetic manner than Miss Silberrad. The reader does not penetrate far into that portion of this interesting book without discovering that everything Dutch has for her a peculiar charm. Perhaps for that reason she voyaged to Amsterdam in a leisurely-trading Dutch vessel.

It may be that it is owing to her proclivity for the Dutch that the purely English horticulturist will not find much to suit his insular tastes. But then the book is about the bulb gardens of Holland, and certainly little transpires in these that is forgotten. We are told how Crocuses and winter Aconites are produced; all about Anemones and Ranunculi, which the authoress is grieved to see so little thought of at home. How the less hardy bulbs are protected in winter, and the diseased are rogued in summer, by workmen protected with umbrellas and armed with implements with which they uproot the offending plant. How flower-spikes and blooms are destroyed in order that the bulbs may be strengthened, with detailed accounts of their harvesting, storing, and propagation. But these and kindred

* *Dutch Bulbs and Gardens*, painted by Mima Nixon, described by Ana Silberrad and Sophie Lyall. (London: Adam and Charles Black.) Price 7s. 6d.

facts are little more than incidents which meet us in our passage through a gallery of pleasantly-arranged word-pictures. Miss Silberrad is a free-and-easy writer, possessed of many adjectives, which are selected with due effect. True, she just escapes being irreverent once or twice, misquotes Gerarde, to his hurt, and while her Parkinsonian allusions are picaresque reading, the difficulty of recognising *Sprekelia formosissima* and *Pancreatum maritimum* in their quaint, early designations is as perplexing to the ordinary reader as they are to her. "The Aristocrat of the Bulb Garden," as the Tulip is called, is one of the pleasantest chapters. Miss Silberrad, it may be noted, favours Sir Philip Sidney as introducer of the Tulip, from Vienna, in 1577. Gerarde, of course, implies that his friend Garret was the man, and Clusius, who gives the dates of the flowering of the several varieties he cultivated in Vienna, has none earlier than 1585. Irises are treated after the same manner as

The frontispiece, a view in the Royal Gardens of the Het Loo, recalls some of the coloured illustrations of 90 years ago. Some of the others are delightfully Dutch. "The Promise of Spring," for instance, and a "Boatload of Fragrance," "A Dutch Garden in Spring," "Darwin Tulips," "Hyacinths on Sand," and "Here are Tulips for You" are remarkable for colouring. The reproductions are beyond praise, and the book is produced in A. & C. Black's well-known style.

HARDY HEATHS.

(Concluded from page 259.)

E. VEITCHII.—This hybrid between *E. arborea* and *E. lusitanica* is figured in the *Gardeners' Chronicle*, April 15, 1905. It was introduced some six or seven years ago by Messrs. Robert Veitch & Sons, of Exeter. The white flowers are

18 inches in height. It flowers in autumn, the colour being bright reddish-purple.

CALLUNA VULGARIS.—The Ling or common Heather is closely allied to the *Ericas*, the distinction being that in *Calluna*, in addition to the calyx, which consists of four, coloured sepals concealing a bell-shaped corolla, there are four bracts suggestive of an outer calyx. The true *Erica* has a calyx of four, green sepals. This distinction is not considered sufficient by many botanists to warrant a second generic name, hence the name of *Erica vulgaris* given by Linnæus is often preferred. In the British Isles thousands of acres on moor, common, and mountain side are clothed with Heather, providing cover for game and honey for bees. The plants vary considerably in growth, 12 inches to 3 feet being about the average, although sometimes they reach a height of 6 feet. In contrast with these comparatively tall-growing forms, there are the low-growing moss-like varieties a few inches high. The

FIG. 130.—THE UPPER TERRACE OR ITALIAN GARDEN AT BOWOOD, WILTS.

(Photograph by H. N. King.)

(See p. 298.)

Tulips, and Daffodils likewise, while Crown Imperials and other Fritillaries find a corner. Tuberos Begonias are not much grown in Holland. The authoress makes the astonishing statement that they were originally introduced from Jamaica!

Miss Lyall's part of the book consists of appendices, the first of which is a translation of almost the whole of St. Simon's *Des Jacinthes, de leur anatomie, reproduction et culture*. The original is a duodecimo published in 1768. Though only of slight value to the British cultivator as a guide to bulb growing, many will be grateful, as they were to Bradley, for rescuing Dr. Beale's rare tract from oblivion, to have, what at one period was esteemed a choice monograph, placed within their reach. Other appendices relate to the Tulip and Hyacinth trade of bygone days. The illustrations from paintings of Miss Mima Nixon are well worthy the letterpress

produced freely from March to May. The one fault of this, otherwise charming, hybrid is that it is, if anything, more tender than either of its parents. Last winter at Kew nearly all the plants were killed to the ground. They have, however, produced plenty of strong growths from the base. Fortunately, treacherous winters such as that of 1903-9 do not occur frequently. Beside its usefulness for outdoor cultivation, *E. Veitchii* is a valuable, early spring-flowering, pot plant, either in 5-inch (48 size) pots, or larger ones. Bushy specimens in 12 inch pots are extremely showy for the cool conservatory or corridors.

E. WATSONII.—Originally found growing wild in the south-west of England, *E. Watsonii* is generally supposed to be a natural hybrid between *E. ciliaris* and *E. Tetradix*. In habit it more resembles the first-named parent, the growths being tall and slender, 12 inches to

leaves are small; the purplish-lilac blossoms appear from July to September, lasting on the plants in good condition for a considerable period. It is also valuable for cutting to use for decoration in winter. The double variety is found wild in Cornwall, and the hoary form var. *tomentosa* on Moseley Common. The varieties are both numerous and varied in habit and colour of the flowers. Many of these forms have been given distinctive names, more or less descriptive of the variation. *Alba* is the popular White Heather, for which there is a considerable demand in a cut state, and whose flowers are at their best in August; other varietal names are *alba aurea*, *alba minor*, *alba pilosa*, *alba prostrata*, *alba pumila*, *alba rigida*, and *alba Setcei*, a splendid upright-growing variety with rich green leaves and pure white blossoms produced in September. Amongst the numerous varieties, *alba tomentosa* is the most free flowering of the white

forms; as the name implies, the stems and leaves are tomentose, covered with hairs. *Alba spicata* and *alba tenella*, a strong grower. All the foregoing have white flowers. *Alportii*, upright in habit, tall grower, rich red flowers; *argentea*, silvery leaves; *aspera*, coppery leaves; *aurea*, the "Golden-leaved Heath"; *carnea*, flesh-coloured; *coccinea*, *cuprea*, with a distinct golden-bronze tint in the foliage; *decumbens*, *dimosa*, *elata*, *flora plena*, a charming free-flowering double variety with purplish-lilac blossoms; *Foxii*, a dwarf moss-like variety—old specimens form a perfectly green, moss-like cushion speckled with purplish-lilac flowers in August and September; *Hammondii*, white; *hypnoides*, low-growing, moss-like shoots; *lanulosa*, *minima*, a small form of the type; *pygmaea*, a compact-growing form; *rosea*, *rubra*; *serotina*, *spica brevis*, *spica longis*, *tenuis*, deeper in colour than the type and more branching in habit; *tenuifolia*, and *variabilis*.

DABECIA POLIFOLIA.—The popular names of this plant are the "Irish Heath" and "St. Dabec's Heath." It is a widely distributed plant, occurring in Ireland, specially abundantly in Connemara, Spain, Portugal, the west of France, and the Azores. It grows from 1 foot to 2 feet in height and is very floriferous, being clothed with purple flowers from June to September. These are drooping, borne on upright terminal racemes, loosely arranged; a single raceme being as much as 7 inches in length and bearing 20 elegant blossoms. The plants are evergreen, the leaves green above and white beneath. There are three synonyms for this plant—*D. cantabrica*, *C. Koch.*, *Andromeda Dabecia*, *L.*, and *Menziesia polifolia*, *Juss.* The varieties are *alba*, white; *bicolor*, purple and white; *purpurea*, deeper in colour than the type; and *pygmaea*, a small, dense-growing form. With the exception of the last-named, these are similar in habit to the species. *A. O.*

FRUIT REGISTER.

PLUM DECAISNE.

THIS variety is not so good in flavour this somewhat indifferent season. I accordingly tried it for cooking, and was agreeably surprised at its good quality when cooked in a pudding. The flesh is yellow, and almost as good as Washington, which I consider the best Plum for puddings, if Gages are not to be had. Decaisne is not much grown, for some reason which I have failed to discover. It is mentioned in Scott's *Orchardist*, second edition, which is not dated, but was certainly printed before 1876. Decaisne is there described as "One size, one quality, September to October. Fruit shortly oval, skin yellow speckled with red, flesh freestone, yellow, juicy, melting, and of excellent quality; shoots smoothish. A French Plum of 1860, described as being of first-rate quality, dessert." The tree grows and bears well here on a wall with a S.E. aspect, and the fruit was gathered on October 14, but would have hung longer. It is, therefore, a very useful variety for the end of the season, and in favourable years I have used it for dessert. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

SOME OLD GOOD APPLES.

AMONGST old varieties which still grow vigorously and crop well and that Mr. Brotherston might have instanced to show that Mr. Knight's theory as to the decadence of Apple varieties was not of universal application, are *Emperor Alexander*, *Hambleton Deux-ans*, *Norfolk Beefing*, *Scarlet Nonpareil*, *Fearn's Pippin*, *Adam's Pearmain*, *Red Quarrenden*, *Blenheim Pippin* and *Cockle Pippin*. These are only a few of the varieties still widely grown, yet they were in cultivation long before 1834. Some Apples like the old Hawthornden, displaced by *Stirling Castle* and others; *Manx Codlin*, largely displaced by *Lord Suffield*; were comparatively weak or sparse growing varieties, but heavy croppers. It is not surprising that these, when left to produce heavy crops year after year with very little manuring, eventually became weakened, or were ousted by larger fruited. There are few varieties of Apple that will not endure for generations if proper cultivation is given them. *A. D.*

The Week's Work.

PLANTS UNDER GLASS.

By A. C. BARFLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Hard-wooded plants.—These plants will require especial care and attention from now until the spring to maintain them in good condition. Insect pests rarely attack hard-wooded plants, and mildew is the chief disease to which they are liable. The simplest method of dealing with mildew is to dust the affected parts with flowers of sulphur. In order that the sulphur may adhere to the foliage, the plant should be slightly sprayed with water. As mildew is influenced by cold draughts, or a close atmosphere, plants which are wintered in a light, airy structure, in which fire-heat is only employed when absolutely necessary, are rarely, if ever, subject to attacks of it. Water must be afforded with extreme care, but whilst hard-wooded plants are better kept a little on the dry side during the winter months, they must on no account be allowed to become dry at the roots, for, with these plants, and especially in the case of *Ericas*, root-action is rarely altogether inactive.

Freesias.—A small batch of the more forward plants may be moved into a warm house, but they must not be subjected to a higher temperature than 50°, or they will fail to flower. Place the plants as near to the glass as possible to induce sturdy growth and dwarf foliage. During the growing season the Freesia requires plentiful supplies of water. Afford supports to the foliage of the later batches as soon as the shoots are a few inches high.

Aquilegia.—The new hybrid Columbinæ are useful subjects for decorating the greenhouse or conservatory in spring-time. The largest crowns should be lifted carefully, potted into pots of a suitable size, and the pots plunged in ashes. Afford protection to the plants during severe frosts. When growth recommences in the spring they should be brought into a warm house to flower.

Campanula media may be treated in the same manner as *Aquilegias*. After being potted, both the *Campanulas* and the *Columbinæ* should be kept moist at the roots, and when growth has started freely they should be assisted by weak doses of manure water.

Humea elegans.—This plant should never be allowed to become root-bound until in its final pot. A suitable soil for seedling *Humeas* is composed of three parts loam, with one of leaf-soil, and a sprinkling of sand or lime rubble, or broken charcoal. Keep the plants in a cool house where they will be exposed to light and air, and apply water at the root only when necessary, keeping the foliage dry.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Planting Currant and Gooseberry bushes.—A plot of ground devoted exclusively to these useful fruits is found in most gardens, and it is a good plan to arrange to have always some young trees coming on, either to replace failures or for planting up a new garden or portion of garden. If these are propagated at home, some will have been transplanted from the cutting bed last year, and should now be useful bushes for making a permanent plantation. Where birds are troublesome, this should be borne in mind when selecting a piece of ground, so that protection can be conveniently afforded during periods when it is necessary. Protection is essential for *Gooseberries*, for, apart from the toll taken by birds in the fruit season, the *tomtits* and *bullfinches* often attack the buds in the spring, and in the absence of protection by netting or other means, the prospects of a crop might be ruined. For bush fruits the ground should be treated more liberally than is desirable in the case of Apples or Plums, but if the plot has been used for vegetable cultivation for some years previously, very little further preparations will be necessary. Having chosen the site, the ground should be deeply dug or bastard-trenched, digging in plenty of rotten manure and leaving the surface rough for a few days. It will be an advantage if the ground has been trenched some time previously, since it will have settled down. Nevertheless, the work may be done now, but the ground should be trodden firm

and levelled before planting. If there is a choice of soils, a good and rather retentive loam is the best, but small fruits will succeed in almost any ordinary soil, and in most situations. The most profitable plan for the main crop is to plant bushes, but in addition to this, *Gooseberries* and *Red Currants* should be grown on north walls, or on strained wires as cordons. As a rule the *Currants* will be best on a north wall, for in this situation the fruit will hang late and thus the season will be lengthened. Some of the late sorts of *Gooseberries*, such as *Warrington*, should also be grown on a cool wall, but dessert *Gooseberries* of the best quality are better grown on wires in an open situation. A convenient system is to have the cordon *Gooseberries* on wires enclosing the remainder of the small fruits, so that the uprights serve as supports to the netting in the summer. In this manner all the bushes are enclosed with a minimum of labour. In planting small bushes, it must be remembered that they grow rapidly, therefore, unless it is intended to remove alternate bushes in a year or two, it is of no advantage to plant closely; a distance of 6 feet between each will not be too much to allow for proper attention being given to the bushes and for the cleaning and hoeing of the ground. *Boskoop Giant*, *Lee's Prolific*, and *Black Naples* are reliable varieties of *Black Currants*, and *The Comet*, *Cherry (La Versailles)*, *Red Dutch*, and *La Constante* are four, good, red varieties which will yield fruit over a long season, while *Versailles* and *Transparent* are good white varieties. If *Gooseberries* are wanted specially for dessert fruits, a number of early mid-season and late varieties must be planted in various situations.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Celery.—Although this crop has grown remarkably well during the present season, there have been few opportunities for earthing-up the plants in weather conditions favourable for the operation. Especially is this the case on wet, heavy land. Much depends upon the circumstances under which the earthing-up is carried out, for if these are not favourable the keeping qualities of the *Celery* is depreciated. Therefore, as far as circumstances will allow, cultivators should wait for suitable conditions. All blanching operations should be carried out at frequent intervals, this being far better than applying a great quantity of earth to the stem at any one time. It will be safe to leave the earthing up of the latest plants for another fortnight or three weeks, but, in the meantime, the plants must be kept clear by removing all superfluous growths, decayed leaves, or weeds that may be present. It will not be safe after this date to use brown paper for blanching *Celery*, as so thin a covering would not protect the plants from frost. At the same time the advantage of using brown paper has been obvious during the present wet season; not only is the operation less costly, but the quality of the blanching is superior, provided a little soot is sprinkled about the stem of the plant to prevent injury from worms and slugs. During the past season I have made a trial of the various varieties of *Celery*, to determine which is the best both for exhibition purposes and for home use. It is perhaps not altogether becoming of me to state that there is no variety to equal that which I introduced some few years ago under the name of *Aldenham Pink*; but this is my experience.

Celeries.—If the late plants of this crop have not been already lifted and stored, this work should be done at once, as the roots are liable to be injured by the first severe frost. Trim back the long roots and growths, and store the *Celeries* in sand or ashes in a cool place free from frost.

Lettuces.—Any plants of *White Cos Lettuce* in the open should be lifted and stored under glass. Plants from the latest sowing should be ready for pricking out in unheated frames. In order to obtain a constant supply during winter and spring, a small quantity of seed of both *Cos* and *Cabbage* varieties should be sown at the present time. Sow the seed in boxes and raise the seedlings in gentle heat.

Other salads.—Sow seeds of the *Silver Skinned Onion* for salad purposes and place roots of *Chervil* in boxes under glass. Box up some roots of *Mint* and *Tarragon* to furnish a supply in winter.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Figs.—These fruits are a welcome addition to the dessert table at this season, and the latest trees should be encouraged to furnish a supply of fruits for as long a period as possible. To do this, the house should be kept dry, and it will be advisable to allow a little heat to circulate in the hot-water pipes whenever the weather is cold or wet. The trees should be given very little water, but they must not be allowed to become too dry at the roots. Keep the ventilators open always, more or less, according to the outside weather conditions. Any trees which have given unsatisfactory results should be attended to. The Fig needs a restricted root run, and does best in a shallow, well-drained, inside border. If the trees are making gross wood, the roots must be partly lifted, and, if necessary, given a smaller rooting space. Great care must be exercised not to disturb the roots more than is necessary, as the Fig resents root disturbance. Examine the drainage, and see that it is in proper order. Mix plenty of old mortar rubble and broken bricks in the new soil, and make the border firm.

Early pot Fig trees.—Some of the earliest trees should be selected and got ready for placing in the forcing-house early in November. For success in forcing Figs, the trees must be perfectly healthy, and must have been forced more or less in former years. The most suitable trees for this purpose are those having hard and well-matured shoots of medium strength. Little pruning will be necessary if the growth was properly stopped and regulated during the growing season, but any weak shoots may be removed and the trees trained into shape, which may be done in large measure by tying out those branches which are close together. See that the trees are quite free from insect pests before placing them indoors. A weak solution of soft soap and sulphur, applied carefully with a soft brush, is a suitable specific, unless the trees are affected with scale, when more vigorous measures must be taken. The utmost care must be exercised in the application of insecticides not to damage the young fruits. Forcing must be done very gradually, till both shoots and roots are active. A temperature of 45° or 50° will be ample for a few weeks, and, if this can be maintained without the use of fire-heat, so much the better. It will be better to dispense with a hot-bed till growth is active, as this may cause the plants to grow too quickly, to the prejudice of good fruiting. Spray the trees lightly with clear water on fine mornings, but avoid excessive moisture in the house, as this, with the absence of fire-heat, will cause a cold, stagnant atmosphere. Water must also be applied to the roots with care, especially if they have been re-potted this season. Make sure that moisture is needed before it is given, then give sufficient to soak the soil thoroughly. About the middle of December the trees may be plunged in a hot-bed, made of leaves and stable litter in equal proportions. The materials should have been previously turned several times to allow the gases of fermentation to escape. It will then form a hot-bed with a temperature of about 60° or 65°, which will be sufficient till growth is active. A house not too roomy, and having a southern aspect, is the most suitable structure for early Figs.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to SIR EDMUND G. LODGE, Bart., Leonardslee, Sussex.

Planting Roses.—Roses will grow fairly well in most kinds of soils, but the question of the staple is very important, as in some kinds of ground the plants will flourish well for 30 years or more, whilst in others, even with the best cultural management, they last well for a few years only. Ground intended for the planting of Roses cannot be prepared with too much care. It should be trenched deeply and plenty of rich manure incorporated with it, using cow dung if the texture is light. The manure should be well broken up and thoroughly mixed with the soil. If the ground is wet and requires draining this must be attended to, as the roots of Roses, in common with other plants, will not grow in a water-logged soil. Any large clods should be

broken finely, but if the soil is of a light, sandy character some heavy loam should be incorporated at the time of digging. In preparing beds for Roses, it should be borne in mind that large beds are more effective than smaller ones, and that fancy designs are not to be preferred to square, oblong, or round beds. It is better to plant each bed with one, or, at the most, a few varieties only. If the plants are received from the nursery before it is convenient to plant them they should be unpacked and laid on damp soil, preferably where they will not be exposed to sunshine or drying winds. When planting, examine the roots and remove with a sharp knife all damaged or diseased portions. Make the holes of sufficient size to accommodate the roots when they are spread out evenly. Cover the roots with some of the finer particles of soil and plant firmly. After the planting is finished, spread some litter over the roots in order to protect them from frost. Tea varieties should be given the warmest positions, and on no account should they be planted under the shade of trees. It is a suitable time to plant wall Roses, treating the soil in the manner recommended in the case of beds. Established Roses on walls should be detached and pruned if they require it. It is best to untie all the branches, as this allows of the pruning being done more easily, and of the shoots being regulated afresh. Established Roses in beds are often benefited by being lifted so that the ground can be manured and dug deeply. Whilst rejuvenating the plants, this treatment will only slightly affect their flowering in the following season. Where mildew exists the plants must be dressed with flowers of sulphur or sulphide of potassium.

Sweet Peas.—Seeds that were sown as advised in a previous Calendar have germinated well. Insect pests are unusually troublesome to Sweet Peas this season, and are best checked by dressing the seedlings just before nightfall with a little lime and soot. A further sowing of seeds should be made in pots in a cool frame.

Spring bedding.—The planting of bulbous and spring-flowering plants should be completed as soon as possible. At the present time the ground is warm, but a few frosts will cause the temperature to drop very considerably. Although this has been a cold and damp autumn, the temperature of the soil at 2 feet deep is 56°, which compares favourably with most seasons.

Herbaceous border.—Perennial Asters, Anemone japonica, Sunflowers, and other autumn-blooming plants, make the borders very attractive at this season, but other subjects that are past will spoil the effect unless their old flowers and dead leaves are removed. In the case of tender subjects that have finished flowering it will be advisable to place a few ashes over their crowns, as the growths this season are unusually soft, and will not be so capable of resisting frost as in ordinary seasons.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to SIR TREVOR LAWRENCE, Bart., Burford, Surrey.

Catasetum, Cynoches and Mormodes.—Plants which have done flowering, or are past the stage at which they should flower, should now be placed in a drier atmosphere, such as is generally maintained in the Cattleya house during winter, selecting the lightest position possible. These plants require direct sunshine, now that the growths are approaching maturity. They will only need watering at long intervals till their leaves have fallen; then, if the pseudo-bulbs remain plump, water must be withheld entirely for some weeks. To keep these difficult plants in good health for any length of time it is necessary to give them first a generous growing treatment, and afterwards a long and decided rest. Strong plants of *Catasetums*, after producing their first flower-spikes, frequently develop others a few weeks later, but these should be pinched off to prevent the new pseudo-bulbs being weakened.

Mexican Orchids.—In the house or division devoted to such Mexican species as *Laelia alba*, *L. autumnalis*, *L. Martiana*, *L. anceps*, and their varieties, many of the plants have their flower-spikes well advanced, and from this time onward they require to be watered very carefully. If too much water is afforded during the flowering period, many of the old roots will decay; it

will be sufficient if the potting materials are kept just moist. The temperature at night should be kept at between 55° and 60°, but by day, with sun-heat, it matters little how high the temperature may rise, if plenty of ventilation is given. After flowering, a very small amount of water will preserve the pseudo-bulbs plump until such time as growth recommences. *L. Gouldiana*, being in full growth, should be placed well up to the roof glass, and given copious waterings until the flower-spikes appear. *L. rubescens (acuminata)*, now producing spikes from its partially-matured breaks, thrives well when suspended in a light position in the warmest house. Strong plants of *Cymbidium Lowianum*, *C. eburneo-Lowianum*, *C. giganteum*, &c., that are showing their flower-spikes, should be afforded plenty of water at the root, and those not yet showing for flower kept rather dry at the root for several weeks longer, otherwise they will recommence to grow, and, in consequence, fail to flower. Arrange these plants on the lightest side of the intermediate house, with their foliage nearly touching the roof glass. The present is a good time to examine these *Cymbidiums*, and to thoroughly sponge the leaves, so as to clear them of small scale insects that are liable to infest them.

Dendrobium Falconeri.—Plants that have completed their growths should now be sprayed over just often enough to prevent undue shrivelling. In order to obtain a fair amount of bloom, suspend the plant in a light position in the Cattleya house, and, during winter, give it a good watering, if it is growing in a pot or basket, once every week, but if it is on a raft it will need moisture about every other day. Do not over-rest this plant, for if it is kept cool and quite dry for several months it will produce an abundance of bloom in the following season, but generally when the new growths appear they are too thin and weak to ever form flowering pseudo-bulbs. The rare *D. Falconeri giganteum* and *D. venus* should be treated similarly.

Odontoglossum.—Plants of *Odontoglossum* which, owing to insufficient sunlight, have not made their usual progress, may be removed from the Cattleya house to a light, airy position in the East Indian house or warm stove, keeping them well supplied with water at the root. Such plants, under the influence of increased heat and moisture, will finish up in good time, and become properly matured before the winter. On the completion of growth, remove them to cooler, drier and more airy quarters.

THE APIARY.

By CHLOKIS.

How to winter bees successfully.—There are many losses by death among bees which, with care, could be avoided. If we have secured young queens, plenty of broods, a strong and vigorous colony and a larder of well-filled and sealed stores there remains very little to be done before the period of inactivity sets in, but, on that little, much of the success of next year depends.

Quilts.—First the quilts must be seen to. These should be of woollen material, cut to fit the top of the brood chamber exactly so that no gaping corners are left. Greater warmth may be secured by placing some brown paper between two of the quilts. Some apiarists place over the quilts a cushion, loosely filled with cork dust such as is used for packing foreign grapes, and which costs a few pence. Before placing on the quilts it is wise to place above the frames some pieces of wood to raise the quilts, so that the bees may move from frame to frame without exposing themselves to the cold draughts which come through the entrances.

Painting.—Having seen to the internal heat we must now make the hives watertight. The summer sun has perhaps caused the wood to split, or a joint to gape. These spaces, after the first coat of paint should be well puttied and the hives again painted.

Clearing grass, &c., from the front of the hives.—Hives that are in fields need to have the front cleared of grass for at least 2 feet in front of them, and the present wet weather forms a favourable opportunity of removing this growth easily with a spade. When the warmer and drier weather comes in the spring the operation will take more time, when it can be ill spared.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR NOVEMBER.

TUESDAY, NOVEMBER 2—

West of England Chrys. Sh. at Plymouth (2 days).
Brighton and Sussex Hort. Soc. Autumn Sh. (2 days).
Bournemouth Chrys. Sh. (2 days). Southend-on-Sea Chrys. Sh. (2 days).

WEDNESDAY, NOVEMBER 3—

Nat. Chrys. Soc. Autumn Ex. at Crystal Palace (3 days).
Liverpool Chrys. and Fruit Sh. (2 days). Cardiff Chrys. Sh. (2 days). Portsmouth Chrys. Sh. (3 days).
Bath Gard. Soc. Chrys. Sh. (2 days). Doncaster Chrys. Sh. (2 days).

THURSDAY, NOVEMBER 4—

Torquay Chrys. Sh. Forest Gate and Stratford Chrys. Sh. (3 days). Linnean Soc. meet.

FRIDAY, NOVEMBER 5—

Windsor, Eton and District Chrys. Sh. Nottingham Chrysanthemum Sh. (2 days). Altrincham Chrys. Sh. (2 days).

SATURDAY, NOVEMBER 6—

Soc. Franc. d'Hort. de Londres meet.

MONDAY, NOVEMBER 8—

United Hort. Ben. and Prov. Soc. Com. meet.

TUESDAY, NOVEMBER 9—

Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Edwin Beckett on "Some Beautiful Shrubs"). Ulster Hort. Soc. Chrys. Sh. at Belfast (2 days). Southampton Chrys. and Fruit Sh. (2 days). Chesterfield Chrys. Sh. (2 days). Clevedon Chrys. Sh. (2 days). British Gard. Assoc. Ex. Council meet.

WEDNESDAY, NOVEMBER 10—Bromley Chrys. Sh.

FRIDAY, NOVEMBER 12—Bradford Chrys. Sh. (2 days).

MONDAY, NOVEMBER 15—

Nat. Chrys. Soc. Executive and Floral Coms. meet at Essex Hall, Strand.

WEDNESDAY, NOVEMBER 17—

York Chrys. Sh. (3 days). Chester Paxton Soc. Chrys. and Fruit Sh. (2 days). Roy. Meteorological Soc. meet.

THURSDAY, NOVEMBER 18—

Scottish Hort. Soc. Chrys. Ex. in Waverley Market, Edinburgh (3 days). Bainsley Chrys. Sh. (2 days). Linnean Soc. meet. Manchester Chrys. Sh. (3 days).

FRIDAY, NOVEMBER 19—

Bolton Chrys. Sh. (2 days). Leeds Paxton Soc. Chrys. Exh. (2 days).

TUESDAY, NOVEMBER 23—

Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. J. A. Alexander, on "Spices").

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—46.7°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, October 27 (6 P.M.): Max. 47°; Min. 45°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden. London—Thursday, October 28 (10 A.M.): Bar. 29.6; Temp. 48°; Weather—Dull.

PROVINCES.—Wednesday, October 27: Max. 45° England South; Min. 36° Scotland North.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—

Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

TUESDAY TO FRIDAY—

Unreserved Sale of Nursery Stock at St. John's Nurseries, Worcester, by order of the Receiver for Debenture Holders re R. South & Co., by Protheroe & Morris, at 11.30.

WEDNESDAY—

Eleventh Annual Sale of Nursery Stock at Shortlands Nursery, Shortlands, Kent, by order of Mr. J. B. Bryant, by Protheroe & Morris, at 11.

WEDNESDAY—

Duplicate Cypripediums from the "Rann Lea" Collection of Orchids, at the Coal Exchange, Manchester, by Protheroe & Morris, at 1.30.

FRIDAY—

Choice Cypripediums, also Established Orchids in variety, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

David Thomson.

In the death of David Thomson this country loses one of its greatest exponents of practical gardening. Like Peter Barr, whose death we had to announce but a few weeks ago, Thomson had outlived almost all his contemporaries, and doubtless most of the younger generation of gardeners know little of the great fame attached to the gardens of Archerfield and Drumlanrig during the period they were under David Thomson's superintendence. The question is sometimes asked whether there are men among present horticulturists equal in their knowledge and prac-

same degree as was possible when the art of gardening in England was in an earlier stage of development. But, whilst such thoughts as these are suggested by the passing away of David Thomson, they do not lessen our appreciation of his great personality. Those who enjoyed a close acquaintanceship with him at any period of his life must have been impressed by his superior intelligence, his great knowledge of horticulture, his indomitable perseverance and integrity.

Thomson was born on March 5, 1823, at Torloisk, in the Island of Mull. His father held a position as assistant steward, to which

THE LATE DAVID THOMSON, V.M.H.

tical skill to the giants of last century. Some are apt to conclude that there are no such men, because the same degree of fame is not attached to a few names as was formerly the case. We can hardly imagine, for instance, a gardener's influence dominating through the length and breadth of the land, as did that of David Thomson! But it must be remembered that gardening is more widely practised than formerly, there being hundreds of private establishments of repute where there used to be but few. In such circumstances there are, perhaps, fewer opportunities for men to distinguish themselves in the

post he had been recommended by Sir Walter Scott. The lack of educational facilities in the neighbourhood must have been felt very keenly by the lad who afterwards showed a persistent desire to study. At the early age of 14 he became employed in the gardens of Carstairs House, Lanarkshire. On leaving Carstairs, he worked next at Bothwell Castle, under Andrew Turnbull, the most celebrated plant grower of the day. To Turnbull's example and methods Thomson doubtless owed much of his subsequent success in plant culture. In 1844 he proceeded south to the Royal Botanic Gardens, Regent's Park.

It is clear that, in going to the Botanic Gardens, Thomson was merely seeking further experience, for his wages whilst there amounted to only 14s. per week, and that only when the weather permitted of a full week's work being completed. Out of this sum he was required to pay for food and lodging. The Botanic Gardens, then under the care of Marnock, offered first-rate opportunities for young men seeking practical knowledge in the laying out and management of pleasure gardens. Two years later, Thomson became foreman to his brother William, who was then gardener at Wrotham Park, Barnet, and who subsequently returned to Scotland and established the business now known as W. Thomson & Sons, Clovenfords. At the age of 22 David Thomson was appointed head gardener to Mr. Drummond, the noted banker, but soon afterwards removed to the more important charge of Dyrham Park Gardens, belonging to Captain Trotter. There he remained for eight years, during which time he remodelled the gardens and grounds. In 1858, he returned to Scotland, to become head gardener at Archerfield, East Lothian. It was at Archerfield that Thomson made his reputation. The gardens had been left in a state of neglect, hence there was just the opportunity the energetic young gardener appreciated. Being allowed a free hand and adequate means, he carried out many alterations. In a few years Archerfield became widely known for its successful fruit growing, particularly for its Vines and Pine-apples; the flower gardening at the Castle grounds at Dirleton, which were also under his charge, achieved equal celebrity. Here Thomson practised what is now described as the old-fashioned system of flower bedding in first-class style. He it was who first made an extensive use of East Lothian Stocks, and they ever afterwards occupied a dominant place in his flower schemes. In 1868, Mackintosh having retired from Drumlanrig, Thomson was asked by the Duke of Buccleuch to accept one of the most important positions in private gardening in this country. For nearly 30 years afterwards Thomson maintained Drumlanrig in the forefront of British horticulture. Every type of gardening known in those days was practised there. Fruit cultivation was carried out on a large scale, vines being treated as a speciality. The enormous glass structure which was erected on the place where the south wall of the kitchen garden stood gave him extraordinary facilities for experimental fruit culture under glass. Stove and greenhouse plants, a good collection of the species of Orchids then in cultivation, and Zonal and Regal Pelargoniums are only a few of the features which made the garden famous. Drumlanrig having obtained such notoriety, young gardeners were attracted to the place for the purpose of gaining experience. There were plenty of changes, for Thomson was always in a position to obtain situations for those under him. Gardeners were anxious for journeymen who had passed a period at Drumlanrig, and owners of gardens were not less eager in seeking Thomson's advice when changing their gardeners. In this way many of the most important gardens were placed under the care of pupils from Drumlanrig.

So things continued for 29½ years, until, May, 1897, when Thomson was obliged, on

the urgent advice of his doctor, to tender his resignation to the Duke. We have seen the reply to that letter in which the Duke expressed his appreciation of the services rendered by Thomson, and begged him to remain for a longer period in his situation. But, having once made up his mind, Thomson invariably held to his resolution, and in this case, knowing that the time had come when he was unable any longer to continue his work with the same vigour as formerly, he would not consent to hold the position. He left Drumlanrig with the good wishes of all, not only of those in the neighbourhood, but of gardeners throughout the country. This feeling was expressed by the presentation of an illuminated address, enclosed in a silver casket, from 75 of Thomson's old pupils who were scattered over various parts of the country.

We have dwelt upon the practical side of Thomson's character, but he would never have succeeded as he did if his intellectual capacities had not been of the highest order. His contributions to horticultural literature for a period covering more than half a century are sufficient to show that his mind was devoted to study. Sixty-four years ago he contributed his first article on Heaths. He was a contributor to the *Scottish Gardener* from its establishment, in 1854, and he became Editor of that journal in 1870, in succession to his brother, continuing as Editor until, in 1882, Messrs. Blackwood ceased to publish the journal, whose title had been altered to *The Gardener*. His published books include *The Handy Book of the Flower Garden*, published by Blackwoods in 1868, whilst Thomson was still at Archerfield, *Fruits under Glass* (1881), and a *Practical Treatise on the Culture of the Pineapple*.

Thomson was awarded the Neill Prize, the Veitch Memorial Medal, and the Victoria Medal of Honour, and was a life member of the Gardeners' Royal Benevolent Institution.

He died on the 22nd inst., at his residence, at Esk Bank, in his 87th year. The remains were interred at Dalkeith Cemetery on Monday last, in a grave close to that of Malcolm Dunn, in the presence of many of Thomson's old pupils. Deceased's only son, David William, is the well-known Edinburgh nurseryman who recently contributed to these columns a summary of the history of the Royal Caledonian Horticultural Society.

ROYAL HORTICULTURAL SOCIETY.—We have received from the Rev. W. Wilks the following list of successes gained this summer by the second-year students at Wisley:—Diploma examination (in order of merit).—A. W. Simmonds (diploma and demonstratorship of £40 for one year); W. G. Kent (diploma and prize); J. Ridley (diploma and prize); H. W. Abbiss (diploma and prize); G. A. S. Brookes (diploma); S. B. Goringe (diploma); H. L. Robson (diploma); N. A. Phillips (diploma). Nicholson's prize for observation.—A. W. Simmonds. General examination.—J. W. McCaig (scholarship of £25 per annum for two years, Silver-gilt Medal, certificate and prize); W. Miles (certificate and prize); W. G. Kent (certificate and prize); H. L. Robson (certificate and prize); A. W. Simmonds (certificate and prize); and 12 other certificates. In the absence of the president, these awards were distributed a few days ago by Mr. HARRY J. VEITCH, V.M.H., who was accompanied by other members of the Council, together with the Right

Hon. ARTHUR C. DYKE ACLAND, ex-Minister of Education, who gave a short address. Mr. JAMES HUDSON, V.M.H., also gave advice arising from a lifelong experience as a practical and scientific gardener. One of the students, Mr. SEATON, after a three-years' course, was this summer appointed by the British Columbia Government to superintend one of their public parks at a commencing salary of £200 a year.

LINNEAN SOCIETY.—The first meeting of the forthcoming session will be held on November 4, at 8 p.m., when a lecture by Professor H. H. W. PEARSON, M.A., Sc.D., will be delivered on "Some Account of the Field-botany of Namaqualand, Damaraland, and South Angola," illustrated with lantern-slides. Mr. ECIL CARTS-WILSON, F.G.S., will make an exhibit illustrating the natural inclusion of stones in woody tissue.

JUBILEE FLOWER SHOW AT HAARLEM, 1910.

—In preparation for the great bulb show to be held at Haarlem next spring, we are informed that nearly one million bulbs were planted during the first half of the present month. These are distributed in about 1,500 beds and borders of various shapes and dimensions. A portion of the grounds is laid out in the regular French style in connection with the imposing building of the palace at the north side of the show ground and formerly belonging to King LOUIS NAPOLEON during his short stay in Holland. The other part of the show is designed in natural landscape style, affording an opportunity for a great number of picturesque groups and clumps of all kinds of bulbs, growing naturally at the feet of the old trees, which are the pride of the Haarlem Park. The nurserymen of Boskoop and Aalsmeer and other centres of the Dutch nursery trade will plant Conifers and flowering shrubs and trees early in spring. The temporary shows will be held in two spacious buildings specially erected for the purpose. The show is being held to celebrate the half-centenary of the Dutch Bulb Growers' Society, and it is hoped the principal horticultural centres of the world will send delegates. Deputations have already been announced by the Royal Horticultural Society, the Société Nationale d'Horticulture de France, the Société Royale d'Agriculture et de Botanique de Gand, and others. The deputation from the Royal Horticultural Society will consist of Sir ALBERT ROLLIT and Messrs. HARRY J. VEITCH, E. A. BOWLES, JAMES HUDSON, and Rev. W. WILKS. The prospects for the show are said to be favourable, and it is hoped that the show will prove of great interest to horticulturists.

FRUITERS' COMPANY.—The old custom of presenting a collection of fruit by this City company to the Lord Mayor of London was observed on the 20th inst. Sir GEORGE TRUSCOTT was accompanied by the Lady Mayoress, the presentation being made by Dr. ORWIN, Master of the Company. At the close of the ceremony, the Lord Mayor and Lady Mayoress entertained the master, wardens and members of the company to dinner. Formerly the Lord Mayor demanded a toll upon all fruit sold in London, and this annual ceremony is a reminder of this right, which is no longer enforced.

WARLEY PLACE GARDENS.—Mr. BERNARD QUARITCH announces that he will publish early in December a selection of 41 colotype views of Miss E. A. WILLMOTT'S interesting garden at Great Warley. These will be issued in one volume, the folio measuring 16 inches by 12 inches.

FRUIT-GROWING IN NEW BRUNSWICK, CANADA.—This business having been taken up seriously by the Government of New Brunswick, a horticulturist will be appointed during November, part of whose duty it will be to visit different parts of the province and encourage the farmers to begin or develop fruit growing.

MR. A. DEAN, V.M.H.—The many friends of Mr. ALEXANDER DEAN will be interested to know that he and Mrs. DEAN will attain the 55th anniversary of their wedding on Thursday next, November 4.

HYBRIDS OF KNIPHOFIA.—We have received some flowers from Messrs. R. WALLACE & Co., Colchester, representing hybrid Kniphofias, obtained from *K. modesta* and *K. Nelsonii*. The flowers vary from pure white to shades of amber, but there are no deeply-coloured flowers. Messrs. WALLACE describe the height as being 3 feet, and the leaves as being similar to those of *K. Nelsonii*. *K. modesta* is a Natal species, figured and described by Mr. J. G. BAKER in *Bot. Mag.*, t. 6716, and *K. Nelsonii*, a native of the Orange River Colony, was originally described by the late Dr. MASTERS in *Gardeners' Chronicle*, April 30, 1892, fig. 83. These hybrids bloom from early in September until the end of October. They are described as perfectly hardy at Colchester, although *K. modesta* itself is not hardy. Whilst the flowers received are small in comparison to some of the larger-growing Kniphofias, they are extremely dainty in appearance and tint.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE CRYSTAL PALACE COMPANY.—I have read paragraphs and letters in many newspapers regarding the winding-up order made by Mr. Justice Swinton Eady, and I should be grateful if you would allow me to inform the public by means of this letter, that the order only refers to the Crystal Palace Company, and does not affect the Crystal Palace itself, or me, its receiver. I should like further to state that it is intended that the business of the Palace shall go on as before; in fact, I am at this moment in negotiation with influential people, with the object of holding at the Palace next year a function of world-wide interest. *Ernest J. Hussey, Receiver and Manager.*

PRUNUS PISSARDII.—I do not agree with Mr. Williamson (see p. 270) that the fruiting of *Prunus Pissardii* is a rare achievement in Scotland. There is a large specimen in my garden which bears fruit in most years; and at Culachy, Fort Augustus, I saw last September a tree about 15 feet high loaded with fruits, and was informed that it bears fruit every year in profusion, so much so that it is used for preserving. There are also self-sown seedlings under this tree. *Prunus Pissardii*, Carrière, first appeared at Tauris, in Persia, and was sent to France about 30 years ago by Mons. Pissard, at that time head gardener to the Shah of Persia. It is really a coloured-leaved variety of the common Cherry Plum, its proper name being *P. cerasifera atropurpurea*, Dieck. The fruit is round and red, about 1½ inch in diameter, with a long stalk like a Cherry. *H. Clinton-Baker, Bayfordbury, Herts.*

DIMORPHOTHECA AURANTIACA.—History repeats itself, for in Curtis's *Botanical Magazine*, t. 403, this plant was figured under the name of *Calendula Tragus*, and it is there stated that it was first introduced by Mr. Masson in 1774. Later on in the *Bot. Mag.*, t. 1961, another form with white flowers was figured as *Calendula Tragus*, B., and by this the writer meant that it was a second form of that plant. The white flowered plant was really *Dimorphotheca Tragus*. A third one was described with the rays orange-coloured on both surfaces, and the writer took it for granted that this was the *Calendula flaccida* of Ventenat, and he was right, but many of the old species of *Calendula* have now been removed to *Dimorphotheca*, because the fruits are of two or more forms, as implied by the name, and the *Calendula flaccida*, Ventenat, is now *Dimorphotheca aurantiaca*, De Candolle. This is the plant that was reintroduced by Messrs. Barr & Sons in 1905. In its native home,

Namaqualand, in South Africa, it forms a shrubby plant, with branches 12 inches to 15 inches long, with large erect heads of bright orange-coloured rays and a black disc. In the early days of its introduction it was readily propagated by means of cuttings, and grown as a greenhouse perennial. Such being the case, it might be raised in quantity for planting out in summer in beds of light soil and sunny situations, such as most South African plants like. The past summer was too wet and sunless for this plant to succeed well. *J. F.*

THE NATIONAL VEGETABLE SOCIETY AND THE ROYAL HORTICULTURAL SOCIETY.—Late on Tuesday last, after attending a business meeting of the National Vegetable Society's Committee, I learned that it is the intention of the Council of the R.H.S. to hold a vegetable exhibition at Vincent Square next autumn. Having regard to the comparative indifference with which vegetables have been treated by the Council as competitive subjects (for the small competitions of the present year have brought very few entries), the announcement will cause surprise to many. There will surely be comment on the Council's action, seeing that the National Vegetable Society has recently applied for the use of the Horticultural Hall in September next for a great national vegetable exhibition, and the request has been granted. Prior to the intimation that the Vegetable Society would hold a show, no reference to the R.H.S. arranging such a show had been made. It is difficult to avoid the conclusion that it is a case of stealing clothes. Had the R.H.S. shown that interest in vegetable exhibitions it seems now so anxious

FIG. 132.—THE GARDENERS' DOTHY, BOWOOD.

to evince, no other proposal to hold exhibitions in London would have been made. Obviously, two shows cannot be held next September in the same place. Had the Council (having knowledge of the intentions of the Vegetable Society to hold an exhibition) approached this latter body and intimated its intention earlier, a great deal of hard work might have been saved. Those growers who have been organising the proposed exhibition have been actuated by the best motives. They have realised the enormous value of vegetables as food, and desired to popularise them for such purpose in a way that no other society has striven to accomplish. No body of men ever merited the confidence and support of their fellows more than does the committee of the Society. Already many valuable prizes have been offered to the committee. Assuming, therefore, that, owing to the proposed action of the R.H.S., the National Society's exhibition falls through, these will be lost. *A Member of Both Societies, Oct. 20.*

NICOTIANA SANDERAE AS A HARDY ANNUAL.—Until the present year I have treated this plant as a half-hardy annual, raising the seedlings under glass in the spring under cool conditions, and gradually hardening them for planting out in May. But, having observed that self-seeded plants grew and bloomed well, I determined, as an experiment, to treat them as hardy annuals. Accordingly, a dry south border, which has a retaining wall, was prepared for them. The seed was sown in October an inch deep in rows, and covered with fine soil. The border was left in this condition until sharp frosts occurred, when a thick covering of straw was placed on the top, the straw taken from the Strawberry

beds being used for the purpose. When the seedlings appeared, the straw was removed, and when large enough the plants were thinned so that the plants were 2 feet apart. By treating them thus they came into bloom about the same time as those which I have previously sown under glass in spring. But they were more stocky, and had a better constitution. These plants are blooming profusely at the present time (October 11), and have every appearance of continuing to do so until destroyed by frost. Should the coming winter prove milder than that experienced last year (which was rather severe here), the plants raised out-of-doors may commence blooming even earlier than those raised under glass in spring. *Thomas Francis, Wednesday, Staffs.*

BOWOOD.

(See figs. 130, 132 and 133, and Supplementary Illustration.)

Bowood, the seat of the Marquess of Lansdowne, lies on the Calne branch of the Great Western Railway from Chippenham, but the visitor should alight at the little station of Black Dog, which takes its name from an inn that used to exist there. Bowood was purchased in 1754 by John Earl of Shelburne, whose son William became the first Marquess of Lansdowne, the present owner being the fifth marquess. The mansion, one of the private treasure houses of the country, is rich in paintings and other works of art by the great masters. The original house was a plain structure, but many additions and improvements have transformed it into the imposing mansion represented in the Supplementary Illustration. The buildings on the left, which dominate the garden front, although relatively modern, form one of the most interesting features of the place. They are almost a replica of the villa which overlooked the Adriatic Sea at Spalatro, Italy, built or used by the Roman Emperor Diocletian. They are arranged in two hollow squares, separated by a chapel. Almost the whole of the south front of this villa is formed of an orangery, the remaining part being the library. Between the library and the original house are the drawing-room and a gallery which connect the old and new buildings.

The most important gardening features at Bowood are the two terraces, the upper of which is shown in fig. 130, and the lower one in the Supplementary Illustration. The lower terrace has eight rectangular lawns, and on each lawn are flower-beds, some of which are formed in the turf and others enclosed with stone, the centre being planted with a Standard Rose. Each design includes a pair of fastigate Yews, there being sixteen in all.

The low wall which divides the upper from the lower terrace is covered with Roses, Magnolias, *Viburnum macrocephalum*, *Loniceras*, and other suitable plants. The upper terrace, known as the Italian garden, is laid out with two bold designs, each with a marble fountain as a centre-piece, about which four Irish Yews are grouped. The beds are planted in summer-time with *Pelargoniums*, *Begonias*, and *Verbenas*, edged with *Lobelia*, *Iresine*, and *Pyrethrum*. The view from the upper terrace is over a wide sweep of the park with the broad lake, and, in the distance, the Cherhill Downs. In order to provide glimpses of the park and the distant country, vistas have been opened up in appropriate places, and one of these affords a delightful glimpse of a rustic building used as a boathouse on the borders of the lake. Herons frequent this water, and they build and breed in the trees near its margin, the heronry being one of the finest in the country. A good view of the lake is obtained from the stone steps, on the side of the old mansion opposite the terrace (see Supplementary Illustration).

Extending some distance from the back of the "old-house" is a broad plateau with scroll

beds in the turf, and a large tree of Ayrshire Rose in the centre of each bed. Looking at the mansion from this spot, the walls, almost to the top, are covered with large specimens of *Vitis* (*Ampelopsis*) *inconstans*, the autumn colours of which are magnificent. On the walls also are many large plants of *Vitis* *Coignetiae*. The walls of the library and orangery are furnished with a variety of climbers, including *Lonicera* *Halleana* (in flower), *L. flava*, *Escallonia* *langleyensis*, *E. exoniensis*, *E. angustifolia*, *Vitis* *Coignetiae*, *V. inconstans*, and *Roses*. In the orangery are several old Orange trees, which have been cut back to the main stems, and are sending forth strong shoots, and promise to develop again into good specimens. Passing through the orangery, the first of the two courtyards is reached, and in this there is a remarkable plant of *Vitis* *inconstans*, the spread of branches on two walls of the

for growing Melons, Tomatos, and Cucumbers in the summer season, and for housing bedding plants during the winter. One of these pits is planted with Violets of the varieties Princess of Wales and Cyclops; others contain Carnations, *Streptocarpuses*, &c. There are several small plant houses, and, in the centre, a larger greenhouse. Some of the plants contained in these structures were *Clerodendron fallax*, *Cantua dependens*, *Cypripedium insigne*, of which there were several excellent plants in flower, *Plumbago rosea*, *Gloriosa superba*, *Chirenia exifera*, *Calanthe Veitchii*, *Euphorbia pulcherrima*, *Bouvardias* in variety, seedling *Gesneras* with a profusion of flowers, and *Jacobinias*. Two of these houses were filled with Carnations, one wholly with the variety Winter Cheer. Another was filled with stove plants, including *Codiaeums*, *Coleus*, *Dracenas*, *Ruellia macrantha*, *Begonias*, and other plants needing a warm tem-

The pleasure grounds and flower gardens embrace about 70 acres. They were laid out by "Capability" Brown. But many alterations have been carried out by the present owner with the aid of his gardener, Mr. George Brown, who has been at Bowood upwards of 30 years. Flowering shrubs have been planted in recent years in great numbers, and improvements carried out in other directions. To the tree lover the pinetum at Bowood is especially interesting. Some of the more remarkable Conifers, with their dimensions, are as follow:—*Pinus insignis*, height 75 feet, girth 15 feet; *P. Lambertiana*, 74 feet, 7 feet; *Abies Smithiana*, 27 feet, 7 feet 6 inches; *A. sitchensis*, 75 feet, 10 feet 6 inches; *A. excelsa*, 124 feet, 10 feet 6 inches; *Pseudotsuga Douglasii*, 105 feet, 11 feet; *Taxodium sempervirens*, 70 feet, 15 feet; *Sequoia* (*Wellingtonia*) *gigantea*, 85 feet, spread of branches 15 feet 6 inches; *Thuja gigantea*, 70

FIG. 133.—ENCLOSED GARDEN AT BOWOOD.

[Photograph by H. N. King.]

rectangle measuring 144 feet. There are also several large plants of *Vitis* *Coignetiae* which have been raised at Bowood from seed.

The kitchen gardens include about five acres, divided by high walls into four portions. A very fine floral effect is obtained in the kitchen garden by broad flower-borders on either side of the main pathway. Many of the plants were still beautiful a fortnight ago. On the walls around this garden are trained a great variety of fruits, and even the Fig gives crops of good fruit in favourable seasons.

Many of the older Apple trees in the kitchen garden were grubbed up a year or two ago and replaced by young trees, which are growing with a freedom that betokens a favourable and rich soil. In one of the divisions a range of glass-houses has been erected, from designs by Mr. Brown, the gardener. There are six pits, each divided into two portions. These are employed

perature, the sides of the staging being draped with *Lotus peltorhynchus*. The largest structure was filled with *Chrysanthemums*, which were just coming into flower, the side stagings being furnished with varieties of *Zonal Pelargoniums*. But the prettiest of all was a house of *Begonias Gloire de Lorraine* and *Turnford Hall*, the plants being admirable specimens and covered with their pretty rose-coloured and white flowers.

There is also a range of houses used as vineries and Peach and Fig houses. This range measures 160 feet, and is divided into five compartments. Two of the vineries have been newly planted, one with *Black Hamburg* and the other with *Muscats of Alexandria*. A third vinery is planted with *Lady Downe's*. Close to the glass-houses are the potting sheds, fruit room, and other garden structures, among which is the bothy (see fig. 132), a new building, containing every convenience for the young gardeners.

feet; *Cedrus libani*, 98 feet; *C. atlantica glauca*, 80 feet; and *Abies grandis*, 80 feet.

There are large Beeches and Elms in the pleasure grounds which are supposed to be remnants of the old forest of which Bowood once formed a part. We noticed a remarkable specimen of the *Lucombe Oak*, 90 feet in height, and many noble examples of the *Tulip tree*, *Liriodendron tulipifera*, all in their full autumn glory. The enclosed garden shown in fig. 133 is known as *Her Ladyship's garden*, and is very pretty with its flower-beds and plant-clothed walls.

The lake has been formed by damming a stream, the overflow, tumbling over precipitous rocks, forming a charming cascade. The banks of the stream and lake are planted with *Hypericum calycinum*, and with shrubs, including many choice varieties of *Rhododendron*. In the dell near by Ferns thrive in great luxuriance.

SOCIETIES.

ROYAL HORTICULTURAL.

OCTOBER 26.—The usual, fortnightly meeting was held on Tuesday last, in the Society's Hall, Westminster. The building was again well filled with exhibits, all the available space being utilised.

One of the largest exhibits was a display of perennial Asters from Lord ALDENHAM's gardens at Elstree. Winter-flowering Begonias were shown grandly by Messrs. JAS. VEITCH & SONS. A representative collection of Gleichenias was interesting, and also varieties of Blechnum spicant. There were also notable groups of Dahlias, Chrysanthemums, ornamental shrubs, Carnations, and hardy plants. The FLORAL COMMITTEE conferred eight Awards of Merit to novelties, three of which were for new Chrysanthemums and three for Carnations. In the Orchid section there were several good groups, including a magnificent exhibit of Cattleyas and Lælio-Cattleyas from Lieut.-Col. HOLFORD's unique collection. The ORCHID COMMITTEE granted two Awards of Merit to varieties of Cypripediums. As on recent occasions, the FRUIT and VEGETABLE COMMITTEE had many important groups to consider. These were chiefly displays of hardy fruits, vegetables being represented by an exhibit of Onions. No award was made to a novelty by this Committee, although several new fruits and vegetables were submitted.

At the 3 o'clock meeting in the Lecture Room, a lecture entitled "Remarkable Instances of Plant Dispersion" was delivered by Rev. Professor G. Henslow, V.M.H.

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. C. T. Druery, H. B. May, Jas. Walker, Jno. Green, W. J. Beau, W. Howe, George Gordon, Chas. Blick, W. Bain, Ch. Dixon, H. J. Jones, F. Page Roberts (Rev.), Chas. E. Shea, Chas. E. Pearson, W. P. Thomson, E. H. Jenkins, W. J. James, Ed. Mawley, Herbert J. Cutbush, Arthur Turner, J. F. McLeod, and R. Hooper Pearson.

Messrs. JAMES VEITCH & SONS, LTD., Chelsea, filled one of the large tables with groups of winter-flowering Begonias of the type which was first raised in this Chelsea nursery. The plants were extremely attractive, and we have never before seen them exhibited in finer quality. The following varieties were shown in great batches:—Elatior, rosy-carmine; Julius, a delicate salmon-pink; Mrs. Neal, brilliant rose, one of the largest-flowered varieties; Winter Perfection, semi-double, rose-pink blossoms; Success, crimson; Agatha, like a glorified form of Begonia Gloire de Lorraine; and Ideala, one of the dwarfest of the set, with rose-pink flowers. An interesting plant was seen in Begonia socotrana, a species which has been largely employed as a parent in raising florists' varieties; the flowers are roundish, and of a pale shade of pink. (Silver-gilt Flora Medal.)

Begonias were also shown by Messrs. H. CANNELL & SONS, Swanley, Kent, who displayed varieties of the perpetual-flowering type in Pink Gem, Dregei (with pure white flowers), and Vesuve (pink). The plants were very ornamental, with their tall, lax shoots freely furnished with pretty blossoms.

Mrs. STEWART MACKENZIE, Haywards Heath, showed a batch of Begonia Eusien, a semi-double-flowered variety of carmine colour.

Six well-grown plants of Begonia Ideala were displayed by Lady DE RAMSEY, Norwich (gr. Mr. A. V. Coombe).

Varieties of tuberous-rooted Begonias, in crimson, pink, white, scarlet, yellow, and other colours, were exhibited by Mr. A. LE. GWILLIM, New Eltham, Kent. Some with frilled petals were especially pleasing.

Messrs. T. S. WARE, LTD., Feltham, exhibited blooms of tuberous-rooted Begonias, massed in bold batches and having a splendid selection of colours. (Silver Flora Medal.)

A group of Gleichenias shown by Messrs. J. HILL & SON, Lower Edmonton, was one of the outstanding features of the meeting, a full table being occupied by the best species and varieties of this genus of Ferns. The many fine specimen plants which the group contained evidenced the

highest skill in their cultivation. The following species and varieties were included in the collection:—*G. dicarpa*, one of the most elegant species, *G. d. longipinnata*, *G. d. dubotoma*, the distinct-looking *G. flabellata*, *G. rupestris gigantea*, *G. r. glaucescens*, *G. semivestita*, *G. spelunca*, and *G. Mendellii*. (Silver-gilt Flora Medal.)

Messrs. H. P. MAY & SONS, The Nurseries, Edmonton, again exhibited varieties of large-flowered Veronicas, also some richly-coloured forms of *Primula obconica*, some of a deep rose tint being especially noteworthy. Adjoining the flowering plants, Messrs. MAY showed varieties of *Blechnum spicant* in batches. They represented excellent culture. (Silver Flora Medal.)

Messrs. STUART LOW & CO., Bush Hill Park, Enfield, displayed Carnations, including several novelties. *Britannia* was finely shown, and near it a new scarlet variety named *O. P. Bassett*. *Royal Purple* is also new. Messrs. LOW also showed large and small plants of *Phœnix Roebelenii*, and a batch of small Orange trees in fruit.

Messrs. DAVID RUSSELL & SON, Essex Nursery, Brentwood, showed a group of Hollies and a few other evergreen shrubs. The Hollies were remarkably fine, especially some large trees of the Golden Queen variety. Also good were *Hodginsii*, the best of the green-leaved varieties; *Wateriana* with golden margins; *Silver Queen*, *lutescens*, and *Lawsoniana aurea maculata*. There were several varieties of *Osmanthus*, one labelled *argentea variegata* having broad, handsome leaves that are heavily marked with silver; the companion variety, *aureo-variegata*, is also very handsome. (Silver Banksian Medal.)

Mr. L. R. RUSSELL, Richmond, Surrey, displayed a floor group of berried shrubs, the majority as small plants in pots. *Aucubas*, *Skimmias*, *Hollies*, and *Cotonæsters* were represented, the most decorative being tiny plants of *Aucuba vera*, which were crowded with scarlet berries. (Silver Banksian Medal.)

Messrs. J. CHEAL & SONS, Crawley, Sussex, set up a charming exhibit of sprays of ornamental trees and shrubs, most of them showing their autumn tinting. Some were in berry and a few in flower. The species of *Quercus* were strikingly handsome, especially *Q. coccinea splendens*. Another with finely-coloured foliage was *Pyrus aronia arbutifolia*. *Prunus sinensis*, *Liquidambar*, *Liriodendron tulipifera*, *Hypericum Moserianum* (finely in flower), *Lycocateria formosa*, *Taxodium distichum*, with various *Maples*, *Cornuses*, *Elms* and other species showed the wealth in beautiful trees and shrubs. Messrs. CHEAL also showed a collection of single and a considerable number of *Pompon-Cactis* Dahlias. (Silver Banksian Medal.)

Messrs. W. WELLS & CO., Merstham, Surrey, exhibited a large group of Chrysanthemums, of large and small-flowered kinds. Many were of the single type, these being used as a groundwork, in which were shown large Japanese kinds. Amongst the newer varieties of the exhibition type we noticed *Mrs. K. Laxford* (Indian red), *Lady Crisp* (a big, yellow variety), *Miss Alice Finch* (a decorative kind, the tone plum-purple, with silver on the reverse side), *Bryant's Beauty* (pink), *Miss Annie Nicol* (best described as a white *Walter Jinks*), *Golden Glow* (medium-sized, yellow blooms, suitable for the flower border), and *Miss E. King* (yellow). The single varieties were very pretty, and included many new kinds raised at Merstham. (Silver-gilt Banksian Medal.)

The Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), set up a group of Michaelmas Daisies arranged in large yet graceful bunches. The finest varieties were to be seen in this collection; the cordifolius section, because of the lateness of the season, figuring conspicuously. In the centre was a handsome vase of the new, blue-flowered variety *Climax* raised by Mr. Beckett, while the newer, white-flowered *Bianca* (see Awards), with horizontally-disposed branches, was also prominent. The bunches were displayed in a natural manner and with much skill. (Silver-gilt Flora Medal.)

Messrs. H. J. JONES, LTD., Rye-croft Nurseries, Lewisham, S.E., displayed an excellent table arrangement of Michaelmas Daisies and early and large-flowered Chrysanthemums. Of the latter, the new reddish-maroon-coloured variety *Cham pagne* was prominent, whilst *Miss B. Miller* (golden), *Crimson Source d'Or*, *Kathleen Thomp-*

son (crimson, tipped with orange), and *Ryecroft Glory* (a rich yellow variety) were all good. These are of the decorative class, and may be flowered in the open ground. Of large-flowered varieties, *Sir Frank Crisp* (chestnut and gold) and *F. W. Lever* (white) were well shown, while the yellow-flowered *Argo* and the pink *Capella* were attractive amongst the single varieties. (Silver Flora Medal.)

Messrs. WILLIAM CUTBUSH & SONS, Highgate, arranged a fine group of Michaelmas Daisies, *Kniphofias*, *Pentstemons*, and other hardy flowers. The Asters included the large blue-flowered *Climax*, which has the merit of distinction as well as size; the colour is of a clear blue tone. *Maidenhood*, with white, starry flowers, is also a delightful variety. As a separate exhibit, Messrs. CUTBUSH displayed choice blooms of perpetual-flowering Carnations, of which *Beacon* (scarlet), *Mrs. Burnett*, *Enchantress*, and *Mikado* (*heliotrope*) were the best. (Silver Flora Medal.)

Messrs. BARR & SONS, Covent Garden, exhibited many good hardy flowers, such as border Chrysanthemums, *Crocus* species, *Kniphofias* of sorts, and *Cimicifuga simplex*.

Mr. FRANK BRAZIER, Caterham, Surrey, arranged in one of the annexes a very showy display of Michaelmas Daisies, *Phloxes*, *Pentstemons*, and early-flowering Chrysanthemums. The daintily-coloured pink and white *Phlox Elizabeth Campbell* is of a particularly pleasing character. The single-flowered Chrysanthemum *Brazier's Pink* is of an effective shade and very free in flowering. (Silver Flora Medal.)

Messrs. BAKER'S, Wolverhampton, showed a group of *Pæony*-flowered Dahlias, the colours being of a more decided tone than those observed earlier in the season. There were some three dozen handsome vases staged, the exhibit being very effective. We were particularly impressed with the rich crimson maroon of *Duke Henry*, the pleasing pink of the somewhat small-flowered *Mrs. R. Copland*, and the deep rose-pink flower suffused with yellow and named *Lady Norman*. (Silver Banksian Medal.)

Messrs. CARTER PAGE & CO., London Wall, also contributed a collection of these Dahlias as a centrepiece to a large assortment of early-flowering Chrysanthemums of the best-known varieties staged in bold basket groups, which well demonstrated their value for decorative purposes. (Silver Banksian Medal.)

The Misses HOPKINS, Merz Nursery Gardens, Shepperton-on-Thames, had an interesting lot of hardy plants, which included the pretty yellow-flowered *Saxifraga cymbalaria*.

Mr. G. REUTHE, Keston, Kent, staged Alpine and rock-garden plants, including *Crocus speciosus*, *Cyclamen cilicium*, and a fine lot of *Tropeolum tuberosum* with tubular blossoms of scarlet and gold.

Messrs. GEORGE MALLET & CO., Cheddar, showed a vase of the flowering stems of *Lilium sulphureum*, which had been cut from 8-feet high plants growing in the open. The huge drooping trumpet-shaped blossoms were richly coloured with golden yellow internally.

Messrs. GUNN & SONS, Olton, near Birmingham, brought some remarkably good and fresh-blooms of early-flowering Chrysanthemums, arranging them in handsome bunches of distinct varieties. *Cranford* (white), *Perle des Blanches* (white), *Ethel Blades*, *Goacher's Crimson*, and *Roi des Precoces* (all of the crimson-flowered class), and *Eden* (rosy-lilac) are worthy of mention. *Viola cornuta atropurpurea* was also shown in capital form by this firm. (Silver Banksian Medal.)

Messrs. J. PEED & SON, West Norwood, S.E., set up a rockwork exhibit planted with Alpines and succulent plants in variety.

Mr. W. LEGGETT, Colechester, brought a small yet welcome exhibit of *Rosss*, the blossoms being of good form and colour.

A dwarf bedding Dahlia with miniature blooms of a reddish tone with white tips was shown by Mr. F. WYATT, Sherhall Nursery. The variety is named after Mrs. WYATT.

AWARDS OF MERIT.

Aster "Bianca".—This is a variety of Michaelmas Daisy, having a spreading habit of growth, the flower-sprays being almost horizontal. The flowers are white, and measure about half an inch in diameter. Shown by the Hon. VICARY GIBBS.

Carnation May Day.—This magnificent, rosy-pink tree Carnation is the best of its type we have seen. The flowers, of excellent form, have large, unfringed petals, and the colour is very pleasing. Shown by Messrs. J. PEED & SONS, Messrs. BATH, LTD., and Messrs. STUART LOW & Co.

Chrysanthemum Altrincham Yellow.—A large, single-flowered variety, of rich yellow colour. The individual flower-heads are 4 inches across.

C. Mrs. R. Luxford.—A purplish-red Japanese variety, of moderate size. The two varieties already mentioned were shown by Messrs. WELLS & Co., Merstham.

C. Mrs. Thornton.—A large Japanese flower, showing considerable refinement. The florets

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, H. Little, W. Boxall, R. G. Thwaites, J. F. Alcock, W. Cobb, A. A. McBean, J. Cypher, W. H. Hatcher, A. Dye, C. H. Curtis, H. Ballantine, Gurney Wilson, W. H. White, W. Bolton, F. J. Hanbury, C. J. Lucas, and Sir Jeremiah Colman, Bart.

One of the best Orchid shows for a considerable time past was made at this meeting. The fine group for which Lieut.-Col. G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander), was awarded the Gold Medal, was the best display of hybrid Cattleyas ever staged. It comprised about 150 plants of Cattleyas, bear-

ing together 175 spikes, with an aggregate of about 600 flowers, the specimens representing the highest state of perfection both with respect to the varieties shown and to the cultural skill bestowed upon them. Cattleya hybrids and Lælio-Cattleyas raised at Westonbirt formed the main feature, the gorgeously-coloured forms of *C. Fabia* (*labiata* × *aurea*), of which 60 plants, with an aggregate of about 300 flowers, were staged, in themselves constituting a remarkable exhibit. All were of the highest order of merit, the best noted being *Sunset*, *flammea*, *fulvescens*, and *Westonbirt* variety. With them were several plants of *C. Dowiana*

aurea and *C. labiata*, the parents of *C. Fabia*, including *C. labiata* G. G. Whitelegge, with a spike of four, fine, white flowers with richly-coloured lip. Other Cattleyas noted were several good *C. Mantinii*, *C. fulvescens* Westonbirt variety (F.C.C., 1907), *C. Hardyana*, and *C. Iris*, *C. Dusseldorferi* Undine, of which three plants were staged. Among the Lælio-Cattleyas were two very fine forms of the Westonbirt strain of *L.C. Berthe Fournier*, the var. *tigrina* already certificated being very distinct; *L.C. Ophir*, *L.C. Pactolus*, *L.C. Pizarro*, *L.C. Ortrude* (*anceps* × *aurea*), *L.C. Gwennie*, *L.C. luminosa*, and *L.C. Priam*, a distinct and pleasing hybrid of *C. Harrisoniana* and *L.C. callistoglossa*. The Brasso-Cattleyas were represented by *B.C. Madama*

FIG. 134.—COLUMNNEA MAGNIFICA: FLOWERS FLAME-COLOURED.
(Obtained R.H.S. Award of Merit on Tuesday last.)

are rather narrow, white, or bearing a cream shade; the effect is good. Shown by Mr. H. PERKINS, Greenlands Gardens, Henley-on-Thames.

Columnnea magnifica.—Sir TREVOR LAWRENCE, Bart., exhibited a plant of this showy, Gesneraceous species. It appeared to excite considerable interest, and we therefore reproduce our published figure of a specimen which bloomed in Mr. Gumbleton's collection. The plant succeeds in a cool greenhouse, and produces its bright, flame-coloured flowers very freely. A full description of the species will be found in *Gardeners' Chronicle*, February 1, 1903.

ing together 175 spikes, with an aggregate of about 600 flowers, the specimens representing the highest state of perfection both with respect to the varieties shown and to the cultural skill bestowed upon them. Cattleya hybrids and Lælio-Cattleyas raised at Westonbirt formed the main feature, the gorgeously-coloured forms of *C. Fabia* (*labiata* × *aurea*), of which 60 plants, with an aggregate of about 300 flowers, were staged, in themselves constituting a remarkable exhibit. All were of the highest order of merit, the best noted being *Sunset*, *flammea*, *fulvescens*, and *Westonbirt* variety. With them were several plants of *C. Dowiana*

Hylo, *B.C. Mrs. J. Lecamm*, *B.C. Digbyana Warszewiczii*, *Brasso Lælio-Cattleya Rowena* (*L.C. Doris* × *B. Digbyana*), a pleasing, yellow-tinted hybrid, and *B.C. Siren* (*B. Digbyana* × *C. Skinneri*), a very pretty rose flower, and one of the few really satisfactory hybrids of *C. Skinneri*. The *Cypripediums* in the group were six plants of the delicate greenish yellow *C. Rossetii*, *C. Lecamm Corona*, very fine, *C. L. Staffordianum*, *C. Niobe* Westonbirt variety, *C. Leander*, *C. Hitchinsii* Holland's variety, *C. Chas. Rickman magnificentum*, *C. Charlesannum superbum* with five flowers, *C. insigne Sanderi*, *C. triumphans*, *C. Hera Euryades*,

several good *C. Fairrieannum*, *C. vexillarium* with three flowers, and the new *C. Beacon* magnificent with four flowers (see Awards). Bright colour in the front of the group was given by pretty dwarf plants of *Sopbro-Laelio-Cattleya Alcedo superba*, *S. L. C. Dana*, *Sopbro-Cattleya saxa* and others. Specially fine species were represented by six, finely-flowered plants of the large, white *Dendrobium formosum giganteum*, the white *Dendrobium Phalenopsis hololeucum*, and six good spikes of *Phalenopsis amabilis Rimstadiana*.

ERNEST R. ASHTON, Esq., Broadlands, Camden Park, Tunbridge Wells (gr. Mr. Wright), was awarded a Silver-gilt Flora Medal for a very pretty group of showy things, comprising *Cattleya Bowringiana* with seven spikes, and other smaller specimens of it; good *C. Dowiana anrea*, *C. Mastersoniae*, *C. Pittiana*, *C. Fabia*, *Laelio-Cattleya Lady Rothschild* with six flowers; *L. C. luminosa* and other pretty hybrid *Cattleyas* and *Laelio-Cattleyas*; *Brasso-Laelia Mrs. M. Gratrix*, good *Cattleya Mantini* and *C. Portia*; *Vanda cerulea*, *Epidendrum vitellinum*, some well-flowered *Laelia pumila*; *Odontoglossum Lambeanum* and other *Odontoglossums*, including some spotted *O. crispum*. Also prominent at the back of the group were the graceful sprays of yellow *Oncidium varicosum*; the white and rose-coloured *Dendrobium Phalenopsis*, and a number of interesting small species.

H. S. GOOPSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), was awarded a Silver-gilt Flora Medal for an excellent group of well-grown plants, including many rare varieties. Among them were good forms of *Cattleya labiata*, the white varieties being represented by *C. I. Amesiana*, *C. I. corulea*, and *C. I. Goodsoniae*, a very fine white flower with a veined blotch of violet-purple on the lip. Some excellent specimens of *Cattleya Bowringiana* and the hybrids of it, *C. Mantini nobilior* and the lighter *C. Brownie* being specially fine; also *C. Alicea*, a very remarkable flower with a showy ruby-crimson lip; *Odontoglossum eximium* and other hybrid *Odontoglossums*. Other plants included *Sopbro-Laelio-Cattleya Marathon*, with a very distinctly-coloured flower; a scarlet *Odontioda*; a selection of good *Cypripediums*, *Oncidium*, and *Lycaste*s.

MESSRS. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, were awarded a Silver Flora Medal for an attractive group, in which the most beautiful object was their new *Cypripedium Elatior* var. *Rex* (see Awards). The group was principally composed of good forms of *Cattleya labiata*, *C. Bowringiana*, *C. Fabia*, *C. porphyrophlebia*, *Brasso-Cattleya Digbyano-Warszewiczii*, *Laelia pumila*, *Oncidium varicosum*, and *Cypripediums*.

MESSRS. SANDER & SONS, St. Albans, secured a Silver Flora Medal for a representative group of the Orchids of the season, the forms of *Cattleya labiata* having among them the variety *Ruby*, an intensely dark form without the usual light-yellow disc to the lip. *Cattleya Klondyke* (*Harrisoniana* × *Mariottiana*) bore a spike of several, creamy-yellow flowers tinged with rose and with a prominent Buttercup-yellow lip. *C. Empress Frederick* var. *Sandera* had a fine, white flower with yellow disc and rose marking on the lip. Others noted included a distinct light form of *C. Hardyana*, *Vanda cerulea*, *Cypripedium J. Wilson Potter*, and other *Cypripediums*, *Brasso-Cattleya Mad. Chas. Maron*, *Lycaste macrophylla*, *Cattleya maxima*, and *Cirrhopetalum refractum*.

MR. E. V. LOW, Orchid Nursery, Vale Bridge, Haywards Heath, was awarded a Silver Flora Medal for a group of white varieties of *Cattleya labiata*, which included *C. I. The King*, *C. I. Purity* (a very fine, clear white), *C. I. Reedleyensis*, *C. I. R. I. Measures*, *C. I. G. G. Whitelegge*, *C. I. Amesiana*, and *C. I. Mrs. E. V. Low* (a fine white variety with clear light-pink flush on the lip). Mr. Low also showed *Cypripedium Gaston Bultel* and several others.

MESSRS. J. CYTHER & SONS, Cheltenham, were awarded a Silver Flora Medal for a good group, the centre of which consisted of hybrid *Laelio-Cattleyas*, *Brasso-Cattleyas*, and *Cattleyas*, including good dark *C. Fabia*. Among the *Cypripediums* were *C. Mimos Veitchi*'s variety, some fine forms of *C. insigne*, including the yellow variety *Sandera*, *C. Mandia*, *C. Fairrieannum*, *C. Niobe superbum*, and others. Effectively arranged with these were forms of *Dendrobium Phalenopsis*, *Oncidium varicosum*, *Phaio-Cymbidium Chardwarense*, &c.

MESSRS. CHARLESWORTH & CO., Haywards Heath, received a Silver Banksian Medal for an interesting group in which were a new *Miltoniodes* from a cross between *Cochlioda Noezliana* and *Miltonia Schroderiana*, with narrow reddish sepals and petals; a fine scarlet *Sopbro-Cattleya Doris*, the beautiful *Odontoglossum ardentissimum xanthotes*, and other hybrid *Odontoglossums*; *Cattleya Fabia*, *C. Rhoda*, *C. Lord Rothschild*, a very handsome blotched *O. crispum* seedling; the true *Cypripedium purpuratum*, and *Odontioda Bradshawie*.

MESSRS. STUART LOW & CO., Bush Hill Park, Enfield, staged an effective group, for which a Silver Banksian Medal was awarded. Among other interesting species noted were *Cirrhopetalum appendiculatum*, with seven of its singular flowers, *C. refractum*, *Bulbophyllum Dayanum*, *B. Godseffianum*, *Grobya galeata*, *Cycnoches chlorochilon*, *Miltonia Clowesi*; and, among the hybrids, *Cattleya Maronii*, *Cypripedium Rossettii*, and other *Cypripediums*.

MESSRS. J. & A. A. McBEAN, Cooksbridge, were awarded a Silver Banksian Medal for a select group, at the back of which were several grand specimens of their fine, dark, rose-purple type of *Cattleya Bowringiana*. With them were *Cattleya Portia Perfection* (*labiata* × *Bowringiana*), a handsome rose-purple flower nearly as large as *C. labiata* and with a white base to the lip.

THE DUKE OF MARLBOROUGH, Blenheim, Woodstock (gr. Mr. Hunter), showed *Cattleya Fabia*, *Blenheim* variety, a white form with finely coloured lip, and another light variety.

LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House (gr. Mr. Hudson), sent *Cattleya Armstrongiae superba*, a very handsome rose-coloured flower with yellow disc to the lip.

SIR JOHN EDWARDS-MOSS, Roby Hall, Torquay, sent a flower of a white *Cattleya* raised between *Schroderae* and *Harrisoniana*.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), sent four white forms of *Cattleya labiata*, *C. I. Lady Leese* being a fine pure white flower with a large violet blotch on the lip margined with white; *C. I. Her Majesty*, *C. I. The Empress*, and *C. I. Miss Ethel Harting* being all pure white with a pale pink tint on the lip.

MONSIEUR MAURICE MERTENS, Ghent, showed several hybrid *Odontoglossums*.

J. FORSTER ALCOCK, Esq., Northchurch, showed a hybrid *Cypripedium* between *Harrisonianum superbum* and *insigne Sanderae*, which was very near to the former parent, whilst others of the same origin are said to be nearer *C. insigne Sanderae*.

AWARDS.

AWARDS OF MERIT.

Cypripedium Beacon magnificum (*J. Hovers* × *nitens Lecanum*), from Lieut.-Col. G. L. HOLDFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander).—A very fine flower, somewhat resembling a good form of *C. Charlesianum*. The ground colour is pale greenish-yellow, slightly tinged with pale purple; the base of the dorsal sepal is emerald green, the upper half white, the lower with brownish purple spots.

Cypripedium Elatior var. *Rex* (*Lecanum* × *Baron Schroderae*), from MESSRS. JAS. VEITCH & SONS.—A superb hybrid, with some resemblance to the fine *C. Thalia* Mrs. Francis Wellesley in its perfect form and fine substance. The broad dorsal sepal is pure white, with an emerald green base, the back being heavily tinged with purple and the surface bearing dotted claret-purple lines. The lower sepals are broad and circular, whitish, with a few purple lines; the petals are broad, primrose-yellow, tinged and spotted with purple, the lip being similarly coloured.

CULTURAL COMMENTARY

To Major G. C. ROBERTSON, Widmersport, Nottingham (gr. Mr. F. Wotton), for a very fine plant of *Cymbidium Gammieanum* with five spikes.

Fruit and Vegetable Committee.

Present: G. Binyard, Esq. (in the chair), and Messrs. J. Cheal, C. G. A. Nix, P. D. Tuckett, E. Beckett, H. Parr, A. R. Allan, H. Markham, G. Hobday, J. Jaques, W. Crump, C. Foster, W. Pope, G. Wythes, G. Woodward, G. Reynolds, A. Dean, G. Kelf, H. S. Rivers, J. Willard, and J. Davis.

MR. R. FENN, Sulhampstead, the veteran Potato raiser, sent several seedling varieties of

this vegetable. They are to be grown under trial in the Society's gardens at Wisley next year.

MR. W. POPE, on behalf of Mr. Charles Ross, sent from Welford Park, Newbury, two seedling Apples, one named *Charles Eyre*, a fine, conical, green fruit, and the other *Double X*, a dessert variety of handsome appearance. The Committee expressed the desire to see the fruits again next year.

A very handsome Pear named *Roosevelt* was shown by Mr. G. PYNE, Topsham, who also exhibited a clear, conical-shaped Apple named *Denver Beauty*. Both the fruits were, presumably, of American origin. Various other Apples were sent, but no award was made.

MR. W. KNIGHT, Hailsham, Sussex, sent fruiting canes and picked fruit of a hybrid Raspberry named *Hailshambury*.

MESSRS. MASSEY & SONS sent plants in pots of their fine Parsley *Dwarf Perfection*. This variety received an Award of Merit at Wisley last year.

M. DRUMMOND, Esq., Welwyn, Herts. (gr. Mr. G. Kelf), staged a collection of about 70 dishes of Apples and Pears. Of the former, the best samples were *Peasgood's Nonesuch*, *Striped Beeling*, *The Queen*, *Annie Elisabeth*, *Fearn's Pippin*, *Jas. Grieve*, *Lady Sudeley*, *Wyken Pippin*, and *Blenheim Pippin*. There were also good examples of the following Pears:—*Durondeau*, *Louise Bonne* of Jersey, *Pitmaston Duchess*, *Marie Louise*, *Doyenné du Comice*, *Beurré Diel* and *Forelle*. (Silver Banksian Medal.)

FROM THE HORTICULTURAL COLLEGE, Swanley, Kent, was exhibited a table of capital fruit, chiefly Apples, of which excellent samples were seen in fruits of *Warner's King*, *Peasgood's Nonesuch*, *Bismarck*, *Golden Noble*, *Catshead*, *Alfriston*, *Cox's Orange Pippin*, *King of the Pippins*, *Blenheim Pippin*, and *Court of Wick*. The Pears included *Louise Bonne* of Jersey, *Pitmaston Duchess*, *Beurré Hardy*, and *Marie Louise d'Uccle*. (Silver Knightian Medal.)

W. WHITLEY, Esq., Torquay, an amateur grower, set up a very large collection of Apples and Pears, the fruits being rather small from so favoured a district. The best Apples were (culinary) *Crimson Bramley*, *Bramley's Seedling*, *Stone's Pippin*, *Peasgood's Nonesuch*, *Emperor Alexander*, *Royal Jubilee*, *Wolf River*, *Mère de Menage*, *Annie Elisabeth*, *Stamford Pippin*, *Sanspareil*, and *Golden Nugget* of cooking varieties, and (dessert) *Ben's Red*, *Mother Apple*, *Winter Pearmain*, *King of Tompkins County*, *Houblon*, *Rival*, *Rougemont*, *Charles Ross*, and *Adams's Pearmain*. The collection also included *Monarch* and *Cox's Emperor* Plums. (Silver Knightian Medal.)

A. E. HUMPHREYS, Esq., Owenllyr, Montgomery, staged a dozen dishes of Apples, the samples being very good for the district. (Silver Banksian Medal.)

MESSRS. LAXTON BROS., Bedford, filled a table some 50 feet long with hardy fruits and Grapes, thinly but neatly displayed. There were some 70 dishes of Pears and Apples, with some half dozen bunches of *Black Alicante* Grapes. The best Apples were (cooking) *Peasgood's Nonesuch*, *Lord Derby*, *Cellini*, *Horstead Pearmain*, *The Queen*, *Bismarck*, *Warner's King*, *Newton Wonder*, *Emperor Alexander*, *Golden Spire*, and *Pott's Seedling*, and (dessert) *Gascoyne's Scarlet*, *Wealthy*, *Blenheim Pippin*, *Allington Pippin*, *Cox's Orange Pippin*, *King of the Pippins*, *Winter Quarrenden*, *Worcester Pearmain*, and *Charles Ross*. Good Pears were *Beurré Clairgeau*, *Marie Louise d'Uccle*, *Emile d'Heyst*, *Conference*, and *Beurré Bachelier*. The method of staging was especially pleasing, the exhibit being very attractive. (Silver Knightian Medal.)

MESSRS. W. SEABROOK & SONS, Chelmsford, filled a long table with fine samples of hardy fruits. The exhibit included about 100 dishes of Apples and Pears. Of the former we noticed good dishes of *Newton Wonder*, *Warner's King*, *Ecklinville Seedling*, *Pott's Seedling*, *Lord Derby*, *Royal Jubilee*, *Beauty of Kent*, *Stirling Castle*, *Bismarck*, *New Hawthornden*, *Peasgood's Nonesuch*, *Allington Pippin*, *Blenheim Pippin*, *Cox's Orange Pippin*, *Lord Burghley*, *Claygate Pearmain*, *Worcester Pearmain*, *Jas. Grieve*, *Charles Ross* and *American Mother*. The best Pears were *Beurré Superfin*, *Beurré Diel*, *Le Lectier*, *Charles Ernest*, *Conference*, *Durondeau*, *Beurré Bosc*, and *Mme. Treyve*. (Silver-gilt Banksian Medal.)

MESSRS. AMROSE PALMER & CO., Grosvenor Square, displayed several dishes of Apples and

DEBATING SOCIETIES.

MARKETS.

COVENT GARDEN, October 27.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Ems.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices. Columns include flower names (e.g., Asters, Azaleas, Carnations), quantities (e.g., per dozen, per bunch), and prices in s.d. and s.d.s.d. formats.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their prices. Columns include foliage names (e.g., Adiantum, Asparagus plumosus), quantities, and prices in s.d. and s.d.s.d. formats.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various potted plants and their prices. Columns include plant names (e.g., Ampelopsis, Aralia Sieboldii), quantities, and prices in s.d. and s.d.s.d. formats.

CROYDON & DISTRICT HORTICULTURAL.

One of the principal aims of this society is to cultivate an interest in the minds of its younger members, and the committee therefore invited papers from young gardeners. On Tuesday, October 19, papers were read by Mr. P. Runtou, Falkland Park Gardens, and Mr. E. Strudwick, Coombe House Gardens, who chose as their subjects "Perpetual-flowering or Tree Carnations," and "Begonia Gloire de Lorraine," respectively.

WARGRAVE GARDENERS.—At the last meeting of the above association Mr. J. A. Hall, Gardener at Ship-lake Court, read a paper on "Temperature and Ventilation in Connection with Fruit and Plant Culture." The lecturer stated that the horticultural builder and gardener should confer together when new plant houses are to be erected. It was too often a matter of "How does it look?" instead of "Is this house suited for its purpose?"

BULLEIGH SALTERTON HORTICULTURAL.

On the 20th inst. Mr. A. Hope, of Messrs. R. Veitch & Son's Nursery, Exeter, gave a lecture on "Bulb Culture in Pots and in the Open." The lecturer gave details of the preparation of the compost, and drew attention to the mistake, too often made, of introducing into heat any kind of bulb before plenty of roots had been formed. He gave a list of the best varieties for pot culture, and the safest stimulant to apply to the roots and emphasised the necessity of keeping the plants within a few inches of the roof glass when growth had commenced. J. M.

FARNHAM & DISTRICT HORTICULTURAL.

A lecture, illustrated by lantern slides, on "Vegetables—Old and New," was delivered before the members of this society on October 25, by Mr. W. F. Giles, of Messrs. Sutton & Sons Nursery, Reading.

GARDENING APPOINTMENTS.

Mr. HENRY SMITH, for 24 years Gardener and 3 years previously as Foreman to the late CHARLES EVAN-THOMAS, Esq., The Gnull, Neath, Glamorgan, as Gardener to HERBERT ECCLES, Esq., at the same place.

Mr. F. H. MANNERS, as Gardener to E. M. EVERSFIELD, Esq., Denme Park, Horsham, in succession to Mr. H. HAKMS, retired.

Mr. DUNCAN FARBOUR, for the past 4 1/2 years Gardener to F. D. S. SANDEMAN, Esq., Benchie, Broughty Ferry, Forfarshire, as Gardener to D. R. GARDNER, Esq., Tillicoultry House, Clackmannanshire.

Mr. C. Y. RICHARDS, for 4 years and 8 months Pleasure Ground Foreman and decorator at Hoar Cross, Burton-on-Trent, as Gardener to the Rev. REGINALD FAWKES, Parkstone House, Poole, Dorset.

Mr. WILLIAM FREDERICK MATTHEWS, for the past 9 years Gardener at Hill Court, Edenbridge, Kent, as Gardener to GEORGE ING, Esq., The Gardens, Lewins, Edenbridge, Kent. (Thanks for 1s. received for R.G.O.F. Box.)

Mr. S. W. ALEXANDER, previously Foreman at Paddock-burst, as Gardener to C. B. YATE, Esq., Bere Court, Pangbourne, Berks. (Thanks for 2s. 6d. received for R.G.O.F. Box.)

Mr. MARTIN RAWSON, for the past 2 years Gardener to F. S. BRICE, Esq., J.P., Middlemeade, Stoughton Drive, Leicester, as Gardener to H. A. FOSTER, Esq., Littlemore, Queensbury, Bradford, Yorkshire.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending October 27.

The first keen frost of the present autumn.—The early part of the week proved warm, but since then both the days and nights have been cold for the time of year. On the coldest day the temperature in the thermometer screen did not rise above 45°, which is 9° lower than the average; and on the two cold nights the exposed thermometer registered respectively 6° and 8° of frost—the latter being the lowest reading registered as yet by that thermometer this autumn. The recent warm period lasted over three weeks, during which there occurred only one cold day, and only three cold nights. The ground temperatures have fallen, being now at about an average temperature at 2 feet deep, and 1° colder than is seasonable at 1 foot deep. Since the present month began rain has fallen on all but seven days, and to the total depth of nearly 3 1/2 inches, which is about a quarter of an inch in excess of the average rainfall for the whole month. During the past week 4 gallons of rain-water have come through the bare soil gauge—virtually the whole of the rainfall for the week—and 24 gallons through that on which short grass is growing. The sun shone on an average for 3 1/2 hours a day, or for half an hour a day longer than is usual at this period of October. On the brightest day the sun shone for altogether 8 1/2 hours. The wind has been, as a rule, high, and in the windiest hour the mean velocity amounted to 21 miles—direction west. The average amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 5 per cent. The flowers of all my Dahlias were killed by frost during the night of the 25th. E. M., Berkhamsted, October 27, 1909.

CATALOGUES RECEIVED.

HORACE J. WRIGHT, 32, Dault Road, Wandsworth, London, S.W.—Sweet Peas. WM. WATSON & SONS, LTD., Clontarf Nurseries, Dublin—Fruit Trees, Roses, Shrubs, Forest Trees, &c.

FOREIGN.

WILLY MULLER, Nocera Inferiore, Italy—New and uncommon Plants.

SLUIS & GROEF, Enkhuizen, Holland—Vegetable, Flower, and Agricultural Seeds.

Pears, including, of the former, Bismarck, Newton Wonder, Chas. Ross, Peasgood's Nonesuch, Jas. Grieve, Blenheim Pippin, and Cox's Orange Pippin. (Silver Banksian Medal.)

The only exhibit of vegetables was one of Onions shown by Messrs. G. MASSEY & SONS, Spalding. The bulbs were evidently cultivated in a field, but they were excellent examples. The varieties ranged in colour from white to blood-red, and in form were flat, round, and globular. Ailsa Craig was found under several diverse names, as offered by various seedsmen. The red varieties included Crimson Globe, Wethersfield, Southport, Red Globe, Small and Large Blood Red; and of white kinds we noticed Silver Globe, Silver Queen, Uncle Sam, Southport White, and Tennis Ball Globe. (Silver Banksian Medal.)

COMPETITIVE CLASSES.

These were limited to varieties of Apples and Pears introduced since 1892, but they resulted in quite a small competition. Of 15 classes, seven were open to the trade growers only, but not a single exhibit was staged.

In the class for six dishes of Apples, open to amateurs, W. J. WILLIAMS, Esq., Tring, Herts. (gr. Mr. F. G. Gerrish), was awarded the 1st prize for good samples of Norfolk Beauty, Bramley's Seedling, Charles Ross, Baron Wolseley, Rival, and Christmas Pearmain. SIR MARCUS SAMUEL, Maidstone (gr. Mr. W. H. Bacon), was placed 2nd, his varieties including Byford Wonder, Christmas Pearmain, Rival, Allington Pippin, and Charles Ross. An extra prize was given to Mr. WHITLEY, of Torquay, who, under a misapprehension, had staged dessert varieties only.

In the class for three dishes the only exhibitor was Lord CLINTON, Bicton, Devonshire (gr. Mr. Mayne), a 2nd prize only being awarded. The varieties were Hambling's Seedling, Allington Pippin, and King's Acre Pippin.

In the single-dish class for any cooking Apple, Earl BEAUCHAMP, Madresfield Court, Worcester (gr. Mr. W. Crump), was well 1st with handsome fruits of King Edward VII.; 2nd, Mr. MAYNE, with the same variety.

In the single-dish class for dessert Apples, Mr. BACON was placed 1st, having the variety Charles Ross; 2nd, Mr. CRUMP with the variety W. Crump.

A variety shown as Castle Major was disqualified.

In the class for three dishes of Pears, Lord HILLINGDON, Uxbridge (gr. Mr. A. R. Allan), won the 1st prize, having St. Luke, Charles Ernest and Le Lectier. Mr. BACON was 2nd with Directeur Hardy, St. Luke, and Charles Ernest.

In the class for one dish of Pears, Mr. BACON was placed 1st with the variety St. Luke; 2nd, Mr. GERRISH with Princess.

DUTCH BULB-GROWERS'.

The following awards were made at a recent meeting of the Floral Committee of this Society held at Haarlem:—

First-class Certificates to Cactus Dahlia Flora, Brigadier, Debutante.

Award of Merit to Cactus Dahlia Snowstorm.

Obituary.

FREDERICK MEADE.—The following appeared in the obituary columns of The Times of the 21st inst.:—On October 17, at the General Hospital, Birmingham, Frederick Meade, for 34 years gardener and faithful friend in the family of the Rev. B. Jones-Bateman, Sheldon Rectory, Warwickshire.

SCHEDULES RECEIVED.

Bromley Chrysanthemum Society's twenty-eighth annual exhibition, to be held in the Grand Hall, Bromley, on Wednesday and Thursday, November 10, 11. Hon. secretary, Mr. R. S. PATTERSON, The Gardens, Bromley Place.

Royal Botanical and Horticultural Society of Manchester's Chrysanthemum exhibition, to be held at the Botanical Gardens (White City), Manchester, on November 18, 19, 20. Secretary, Mr. P. Weathers, Botanical Gardens, Manchester.

REMARKS.—The best English Apples continue to sell freely. The last consignment of Apples from Nova Scotia were of better quality than previous shipments. Pears are plentiful, but there has been a good demand. Newtown Pippins are of superior quality but their prices are a little lower. Italian Chestnuts are received in limited quantities. Prices for English Tomatoes are firm at from 3s. 6d. to 4s. per dozen lbs. Foreign Tomatoes are arriving in a very wet condition. The trade in vegetables and fruit is dull. E. H. R., Covent Garden, Wednesday, October 27, 1909.

REMARKS.—The Potato remains about the same as last week. Edmond J. Newborn, Covent Garden and St. Pauls, October 27, 1909.

COVENT GARDEN FLOWER MARKET.

The unfavourable weather not only exerts a bad influence on trade, but also checks the development of the plants. Frost has been late in putting in an appearance this autumn, but during the past few days most tender subjects

have suffered damage. The splendid exhibits of Begonias from the open ground shown at the R.H.S. meeting on Tuesday, 26th inst., were indicative of the mildness of the season. Those who grow market plants under natural conditions do the best trade, for although they take a little longer to develop they are of greater service, and make better prices. Chrysanthemums were never seen in better condition. Ericas have sold rather better than last week. I may repeat that the small plants in 3-inch pots are the most profitable. Begonia Gloire de Lorraine is good from several growers. Supplies of Pelargoniums of all sections are falling off, although a few well-flowered plants are seen. Solanums are not large, but are well berried. Other subjects in season include Cyclamen, Bouvardias, Lilliums, and Fuchsias.

CUT FLOWERS.

The recent frosts have spoiled the Dahlias in most districts, and also many other tender flowers in the open. Some varieties of Chrysanthemums have also been damaged, chiefly owing to frost whilst they were wet. No great change has yet taken place in regard to prices, but it may be regarded as certain that there will be an advance all round in the value of good cut flowers. During the past week Roses were very cheap, except those of extra good quality. Lilliums were also cheap, but they may be scarce later; Carnation supplies are already falling off. Violets are coming from many sources. The French Parma Violets are not quite so good as usual. There are some very fine English grown flowers of the Princess of Wales and La France varieties; The Czar, from several sources, is also good. Oak is the most useful of all hardy foliage. Smilax, Asparagus, and other tender foliage is plentiful. Adiantum (Maidenhair Fern) is coming more into use again, but just at the present time it does not make big prices as the autumn crops have to be cleared and the supplies are large. A. H., Covent Garden, October 27, 1909.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

BOWLING GREEN: Florist. You have omitted to give your name and address, which is required as a guarantee of good faith. If you wish to make merely a lawn, you will find instructions in the issue for August 29, 1908, p. 176, whilst the Lancashire Crown bowling green is described in the issue for January 16, 1909, p. 48.

CHRYSANTHEMUM: T. L. The specimen shows a state of proliferation similar to that known as the "Hen and Chicken" Daisy. It is not possible to say what is the exact cause, but anything tending to hinder the normal development of the main bud, or to unduly excite the roots, might have that effect.

DAFFODIL: Bicolor. The true Daffodil is Narcissus Pseudo-Narcissus. N. poeticus is known as the Poet's Narcissus, although the term Daffodil is often loosely applied to this and to all the other species.

EIGHTEEN FLOWERING SHRUBS FOR A NORTH BORDER: W. J. P. Ribes sanguineum, Baphne Mezereum, Spiraea arifolia, S. Douglasii, S. chamaedrifolia, Berberis Aquifolium, B. Darwini, Cydonia japonica, Olearia Haastii, Skimmia japonica, Nuttallia cerasiformis, Viburnum Tinus (Laurestinus), Rhododendron molle, R. ponticum, Leycesteria formosa, Philadelphus grandiflorus, Halesia tetraaptera and Lilac (Syringa) alba grandiflora.

FERN MITE: G. O. P. The best plan to eradicate this pest is to dip the leaves in an insecticide. Tobacco water is efficacious, but there is a danger of injuring the plants unless it is used in a very dilute form.

MARIGOLD BLOOMS: S. S. Very few Marigold blooms are sent to Covent Garden Market, and it is now too late to procure them, unless they can be got direct from some of the nurserymen who specially cultivate hardy flowering plants.

MUSHROOMS: G. T. The new process of raising Mushrooms to which you refer is described in the *Gardeners' Chronicle*, January 23, 1909, p. 59. Under this system, minute pieces of tissue are taken from the centre of a Mushroom planted in a suitable bed, and the growth from these utilised as spawn. The cultivation of Mushrooms from spores has been often referred to in these pages.

NAMES OF FRUITS: T. B. 1, Northern Duplicating; 2, Washington; 3, Belle de Boskoop; — *H. Spight*. 1, Bergamotte Esperen; 2, Win-

W.* Gomphocarpus fruticosus.

NURSERY BUSINESS: H. S. S. It is difficult to recommend any particular locality, there being so many good centres in which you might start with every likelihood of finding a ready and remunerative sale for the Tomatos, Chrysanthemums, and Roses you wish to cultivate. Success will depend upon your practical knowledge of plant culture and your energy and capacity for work and general business. You must make the most of the experience you have obtained in the four years spent in the different nurseries. The seaside towns you mention, as well as other favourite resorts on the east and south-east coast, are already pretty well provided for in the way of floral and other nurseries. But this fact need not deter you from taking your chance and adding to the number of nursery businesses already established, for not infrequently newcomers gauge and cater for the requirements of the inhabitants and visitors better than nurserymen already established there, and hence build up a flourishing business within a few years from the time of starting. We presume you contemplate renting a small nursery; by doing this you would have a fairly good sum available for working capital. We should advise you to visit some of the nurseries advertised for sale; examine carefully the books as regards the annual turnover, and inspect the houses as to their condition and suitability for the growth of the plants which you intend to cultivate. Ascertain that the heating apparatus is in good condition, and see that the place you select is not situated at a great distance from a railway station.

SCOTCH FIR: H. G. There is no disease present on the needles, neither do they suggest injury from a lime-kiln. Examine the root and collar, and if white, the mycelium of a parasitic fungus is present under the bark. Dress the soil with kainit and lightly fork it into the ground.

SEQUOIA DISEASED: H. M. The Sequoia is attacked by a fungus—*Botrytis Douglasii*. Remove the affected shoots and burn them, and spray the tree with sulphide of potassium, at a strength of 1 ounce in 3 gallons of water, commencing in March.

A MARKET FRUIT-GROWER'S YEAR.

OCTOBER was a month of phenomenal rainfall. In our district of Sussex it fell on 23 days, and the total registered was 7.51 inches, or about three times the average for the month. This is the largest quantity registered at my station for any month in the present century. The nearest approach was 6.72 inches in October, 1903, when rain fell on 30 days, and the next was 5.78 inches on 26 days in October, 1907. In this south-eastern district we had the greatest rainfall that occurred in the country in the three days ending with October 28, or rather at 7 a.m. on the 29th, though it was bad enough in most other localities. For one of these days and for the three together the measurements were records—the first, one of 2.28 inches for the 24 hours ended at 7 a.m. on the 27th, and the second, 3.69 inches, for three days ended at 7 a.m. on the 29th. These quantities, however, were beaten at a few other stations in the south-east of England. Brighton had 2½ inches in 24 hours and 5.14 inches in the three days, while Margate had 5.43 inches, and Ramsgate 5.14 inches in the same three days. The floods which prevailed in low-lying dis-

tricts were the most extensive for some years past.

GALES AND THEIR RESULTS.

There was a great gale from the south-west on October 23, which blew quantities of late Apples and Pears off the trees, and did further damage. The effects, however, were insignificant in comparison with those done by the north-eastern gale of the night of the 28th. It will be noticed that this second gale occurred immediately after the great, three-days' rainfall mentioned above, and this sequence accounts for its astonishing effect now to be reported. In a field of nine acres of Apples, planted partly in the autumn of 1905 and partly in that of 1906, the soil was in a state of fine division at the beginning of October, as left by horse cultivation and hand hoeing. It was full enough of water before the week of the tremendous downpour, but that converted it into a perfect ooze, although the field is drained. Consequently, there was no firmness in the soil to resist the force of the gale, and hundreds of trees were blown partly down, while some were laid flat on the ground. They were staked, but this made only a little difference, as stakes that were half rotten from age were snapped off at their bases, while such as were new were driven through the soft soil with the trees tied to them. In other cases, the ties were burst, and the trees driven down while the stakes remained standing. A great number of the trees had been freshly staked in consequence of the effects of the earlier gale, but this did not save them. The greatest damage was among trees planted three years ago, partly because they are on the north-eastern side of the field, and partly because they had not acquired so good a root-hold as those planted a year earlier. Among those that suffered most were free-growers as Bramley's Seedling, Warner's King, and Gascoyne's Scarlet, splendidly furnished young trees, and densely covered with foliage. They caught the full force of the gale, and hardly one of them, 260 in all, remained upright after the wind subsided. Varieties of less rank top growth, and particularly those that had lost most of their leaves, such as Cox's Orange Pippin, Allington Pippin, Duchess of Oldenberg, and Lane's Prince Albert, suffered comparatively little, though many of them had their stakes snapped off or their ties broken, and a few were blown down. Worcester Pearmain was blown out of position to a considerable extent. All the trees are trained in bush shape on stems about 3 feet high. It must not be supposed that the stakes were little sticks. On the contrary, most of them were cut out of 14 feet Hop poles, and are very stout. In consequence of the two gales, it will be necessary to provide fully a thousand new stakes, and quite half a hundred-weight of stout rope-yarn.

A MONTH'S WORK LOST.

So far as work on the land is concerned, October may be regarded as having been washed clean out of the season. An attempt was made on two of the few fine days to horse-cultivate one fruit plantation, but rain followed immediately, and more harm than good was done. The field is smothered with chickweed and grass, although it has been cultivated several times in two directions, and hand-hoeing has been done twice in the spaces around trees and bushes left by the implement. Another plantation is also covered with

chickweed, which will now have to be left to grow till frost kills it. If cultivation and hand-hoeing had been practicable in October, both fields would have been clean. A plantation of Plum is more like a pasture than cultivated land, although it has been hoed three times by hand at a great expense. Since the middle of August both cultivation and hand-hoeing have been wasted labour, as rain has reset the weeds after each operation.

DAMAGE TO GROWTH BY APHIS.

In pruning young Apple trees, the enormous damage done by the unusually severe attack of the aphis in the past season is distressingly obvious. Many trees have to be cut back severely, to take off the twisted growths due to the attack, and to get down to clean and vigorous wood. These twisted growths are covered with feeble and distorted buds, which would develop into miserable, little fruit buds if left, and the trees would be permanently dwarfed. Lord Grosvenor is one of the worst punished of the varieties, and in consequence of the partiality of the aphis for this Apple, with its great liability to scab, it is not to be recommended for planting. A much finer Apple, Royal Jubilee, is another badly-injured variety, while Warner's King, Worcester Pearmain and Beauty of Bath have suffered much damage. Brandley's Seedling is the most nearly immune of the free-growing varieties, with Duchess of Oldenberg and Early Julyan as fair seconds. Lane's Prince Albert and other feeble growers have suffered only slightly. Cox's Orange Pippin, Allington Pippin and Charles Ross, are among the least liable to serious injury from the aphis of any dessert varieties on my farm, but the two former varieties discount this advantage by their susceptibility to scab.

AN ASTONISHING VERDICT.

In glancing into Ledeman's classical work on *The Spraying of Plants* the other day, I was astounded to read, under the heading of "Aphis," the following remarks:—"They are supposed to cause considerable damage by sucking the juices from the blossoms and young leaves, but the injury done by them has probably been over-estimated. . . . Unless the bees are very abundant, it is not necessary to try to destroy them for they do not cause any serious damage, and in a short time they naturally disappear." No serious damage indeed! They do more damage among my trees than all other insects together.

PREPARING FOR FRUIT PLANTING.

Fortunately, a field of 6½ acres was mostly ploughed and subsoiled for Apples and Black Currants before the land became waterlogged. The crop of this season was one of second-early Potatoes, cleared off, all but a small corner, by the end of August. The soil was not as dry as could have been desired for the work of ploughing and subsoiling during the latter part of the time, but nearly all of it was done before the heavy rainfall of the latter part of September occurred. Unfortunately, the soil has been run into a compact mass by the enormous rainfall of October, and several dry days will be needed before it can be harrowed and marked out for planting. The prospect of getting the work done in November, the most desirable of all months for planting fruit trees, is not brilliant at present. The leaves have not yet dropped off

the young trees, so a start could not be made at present, even if the land were ready.

DIGGING UP TREES AND BUSHES.

One kind of work that was not stopped by the wet state of the land was that of digging up a number of Damson trees and Gooseberry bushes. Damsons, in my opinion, are not worth growing, as they make only 1s. to 1s. 6d. per half-sieve when there is a fair crop, and they cost at least 6d. to gather. The trees dug up were planted mainly to shelter Apple trees, but are not needed for that purpose now, as an outside row of ever-greens and a very high hedge are all that are needed, while the Damsons were shading the Apple trees next to them. The Gooseberry bushes taken up have been ruined by the

NOTICES OF BOOKS.

* FRENCH GARDENING.

A FEW weeks ago (see p. 152) a larger and more detailed treatise on *French Market Gardening*, by Mr. J. Weathers, was reviewed in these columns. Mr. Smith's book, which is the subject of the present notice, runs into about 160 pages and contains 22 full-page photographs of scenes in the "French" garden at Mayland. The author has managed this garden during the two or three years it has been established. With such a means of obtaining valuable information at his disposal, it is somewhat disappointing to find that Mr. Smith has not lifted the veil very much to show how it is possible to secure as good results in England as in France by intensive methods of cultivation. It is true that

Smith tells us that he has secured £216 15s. 9d. from one-third of an acre, £120 17s. 8d. from one-seventh of an acre, £44 12s. 1d. from about one-tenth of an acre, and, in the open air, £14 16s. 1d. from rather more than one-twentieth of an acre. These figures were recently seized upon by one of the daily papers, and quoted to show that it was possible to make as much as £850 per acre by intensive methods of cultivation—and this not in 12 months, but in half that time. The fallacy of quoting returns from small parcels of land, and of then estimating those of larger areas at that rate, is well known to practical growers, but does not appear to be quite so obvious to the novice.

Considering the excellent way in which the garden at Mayland is furnished with all the necessary means of intensive cultivation, it is rather disappointing to find that Radishes and

FIG. 135.—INTERIOR OF FRUIT-ROOM IN DOVER HOUSE GARDENS.

fungus *Botrytis*, and are to be replaced by Black Currants.

CLEARING DRAIN OUTLETS.

A very important work was fortunately done before the flooding rains occurred, namely, the clearing of outlets of drains partially blocked by silt washed up to them or by the scraping of rabbits, rats, or mice. Many a drain has been burst or filled with silt through the neglect of seeing to the outlets regularly. Quite a large number of such drains, put in and neglected by a predecessor, have been discovered since my occupation of the farm. In some cases it has been possible to make them good by opening the outlet ends for two or three rods, and removing the drain pipes. The outlets should be examined twice during the year, and cleared where there is any approach to blocking. *A Market Grower.*

figures and estimates are given showing that the cost of a two-acre garden would run into £1,290 (including £300 for manure) and that about £700 more would be required for working expenses for 18 months, bringing the total up to close on £2,000. Unfortunately, no estimate of receipts is given; but if one may judge from the figures returned for produce sold from the Mayland garden itself between September, 1907, and September, 1909, the outlook is not rosy. During this period the value of the produce sold amounted to £766 4s. 6d., all but about £40 being realised by the sale of Cabbage Lettuces, Cos Lettuces, Carrots, Cauliflowers, and Melons. This left a balance of £51 9s. after the expenses had reached a total of £714 15s. 6d.; but this balance was subject to a rent-charge and depreciation. It may, therefore, be assumed that the profit from the Mayland garden is not yet very considerable. And yet, immediately preceding the general financial statement, Mr.

Cabbage Lettuces were not marketed until March; Cos Lettuces not until April; no Carrots until May; and no Cauliflowers before June. Surely some of these crops could have been ready earlier, and, if so, would have realised better prices.

Short chapters are given on the questions of site, water, manure, frames, lights, cloches, mats, tools, packing and seeds; but cultural details are lacking. Such crops as Lettuces, Cauliflowers and Melons have altogether 12 pages devoted to them, while such highly important crops as Carrots and Radishes appear to have been overlooked, except in the way of odd references.

Owing to the short time at their disposal, their insecurity of tenure, their lack of knowledge in most cases, it is doubtful whether French gardening for allotment holders would prove a success; but Mr. Smith, from the five pages he devotes to this particular point, seems to be sanguine.

The book is well printed, and generally free from mistakes, but it would have been far more useful if it had been provided with an index. *J.*

* *French Gardening*, by Thomas Smith. (London: J. Fels and Utopia Press.) 1909. Price 2s. 6d.

FRUIT-ROOM AT DOVER HOUSE.

NEXT in importance to getting a good fruit harvest is the provision of a store in which the fruit may be preserved in perfect condition for as long a period as possible. The value of a particular fruit usually increases gradually from the moment the harvest is past; therefore, its proper conservation, important as it is from the point of view of maintaining a supply, is also to be recommended as good business practice. Most of our readers know that late Apples may be kept in excellent condition if stored simply on the damp soil with a covering of straw in a thatched hut or outhouse. But this method is not to be recommended for early maturing Apples, much less Pears. For general purposes, a properly-constructed fruit-room is needed in most gardens, it being desirable that most of the fruits shall be directly under observation, in order that any which show signs of decay may be removed, and that varieties which show signs of ripening may be used for consumption in preference to others that are capable of keeping for a longer time.

In figs. 135, 136, and 137 is illustrated a new fruit-room erected in the gardens at Dover House, Roehampton, the residence of Mr. Pierpont Morgan, by Messrs. Mackenzie and Menour, Ltd., from designs by Mr. J. F. McLeod, gardener at Dover House. The building is 36 feet long, 16 feet wide, and 6 feet 6 inches high at the eaves, the ridge being 13 feet 6 inches from the ground. The structure rises from a low brick wall, 1 foot above the floor level, the walls being set in a foundation of concrete. Above this arise walls of woodwork lined with narrow matchboarding, and, outside, with Norfolk reeds. The roof, also of reeds, is 10 inches in thickness; and the reeds on the walls are 8 inches through.

The thatching is a splendid example of reed-ing, every reed being selected and laid in its place with extreme care and patience. Ventilators are placed on each side, in the base walls, and there are movable shutters at each gable over the doors, the ventilators in all cases being covered inside with perforated zinc, to exclude wasps and flies. The path around the interior is of gravel, so that moisture arises from the ground naturally and without the obstruction which a concrete floor would offer. Ample shelving is provided around the sides and at the ends, whilst a central table gives accommodation for the display of the finer or more interesting fruits. The windows are screened by heavy shutters, it being well known that light is only needed in a fruit store during occasions when an inspection is made of the fruit. Electric arc lamps are provided for use at these times.

TREES AND SHRUBS.

SCHIZOPHRAGMA.

THERE are two known species of Schizophragma, one from China and Japan and the other from China. Neither is at all common or

ably smaller number of sterile ones, which consist of a single bract only, and not of several bracts as is the case in the allied genus Hydrangea. These bracts are white in colour, 1 to 1½ inch long and an inch or so wide. They form the conspicuous part of the inflorescence, the fertile flowers being cream coloured and not showy.

FIG. 136.

THE FRUIT-ROOM IN DOVER HOUSE GARDENS; EXTERIOR VIEW WITH INSET SHOWING ENTRANCE DOOR.

FIG. 137.—SECTIONAL ELEVATION OF FRUIT-ROOM.

well known, although the older of the two species was collected 50 years ago. A somewhat similar plant in general habit, *Hydrangea petiolaris*, has been confused with the older species, *S. hydrangeoides*, and what was thought to be the true *Schizophragma* turned out to be the commoner *Hydrangea*. It has, however, existed here and there, and, occasionally, flowering specimens have been recorded. The earliest description of the genus appears in Siebold and Zuccarini's *Flora Japonica*, p. 58, tab. 26, published in 1855. In this *S. hydrangeoides* is described and a good figure of it is given. Subsequently in 1859

specimens were collected by Wilford in Hakoadi, and in 1862 it was gathered by Oldham in Nagasaki. Although original descriptions recorded it as Japanese only, later explorations have revealed it to be a native of China also. It resembles *Hydrangea petiolaris* by being of climbing or trailing habit and producing roots from the branches, by which it attaches itself to rocks or trees in a similar manner to Ivy. The leaves are large, broadly ovate or almost cordate, coarsely toothed, 5 to 7 inches long and 4 inches or more wide. The flowers are produced in large, terminal corymbs, an indefinite number of fertile flowers being intermixed with a consider-

The second species, *S. integrifolia*, was collected by Dr. A. Henry in Szechuan, and was figured in Hooker's *Icones Plantarum*, t. 1954, in 1890. It was not, however, until after Mr. E. H. Wilson had sent seeds to Messrs. Veitch some 10 years later, that living plants were seen in English gardens. From native specimens it promises to be a more ornamental plant than the older species. It is of similar habit to its relative, with opposite, ovate or ovate-lanceolate leaves, the largest of which are 8 or 9 inches long and 4 inches wide, dark green above, glaucous beneath and, together with the bark, pubescent in the early stages. The margins are sparingly armed with fine teeth. The inflorescences are large and the bracts of the sterile flowers are 3 inches long and 1½ inch wide. As in the other species, the sterile flowers are composed of single, white bracts. A good illustration of it appeared in vol. xxviii. of the *Journal of Royal Horticultural Society*, p. 62, fig. 21. Both species thrive in loamy soil and may be grown against a wall, the bare trunk of a tree, or over the reversed butt of a tree. Both species are in cultivation at Kew, and are, apparently, perfectly hardy. W. D.

ESCALLONIAS

THESE excellent flowering shrubs thrive best in the warmer counties, and especially in situations near to the southern coast. The varieties include white, rose, and pink flowers, which are produced in abundance throughout the greater part of the summer and early autumn months. *Escallonia macrantha* is the best known variety, and forms immense bushes throughout Devonshire and Cornwall. It makes an excellent hedge plant, and may be subjected to annual clipping as ordinary Privet, but even in such warm parts as Devonshire, frosts often damage the foliage. There is a white-flowered variety and another

with pink flowers, the latter named *Ingramii*. *E. illimita* is a good, white-flowered variety which branches freely. *E. rubra* has beautiful, red flowers, while *E. philippiana* bears an abundance of tiny, white flowers amongst its small leaves, and is well suited for training against a wall. *E. organensis* has deep rose-coloured flowers and branches of a reddish-brown. *E. montevidensis* is an excellent, white-flowering variety, somewhat resembling *Choisya ternata*, the Mexican Orange Blossom. It is usually in bloom about July, but a plant here is now (October 16) in full flower on a south-east wall. There are several other varieties, but those enumerated comprise the best for garden purposes, with the exception of *E. langleyensis*, which has slender, elongated branches thickly studded with side shoots, each carrying some half-dozen, bright, rosy-carmine flowers. Escallonias are easily increased by cuttings of half-ripened wood inserted at this time of the year in sandy loam and covered with a handlight. *J. Mayne, Bicton.*

FLORISTS' FLOWERS.

THE DAHLIA.

THE need of stout flower-stems has long been insisted upon in the case of the Cactus Dahlia, and the present season has witnessed a definite advance in this direction. Many writers and other fault-finders overlook the fact that, to the exhibitor, the stem is often less trouble if flexible, and for this reason there must be two distinct sections. Very few exhibitors would discard a Dahlia merely because it was of indifferent habit, provided the flower was a valuable one when staged, and thus it is not always fair to condemn a flower on account of its weak stem. Indeed, it is almost useless to expect the finest flowers to possess the strongest stems, as strength of stem and refinement of flower seem to be antagonistic qualities, although it is possible that, in time, this trouble may be overcome. A peculiar feature of Dahlia judging is the fact that, despite the yearly wail of the need of a strong stem, very little encouragement is given to the production of stout-stemmed varieties. It would be foolish indeed for a raiser to wilfully ignore a weak-stemmed flower if it is valuable from a commercial point of view, and to offer to the public a flower with strong stem, yet with no recommendation from the Floral Committee. In every other branch of floriculture there is a marked distinction between show and garden varieties. What a difference there is, for instance, between the Rambler and the exhibition Tea Rose. The very fact of a raiser aiming at the production of the highest forms of Cactus Dahlia in a great measure bars the probability of raising hardy, garden kinds. The parents are probably of soft growth, they are disbudded, and treated unnaturally in every way; under these conditions it is scarcely likely that the progeny will be of a type suitable for the garden. It is not that the raisers do not realise the necessity of hardier Dahlias, but rather, as I have mentioned before, because of the scanty measure of popularity accorded to varieties with every good quality except the finest floret and latest incurved form. I have for years had in my mind's eye the typical garden Dahlia, a variety which is bushy, yet makes a strong stem, and, what is of the utmost importance, a flower which holds good in the centre even when not disbudded or thinned. The only way to secure this latter feature is to raise flowers which, if thinned and grown under exhibition rules, would become so heavy in the centre as to be useless, but which, when left down as to retain sufficient florets to cover the

pollen. It is evident, then, that this section must be developed on quite distinct lines from exhibition flowers, and it is a most hopeful sign for the future prosperity of the Dahlia that one or two leading raisers are introducing sorts which can be left to grow naturally.

It may be said with truth that anyone who troubles to plant Dahlias can surely also take the trouble to stake and thin them, but one has only to look round even in the public parks to see that a number of Cactus Dahlias are simply tied round like a bundle of straw, and left to do as best they may. If varieties of pendant habit and soft wood are so treated, the result is unsatisfactory. So, in some measure to rectify the shortcomings of the average grower, and in order to keep the Dahlia in the forefront of autumn flowers, wiry-stemmed varieties must be raised, and, it is not too much to say, may be raised. It would, however, be quite foreign to my intention to seem to advocate garden Cactus varieties in preference to the magnificent exhibition flowers. These are, and will remain, the perfection of form in Dahlias, and their production the ultimate aim of all who are Dahlia lovers in any but a general sense, either as raisers or growers. Prosperity is not bound up in any one form, and so it behoves the Dahlia raisers, now that form, colour and floret are so beautiful, to turn their attention to raising a more hardy race, which shall withstand, at any rate, in some degree, the adverse weather which may be expected in early autumn, and, at the same time, stand erect. *P. P.*

AMERICAN HAWTHORNS.

SOME NEW ARBORESCENT SPECIES.

(Concluded from page 289.)

C. LETCHWORTHIANA reaches a height of 20 feet, bears mostly ascending branches, and forms a broad, dense head, usually branching low. The leaves are ovate, and somewhat rounded at the broad base, $2\frac{1}{2}$ inches long and 2 inches wide. The 10 to 15-stamened flowers, with pink anthers, are borne on 10 to 15-flowered, hairy corymbs and blossom about May 29. The scarlet, obovate fruit, rounded at the apex and tapering towards the base, ripens in the second week in September. The type tree grows at Portage, on the Genesee River, 50 miles south of Rochester, N.Y. This is a highly ornamental species, and was named by Dr. Sargent, in compliment to William P. Letchworth, who takes a great interest in American dendrology, and who owns a large and beautiful wooded estate at Portage, 1,000 acres of which he has lately presented to the State of New York to be used as a State park.

C. MACGOWNI is frequently a tree 25 to 30 feet high with a slender trunk 10 inches in diameter at the base, with the branches usually ascending, and with an open, spreading head. The leaves are ovate, slightly rounded, to subcordate at the base, 4 inches long and $3\frac{1}{4}$ inches wide, and very thin in texture. The 20-stamened flowers with rose or pinkish-red anthers are borne on 12 to 15-flowered, hairy corymbs, and open about May 30. The oblong-obovate, scarlet fruits, slightly mottled with greenish-yellow and tapering towards the base on long, drooping stalks, ripen about October 1. The type tree grown on the banks of the Humber river in Lambton on the west side of Toronto, and is quite common in the neighbourhood of Toronto. A large and beautifully-developed specimen, showing a clear stem 7 to 8 feet, grows near the grand stand at the racecourse, Gananoque, Thousand Islands. One distinguishing, specific characteristic is the remarkably thin leaves. This handsome Hawthorn is named in compliment to John Macgown, the distinguished Canadian botanist.

C. PENCHILLATA is a tree 20 to 30 feet high, with intricate spreading and ascending branches, and usually forms a low-branching

stout trunk not more than 3 feet in length and about 15 inches in diameter. The leaves are broadly ovate to oval, and distinctly rounded at the base, with a slight convexity of surface, $3\frac{1}{2}$ inches long and 5 inches wide. The 7 to 10-stamened flowers, with rose anthers, are borne on 12 to 15 loose, villous corymbs, and open about May 20. The oblong, bright scarlet fruits, which are much rounded at the summits, ripen about September 15 and soon fall. The type tree grows in Genesee Valley Park, Rochester, N.Y. It is a common species throughout Western New York, and is widely distributed throughout Ontario, Canada. This handsome Hawthorn in its general characters bears some resemblance to *C. gloriosa*, but it can easily be distinguished by its rose-coloured anthers and by the ripe fruits, which are not mammillate, and by the leaves, which are only slightly convex, and always prominently rounded at the base.

C. PRINGLEI sometimes assumes the dimensions of a tree 40 feet high and 20 inches in diameter at the base of the trunk. When it attains this size it develops an open head with remote branches. It is frequently seen about 20 feet high, with a compact, oval head branching low. The leaves on the fertile shoots are oval to orbicular, and rounded at the base; on vigorous shoots they are somewhat truncate to subcordate. The 7 to 10-stamened flowers with pinkish-red anthers are borne on 10 to 15-flowered, tomentose corymbs, and open from May 15-20. The subglobose to oblong, orange-red fruits, usually impressed with yellowish blotches, are distinguished from the fruits of most of the Flabellate species by a narrow, constricted calyx cup. The fruit is usually ripe about the last week in September, and soon falls. The type tree grows in the Champlain Valley, Vermont. It is a common species in the New England States, New York, and Ontario, Canada. A number of well-developed and handsome individuals are indigenous in the parks at Rochester, N.Y., and form an important, ornamental feature. It can be readily recognised by its convex, thin, drooping leaves.

C. SEJUNCTA is usually a low-branched tree or a tall shrub, with slightly ascending branches. The leaves are ovate, rounded or cuneate at the base, 3 inches long and $2\frac{1}{2}$ inches wide. The 7 to 10-stamened flowers with rose-coloured anthers are borne on 8 to 10-flowered, hairy corymbs, and open about the end of May. The subglobose to oval, crimson, lustrous fruits on stout, hairy pedicels, ripen about the middle of September. The type tree, which I have not seen, grows on the west side of the City of Albany, N.Y. There are a number of well-developed, low-branching trees growing on the east side of the old Pan-American exhibition grounds at Buffalo, which were pointed out to me by Dr. C. S. Sargent a few years since. The species is pretty well distributed throughout the New England States and Ontario.

C. TARDIPES frequently grows to a height of 30 feet, with spreading and ascending branches, forming a wide and somewhat open head, and a trunk of from 6 to 7 feet, and about 12 inches through at the base. The leaves are oblong-ovate and often narrowly oblong, slightly rounded at the base, distinctly thin in texture, 3 inches long and 2 inches wide. The 5 to 8-stamened flowers with purplish-rose anthers, are borne on 12 to 14-flowered villous corymbs and open about May 25. The oblong, scarlet fruits, much narrowed towards the base, and slightly narrowed towards the apex, ripen at the end of September. The type tree grows on the Black Creek Flats near Toronto. The species, which is common from Toronto to Quebec, is a handsome, arborescent form, and in the outline of its leaves and in the shape of the fruits resembles *C. Holmesiana*. *C. Holmesiana* has, however, pink-anthered flowers, and ripens its fruits three or four weeks earlier. *John Dunbar, Rochester, New York, U.S.A.*

NOTES FROM A "FRENCH" GARDEN.

We have pricked off all the Lettuces and the early batch of little "Black Gott" and Cos Lettuces is already established. The Lettuces may now be afforded ventilation, admitting air very carefully at first and increasing the quantity as the plants get bigger, and raising the cloches about 2 inches early in December. In the event of cold weather the cloches must be lowered, or closed altogether. The grower must endeavour to prevent his plants suffering a check during the course of development. On several occasions last week it was necessary to spread the mats over the cloches, but this was not done until the glass frames appeared white with frost; they are removed again directly the

weather is milder. These details can easily be attended to, at any rate, where the garden cloches do not exceed two thousand. In the course of 8 or 10 days the Cos Lettuces may be pricked out a second time, 14 plants being placed under each cloche. They will be pricked out in the cloches in which the Cabbage Lettuces have been growing since September, as we expect to market the Cabbage Lettuces shortly. In transplanting Lettuces the seed leaves and any decayed leaves are removed, the plants are put rather deeply in the ground, and the lights of the frames are kept closed until the plants have made fresh roots.

The Cardoons have been wrapped with straw for bleaching them and protecting them from frost. They will

be allowed to remain in their present quarters, as, since they are very sappy, decay would soon set in were they lifted and stored in a shed.

We are now bleaching the Batavian Green; this crop has succeeded well, and we expect it will sell at satisfactory prices. Owing to the unfavourable condition of the ground, we have to defer the planting of the Ox Heart Cabbages, although they are in a capital condition for removing. *P. Aquatics.*

FOREIGN CORRESPONDENCE.

NOTES FROM LA MORTOLA.

SUCCULENTS.

A GROUP of succulents on the terrace in the south front of the Palazzo was replanted last year. It contains a large number of rare and interesting plants. The chief features are a big *Cereus giganteus*, which is 5½ feet high, a tall *Aloe ferox* var. *xanthostachys*, and *Euphorbia candelabrum* var. It is impossible to enumerate all, but the following may be mentioned:—*Aloe Marlothii*, an unique plant with extremely spiny leaves from British Bechuanaland. It was discovered by Dr. Marloth, and sent to La Mortola in 1905. It is remarkable for its nearly horizontally-spreading flower-spikes, which, however, it has not yet produced at La Mortola.

Another *Aloe* (*A. rubrolutea*) has lately been figured in the *Botanical Magazine*. It is a native of German South-west Africa. *A. Greenii*, *Greatheadii*, *somaliensis*, *longiflora*, *lateritia*, *percrassa*, *abyssinica*, *Eru*, &c., adorn the group at various times with their beautifully-coloured flower-spikes. Besides these taller plants a far greater number of smaller succulents, *Stapelias*, *Euphorbias*, *Crassulas* are to be found in the group. A small part of the group has been planted with those peculiar *Mesembryanthemums* which resemble stones in their appearance, and which suggest "mimicry" in plants. There is a considerable number of these *Mesembryanthemums*, and their likeness to the surrounding stones of their native haunts is said to be absolute.

We have planted a number of *Mesembryanthemum Bolusii* between pebbles from our seashore, and so great is their resemblance that, from a certain distance, it is not possible to distinguish stones from plants. This fact is even more evident in the case of *M. pseudotruncatellum*, from German South-west Africa, and *M. minimum*, *minutum*, *obcordellum*, *obconellum* and *Wettsteinii* from the Cape. These plants are covered with a greyish, rough coat when at rest, and are then apt to be completely overlooked. I spoke about this case of mimicry at some length last year in my little handbook on *Mesembryanthemums*, and also of the curious method by which the seeds are thrown out from the very hygroscopic capsules of these plants.

M. Bolusii has most beautiful yellow flowers, which appear in September and open before sunset. We owe our specimens of this interesting, and at one time very rare, succulent to the kindness of its discoverer, Mr. Harry Bolus, who some years ago sent us a number of seeds. Whilst all the other species mentioned above are perfectly at rest, and are best kept without any water, *M. Bolusii* grows during part of the summer. It has been much admired by visitors to the garden, who soon baptised it the "living stones." *A. B.*

FELJOA SELLOWIANA IN SOUTHERN CALIFORNIA.

This plant, belonging to the *Myrtaceæ*, was introduced into Southern California several years ago from Uruguay by Dr. E. Franceschi. Of the three original plants which Dr. Franceschi imported, all have borne fruit, and several seedlings

Beschorneria Yuccoides

FIG. 138.—*BESCHORNERIA YUCCOIDES* FLOWERING IN MR. GUMBLTTON'S GARDEN, CO. CORK. (See p. 312.)

from them are beginning to bear regularly. The fruit is about the size of a small hen's egg, and in character closely resembles that of the Guava, to which plant Feijoa is closely allied. It is dull green in colour, with sometimes a touch of crimson on the cheek. The seeds are very minute, being very little larger than Strawberry seeds, and the pulp is most delicious and aromatic. It is so aromatic that a few specimens will scent a whole room. The plant grows to a height of about 6 feet, and its beautiful flowers, which open in May, render it very ornamental. The plant has proved perfectly hardy wherever planted in Southern California. The fruit is likely to become of commercial importance, as it stands shipment well and is liked by almost all who taste it. *F. W. Popnow.*

THE ROSARY.

ROSE MRS. F. W. FLIGHT.

I CAN corroborate all that was said on p. 213 in favour of this Rose, having seen the original plant on many occasions in Mr. Flight's garden. Mr. Flight has a strong penchant for raising new varieties of the climbing section. This season he has named one Mrs. Nut-hall, a white, free-flowering variety of compact growth, that is certain to make its mark when better known. Another novelty that I saw there this summer and that cannot fail to meet with appreciation is a rich, yellow-flowered variety of the multiflora type. To return to the subject of this note, as a Pillar or pergola Rose it would be difficult to find a superior to Mrs. F. W. Flight. The growth is robust, yet compact, the foliage a deep green, and the blossoms are produced in huge clusters which last a long time in a fresh condition; indeed, the rosy hue becomes deeper with age, which is contrary to the general rule. As a pot plant, too, in either a large or small state, this Rose is valuable. *E. Molyneux.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Vanda.—The Java *Vandas* such as *V. tricolor* and *V. suavis*, if well grown, attain to 4 or even 6 feet in height, and, being furnished with foliage down to the rim of the pot, they are stately specimens. Moreover, they furnish fragrant flowers that will last a considerable time for table or other indoor decoration. The present is the best time to overhaul and attend to the repotting of these plants, there being less likelihood of losing any foliage than when the operation is deferred until spring. The old potting materials should be kept somewhat on the dry side for a week previous to disturbing the roots, during which time the plants should be carefully sponged over so as to effect a thorough cleansing, especially if there are any scale insects upon them; the small, brown species adheres very firmly to all parts of the plant, and sometimes to the roots that are out of the potting material. If it is necessary to repot a plant through loss of foliage at its base, remove the old material and drainage, then carefully lift the plant out of the pot, and cut the stem off at the base so as to bring the leaves close to the rim of the pot. This should be done only when there are plenty of living roots above the severed part to support the plant. If there are but few roots on the stem, it is advisable only to cut off such of the lower part that may be dead or rootless. In some cases there will be plenty of living roots inside the pot, some clinging firmly to the sides. After removing the drainage, &c., the grower, with care, may cut off the lowermost part of the stem without removing the roots from the sides of the pot; then, by gently pressing the plant down in the pot to its proper position, there will be less disturbance of roots than if the plant had been taken from the pot. During the operation, there are sure to be several roots cracked, but this will not affect the plant in the least. Place a few large pieces of cork over the bottom of the pot, which may then be covered with some rough Sphagnum-moss; replace the loose and lowermost

roots over this, and carefully work in amongst them a mixture of unchopped Sphagnum-moss and crocks of moderate size, pressing them down rather firmly. Then distribute more roots likewise, bringing them up toward the surface, and finish off with clean, freshly-gathered Sphagnum-moss, well mixed with finely-broken crocks. Most of the roots will be inside the pot, but it is not advisable to bury all the aerial roots that are on the stem; those that are long enough may be pegged down on the surface of the moss, and in time these will send lateral roots into it. The more roots that are enticed down in this way the better it is for the retention of the lower leaves and for the health of the plant generally. Plants that need no root disturbance by repotting should be examined as to the condition of the potting materials. If the Sphagnum-moss has become decomposed, it should be carefully picked out from between the roots, and fresh material substituted. After repotting, secure each stem in an upright position to neat Bamboo stakes, it being essential that the plant shall be quite firm in its position. These *Vandas* must be well shaded from all direct sunshine, especially after root disturbance. No water need be afforded for several days, after which give each plant a thorough soaking with tepid rain-water, which will be sufficient for the needs of the lowermost roots for several months to come. Whenever the moss on the surface becomes dry, it should be lightly sprinkled over, and by this means kept growing as luxuriantly as possible. During the winter months the plants require the temperature of a Cattleya house; but during the other seasons of the year a cool, moist stage in the cool intermediate house is the more suitable place for them. Dump well between the pots several times a day so as to keep their immediate surroundings moist.

Odontoglossums.—The remarks printed last week under this heading were intended to refer to *O. citrosimum*.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Strawberries in pots.—Some provision must be made for protecting pot-Strawberries from frost. The present season has not been favourable for the ripening of the crowns, therefore the earliest plants should be left out-of-doors as long as possible, so that the crowns may mature better. In gardens where only small numbers are grown, the affording of protection may be left until frost actually occurs, remembering that after they are packed closely together the plants are apt to lose some of the foliage during spells of dull, wet weather; but, in other cases, where there are very many plants to handle, the work must be commenced at once. Perhaps the best way to protect them from frost is to plunge the pots in coal-ashes to the rim. This method entails considerable labour, but it will be found that there are few broken pots at the end of the season. Common Bracken is sometimes used for strewing over the plants, and this material would answer if it could be kept always dry; but, being exposed to the weather, the fronds quickly decay, and become unsuitable for the purpose. An excellent method of protection is that of plunging the pots in cold frames in a bed of leaves. The plants can then be sheltered from snow and heavy rains. If this method is adopted, the lights must be left off whenever the condition of the weather will permit. During severe frosts it will be necessary to cover with dry Bracken the Strawberry plants that are plunged in the open air, removing the Bracken as soon as the frost has disappeared, and keeping the material dry for further use.

The forcing.—If ripe fruits are required very early in the season, it will be necessary to place a batch of plants under glass at the end of the present month, or, at the latest, early in December. As a rule, ripe Strawberries are not expected until the commencement of March, neither is it desirable to attempt to obtain them at an earlier date, unless circumstances compel one to do so. Be careful to select the most forward plants for the earliest batch, and only those which have a single crown. Examine the drainage material and see that, in every case, it is left in a perfect condition. Before taking them indoors, lay the pots on their sides, and thoroughly syringe the plants with an insecticide. The best structure for the plants at the first is a shallow, heated pit, where the plants can be placed near

to the glass. They may be moved into a warmer house when the flower-spikes are in course of development. The pots should be plunged in a bed of Oak leaves, which will give just sufficient heat to excite the roots into growth. The atmospheric temperature should be kept at about 45° or 50° for the first few weeks. After forcing has commenced, spray the foliage with lukewarm water on the mornings of fine days, and exercise the greatest care in applying water to the roots until the plants are actively growing.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir Edmund G. Loder, Bart., Leonardsllee, Sussex.

Weeping trees.—Trees and shrubs with pendulous branches have a very good effect, provided they are planted in suitable places. How beautiful, for instance, is a large specimen of the Weeping Birch! Weeping trees are effective on hillsides and occasionally in mixed groups, but they are never seen at their best except as isolated specimens. Weeping Ashes, Beeches, Limes, Willows, and weeping varieties of Prunus, Sophora, *Cytisus scoparius*, *Halesia tetraptera*, *Desmodium*, *Corylus*, *Cupressus*, *Sequoia gigantea*, *Taxodium distichum*, and others are all useful for various decorative purposes. Occasionally, such trees show a disposition to produce erect branches; these should be cut away. Some of the prettiest weeping plants are the weeping Roses, especially of the Rambler section. These should be budded on tall Briers 6 to 10 feet high, and will soon make good heads, which will have a very fine effect when in flower. Some of the prettiest varieties are Hiawatha and Dorothy Perkins. Such Standards should be supported with strong poles which have had their bases dipped in creosote; they should in every instance be tied with strong string. Standard Roses of this height should now be planted in exposed positions. Some plants, like the common *Laburnum*, have drooping inflorescences, and present, when in flower, an effect similar to pendulous trees.

Variogated shrubs and trees.—When trees and shrubs are being planted in numbers for pleasure-ground ornamentation, care should be taken to select a sufficient number with variegated foliage for the sake of variety in colour. There are so many species that have forms of this nature that the choice is as wide as could be desired.

Bamboos.—Bamboos may be transplanted at any time between October and April, but, preferably, during moist weather. Bamboos should be planted where they can be easily watered in the event of dry weather, and where they will relieve the monotony of other evergreens.

Palms.—Palms may be shifted at this season, and will take very little harm, provided that a good ball of soil remains attached to their roots. Do not, however, allow the roots to be exposed to the atmosphere for one moment longer than is necessary.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. Ford, Pencarrow, Cornwall.

Tree Carnations.—The cuttings of such varieties as America, C. J. Thornton, Enchantress, Fair Maid, and Mrs. S. J. Brooks, which were rooted early in the spring, have developed into plants now on the point of flowering. They require an atmospheric temperature of 55° at night with a rise of 5° or more during the day, according to the conditions out-of-doors. The plants from which the early supplies of blooms are expected must not be coddled at this stage of their growth. Advantage must be taken of every favourable opportunity to ventilate the structure in which they are growing. On dull, damp days a little fire-heat is necessary to dispel the superfluous moisture and to render the air buoyant, and on these occasions the leeward ventilators should be opened to insure that there is a free circulation of air amongst the plants. Timely attention must be paid to disbudding; it is waste of energy to allow the superfluous flower-buds to become larger than necessary before removing them. Occasional doses of weak liquid manure should be given to all the forward plants. Neither aphid nor red spider should be allowed to obtain a hold on the plants.

Carnation Souvenir de la Malmaison.—Layers rooted early in autumn, and now growing

in 3-inch pots, should be transferred to others of a larger size as soon as the roots have penetrated the soil. For various reasons this work is often postponed, but, to obtain really good results, there must be no delay in shifting the "Malmaison" varieties into their flowering pots as soon as the young plants have made sufficient roots. For this potting the soil should consist of such a mixture as three parts loam and one of leaf-soil, to which has been added a dusting of lime rubble, sufficient sand to keep the soil porous, a 6-inch potful of bonemeal, and nearly as much soot to each barrow-load. In gardens where Carnation culture is a speciality, a light and well-ventilated house will be available for the plants. In other establishments they have to be accommodated in a cool pit, or, perhaps, in an unheated frame. In these conditions the plants will successfully pass through the winter, if proper attention is given to watering, but it will be wise to plunge the pots to the rims in ashes. To obtain early flowers, artificial heat is necessary, and these plants must be given more water at the root and be grown in a moister atmosphere than would be beneficial to the more naturally grown plants.

Primula obconica.—The plants which are on the point of flowering must be given a good position in a light house having a temperature of from 45° to 50°. They should be given some stimulant to enable them to produce a succession of flowers. Many persons, including myself, have to be careful not to touch the foliage of this beautiful plant, since it sets up severe irritation to the skin.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Raspberries.—The present season is the best for forming new plantations of Raspberries. In planting early, the grower has the double advantage of open weather for the operation, and a moderately warm soil is likely to cause the roots to make some growth before severe frost. Apart from these important considerations, if canes are planted early they seldom lie about many days unprotected, but when the planting is delayed till well into the winter, or till the following spring, this exposure is often unavoidable, owing to inclement weather; the result is injury to the roots and failure in the plants. Though many of the fibrous roots of Raspberries are found near the surface of the soil, thoroughly established canes penetrate a good way down into the ground; therefore, and bearing in mind that a plantation is required to last for a number of years, it is necessary, in the first place, to thoroughly trench the soil. As the trenching proceeds, a liberal quantity of manure should be placed at different levels in the soil. If the subsoil is of an inferior character, do not bring this to the surface, but break up and leave it in the bottom of the trench, working in some light soil or manure. Rubbish obtainable from the potting shed might well be utilised in this way. A suitable method of training Raspberries in private gardens is that of tying the canes to strained wires or upright posts. The canes are thus fully exposed to sunshine and air, and the system so disposes of the canes that the fruit can be gathered from them with convenience. Such canes are easily protected from the birds when the fruit is ripe, especially if the uprights are left about a foot higher than the wires. When young canes are being taken from existing plantations for replanting, preference should be given to the smaller ones, if they possess a good quantity of fibrous roots. These, when planted, start into growth much better the following season than large, stout canes, which often suffer from the check of removal. See that the ground is made firm again before planting, giving the surface a dressing of wood-ashes or fine, light soil. If this is well raked in, it will place at the disposal of the planter some fine material to place round the roots when planting. Allow a distance 5 to 6 feet between the rows, and plant the canes 2 to 3 feet apart, according as to whether the clump or wiring system is followed. Where gaps exist in established plantations, the old soil should be removed and a barrowful of fresh loam put in, in which to plant the new canes. Varieties to be recommended are Superlative, Baumforth's Seedling, and Hornet, and, if yellow kinds are

appreciated, Queen of England, Yellow Antwerp and The Guinea.

Autumn-fruiting Raspberries.—Though the weather this autumn has been exceptionally cold and wet, these have produced good crops. Autumn-fruiting varieties require a warm and open situation, as the fruit is produced on the growth of the current year, and this must be encouraged. The best varieties are Belle de Fontenay and November Abundance. Queen Alexandra is a new variety, which has been given an Award of Merit by the Royal Horticultural Society.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

The season.—Seven degrees of frost on the night of October 25 in this district put an end to all the more tender vegetables, such as Marrows, Beans, and Tomatos. The chief work in the kitchen garden during fine days will be to clear up and remove all remnants of crops that are passed, and burn them on a vacant piece of ground at the nearest convenient spot.

Seeds.—The seed harvest is likely to be deficient in this country. Runner Beans especially must be very scarce, owing to the bad weather and the lateness of their coming into bearing. Care should be taken to preserve every seed-pod that is ripened sufficiently. For the purpose of increasing any particular variety of this vegetable, it is a capital plan to cut off the top, lift the roots, which, by the by, are said to be very poisonous, place them in boxes, covering them with sand, and keep them during the winter in a cool cellar or some other frost-proof building. They may be started gently into growth at about the end of April. These succeed very well, and come into bearing much quicker than plants raised from seed.

Vacant ground.—Take the earliest opportunity when the land is dry or frosty to dress it with whatever material it is intended to use, which will depend on the kind of crop to be grown. In cases where manure can be had in plenty, it is frequently used in excess of the requirements, and, as frequently, it is next to impossible to get as much as is needed. It ought, however, to be borne in mind that for soil which has been heavily cropped and manured for many years, lime, soot, and burnt garden refuse will do a great deal to renovate and improve the soil, and, indeed, are often more valuable than ordinary stable manure.

Trenching.—A certain amount of this work, and the more the better, should be carried out each season. As is known to many readers of the *Gardeners' Chronicle*, I am a firm believer in deep trenching, and in bringing the bottom soil to the surface. I am more convinced than ever that such is the right practice to pursue, but whether others differ from me or no as to the method, there can be no two opinions as to the value of trenching. On heavy soils the operation should be delayed until the New Year, if this is convenient, but, on light, stony ground, it should be performed during the autumn; the earlier after this date the work is carried out the better.

French Beans.—Now that the outside plants are past, the value of any which were sown late in slightly-heated pits, or in pots, will be appreciated. Providing the plants are strong and not over-forced, they will continue bearing for some time to come. Admit a little air whenever possible. Maintain a temperature of 50° to 55°, and, when water is needed at the roots, it should be always given in a warm state. Where convenience exists for their cultivation—and Beans are often in demand the whole year through—seed should be sown once a fortnight in well-drained 5-inch pots, using a light soil. Water must be given with extra care in the early stages, and the young plants must be raised in heat. Canadian Wonder and Ne Plus Ultra are good varieties for this season.

Cauliflowers.—Cauliflowers have suffered very little indeed so far from frost, but the plants should be examined at least twice each week, and all those of sufficient size should be lifted and placed under cover. Any heads which are now formed should be well screened from frost by placing spare leaves upon them and tying up the tall ones in such a manner that they will shield the centre. Any late plants which do not

show signs of "turning in" should be lifted with a good quantity of earth attached to their roots and laid in spare frames. When they are planted, apply a good watering and keep the frames closed for three days, after which time the lights may be removed during favourable weather. If a sufficient number of plants are treated in this manner they may supply small Cauliflowers right into the New Year.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of City Parks, Cardiff.

Lost and found property.—Park officials, like others whose calling brings them into constant touch with the public, have many opportunities of realising something of the great complexity of human nature. The carelessness, thoughtlessness, and oftentimes absolute dishonesty of the public can hardly be better exemplified than in the case of property, lost and found, in public parks. Hardly a day passes without lost articles of some description being picked up in public pleasure grounds, a large percentage of which is never even enquired after by the owners. At the same time numerous enquiries are made by visitors regarding property left or lost in the parks, which is never restored to them because never returned by the finders. This is so commonly the case that—here at least—visitors seeking lost property are frankly informed by the officials that the more valuable the article the less the likelihood of its being returned, and this notwithstanding notices inviting finders to hand over everything so found into the custody of the parks department. From this it would appear as if many adults still cling to a belief in the school-boys' adage that "hiding is keeping."

Proposed by-law.—As a means of helping to remedy this kind of thing, we tried a short time ago to include in our by-laws one making it compulsory on the part of every person finding property in the parks to hand it over to the safe keeping of the department. While a good deal might be said in favour of such a by-law, legal opinion was entirely against it, so the idea had to be abandoned. Most authorities have their own method of dealing with "found" property. Here, an account of all found articles is entered into a book kept specially for the purpose, and the names of the persons finding the same, together with date, when, and where found, are entered against each article. Persons claiming found property must satisfy the officer in charge that they are the bona fide owners before it is surrendered and they must then give a receipt. If any article is not claimed within a month the finder—if not a member of the parks staff—is allowed to take charge of it after signing a receipt, as in the case of an owner. Property not claimed by owner or finder is handed over at the end of each month to the police, who dispose of it, along with other found property, &c., by public auction each year.

THE APIARY.

By CHLORIS.

Bee-keeping as an art.—Many persons attend agricultural and horticultural shows and witness exhibitions of bee-driving, and imagine they know all that is required to make a good bee-keeper. With this superficial and rudimentary knowledge they make a start with a hive of bees, only to fail, and they then spread the story that bees are not a success, neither from a business point of view, nor as a hobby. No man became a gardener after once witnessing some simple horticultural operation. There are excellent opportunities for learning the practical side of bee-keeping, for most of the County Councils are desirous of rendering practical help in all such branches of rural industry. At the same time no lecturer on bees, however desirous he may be of telling his pupils all that is known about bee-culture, can tell them the many small details which can only be learned by practice, and it is these small details that make or mar success. Having gained a theoretical and a practical knowledge of bee-keeping, it is then well to make a small beginning, and as the apiarist's knowledge and experience increase, so can he profitably multiply the number of his stocks. There are many who make a good start, but later their interest decreases, and then they find the amount of honey in their hives also decreases in even a greater ratio.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, NOVEMBER 8.—United Hort. Ben. and Prov. Soc. Com. meet.

TUESDAY, NOVEMBER 9.—Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Edwin Beckett on "Some Beautiful Shrubs"). Ulster Hort. Soc. Chrys. Sh. at Belfast (2 days). Southampton Chrys. and Fruit Sh. (2 days). Chesterfield Chrys. Sh. (2 days). Clevedon Chrys. Sh. (2 days). Brit. Hort. Gard. Assoc. Ex. Council meet.

WEDNESDAY, NOVEMBER 10.—Bromley Chrys. Sh.

FRIDAY, NOVEMBER 12.—Bradford Chrys. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—44.4°.

ACTUAL TEMPERATURES:—

LONDON.—(Wednesday, November 3 (6 P.M.): Max. 55°.

Min. 49°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—(Thursday, November 4 (10 A.M.): Bar. 30.2; Temp. 53°; Weather—Dull.

PROVINCES.—(Wednesday, November 3: Max. 54° Scotland N.; Min. 52° Lincolnshire.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY.—Dutch Bulbs at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY.—Consignment of Japanese Lilliums at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 1 Nursery Stock at Bickley Hill Nursery, Bickley, by order of Messrs. Maier & Sons, by Protheroe & Morris, at 12.

TUESDAY AND WEDNESDAY.—Nursery Stock at Arthur's Bridge Nursery, Woking, by order of Messrs. Spooner & Sons, by Protheroe & Morris, at 12.

WEDNESDAY.—Fruit Trees at Ferry Hill, Chiff, near Rochester, by order of Messrs. Horne & Sons, by Protheroe & Morris, at 11.30. Roses at 1.30; Palms and Plants at 5, at 67 & 68, Cheapside, by Protheroe & Morris.

THURSDAY.—Nursery Stock at Portland Grange Nurseries, Matlock, by Protheroe & Morris, at 11.30.

FRIDAY.—Imported and Established Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The
Operation
of the
Small
Holdings
Act.

A summary of the recently published Report of the Small Holdings Commissioners is printed in the October number of the *Journal of the Board of Agriculture*. It is unfortunate

that the Report gives information on the administration of the Small Holdings Act only up to the end of last year (1908). So much criticism has been directed from various quarters on the slowness with which the provisions of the Act are being put into practical operation, that it is greatly to be desired that more recent data should be issued, in order that the criticisms may be rebutted or confirmed.

When it is remembered that the Act only came into operation in 1907, it cannot be said that the results of the first year's work are inconsiderable. Though, as will be seen when we summarise these results, the quantity of land purchased and the numbers of holders actually in possession are, at present, extremely small, yet it has to be remembered that a very considerable amount of preliminary enquiry was necessary before a start could be made. If the progress made during the present year indicates a moderate acceleration on that of 1908, the adverse criticisms will, in our opinion, be adequately met. If, on the other hand, the rate of settling men on the

land does not show an increase, then it will be evident that something is wrong with the machinery or mode of administration of the Act. For the Commissioners themselves are convinced, as the result of personal interviews with a large number of the applicants, that there is a very real and considerable demand on the part of "industrious, self-reliant and capable men" for small holdings. They point out, further, that "it is just this type of man who too often in the past has despaired of obtaining land in this country and has emigrated to the colonies."

Turning to a consideration of the facts, we find that, during the first year of operation of the Small Holdings and Allotments Act of 1907, some 23,000 applications were received by the county councils for 373,000 acres; and, of these applicants, 13,000, or about 56 per cent., were approved, provisionally, as suitable. The estimated quantity of land required by the approved applicants is 185,000 acres. Of this amount, 21,400 acres have been acquired by county councils; rather more than half (11,800 acres) having been purchased for £370,000, and the remainder, about 10,000 acres, leased at a total rent of £11,000.

The land thus acquired will provide for 1,500 applicants. By December 1, 1908, 504 men were in actual possession of holdings and about 12,700 of the selected applicants were not.

It is noteworthy that over and above the 500 men provided with land by the councils, another 700 have been supplied with holdings by landowners direct. Since the councils have helped also toward the settlement of these latter applicants, their number may properly be added to the 504 who have been provided with land directly by the councils. Thus, the net result of the first year's work is the provision of 1,200 small holdings.

Other points of considerable interest in the Report are that, of the 13,000 approved applicants, no fewer than 4,470, or about 34 per cent., are agricultural labourers; and that their applications are mainly for quite small holdings, to which the men do not propose to devote their whole time, and out of which they do not expect to obtain their whole livelihood. An unprejudiced consideration of the Report leads us to the opinion, already indicated, that it is premature to pass any confident judgment on the success with which the Act is being administered. Common fairness would appear to demand a suspension of judgment till the figures for the current year are available.

Perhaps the most important of all the observations made by the Commissioners is that in which they express their conviction that the not inconsiderable demand for small holdings already disclosed is only part of the demand which actually exists.

BESCHORNERIA YUCCOIDES (see figs. 138 and 139).—The *Beschomerias* are Mexican plants, with the habit of the soft-leaved Agaves, and drooping, fleshy, urn-shaped, greenish flowers, arranged on a paniculate raceme, the stem and large bracts being the most attractive parts. They are hardy in the warmest parts of the British Islands, where they form tufts of leaves and develop annually their striking flower-spikes. One of the best species is *B. yuccoides*. In Mr. GUMBLETON's garden at Queenstown, Ireland, the plant has grown into quite a big clump, and last May

it bore no fewer than six flower-spikes. Mr. GUMBLETON likens the flowers to big, brownish Fuchsias, with green tips. In the garden at Tresco, this *Beschorneria* is a most striking feature, forming a magnificent fringe to the top of a terrace wall by the side of one of the principal paths. When in flower, the bright crimson, partly-developed spikes hang over the wall in most picturesque fashion, suggesting long-necked birds, or, as one imaginative visitor put it, red snakes peering over it. *B. yuccoides* and *B. tubiflora* are the two best of the half-dozen or so species known. They are all polycarpic, that is, they do not die at once after they have flowered, as many of the Agaves and *Furcraeas* do. Where they cannot be grown as hardy plants, the *Beschomerias* are worth pot culture for the conservatory. They are sun-lovers, and like a strong, loamy soil. *B. yuccoides* appears to be the best known in gardens. It was first introduced about 60 years ago by Lord LICHETER, and was first flowered in 1860 in the garden of the late Mr. WILSON SAUNDERS, at Reigate. The flower-scapes are from 3 to 5 feet long.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees of this Society will take place on Tuesday, November 9, in the Society's Hall, Vincent Square, Westminster. At 3 p.m., a lecture on "Some Beautiful Shrubs" will be given by Mr. E. BECKETT, V.M.H.

NATIONAL CARNATION AND PICOTEE SOCIETY (SOUTHERN SECTION).—At a committee meeting held on Saturday, the 30th ult., it was decided that the show for 1910 be held at the R.H.S. Hall on Tuesday, July 26, and that the schedule remain as for 1909, with the addition of a class—open to amateurs only—for 12 distinct varieties of *Sells*, *Fancies* and *Yellow-ground Picotees*. The 1st prize in this new class will be the Martin Smith Memorial Challenge Cup and Medal, 2nd prize 25s., and 3rd prize 15s. The Challenge Cup will be the property of the winner for one year only.

NATIONAL AURICULA AND PRIMULA SOCIETY (SOUTHERN SECTION).—A committee meeting of this society was held on the 30th ult., when it was resolved to hold the show for 1910 on Tuesday, May 3, in conjunction with the Royal Horticultural Society, the schedule to remain the same as for 1909.

NATIONAL CHRYSANTHEMUM SOCIETY.—The annual dinner will take place in the Royal Venetian Chamber, Holborn Restaurant, on Monday, November 29, at 6.45 p.m. The President, Sir ALBERT ROBIT, D.C.L., LL.D., will preside. The Challenge Trophy, the Holmes Memorial Cups and Medals won at the Society's exhibition will be presented during the evening. Tickets may be obtained from the secretary, Mr. RICHARD A. WITTY, 72, Savernake Road, Gospel Oak, London.

TOMATO.—We have received from Messrs. J. K. KING & SONS three fruits of a Tomato described as a cross obtained from the varieties Lord Roberts and Beauty of Wales. The fruits are moderate-sized specimens of the Perfection type. They have brightly-coloured, thin, smooth skins, and firm flesh. Messrs. KING describe the plants as being very free croppers, and the variety as suitable for market growers.

GOVERNMENT ORDER FOR ABERDEEN NURSERYMEN.—Our Aberdeen correspondent writes that his Majesty's Commissioners of Woods and Forests have recently placed extensive orders with Messrs. BENJAMIN REID & Co., Aberdeen, for transplanted forest trees for the Crown forests in Scotland and England, amounting in all to 410,000 plants.

FIG. 139.—BESCHORNERIA YUCCOIDES FROM SPECIMENS SUPPLIED BY MR. GUMBLETON; FLOWER-STEM AND BRACTS RED; FLOWERS BROWNISH, WITH GREEN TIPS.

(See p. 312 and fig. 138.)

LEGACY TO A GARDENER.—We are informed that by the will of the late Mr. C. G. RICHARDSON, Beech Hill, Englefield Green, Surrey, the sum of £200 is bequeathed to his head gardener, JOHN RECORD.

BLACK SCAB.—In answer to a question by Mr. STANIER, in the House of Commons on Monday last, Captain NORTON made the following statement:—"The disease is unfortunately very prevalent in allotments and cottage gardens in Cheshire, North Shropshire, Staffordshire, South Lancashire, and parts of Warwickshire, Derbyshire, and Notts. It has been found in certain parts of Fife, but to a much smaller extent. A few isolated cases have been reported from other parts of the country. In none of the districts named does the disease exist except to a very small extent in fields under rotation. We hope that our information as to the results of the investigations which have been instituted will be available in the course of the present week, and they will be at once communicated to every occupier of premises on which the disease is known to exist.

WOMEN'S AGRICULTURAL AND HORTICULTURAL INTERNATIONAL UNION.—The annual meeting of the Union will be held at the club room of the Royal Botanic Gardens, Regent's Park, on Tuesday, November 9, at 3.30 p.m. A paper will be read by Mr. THOMAS SMITH, entitled, "Some Remarks on French Gardening in England." A stall for the display and sale of members' produce will be arranged in the conservatory.

UNFAVOURABLE SEASON FOR BELGIAN RHODODENDRONS (AZALEAS) AND JAPANESE BULBS.—According to a note published in the *Florists' Exchange*, Belgian Azaleas have been adversely affected by the cold, wet summer. The plants are not so well furnished with flower-buds as usual; moreover, the price has risen. Japanese bulbs, especially those of large size, are also scarce. The prices of *L. giganteum* have advanced, and even at the enhanced prices are not easily obtainable in quantity.

UNITED STATES DEPARTMENT OF AGRICULTURE.—The Hon. JAMES WILSON, who has been Secretary of Agriculture, U.S.A., since 1897, is about to resign his office. According to the *Florists' Exchange*, which makes the announcement, Mr. WILSON'S greatest success has lain in making his Department popular with farmers. It is doubtless due to this fact that the scientific information on agriculture disseminated by the Board in their well-known and numerous *Bulletins* has had such a considerable influence on the farming community.

NEW CALIFORNIAN SEED FARM.—We learn from the *Florists' Exchange* that the firm of W. ATLEE BURFEE & Co. has completed the purchase of a 40-acre ranch, near Lampoo, Santa Barbara County, California, for the growing of winter seeds, including Sweet Peas. Mr. LOXSDALE, who was president of the Society of American Florists in 1895, has been appointed to superintend the work of the farm.

THE PROGRESS OF FORESTRY.—Mr. WILLIAM DAWSON, M.A., lecturer on Forestry in the University of Aberdeen, in opening his class for the winter session, reminded his students that within the past twelve months forestry matters had made a great advance. He said the period of national indifference was past, and the true significance of forestry as a national question was becoming more generally understood. We have all the elements necessary for successful timber production in Great Britain, yet we are content to buy from other countries, whilst our own resources remain undeveloped. In Scotland

several million acres of land would realise the full use if planted with trees. Increased activity in forestry, Mr. DAWSON contended, will lead to the development of many other industries. In Germany three-fourths of the forest workers follow some other occupation, many being small-holders.

THE FORESTS OF BRITISH EAST AFRICA.—It will not be disputed by those who have occasion to study them that Blue Books are among the most interesting of all books, and that the truths that they contain are more romantic than the inventions of the novelists. This is certainly the case with the Report on the Forests of British East Africa, which has just been published, and which contains a masterly account of the forest flora of the Protectorate. Mr. HUTCHINS has, alas! the usual story to tell of stupid exploitation of forest land and the usual wise counsels to offer as to measures to be taken to put an end to it. Whilst the neighbouring State, German East Africa, has a well-organised and self-supporting forestry department, British East Africa is thinking about organising an adequate forestry service. Fortunately the Uganda

MR. JESSE WILLARD.

railway, which is dependent at present on wood fuel, is already feeling the consequences of reckless felling, and the authorities are becoming alive to the importance of replacing the happy-go-lucky methods of pioneers by the more economical practices of scientific forestry. With such admirable reports as those by Mr. HUTCHINS and his predecessors, it is difficult to understand how the British system of administration, which seems to involve a general neglect of the development of the natural resources of new territories, can go on much longer. To Mr. HUTCHINS' report is added a series of appendices dealing with the Conifers of Mexico and Central America, the indigenous timbers of the Protectorate, and the foreign trees suitable for planting. In these Dr. MAXWELL MASTERS is recognised as the first authority on coniferous trees, a tribute which will be peculiarly gratifying to readers of this journal.

PUBLICATIONS RECEIVED.—*Contributions to the Flora of the Congo*, by Em De Wildeman and Tb. Durand. Published by the Secretary of State, Brussels.—*In a Yorkshire Garden*, by Reginald Farrer. (Published by Edward Arnold, London.) Price 10s. 6d.—*The Agricultural Gazette of New South Wales*. (Sydney: W. A. Gullick, Government Printer.)

RETIREMENT OF MR. WILLARD.

AFTER serving the late Baroness and Mr. Burdett-Coutts, at Holly Lodge, Highgate, for 45 years, Mr. Jesse Willard has just retired with a pension. Mr. Willard is well known to visitors to the London shows, and is one of the oldest members of the Fruit and Vegetable Committee of the Royal Horticultural Society.

He was born at Hawkhurst, in Kent, and at 12 years of age left the village school and commenced his career as a gardener. Later he obtained employment in Hunton Court Gardens, near Maidstone, the seat of Henry Bannerman, Esq. The gardener was the late Mr. R. Goddard, and the lad started in the kitchen garden. With a view to obtaining wider knowledge, he volunteered to do duty in the glass houses on Sunday, and also assisted with the stoking of the garden fires.

A vacancy soon occurred on the indoor staff, and young Willard was offered the post of journeyman. In course of time he was appointed foreman of the glass department. He attended the Mutual Improvement Society at the neighbouring town of Maidstone, occasionally reading a paper on some gardening subject. His ability attracted the notice of Mr. Thos. Frost, nurseryman in the district, who, when applied to for a foreman by Mr. Hutt, gardener at Holly Lodge, recommended Willard. After being about a year at Holly Lodge, Mr. Hutt retired, and the late Baroness Burdett-Coutts offered the post to Mr. Willard. After a time he was entrusted with the care of the farm also, and he thus became responsible for the management of the whole of the Holly Lodge gardens and estate. At this time the Baroness Burdett-Coutts had a house and gardens at Torquay, where the late Dr. Ramsay also had a residence, and Mr. Willard was directed to send a collection of rare plants, not considered quite tender, to Dr. Ramsay. These plants formed the nucleus of Dr. Ramsay's famous collection, which has often been referred to in these pages.

During the time Holly Lodge was famous for its garden parties throughout the length and breadth of Great Britain, the task of the gardener was no light one. Exotic fruits and flowers were required in abundance, and Pineapples were cultivated extensively. The feature of the flower garden was the herbaceous borders, but, in addition, many beds were filled with Fuchsias, Pelargoniums and Heliotropes, which were fashionable as bedding plants at that time. Many of these were grown as tall standard plants. There were always Roses in abundance, as the owner delighted in these flowers.

Mr. Willard's duties as bailiff caused him to become acquainted with stock, and the goats and Guernsey cows at Holly Lodge were amongst the finest in the country. At one time the Nubian goats at Highgate numbered 30, forming the largest herd in Great Britain. For about 30 years Mr. Willard has served on the committee of the British Goat Society, and is looked up to as a high authority on these animals.

Mr. Willard has been a member of the Executive Committee of the Gardeners' Royal Benevolent Institution for more than 30 years, and in recent years has fulfilled the duties of auditor. He has also subscribed to the Royal Gardeners' Orphan Fund since its commencement.

On the 30th ult., on leaving Holly Lodge to take up his residence at Reigate, Mr. Willard was entertained by Mr. Burdett-Coutts in company with his friends and fellow employes at dinner, the occasion being also selected to present him with a number of gifts for himself and family. The friends and colleagues at Holly Lodge presented him with a clock and armchair. Mr. Burdett-Coutts's gift consisted of a silver inkstand. In making the presentation Mr. Burdett-Coutts made an appropriate and deservedly eulogistic speech, from which we reproduce the following extracts:—

"I was not content that a man who has held the responsible and honourable position for so

long with infinite credit to himself should drop away into the shadow of declining years, unmarked and unnoticed, merely because his lot had happened to be cast in personal or private service. That would not have been consistent with my conception of the dignity of labour. I do feel most strongly that this kind of work, or 'service' as it is commonly called, is as much entitled to that noble phrase 'the dignity of labour' as work in any other field. In one sense more so; because the man who is so placed works without any hard and fast rule of time and quantities, knowing that his daily output cannot be measured, his sense of loyalty his only inspiration, his desire to do his duty his only guide, his consciousness that he has done his best and—as in this case—the knowledge that he has entirely satisfied his employers, his only reward. Is it not right and fitting when such a man is at length compelled by the iron hand of time to lay down his life's task that the honour that is his due should be paid to him.

"Just a word or two as to the personal aspect of this case. It is not needful, after having paid a tribute to the great part he has played in the fame of Holly Lodge, to say anything about his ability as a gardener. He has gained a position of some distinction in the floral world. He is a master of the most ancient art that history can suggest to us—the art of gardening. He could not have gained that without a good deal of hard work, constant application, determination to do his duty, and constant use of his brain.

"I need not say anything about Mr. Willard's personal qualities. I shall miss him greatly. He has been a familiar figure to me in these grounds through all these years and it will be a real loss not to see him here habitually, as in the past. But I am assured he will not infrequently revisit these pastures, in which he has spent so many happy years, and I hope he will still give his successor, Sims, who has been here for many years, the benefit of his advice.

"I have now nothing more to say except the saddest word of all—the word 'Good-bye.' Willard's life and character have been an example to those who in the future, if they follow that example, may rise to better positions than they now occupy; and what is better than a high position, the appreciation, friendship and goodwill of all with whom they have been brought in contact.

"Willard, full of years and full of honour—such honour as comes from having done one's duty and from having deserved and received the appreciation of one's fellow-men—I now have the pleasure of presenting you with these beautiful and useful presents given by your friends, and I wish to add a small memento of my own in this inkstand. There is one word I have inscribed on it—'Friendship'—which perhaps illustrates better than anything else what I feel for you. There are certain men who, whatever their relations with you may be, you feel are your friends."

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

PATRIŇIA GIBBOSA.—In addition to the species of *Patrinia*, referred to by W. L. on p. 244, there is also in cultivation in this country *P. gibbosa*, a native of Japan and a pleasing, although not showy, plant with yellow flowers and growing rather more than a foot high. It is quite hardy with me, and has been in my possession for a number of years, having been sent, if I remember aright, by Mr. Max Leichtlin. It blooms about August and lasts in flower until about the beginning of October. The plant succeeds in loam, and looks best on a rocky. S. Arnott, *Sunnywood, Dumfries*.

GREASE-BANDING OF FRUIT TREES.—I am sorry to read that *Southern Grower* (see p. 275) does not consider grease-banding pays. In the case of bush trees or trees on short stems possibly it might pay best to rely entirely on spraying, but with half-standards or standards, I am sure many southern growers will agree with me that it pays to catch the female moths by means of banding. Even if some of the females do find their way into the branches by other means, the necessity for spraying is reduced by grease-banding. If we can catch 75 per cent. of the female moths on the bands, surely we shall not suffer

wards how so many caterpillars to fight against. I think the wise grower will continue to grease-band, notwithstanding his spraying operations. E. C. Purlove, *County Council Educational Committee, Dorchester*.

ROSES IN SCOTLAND.—I am surprised that the Rev. Williamson, in his interesting and useful note about the best Roses for Scotland, makes no mention of H. T. Mme. Abel Chateau, which, if I were obliged to confine myself to a single variety, would be my choice. It is exceedingly hardy and floriferous, early and late; the quality of its blossoms leaves nothing to be desired, and it is the only Rose I know, except the Sweet Briar, whose perfume scents the open air for many yards around. *Herbert Maxwell, Monreath, November 3*.

ROSE CORALLINA.—As a late autumn-flowering variety, and for bedding purposes, this is first-rate. It is an equal grower too, thus preventing the "gappy" appearance seen in beds of some varieties. The colour is very pleasing. *Yorkshire Gardener*.

LILIUM CIGANTEUM.—As there is a large quantity of seed on the Giant Lilies here this autumn, I shall be happy to send some to anybody who cares to forward an addressed envelope. My plants are all from home-saved seed, sown in a cold frame and pricked out in the open when a year old. It should be remembered that the seed usually lies a year before germinating. In the autumn of 1908 I planted a number of bulbs in the woods in order to test whether rabbits would devour the early and attractive foliage. In no single instance have they done so, although rabbits, I regret to say, have been undeniably prolific this year. I may mention that *Antholyza paniculata* has proved an excellent woodland plant, as immune from rabbits as its well-tried relatives, *Montbretia*. *Herbert Maxwell, Monreath, Wigtownshire*.

PEONIA OBOVATA.—I do not think this charming plant is very widely spread in cultivation, and so, as it has just contributed its essential glory to the garden, I should like to reward it with a word of notice. For, most delicate, freely-borne and delightful as are its single, pearl-white globes of blossom, it is in the dying days of the year, perhaps, that *P. obovata* makes its finest display. For all the seed vessels suddenly gape wide and reveal a gorgeous effect which makes those of *Iris foetidissima* look poor, dowdy things by comparison. They are filled with barren seeds of a glossy-vermillion-scarlet—apparently, as they are all empty, designed by their brilliance to allure birds into eating the whole seed-pod, and interspersed among these scarlet lures are packed the true seeds, which are of a rich black, bloomed with the blue film which one sees on a Grape. The reader may imagine how startling is this revealed contrast of blue-black with glittering, coral-scarlet. For the rest, this simple, wild *Peony* is content with any cool, comfortable soil, in a corner not too arid and sunbaked. It is a Japanese species, and I saw its blossoms gathered at Shoji, where it abounds in the coppice all along those slopes which in open places are so fertile in *Cypripedium verticicosum*. *Reginald Farrer, Ingleborough*.

DEEP PLANTING OF BULBS.—I endorse Mr. E. H. Jenkins's remarks in his interesting article on the merits of deep planting of bulbs in the issue of the *Gardeners' Chronicle* for October 23, p. 277. A fair proportion of the beds in a famous Italian garden, as well as a few large beds outside its boundary, that I am acquainted with were planted with bulbs. These included Daffodils, Tulips, Hyacinths, and Crocuses, which, prior to the year 1871, were planted from 12 inches to 15 inches deep, with the obvious intention of saving the labour that shallow planting would annually incur to make room for spring-flowering plants. The deep planting of the bulbs admitted of a coating of short manure being annually forked into the beds after the bulbs had flowered. During 25 years I had a close acquaintanceship with the floral display made each succeeding spring, and I noted that, each year, the flowers became not only more plentiful, but also finer in size and stoutness of stems. They also flowered earlier than would have been the case had the bulbs been taken up and replanted annually. This is not to be won-

dered at, seeing that the growth experienced no check of any kind, and that, being 12 or 15 inches below the surface of the beds, the soil in which they found themselves was more uniformly moist and warm than would be the case were the bulbs planted only 5 inches or 6 inches below the surface. The soil in which the bulbs were planted was deep, light, rich, and fairly moist. *H. W. W.*

DIMORPHOTHECA AURANTIACA.—Having grown this most brilliant and beautiful annual for the last four years, since it was first introduced by Messrs. Barr & Sons, who sent me seed of it for trial, and before its great merits were known, I cannot agree with your correspondent J. F. (see p. 293) that plate 403 of vol. XII. of *Botanical Magazine* entitled *Calendula Tragus*, at all correctly represents this plant, the flower there figured being of a much lighter shade of colour, larger size and thinner texture. The flower figured on plate 1981 of vol. XIV. of the same work, under the name of *Calendula Tragus* β , which is pure white, with a greenish-brown under petal, looks to me much more like an *Arctotis*, and will, I hope, soon be introduced into cultivation, as it would be a most desirable acquisition. On plate 23 of the first volume of Edwards' *Botanical Register*, under the same name of *Calendula Tragus* β , an altogether different flower of fine, deep-orange colour, which seems to me to be what we now know as *Dimorphotheca aurantiaca*, and on plate 20 of Ventenat's fine, old folio work entitled *Jardin de la Malmaison*, I find the same plant figured under the name of *Calendula flaccida*. All the plants that have come under my notice have been of an entirely annual nature, showing no trace of perennialness, the stems withering away immediately the flowering ceased, and rendering all idea of propagation by cuttings impossible. The plant, however, seeds very freely, and the seed germinates easily and promptly. *W. E. Gambleton*.

SOCIETIES.

ROYAL HORTICULTURAL

Scientific Committee.

OCTOBER 26.—*Present*: Mr. E. A. Bowles, M.A., F.E.S., F.L.S. (in the chair), Messrs. E. M. Holmes, A. W. Sutton, A. Worsley, G. Gordon, J. Fraser, J. T. Bennett-Poe, F. J. Chittenden (hon. sec.), and Rev. Aikman Paton, M.A. (visitor).

Hybrid Solanums.—Rev. AIKMAN PATON, M.A., Souleseat, Castle Kennedy, N.B., showed a series of *Solanums* raised by himself to illustrate the result of crossing *Solanum tuberosum* (a wild form from Mexico) and the white-flowered variety of *S. Commersonii*. He also showed plants and fruits of *S. verrucosum*, *S. etuberosum*, &c. The following is a description of the parents used and the resulting progeny:—

S. TUBEROSUM (Mexico), wild. [The Mexican variety used has larger portions of the rachis bare between the leaflets, fewer leaflets, and the terminal leaflet tapering from the base where the lamina is often adnate to the rachis, and fewer interspersed, small leaflets than the Chilean variety.]—Stems, green to purplish, speckled or streaked with green, with wavy green-winged edges. Leaflets, oval, very short stalked, the lamina much raised between the venation, giving the leaves a crumpled appearance, glossy; edges, crenate. Calyx, hairy, with long, tapering, awl-like points, which turn back from the berry. Corolla, rotate-pentagonal; edges, arcuate. Colour, dark lilac [R.H.S. Colour Chart 202, 2 and 5]. Anthers, short, orange-coloured. Style, slightly projecting beyond the stamens. Berries, somewhat rounded, pointed, heart-shaped, with sloping shoulders at stalk end, covered with white spots, especially at the lower half. Tubers, reddish.

S. COMMERSONII (Uruguay), white-flowering.—Stems, pale green, violet at nodes, especially in axils; edges, slight, straight, green-winged. Leaves, pale green, sparse. Leaflets, shortly stalked, widely separated on the rachis, few or no interspersed leaflets, oval obtuse, flat, dull; edges, plain. Calyx, short, blunt, shouldered with short claws. Corolla, star-shaped, deeply segmented, white (sometimes with a violet tinge

on base of back of petals). Stamens, long, thin, lemon coloured (paler than those of *S. tuberosum*). Style, much exerted. Berries, larger than those of *S. tuberosum*, heart-shaped, dimpled at stalk end, with sulcus down the middle always visible at stalk end, and, especially if seedless, few spots. Tubers, yellowish white, warty (lenticeles).

HYBRIDS of above.—Stems, dark violet, rounded triangular; edges, winged, green, straight. Leaves, dark green. Leaflets, oval obtuse, flat, plain-edged, dull. Calyx, short, blunt, shouldered, with short claws (sometimes triangular tapering with longer claws). Corolla, always blue [No. 202, 4 and 5], rotate-pentagonal. Style, much exerted. Stamens, pale yellow, long. Berries, bluntly heart-shaped, full at top, covered with whitish spots on lower half. Tubers, white, with large lenticeles, like *S. Commersonii*. A comparison of the hybrids with their parents shows that the hybrids have the form of stem, the form and colour of foliage, the venation of the leaflets, and the habit and general appearance of *S. Commersonii*. The calyx is generally that of *S. Commersonii*. The flower in form and colour is that of *S. tuberosum*, the shade only different [No. 202, 4 and 5]. The berry is intermediate, shaped like that of *S. Commersonii*, if but blunter and thicker, and spotted like that of *S. tuberosum*.

The cross above described is particularly interesting, in view of the fact that very rarely has *Solanum Commersonii* been got to produce fertile seed. Mr. A. W. SUTTON has obtained some, but, besides this, no one appears to have done so, although the plant has been widely grown. The Committee, on the motion of Mr. A. W. SUTTON, unanimously recommended the award of a Silver Knightian Medal to Mr. PATON for his interesting exhibit.

Potato tubers.—Mr. A. W. SUTTON showed a series of tubers of various *Solanums* as follows:—1, *Solanum Commersonii* (white-flowered form); 2 (seedling from No. 1), *Solanum Commersonii* (white-flowered), selded 1906. These tubers showed a distinct break from those of the parent, the skin being of a different colour and the tubers of a different shape; 3, *Solanum Commersonii*, Fitzherbert's form; 4, *Solanum Commersonii* (violet-flowered form); 5 (seedling from No. 4), *Solanum Commersonii* (violet-flowered), selded; 6, *Solanum Obrendu*; 7, *Solanum Maglia*; 8, *Solanum Maglia* commercial Potato; 9 (seedling from No. 8), *Solanum Maglia* hybrid × commercial Potato, selded; 10, *Solanum etuberosum*.

Virescence in *Crepis virens*.—Mr. E. M. HOLMES showed a plant of *Crepis virens* in which the individual flowers had become stalked, and in place of a pappus a calyx had developed. The capitulum looked very like the inflorescence of an Umbelliferous plant.

The colonisation of a river bank.—Mr. J. FRASER made some remarks concerning the colonisation of the bank of the River Thames. A piece of the bank had fallen away, and this year upon the newly-bared earth the following plants had appeared. The first two are exceedingly uncommon colonists of such places. *Plantago acerifolia*, or London Plane; *Coronilla varia*; seedling of *Salix alba*, fragilis, Caprea, cinerea, viminalis; *Alnus glutinosa*, Mill; *A. glutinosa*, Gaertn; *Radicula* (*Nasturtium*) *amphibium* and *N. sylvestre*, palustre, amphibium; *Melilotus officinalis* and *indica*; *Solanum Dulcamara* and *S. nigrum*; *Mentha aquatica* and *M. subglabra* and *arvensis*; *Polygonum Convolvulus*, *P. Persicaria*, *P. arietaria officinalis*, *Angelica sylvestris*, *Lycopus europaeus*, *Sambucus nigra*, *Senecio aquaticus*, *Scrophularia aquatica*, *Enanthe crocata*, *Lythrum Salicaria*, *Veronica Anagallis*, and *Barbarea vulgaris*.

***Salix lanata*.**—Mr. FRASER recounted how he had discovered this rare Alpine Willow, and showed specimens. The plant does not appear to thrive in many gardens, but there are fine specimens in the garden of the Society at Wisley, and in the Botanic Gardens at Birmingham.

Pruning after planting.—A communication dealing with the question of the wisdom of pruning immediately after planting trees was received from Mr. J. LANDSELL and will be printed in the Society's Journal.

***Dorstenia Waltheri*.**—Mr. CHITTENDEN showed a plant of this interesting species from the

Society's garden, grown from a tuber received from Central Africa. The species was first described in the *Gardeners' Chronicle*, August 12, 1895, p. 178, plants having been raised at Kew from seed received from Central Africa. Like other plants of the genus, the green inflorescence is flattened, and bears the flowers like an opened Fig upon the flattened stem; the margin of the inflorescence is raised somewhat, and gives rise to four or five coarse, long, tapering filaments.

Acorns refused by stock.—Mr. BOWLES showed some Acorns from three trees at Myddleton House, Waltham Cross, which neither cattle nor sheep would eat. Mr. HOLMES took them for further examination.

Abnormal bulb formation in Nerine.—Mr. A. WORSLEY showed a curious bulb of *Nerine* which had developed at the apex of a flattened process somewhat similar to that seen in the bulbs of *Vallota*. The occurrence of a bulb in the position assumed by this is unique in Mr. WORSLEY'S experience of *Nerines*, and he considered it probable that it was owing to the diseased condition of the basal part of the bulb.

CROYDON CHRYSANTHEMUM.

OCTOBER 27, 28.—The 22nd annual exhibition of this society was held in the Park Lane Schools, Croydon.

The Champion Challenge Class was one calling for 30 cut blooms of distinct Japanese varieties. The 1st prize was won by Mr. G. HALL, Melchet Court Gardens, Romsey, Hants., who showed *Geo. Mileham*, *Reginald Vallis*, *Valerie Greenham*, *Rev. R. D. Eaves*, *Edith Jamison*, *Rose Pockett*, *Mrs. W. Knox*, *Mme. G. Rivol*, *Algeron Davis*, *Mrs. Custer*, *Lady Talbot*, *Mme. P. Radaelli*, *Mrs. L. Thorne*, *F. S. Vallis*, *Hon. Mrs. Lopes*, *Mrs. F. W. Vallis*, *H. Perkins*, *C. H. Totty*, *Leslie Morrison*, *J. H. Silsbury*, *Mme. M. de Mons*, *President Loubet*, *Edith Smith*, *Mrs. M. Davies*, *Mrs. A. T. Miller*, *Sensation*, *Miss D. Fairweather*, *Melchet Beauty*, *Lady Henderson*, and *W. Watson*. The white varieties were, perhaps, the finer blooms, although none was of poor quality. 2nd, *J. Newton Mappin*, Esq., *Headley Park*, Epsom (gr. Mr. T. Beeson), whose best blooms were *Mme. P. Radaelli*, *Mrs. A. H. Lee*, *Mrs. W. Knox*, *Geo. Mileham*, *J. H. Silsbury*, *Mrs. A. T. Miller*, *Mrs. G. Mileham*, *Lady Talbot*, *Mme. G. Rivol*, and *Walter Junks*. The 3rd prize was awarded to *Mrs. Haywood*, *Woodhatch Lodge*, Reigate (gr. Mr. H. G. Bassett).

The President offered a Challenge Cup in the class for 20 cut blooms of four varieties of Japanese Chrysanthemums shown in vases. Chrysanthemum foliage only to be employed as greenery. The blooms in the 1st prize exhibit, shown by *B. F. Smith*, Esq., *Stratham* (gr. Mr. E. Croft), were the finest in the show, and consisted of *Mrs. A. T. Miller* (white), *Mme. G. Rivol* (yellow), *Mme. Radaelli* (blush), and *Reginald Vallis* (crimson). The 2nd prize fell to *M. G. Edwards*, *Windmill Cottage*, Shirley, who showed excellent blooms of *Mrs. A. T. Miller*, *Mrs. N. Davies*, and *Mrs. W. Knox*.

Mr. T. Beeson excelled in the class for 15 blooms of Japanese Chrysanthemums in three varieties with extremely fine blooms of *Mrs. A. T. Miller* (one of which was adjudicated the best white Japanese Chrysanthemum in the exhibition), *Lady Talbot*, and *Reginald Vallis*. 2nd, *Mr. H. G. Bassett*, his best examples being *Reginald Vallis* and *Mrs. George Mileham*.

There was also a class for 10 blooms of Japanese varieties, and in this the 1st prize was won by *Mr. G. Edwards* for moderate blooms of *Mrs. N. Davies* and *Mr. W. Knox*.

The best group of Chrysanthemum plants growing in pots was shown by *G. Pace*, Esq., 101, Park Lane, Croydon (gr. Mr. C. Miarling), the blooms being of Japanese varieties and quite up to exhibition quality; 2nd, *D. Nichols*, Esq., *Linne Court*, Park Hill (gr. Mr. W. Bentley).

For five incurved blooms of one variety, *Mr. Pace* was placed 1st with *Romance*, of fairly-developed proportions; 2nd, *Mr. G. Edwards*, with large, loose blooms of *Chas. Curtis*.

For five blooms of incurved Chrysanthemums of one or more varieties, *Mr. Finch* was placed 1st with capital blooms.

The best 10 blooms of incurved varieties were shown by *Mrs. Haywood*. We noticed a fine bloom of *Buttercup*, an incurved Japanese, and *Romance*, of the ordinary incurved type.

NON-COMPETITIVE EXHIBITS.—Messrs. W. WELLS & Co., Merstham, Surrey, displayed Chrysanthemums of all types as cut blooms. Amongst these were noted the new variety *Miss E. King*, Japanese, with reflexed, yellow florets.

Messrs. J. CHEAL & Sons, Crawley, Sussex, showed several stands of single and Cactus Dahlias, all attractive and usefully decorative.

Mr. Thomas Butcher, South Norwood, showed numerous floral devices. This exhibitor also furnished decorative plants for the stage.

Winter-flowering Begonias were well shown by *Sydney Smith*, Esq., *Wendee Hall*, South Norwood (gr. Mr. F. W. Hart). The plants were 1½ feet high and covered with blooms.

There were also many exhibits of vegetables, roots, hardy fruits, and Grapes.

BRIGHTON CHRYSANTHEMUM.

NOVEMBER 2, 5.—The 27th annual exhibition was held in the Dome and Corn Exchange on the above dates. The number of exhibits was below that of previous years, especially in the classes for groups, the principal class being unrepresented. In respect to pot plants the quality was much below the average; this, however, was made up for in the cut bloom classes, the winning stands and vases of which contained many blooms of a high order of merit and excellence, which caused a good deal of comment in view of the unfortunate season. Fruit and vegetables were exceedingly well shown.

In the class for a circular group of Chrysanthemums arranged with Ferns or other green foliage plants, or foliage, in a circle of 8 feet 6 inches in diameter, *S. C. Witting*, Esq., *Hollingbury Copse*, Brighton (gr. Mr. Geo. Chandler), obtained the premier award, and *P. H. Bayer*, Esq., *Hatch Beauchamp*, *Withead* (gr. Mr. Geo. Bennett), the 2nd prize.

For 36 Japanese cut blooms in not fewer than 24 varieties or more than two of one sort, *Mrs. L. C. Goad*, *Patching*, *Worthing* (gr. Mr. Charles Hack), was placed 1st, thus securing the handsome silver bowl to be held for one year till won three times, also the society's Silver Medal. The varieties most noticeable in this collection were *Mrs. W. Knox*, *Bessie Godfrey*, *F. W. Lever*, *Formality*, *Mrs. A. T. Miller*, *Mrs. F. W. Vallis*, and *Sir Frank Crisp*. The *Rev. F. S. Sclater*, *Newick Park*, *Lewes*, won the 2nd prize.

In the class for 25 Japanese blooms, as cut from the plant, in not fewer than 18 varieties, in five vases, Messrs. JAS. STREDWICK & Sons, *St. Leonards-on-Sea*, won the 1st prize, and the *Rev. F. S. Sclater* was 2nd. Messrs. STREDWICK had excellent blooms of *Reginald Vallis*, *Mrs. Geo. Mileham*, *H. J. Jones*, *Lady Crisp*, *Snowdon*, *Exquisite*, and *Monarch*.

For 12 Japanese blooms, *Col. C. P. Henty*, *Ayisford*, *Arundel* (gr. Mr. J. Harris), was 1st; whilst for 12 incurved blooms, distinct, the premier honour fell to *E. Lake Walker*, Esq., *Hoisted Place*, *Ockfield* (gr. Mr. M. Gourle), *Mrs. BRIDGEN*, *Oakland*, *Hassocks* (gr. Mr. T. Brackley), secured an easy first for three vases of single varieties.

In a class for three vases of Chrysanthemums, five in a vase, one variety of each, *Miss E. Fitz-Hugh*, *Street* (gr. Mr. A. Bish), secured the 1st prize. In the class for one vase of Chrysanthemums, nine blooms, not fewer than six varieties, *O. E. D'Avignon-Goldsmid*, Esq., won the 1st prize for excellent blooms of *F. S. Vallis*, *Mrs. Norman Davis*, *Mrs. G. Mileham*, *Mary Mason*, &c.; 2nd, *HARRY YOUNG*, Esq., *Withead Grange*, Brighton (gr. Mr. Edward Jones).

In the classes for Grapes, *O. E. D'Avignon-Goldsmid*, Esq., was 1st for three bunches of a white Grape, any variety, and *C. R. Scrase Dickens*, Esq., *Horsham* (gr. Mr. A. Kemp), for Black Grapes.

A new class for British-grown fruit, open to all retail fruiterers, met with only a poor response, the sole exhibitors being Messrs. W. MILES & Co., Brighton, whose collection well merited the 1st award of a Silver-gilt Medal.

The best collection of Orchids, arranged with Ferns or other foliage plants on a table 8 feet by 4 feet, was shown by *G. W. Ryder*, Esq., *Keymer* (gr. Mr. Wm. Hill), and was deservedly awarded the 1st prize.

The non-competitive exhibits attracted a good deal of attention, and included displays from Messrs. J. CHEAL & Sons, Messrs. WELLS & Co., THE BARNHAM NURSERIES, LTD., and others.

National Chrysanthemum Society.

NOVEMBER 3, 4, 5.

CHRYSANTHEMUMS, as Sir Albert Rollit said at the luncheon on the opening day of this exhibition, at the Crystal Palace, are everybody's flowers, because of the ease with which they are cultivated, their great diversity and usefulness, and their period of blooming. It is small wonder that the Chrysanthemum has held

a high place as an exhibition flower, but it cannot be contended that its popularity is as high as formerly. Even the National Chrysanthemum Society has felt the wane of interest, and we noticed some falling off in the exhibition, especially in the amateur classes. Against this must be placed the unfavourable season, for many who had intended to exhibit were unable to do so. The nurserymen's exhibits appeared as fine or finer than ever, and the method of staging certainly showed improvement. One of the most pleasing exhibits was a group of small plants in 5-inch pots, each specimen furnished with seven or eight good blooms. This system of cultivating the flower should commend itself to those who have to furnish pot plants for decorative purposes in the dwelling-house. New varieties were as numerous as ever, and several were granted the Society's Certificate of Merit. The opening day was a typical one for a Chrysanthemum show, the weather being foggy and damp, but visitors appeared as numerous as usual. The arrangements were excellent, and the secretary, Mr. R. Witty, and the management are to be congratulated.

GROUPS OF PLANTS.

The first class was for a floral display of Chrysanthemums and suitable foliage plants in pots, with the addition of cut blooms and appropriate sprays of foliage. Each group was allowed a space of 200 superficial feet. Lady TATE, Park Hill, Streatham Common (gr. Mr. W. Howe), had no competitor on this occasion, and, as last year, received the 1st prize. The group was a good representative collection of useful decorative Chrysanthemums, including many of the large Japanese varieties, with handsome Codiaums, Cordylines, Palms, Ferns, and other plants of a like nature for relief. It was arranged as a circle, with the centre rising and terminating with a fine specimen of a Kentia Palm. The border was furnished with elegant-leaved varieties of Nephrolepis exaltata, with clumps of the single-flowered variety, Ladysmith, surmounted by a Codium, at intervals.

There was also a class for pot plants of Chrysanthemums in not fewer than six varieties, but the exhibits were poor. The 1st prize was awarded to Mr. H. G. HEDGES, Sydenham. 2nd, Mr. BRAZIER, nurseryman, Caterham, Surrey.

AFFILIATED SOCIETIES' COMPETITION.

There was a class for a display of cut blooms, occupying a table space of 18 feet by 3 feet, for societies in affiliation with the National Chrysanthemum Society. There was only one society represented, namely, THE DULWICH CHRYSANTHEMUM AND HORTICULTURAL SOCIETY. It made a pleasing exhibit, but the varieties were not named. Ferns, Palms, Codiaums, and Cordylines were freely employed for decoration, and these were as noteworthy as the Chrysanthemums.

OPEN CLASSES: CUT BLOOMS.

INCURVED VARIETIES.—The largest class for incurved Chrysanthemums was for 36 blooms of distinct varieties. There was only one exhibit, this being shown by J. B. HANKEY, Esq., Fetcham Park, Leatherhead (gr. Mr. W. Higgs). The collection was worthily awarded the 1st prize, the majority of the blooms being of high quality, although, perhaps, not so fine as at some previous exhibitions of this Society. The largest blooms were in the back row, which contained the following varieties: H. W. THORP, a finely-formed white flower, a little past its best condition, some of the lower florets showing signs of deterioration; Mrs. B. HANKEY; Butter-

cup, one of the most striking of the yellow varieties; Miss E. Holden; May Phillips, a very large yellow-rose bloom; Mrs. G. Denyer, Fistic Frestian, W. J. Biggs, the largest of the reddish blooms; Embleme Poitevine; Lady Isabel, faint blush; Mrs. J. Hygate, a large white flower; and Clara Wells, a choice specimen of this finely-shaped variety, yellow with a tinge of rose. Other good blooms were Mrs. F. Ashworth, G. F. EVANS, Topaze Orientale, pale yellow; Nellie Southam, and Romance, yellow.

There were three exhibits in the class for 12 blooms of incurved varieties, two of the displays being very close in point of quality. The 1st prize was awarded to A. TATE, Esq., Downside, Leatherhead (gr. Mr. W. Mease), with moderately good examples of Mrs. G. P. Bryce, white; G. F. EVANS, a rather shallow, yellow flower; Mrs. J. Hygate, white; Embleme Poitevine, the largest of the yellow varieties shown; Clara Wells, a refined bloom; Lady Isabel, Buttercup, Miss Cora Stoop, Mrs. J. Wynn, Mrs. F. Ashworth, Mrs. G. Denyer, and Romance. 2nd, J. B. HANKEY, Esq. (gr. Mr. W. Higgs), with H. W. THORP, Lady Isabel, Mrs. G. Denyer, Clara Wells, and Miss E. Holden as his best specimens. Not more than half a point separated the two exhibits. 3rd, J. L. BURGESS, Esq., Hill House, Maisey Hampton, Gloucester (gr. Mr. J. A. Humphries).

For six blooms of incurved varieties of one kind only, there were six competitors. These included some of the finest flowers of the type in the show. A very fine set of the white H. W. THORP, shown by J. B. HANKEY, Esq. (gr. Mr. Higgs), received the premier award, all the other stands being of yellow varieties. Buttercup, shown by A. TATE, Esq. (gr. Mr. W. Mease) was placed 2nd, and Romance, exhibited by A. T. MILLER, Esq., Leatherhead (gr. Mr. Geo. Mileham) 3rd.

JAPANESE VARIETIES.

The large exhibition blooms of this type are generally regarded as the feature of the show, and the finest efforts of the Chrysanthemum grower are seen in the largest class, which is for 48 blooms of distinct varieties. There were six admirable displays, and we could detect no falling off in quality in the leading exhibits. Collectively they made a fine and imposing show. It was an easy task to select the winning stand, and it was additionally interesting in that the exhibitor, A. C. HAMMERSLEY, Esq., Abney House, Bourne End (gr. Mr. T. Waller), had never before won the premier prize in this class. Although shown on stands of regulation size, the blooms were so large as to appear crowded, and it was the general opinion that they constituted the finest 48 Japanese blooms shown at these exhibitions. The 1st prize included a Holmes Memorial Challenge Cup and the Dean Memorial Gold Medal. The varieties were as follow:—Lady Talbot, George Terry, Edith Smith, Australe, Bessie Godfrey, Leigh Park Wonder (a remarkable specimen of this choice red variety), Mrs. A. T. Miller (a superb white flower), Reginald Vallis, Mrs. R. Hooper Pearson, Henry Perkins, Mme. Gustave Henry, Mildred Ware, W. E. Crossley, Daphne, W. H. Whiteham, F. S. Vallis, President Viger, Mrs. Chalk, Mrs. A. H. Lee, Mrs. F. G. Coster, W. A. Etherington, Mrs. Geo. Mileham, Geo. Lawrence, Beatrice May, Valerie Greenham, Mrs. Norman Davis, Sapho, Mrs. A. Knight, Harold Wells, Walter Jinks, Miss Alice Edwards, Mary Inglis, Mrs. Beckett, Mme. G. Rivol, Rev. R. D. Eves, Marquise V. Venusta, Norman Davis (a lovely reddish tint), Mrs. W. Knox, Miss Edith Moore (a charming white bloom), Lady Mary Conyers, Mrs. R. F. Felton, Geo. Mileham 1908 (a massive, broad-petalled yellow flower), Mrs. F. W. Vallis, Mme. P. Radaelli, Splendour, Chrysa, Montigny, J. H. Silsbury, and Frank Payne. The 2nd prize group, shown by E. G. MOCATTA, Esq., Wolurn Place, Adlestone (gr. Mr. T. Stevenson), was characterised by bright, fresh blooms, not so large, generally, as those from Bourne End, but nevertheless highly meritorious. Especially good were F. S. Vallis, W. A. Etherington (faint rose), Miss Annie Lunt (white), Mrs. G. Penford (deep yellow), Henry Perkins, Lady Talbot (a very deep, lemon yellow bloom),

James Lock, Mrs. Geo. Mileham, Master James, and Walter Jinks. 3rd, Exors. of Lady ASHBURTON, Melchet Court, Rousey, Hants. (gr. Mr. G. Hall). The outstanding feature in this stand was a bloom of Hon. Mrs. Lopes, of clearest yellow colour. 4th, A. TATE, Esq. (gr. Mr. W. Mease).

The President, Sir Albert Rollit, LL.D., offered a silver cup for the best exhibit of 24 blooms of Japanese varieties, and for this trophy six growers competed. A. C. HAMMERSLEY, Esq. (gr. Mr. T. Waller), again excelled, beating all the other competitors easily. He had magnificent blooms of Lady Talbot, Leigh Park Wonder, Edith Smith, Reginald Vallis, J. H. Silsbury, Mrs. A. T. Miller, Henry Perkins, F. S. Vallis, President Viger, Bessie Godfrey, Valerie, Mary Inglis, Mme. G. Henry, Mrs. G. Mileham, Daphne, Sapho, Mrs. Beckett, W. A. Etherington, Mrs. A. H. Lee, Harold Wells, Norman Davis, Mme. G. Rivol, Mildred Ware, and Mme. P. Radaelli. 2nd, E. MOCATTA, Esq. (gr. Mr. T. Stevenson), with a choice set, including Mrs. C. Penford, F. S. Vallis, James Lock, Lady Talbot, Mrs. A. T. Miller, Master James, Mlle. J. de la Crozee (pink), Walter Jinks, and Mrs. Norman Davis. 3rd, Rev. A. C. COOPER-MARSDEN, 60, Wickham Road, Beckenham (gr. Mr. W. Rigby), Mrs. L. Thorne and Mrs. A. T. Miller being his best varieties.

In the smaller class for twelve blooms, nine exhibitors staged, the 1st prize being won by Rev. A. C. COOPER-MARSDEN (gr. Mr. W. Rigby) with very large flowers, notably Mrs. L. Thorne (yellow), Mrs. Norman Davis (white), Mrs. C. Penford (yellow), and Mrs. G. Mileham (rose). The Ichthemic Guano Company offered a special prize in this class. The 2nd prize was awarded to E. WORMALD, Esq., Grass Farm House, Finchley (gr. Mr. J. Kirkwood). 3rd, A. TATE, Esq. (gr. Mr. W. Mease).

REFLEXED VARIETIES.

There were two exhibits in a class for twelve large-flowered varieties of this type, shown by Miss LANGWORTHY, Gay's House, Holyport (gr. Mr. T. J. Brown), and J. L. BURGESS, Esq. (gr. Mr. J. A. Humphries), respectively, who were awarded the prizes in the order of their names. Miss LANGWORTHY showed King of Crimson, Miss F. Lunn, Golden Elise, Dr. Sharp, Chevalier Domage, Charles Tutt, and others. The 2nd prize flowers were rather uneven in size.

BLOOMS SHOWN IN VASES.

The class for 12 vases of specimen blooms of Japanese varieties, three flowers of a distinct sort in each vase, makes an imposing display, and this manner of showing large Chrysanthemums appears to be most appreciated by visitors. There was not so good competition as usual, four growers only competing; still, the forty-eight vases filled one of the largest tables.

The 1st prize was awarded to Mr. W. IGGULDEN, Lock's Hill Nurseries, Frome, Somersetshire, who had massive blooms of William Geo (pink), Gladys Blackburne, Mrs. Norman Davis, Lady Talbot, C. H. Totty, Mme. G. Rivol, Mme. P. Radaelli, F. S. Vallis, Mrs. A. T. Miller, Reginald Vallis, Frank Payne, and Mrs. W. Iggulden. 2nd, Exors. of Lady ASHBURTON (gr. Mr. G. Hall) with Edith Smith (white), Algernon Davis (yellow), F. S. Vallis (yellow), Annie Hamilton (white), and Mrs. Geo. Mileham (pink) as his best flowers. 3rd, J. B. HANKEY, Esq. (gr. Mr. W. Higgs).

The best vase of five Japanese blooms of a white variety was of the peerless Mrs. A. P. Miller variety, shown by Miss LANGWORTHY, the 2nd prize being awarded to the variety Mrs. Norman Davis, shown by Mr. H. J. HEDGES, nurseryman, Sydenham. The better of two vases in a similar class for a yellw variety was shown by Marquis CONYNGHAM, Bifrons, Canterbury, who had exceptionally large flowers of Mr. F. S. Vallis. 2nd, Mrs. W. Iggulden, shown by Mr. W. IGGULDEN, Frome.

In the similar class for any colour other than white or yellow, the 1st prize was given for a vase of the beautiful soft pink variety, named after Mme. P. Radaelli, magnificently shown by Mr.

W. JGGULDEN. 2nd, the variety J. Lock, shown by A. T. MILLER, Esq. (gr. Mr. G. Mileham). Four exhibits were staged in this class.

INCURVED VARIETIES.—The only class for Chrysanthemums of this type shown in vases was for 12 vases of distinct varieties, three blooms of each sort. There was only one exhibit, and this was awarded the 1st prize. It was shown by J. B. HANKEY, Esq. (gr. Mr. W. Higgs), who staged average specimens of Clara Wells, Lady Isabel, Embleme Poitevine, Romance, Mrs. J. Hygate, Nellie Southam, Topaze Orientale (very fine), Miss E. Holden, H. W. Thorp (three remarkably good blooms), Mrs. G. Denyer, Mrs. B. Hankey, and very large, finely-coloured blooms of Buttercup.

Messrs. W. Wells & Co. offered prizes in a class for six Japanese varieties distributed by this firm during 1908-1909. The 1st prize was won by A. TATE, Esq. (gr. Mr. Mease), with Pocket's Supreme, Rose Pockett, C. H. Totty, Mrs. L. Thorn, Leslie Morrison, and Merstham Blush. The only other exhibitor, PANTIA RALLI, Esq., Ashted Park, Epsom (gr. Mr. G. Hunt), was awarded the 2nd prize.

Anemone-flowered Chrysanthemums.—There were three competitors in the class for 24 large-flowered varieties, the biggest blooms, shown by J. L. BOYD, Esq., North Frith, Tonbridge (gr. Mr. A. C. Horton), being placed 1st, the 2nd prize being awarded to C. DOUGLAS CLARK, Esq., Bromley (gr. Mr. A. Henderson). Mr. BOYD'S best flowers were Mlle. N. Brun (very choice flowers), Souvenir de Mme. Blandinières (crimson), Sir Walter Raleigh (pink), and Mrs. Judge Benedict (tipped with yellow and basal petals bluish).

Three growers staged in the smaller, similar class for 12 varieties, Mr. BOYD again winning the 1st prize, followed by J. L. BURGESS, Esq.

The class for 12 large-flowered Japanese varieties in as many blooms, brought three entries, and again Mr. BOYD excelled, showing much the best flowers, having John Bunyan, Mrs. H. Eland, Souvenir de Mme. Blandinières, Le Chalonnais-e, Duchess of Westminster, Sabine, Owen's Perfection, W. W. Astor, Souvenir des Norgeot's, Sœur Dorothee, Souille, Mrs. Shimmis, and Mr. A. Gardiner. 2nd, J. L. BURGESS, Esq. (gr. Mr. J. A. Humphries).

A class was provided for six varieties of Chrysanthemums as grown for market without budding, 12 blooms constituting a vase. The only exhibit was put up by J. L. BURGESS, Esq. (gr. Mr. J. A. Humphries), who had highly decorative and useful-sized blooms of Soleil d'Octobre, Crimson Source d'Or, Moneymaker, Chas. Davis, Caprice du Printemps, and Vivian Mores.

Only two exhibitors staged in the class for six vases of Pompon Chrysanthemums, and of these the 1st prize flowers were exceptionally good. The exhibitor was F. BRABY, Esq., Bushey Lodge, Teddington (gr. Mr. F. Fitzwater), who had splendid blooms of Mlle. Elise Jordan (pink, the most perfect in form of its class), William Westlake (yellow), Comte de Morney (crimson), Prince of Orange (brunzy-orange), Mlle. Marthe (white), and Wm. Sabey (deep yellow). 2nd, J. L. BURGESS, Esq. (gr. Mr. A. J. Humphries), with shorter bunches, in consequence not so effective. He showed Wm. Sabey very finely.

In the class for six vases of Anemone-pompons, F. BRABY, Esq. (gr. Mr. F. Fitzwater), had no competitor, and he was awarded the 1st prize for blooms of mediocre quality.

SINGLE-FLOWERED CHRYSANTHEMUMS.—Two classes were provided for these pretty flowers, but the response was poor. The large class was for 12 vases, and only two growers entered. The 1st prize went to Mr. F. BRAZIER, nurseryman, Caterham, for tall bunches of E. Nettle, Florrie Stevens, A. Howard, Mrs. H. Redden, Chas. Graves, Nellie Riding, White Pagram, and several seedlings. 2nd, Marquis CONYNCHAM (gr. Mr. D. Fairweather), with brighter-coloured flowers, which we preferred to the 1st prize set.

For six vases of these varieties the premier award was made in favour of E. G. MOCATTA, Esq. (gr. Mr. T. Stevenson), who had large varieties, all finely shown. Bronze E. Pagram was seen in beautiful form, also Hilda Lawrence (pink), White E. Pagram, Mary Richardson (rose and orange, the finest of the set), and

Edith Pagram. 2nd, J. L. BURGESS, Esq. (gr. Mr. J. A. Humphries).

AMATEUR CLASSES.

SECTION A.

In this section three classes were provided, for 18 Japanese blooms, distinct, 12 Japanese blooms, distinct, and 12 incurved blooms, dissimilar, respectively. The better of the two exhibits shown in the largest class for Japanese blooms was staged by Rev. A. C. COOPER-MARSDEN (gr. Mr. W. Rigby), who had very good flowers, including Reginald Vallis, Mrs. C. H. Totty, Mrs. Norman Davis, F. S. Vallis, Henry Perkins, Mrs. A. T. Miller, Mrs. Geo. Mileham, Formality, and Henry Perkins, all these being very well shown. 2nd, A. GROVE, Esq., M.P., Chalfont St. Giles (gr. Mr. E. Dennis), with much smaller flowers.

For 12 varieties of Japanese Chrysanthemums there were three entries, the 1st prize being again awarded to Rev. COOPER-MARSDEN, followed by J. GARDNER, Esq., Croxsted House, Dulwich (gr. Mr. E. Houlton). 3rd, W. H. STONE, Esq., Donnington, Sydenham (gr. Mr. T. W. Stevens).

No exhibit of incurved blooms was staged in this section.

SECTION B.

The president, Sir Albert Rollit, offered a cup for a decorated display of Chrysanthemums, with any suitable foliage arranged on a table. The only exhibit, staged by Mrs. BREWSTER, Canterbury, was not considered worthy of the 1st prize, the 2nd being awarded. The Chrysanthemums were small, inferior blooms, but the table was prettily arranged with sprays of Vitis hederacea, Grasses, &c.

For 12 Japanese blooms, distinct, only one group was forthcoming, this being shown by C. FOX, Esq., Richmond Lodge, Tunbridge Wells, who had some good blooms, those of Mrs. A. T. Miller, A. H. Broomhead, Beatrice May, Lady Talbot, and Mrs. F. S. Vallis being the best.

There were numerous other small classes for amateurs, but these do not call for special remark.

DECORATIVE CLASSES.

Table decorations figured largely, there being six exhibits arranged with yellow and bronze blooms, and four with varieties of other colours than those mentioned.

The best exhibit in the bronze and yellow class was arranged by Mr. T. W. STEVENS (gr. to W. H. STONE, Esq., Laurie Park Gardens, Sydenham), who employed Source d'Or and yellow Pompon varieties with Asparagus, Vitis sprays, Cordium leaves, Grasses, and panicles of Humea elegans. 2nd, Mrs. R. ROBINSON, Carshalton, with pretty end pieces, but a rather weak centre.

In the other class Mrs. BREWSTER, Canterbury, excelled, using white Chrysanthemums pleasingly disposed with greenery and coloured leaves. This exhibit was awarded a piece of plate presented by Mr. Felton for the best table in the two classes.

Rev. A. COOPER-MARSDEN showed fine blooms of Mrs. A. P. Miller in the class for a vase of five Japanese blooms, arranged with other foliage.

The best pair of bride's bouquets were displayed by Mr. STEVENS (gr. to W. H. STONE, Esq.) and Mr. HOULTON, Croxsted House Gardens, Dulwich, exhibited the best large vase of decorative Chrysanthemums.

There were several exhibits of a vase of large-flowered, single, white Chrysanthemums, the 1st prize evidently being given for quality of flowers. The successful exhibitor was Mr. F. G. OLIVER, 97, Tollington Park, N., who had superior blooms. The best vase of mixed singles was shown by Mr. J. W. HARRISON, Ashbourne Gardens, Sydenham. The best basket of autumn foliage or berries was shown by Miss J. MARTIN, Norwood, Mrs. BREWSTER following with an almost exact replica, but smaller.

FIRST-CLASS CERTIFICATES.

Mrs. Colles (single).—A pretty flower of the shade known as crushed strawberry. Shown by A. W. BIRD, Esq., Manor House, West Wickham (gr. Mr. H. Redden).

Geo. Hemming (Japanese).—The florets are rosy-claret coloured, with a silvery reverse.

Shown by Mr. GEO. MILEHAM, and exhibited in Mr. Davis's group.

J. H. Greswold Williams (single).—A large, bright yellow variety. Shown by Mr. H. TRIBE, Bradenbury Court Gardens, Worcester.

Francis Joliffe (Japanese).—Colour, straw-yellow shaded with rose. From Mr. M. SILSBURY, Shanklin.

Mrs. R. Lufford (Japanese).—A market variety of chestnut colour.

Phosphorescens (decorative).—The colour is bronzy-terra-cotta. Both these shown by Messrs. W. WELLS & Co.

FRUIT AND VEGETABLES.

The best three bunches of black Grapes were shown by J. L. BOYD, Esq., in three finely-shaped but small-berried bunches of Mrs. Pince. 2nd, Sir WALPOLE GREENWELL, Bart., Caterham (gr. Mr. W. Lintott) with Alicante. Mr. BOYD also showed the finest bunches of Gros Colman Grapes.

No entries were forthcoming for white Grapes. Dessert Apples were best shown by Sir WALPOLE GREENWELL, Bart., whilst the best culinary Apples were exhibited by W. E. ALLAN, Esq., Chipperfield (gr. Mr. J. Clement). Mr. BOYD showed the choicest Pears.

Messrs. Robt. Sydenham, Ltd., Tenby Street, Birmingham, offered several prizes for vegetables.

For a collection of eight kinds some splendid produce was shown, a magnificent lot of Parsnips, Potatoes, Celery, Carrots, Brussels Sprouts, Cauliflowers, and Onions shown by Earl SPENCER, Althorp Park, Northampton (gr. Mr. S. Cole) winning the 1st prize in keen competition. The best Brussels Sprouts were shown by Rev. O. TURNER, Weybridge (gr. Mr. A. Basile), who also showed the best Red Cabbage, Savoy, Carrots, and Cauliflowers. Celery, Parsnips, and Leeks were finest from Earl SPENCER'S garden. R. H. KING, Esq., Berkhamsted, excelled in the class for Beet. The best Onions were exhibited by JOHN KING, Esq., Rickmansworth (gr. Mr. T. Avery).

For Messrs. Webb's prizes for a collection of vegetables, three growers competed, the 1st prize being awarded to Hon. VICARY GIBBS, Elstree (gr. Mr. Ed. Beckett), for one of his usual high-class collections. 2nd, Rev. O. TURNER, who had magnificent Parsnips.

NON-COMPETITIVE EXHIBITS.

Mr. NORMAN DAVIS, Framfield, Sussex, showed Chrysanthemums in superb style, the quality of the flowers being of the highest. Large epergnes of Mrs. N. Davis, Miss Lillian Hall, Mrs. A. T. Miller, Mrs. Robert Brown, and other large Japanese blooms arose from a groundwork arranged with artistic effect. (Large Gold Medal.)

Mr. H. J. JONES, Hither Green, Lewisham, staged an equally beautiful and somewhat similarly-arranged group of Chrysanthemums. Some of the choicer blooms were arranged in large china vases and some on tall tripods. All the most popular and choicer varieties were seen in this extensive group. (Gold Medal offered by Messrs. Clay & Son for the best exhibit in the show, also the Society's large Gold Medal.)

MESSRS. JOHN PEED & SON, West Norwood, London, S.E., put up a circular group of Chrysanthemums of all sections. The centre was pyramidal in shape, and around the outside were epergnes at intervals. A good selection of varieties was displayed in well-grown blooms. Messrs. PEED also showed Carnations and about 70 dishes of well-grown Apples and Pears. (Large Silver Medal.)

Messrs. H. CANNELL & SONS, Swanley, made a very large exhibit of Zonal Pelargoniums and Chrysanthemums. In the centre of the display were single varieties most charmingly shown. Messrs. CANNELL also showed 215 varieties of Apples and Pears, with specimen fruit trees. (Gold Medal.)

Mr. PHILIP LADDS, Swanley Junction, Kent, displayed Chrysanthemums as grown for market, the group ranking as one of the finest in the show. It was arranged with perfect taste, and the flowers were of the finest quality. (Gold Medal.)

A large group of Chrysanthemums was set up by Mr. W. J. GODFREY, Exmouth, Devon. (Gold Medal.)

Messrs. W. WELLS & Co., Merstham, Surrey, exhibited a large group of Chrysanthemums,

having numbers of the pretty single varieties raised at Merstham. (Gold Medal.)

Messrs. BUTLER BROS., Bexley Heath, arranged a charming floor group of small Chrysanthemum plants in 5-inch pots carrying seven or more fine flowers and not more than 1½ foot high. (Silver-gilt Medal.)

Mr. FRANK BRAZIER, nurseryman, Caterham, showed Chrysanthemums interspersed with hardy flowers, Vitis species and Oak, with coloured foliage. (Silver Medal.)

Messrs. JOHN LAING & SONS, Forest Hill, Norwood, showed pot plants of tuberous-rooted Begonias.

Mr. H. W. THORP, Durrington, Worthing, showed Chrysanthemums arranged formally in rows with epergnes and Palms at the back. (Large Silver Medal.)

HOBBIES, LTD., Dereham, Norfolk, staged Roses in variety, having a large group that provided a pleasing change. (Silver-gilt Medal.)

Messrs. H. SCOTT & SON, Woodside, South Norwood, exhibited horticultural sundries and garden furniture. (Silver-gilt Medal.)

Mr. G. W. RILEY, Herne Hill, displayed horticultural buildings, garden seats, pergolas, arches, &c. (Large Silver Medal.)

Boxes of Apples as shipped for market were displayed by the Government of British Columbia, all highly coloured and attractive fruits, the grading and packing being an object lesson to home growers. (Silver-gilt Medal.)

HEREFORD FRUIT AND CHRYSANTHEMUM.

OCTOBER 27.—The annual show was held on this date in the Shire Hall, Hereford. The classes were well filled, though more exhibits of fruit have been staged at some previous shows. Apples and Pears were splendidly exhibited, but Grapes, taking them collectively, were not of first-rate quality, although some fine bunches of Gros Colman were shown by Mr. C. LIDDLE. The Chrysanthemum blooms were shown in vases.

APPLES.

The class for a collection of 50 varieties (not more than 12 nor fewer than five fruits to form a dish) brought three exhibits. Mr. WHITING, Credenhill, being awarded the 1st prize with a splendid exhibit. The best samples included Houblon, Cox's Orange Pippin, Barnack Beauty, Pickering's Seedling, Lord Hindlip, King's Acre Pippin, Rival, Charles Ross, Newton Wonder, King Edward VII., Mrs. Barron, Warner's King, Washington and Stirling Castle. 2nd, Messrs. PEWTRESS BROS., Tillington Nursery. Mr. J. LEE, who staged some fine fruits in this class, was disqualified for mixing on one dish Mabbott's Pearmain and American Mother. A special prize was awarded this exhibitor.

In a class for 30 dishes of Apples, Mrs. HILL, Moreton Court (gr. Mr. T. Jones), took the lead with a capital collection, in which culinary varieties predominated. Some of the best dishes consisted of Baumann's Red Winter Reinette, Wealthy, Cox's Orange Pippin, Charles Ross, September Beauty, Royal Jubilee, Annie Elizabeth, Lord Derby, Warner's King, and Mère de Ménage; 2nd, J. RILEY, Esq., Putley Court (gr. Mr. H. Taylor).

There was only one exhibitor, viz., Sir G. CORNWALL, Moccas Court (gr. Mr. Talbot), in a class for 12 dishes of culinary Apples, and he worthily secured the 1st prize.

No fewer than nine exhibitors staged exhibits of eight dishes of dessert varieties, the Rev. S. H. DEVONPORT (gr. Mr. R. Currie) being placed 1st with beautiful, clean fruits of Egremont Russet, Ribston Pippin, Cox's Orange Pippin, American Mother, King of the Pippins, Allington Pippin, Adam's Pearmain and Wealthy. A. G. BURNEY, Esq., The Weir (gr. Mr. Holder), followed closely, and Col. HENRY, Hatfield (gr. Mr. Sykes) was placed 3rd.

In a special class for eight culinary and four dessert varieties Mr. J. BOTT, Brunton, secured the lead amongst three exhibitors; 2nd, Mrs. BLASHILL, Bridge Pollars.

For three varieties of recently-introduced Apples, Mrs. HILL (gr. Mr. J. Jones) was placed 1st with Rival, Houblon and Charles Ross; 2nd, Mrs. WHITING.

There were 18 single-dish classes, and amongst them were to be found many of the best Apples in the show.

There were two entries in a class for a decorative group of fruits, preserved or fresh, arranged in a space of 50 square feet. Messrs. PEWTRESS BROS. won the leading honours with 50 varieties of Apples and Pears, arranged in baskets, intermingled with small decorative plants. The KING'S ACRE NURSERY CO., the only other exhibitors, staged a fine lot of bottled fruit.

PEARS.

In the class for a collection of not more than 12 varieties, four good exhibits were staged. Mr. CURRIE was awarded the 1st prize. He showed splendid dishes of Glou Morceau, Doyenné du Comice, Beurré Bosc, Easter Beurré, Beurré Diel, Marie Louise, Beurré Superfin, Le Lectier, and others. A. W. FOSTER, Esq., Brockhampton Court (gr. Mr. H. Parrott) followed closely.

In the smaller class for eight varieties of dessert Pears there were three entries, the chief one being made by the Rev. Prebendary BRIERLY, Bridetow Vicarage (gr. Mr. Paxton), who staged Mme. Trevey, Emile d'Heyst, Doyenné du Comice, Durondeau, Beurré Bachelier, Pitmaston Duchess, Beurré A. Lucas, and Marie Louise; 2nd, Mr. SYKES.

Three exhibitors staged in the class for a collection of fruits of six kinds. Black and white Grapes were allowed to count as two kinds. Mr. SYKES led with Muscat of Alexandria and Gros Maroc Grapes, a fine fruit of Emerald Melon, Doyenné du Comice Pear, Cox's Orange Apple, and late Admiral Peach. 2nd, Mr. CURRIE.

The champion dish of dessert Apples was Cox's Orange Pippin, shown by Mr. C. THOMAS; the best culinary variety, Peasgood's Nonesuch, shown by Mr. NELME.

Mr. CURRIE showed the finest dish of Pears, the variety being Doyenné du Comice.

GRAPES.

The best three bunches of Gros Colman were shown by Mr. C. LITTLE; 2nd, Mr. H. PARROTT.

Four exhibitors staged in the class for any other black variety, Mrs. Woodhouse, Burghill (gr. Mr. NUNN), being placed 1st with medium-sized bunches of Black Alicante; 2nd, Mr. T. JONES with the same variety.

Mr. CURRIE won the 1st prize in the class for a variety of white Grape, Mr. SYKES being 2nd. Both exhibitors showed Muscat of Alexandria.

VEGETABLES.

These were shown in excellent condition. Seven entries were staged in the class for 10 kinds, the prizes being offered by Mr. J. Wilson, Commercial Street, Hereford. A. G. BURNEY, Esq., The Weir (gr. Mr. Holder), secured the leading place with Cauliflowers, Celery, Leeks, Parsnips, Onions, Potatos, Beetroots, Peas, Brussels Sprouts, and Tomatos; 2nd, Mr. W. STANSBURY.

Messrs. Sutton & Sons also offered prizes for six kinds, and here W. C. KING KING, Esq., Graftonbury (gr. Mr. Davies), led, followed by Mr. STANSBURY.

Tomatos, in an open class contested by 10 exhibitors, were best shown by Mr. SIDDELE.

NON-COMPETITIVE EXHIBITS.

These were not numerous. The KING'S ACRE NURSERY CO. were the largest contributors, staging a grand collection of fruits, including 110 dishes of Apples and 16 of Pears, backed by Apple and Pear trees, also Grape vines, in pots, all splendidly furnished with fruits. This firm also staged a large group of decorative plants, cut flowers, and floral devices.

Mr. JOHN WILSON staged a large stand of bouquets, wreaths and other floral designs.

In the agricultural section were exhibits of cider, perry, grain, Beans, Hops, and roots.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT. (ANNUAL DINNER.)

OCTOBER 28.—The twenty-third anniversary dinner of this institution took place at the Waldorf Hotel under the chairmanship of Mr. J. B. Slade. In spite of the unfavourable weather which prevailed, there was a fairly large number of members and their friends present.

At the close of the dinner the Chairman proposed the toast of "Continued success to the

United Horticultural Benefit and Provident Society." In the course of his speech, the Chairman remarked that nothing stands out so conspicuously in the history of the past hundred years as the great rise in friendly, benefit, and other societies connected with the working classes. The existence of benefit societies was advantageous to the nation. He had been connected with a benefit society ever since he was eligible to join one. He felt sure we should be pursuing the proper course if we could teach young gardeners what an immense value it would be to them if they would join the United Horticultural Benefit and Provident Society at an early age. Not only would they have a benefit fund to assist them in sickness, but, on arriving at the age of 60 or 70 years, they would have a substantial amount in the bank standing to their credit, which might do much to brighten the declining years of their life. The Benevolent Fund was founded to assist members in distressed circumstances, and the Convalescent Fund to help members obtain a change of air, when required, after sickness, which is often the means of effecting a more complete and speedy recovery to health. The Management Fund was also worthy of attention, because it showed that one special contribution of half-a-crown per year from each member defrayed all cost of administration. A special levy is made from the members' yearly contributions for sickness, and the remainder is placed on the society's books to his personal credit, together with the yearly interest which has accrued.

Mr. C. H. Curtis, chairman of committee, responded, and thanked the Chairman for the sympathetic manner in which he had proposed the toast.

"The Honorary and Life Members" was given by Mr. J. Harrison Dick, who stated that, in addition to the money subscribed by them, their names would doubtless be regarded as a "hall-mark" by gardeners who are not members of the society. Mr. Thos. N. Cox made a suitable reply. The next toast, that of "The Visitors," was proposed by Mr. Riley Scott, and replied to by Mr. A. Dawkins. Mr. E. F. Hawes proposed "The Press" in a few well-chosen words, which were responded to by Messrs. G. Gordon and F. W. Harvey. "The Chairman" was given by Mr. R. J. Frogbrook, and, after a suitable reply, Messrs. Collins, Winter, Redfern, and the "Waverley" Glee Party were cordially thanked for their contributions to what had proved a most pleasant evening.

CARDIFF CHRYSANTHEMUM.

NOVEMBER 3, 4.—This society held its 23rd annual show at the Park Hall, Cardiff, on the foregoing dates. The entries this year were quite as numerous as on former occasions, but while there were more exhibits of fruit, there was a slight falling away in the cut bloom classes. There were more groups of plants in evidence than usual, and the competition was correspondingly keen. In spite of the dull, damp season, those best qualified to judge gave it as their opinion that the whole of the exhibits were well up to the average.

In the open classes, Mr. GEO. DRAKE, Cardiff, was awarded the 1st prize and a Challenge Cup for a stand of specimen blooms consisting of eight varieties of Japanese Chrysanthemums arranged in a like number of vases, each variety represented by three blooms. The varieties shown were Mrs. A. T. Miller, F. S. Vallis, President Viger, Bessie Godfrey, Reginald Vallis, Lady Talbot, Mme. P. Radacelli, and J. H. Silsbury. The 2nd prize went to H. H. Prince HATZFELDT, Chippenham (gr. Mr. F. Bible), and the 3rd to L. E. TRAHERNE, Esq., Coedriglan (gr. Mr. S. H. Brown).

For a collection of 24 blooms, incurved, containing not fewer than 12 varieties, there was but one entry made, and that by Mr. DRAKE, who was accordingly awarded the prize. Some fine blooms of Baccasia, Mrs. Wynne, W. Biddle, Nellie Threlfall, Lady Isabel and Pantia Ralli were staged in this exhibit.

In the class for 12 distinct Japanese blooms, Messrs. G. WILLIAMS & SON, Nurserymen, Cardiff, secured 1st place with, among others, fine blooms of Miss Faith Moore, Valerie Greenham, Mrs. G. F. Coster, and F. S. Vallis. H. H. Prince HATZFELDT and Mr. H. A. Joy, Courtalla, Cardiff, were 2nd and 3rd respectively.

DEBATING SOCIETIES.

A. F. HILL, Esq., Cardiff won the 1st prize and a Challenge Cup for a stand of 24 Japanese blooms of not fewer than 18 varieties. First-rate blooms of F. S. Vallis, Maud Jefferies, Purity, Master David, J. W. Molyneux, Mrs. W. Knox, and Mrs. Geo. Mileham found a place in this collection. Mr. H. A. ALLEN, Penarth, was 2nd.

As in other classes for Incurved blooms already noted, there was only one exhibitor who set up a stand of 12 blooms, in not fewer than six varieties. The exhibitor in this case was H. H. Prince HATZFELDT, and the blooms being of high quality, were awarded 1st prize. Mrs. Judson, Boccasio, Clara Wells and Pantia Ralli were some of the best flowers shown. His Highness also staged the only exhibit in the class for 24 specimen blooms—12 Incurved and 12 Japanese—for which he obtained 1st prize and a Silver Challenge Cup. Buttercup, Boccasio and Topaze Orientale were among the best Incurveds, and Master David, Hon. Mrs. Lopes, Mrs. Hooper Pearson, and Mme. G. Rivol the most striking of the Japanese.

For a stand of six vases of cut blooms, three blooms of each, distinct, A. F. HILL, Esq., received the 1st prize and a Challenge Cup. Four of the best were F. S. Vallis, Mrs. N. Davis, Mrs. Geo. Mileham, and the Hon. Mrs. Lopes. The 2nd prize went to F. PRIMAVESI, Esq., Cardiff (gr. Mr. W. Webber).

Messrs. G. WILLIAMS & SONS, Cardiff, were placed 1st for a group of large-flowering Chrysanthemums arranged with foliage plants, occupying a space of 60 square feet. In addition to the prize, a challenge cup was also awarded. Mr. W. TRESEDER, nurseryman, Cardiff, was placed 2nd.

For a group of Chrysanthemums covering an area of 50 square feet, the 1st prize and a challenge cup were awarded to the executors of the late JAMES HOWELL, Esq. (gr. Mr. A. Brown), Cardiff Messrs. J. EMBINGTON and HATHERDALE, of Cardiff, were placed 2nd and 3rd respectively.

In addition to the foregoing prizes, Messrs. W. THOMAS and W. TRESEDER, nurserymen and florists, Cardiff, received numerous awards for floral designs.

FRUIT.

Mr. H. PITT, Abergavenny, showed a very good collection of dissect fruit, consisting of five distinct dishes, for which he received the 1st prize. The following were the kinds of fruit staged:—Grapes, Muscat of Alexandria; Melon, Tamton Hero; Fig, Negro Largo; Pear, Doyenné du Comice; and one dish of Medlars. J. H. MULLINS, Esq., Llanishan (gr. Mr. Huxtable), 2nd; and P. S. LYSAGHT, Esq., Wellington (gr. Mr. C. J. Curtis), 3rd.

Mr. H. PITT also had 1st place for a collection of six dishes of culinary Apples, four of the most striking varieties being King of Tompkins' Country, Emperor Alexander, Gasconne's Seedling, and Lord Derby. L. LYNN THOMAS, Esq., C.B., Cardiff (gr. Mr. Malpas), was placed 2nd, and S. LYSAGHT, Esq., 3rd.

With the varieties Durondeau, Louise Bonne of Jersey, Pitmaston Duchess, Doyenné du Comice, Marie Louise, and Beurré Diel Pears, E. H. EBSWORTH, Esq., Cowbridge, won the 1st prize for a collection of six dishes. The 2nd award in this class went to S. LYSAGHT, Esq., and the 3rd to Sir JOHN GUNN, St. Mellons, Cardiff (gr. Mr. Dobbs). This last competitor was successful in securing the premier prize and a silver challenge cup for a collection of Apples and Pears.

HONORARY AND TRADE EXHIBITS.

J. J. NEALE, Esq., Penarth, staged a beautiful and interesting collection of Orchids and insectivorous plants, which added considerably to the attractiveness of the show. Of the Orchids the most striking blooms were those of Vanda cœrulea and Oncidium varicosum, while a good deal of interest was taken by visitors in the New Holland Pitcher plant (*Cephalotus follicularis*), *Pinguicula cordata*, and numerous species and forms of Sundews. (Gold Medal.)

Messrs. CYPHER, of Cheltenham, put up a fine collection of rare and showy Orchids, for which they received a Gold Medal.

Mr. W. TRESEDER was the recipient of a Silver Medal for a miscellaneous collection of flowering and foliage plants. A Gold Medal was also obtained by Messrs. CLIBBAN, of Atrincham, for a fine assortment—about 80 dishes in all—of different kinds of vegetables.

BATH GARDENERS'.—A well-attended meeting of this society was held on October 25 at the Foresters' Hall. The treasurer, Mr. H. Spary, presided. Mr. P. Parrott, chairman, read a paper on "Mushrooms." If a supply of Mushrooms is required in winter, a house or shed, furnished it possible with means for warming it, should be set apart for them. If artificial heat is not available the shed would require to be well covered with straw or litter. Water should be given the beds sparingly, and not until the manure is really dry. If the paths and bare spaces are well sprinkled very little moisture will be required on the beds. *A. B.*

BRISTOL AND DISTRICT GARDENERS'.—The fortnightly meeting was held on October 28 at St. John's Parish Rooms. Mr. S. Shadlock presided. Mr. Curtis, gardener to Sir W. Howell Davis, Down House, gave a lecture on "Stove and Greenhouse Bulbs." Mr. Curtis included in his remarks Anaryllis, Vallota, Hæmanthus, Nerine, Lachenalia, Eucharis, and Pancratium. The lecturer stated that most of these plants require an abundance of water in their growing season, but they should be dried off afterwards. Eucharis, Vallota, and Pancratium should not be allowed to become excessively dry. All the plants are easily propagated from offsets. Lachenalias are useful for furnishing hanging baskets. *H. W.*

READING GARDENERS'.—A large number of members assembled at the meeting held in the Abbey Hall on Monday, October 25, the vice-president, Mr. Leonard Sutton, occupying the chair. The president, Mr. Alderman Parfitt, was to have lectured, but owing to his absence from Reading, Mr. F. Townsend, gardener to the vice-president, gave a paper on "Annuals and Perennials Grown as Annuals." First dealing with annuals grown in pots, Mr. Townsend enumerated Clarkia, Schizanthus, Godetia, Stock-flowered Larkspur, annual and perennial Chrysanthemums, Nicotiana, Balsam, Nemesis, and *Dimorphotheca aurantiaca* as suitable for the purpose. Passing to half hardy and hardy annuals raised under glass for summer bedding, the lecturer spoke of *Rehmannia angulata*, Carnations, Dianthus, *Amaranthus*, Penstemon, Salvia, Lobelia, fibrous-rooted Begonias, Petunias, Nicotianas, Cosmos, *Aretotis grandis*, Statice, Mimulus, Verbena, Fuchsia Drummondii, Salpiglossis, Scabiosa, and Zinnias. Instructions as to sowing, the proper compost to be used, and advice as to subsequent treatment were fully given. For the raising of annuals a preponderance of leaf-soil may be, with advantage, used in the compost, at the ratio of two parts leaf-soil to one of loam. The paper was brought to a conclusion with instructive remarks as to the treatment of annuals sown in the open, where they are intended to flower.

BRITISH GARDENERS' (LONDON BRANCH).—A smoking concert in aid of the branch funds will be held at Carr's Restaurant on Saturday, November 27, at 7 p.m. Tickets may be obtained from the branch secretary, Mr. V. Cockram, 19, Rosenau Road, Battersea Park, S.W.; or from the general secretary, Mr. J. Weathers, Talbot Villa, Isleworth. The next meeting takes place at Carr's Restaurant, 204, Strand, on Thursday, November 11, at 8 p.m., when a paper will be read by Mr. E. F. Hawes, entitled, "Should we have Independent State Recognition of Horticulture?"

KINGSTON GARDENERS'.—The second lecture of the season was delivered to a large gathering of the members on Thursday, October 28, by Mr. A. Dean, V.M.H., whose subject was "The National Vegetable Society: Its Aims and Objects." The president, Mr. E. H. Jenkins, occupied the chair. Mr. Dean said one special object of the new vegetable society was to promote from time to time trials of diverse vegetables, to ascertain which was the most profitable and suitable methods of culture, as well as the best varieties to recommend for general culture. Three trials of autumn-sown Cabbages and Onions were in progress, one at Twickenham, one at the "Times" Experimental Farm, Sutton Green, Guildford, and one on still fresh land at Romford. Each trial was being conducted on exactly similar lines, and with the same varieties. Great efforts are being made to hold at Westminster next September a representative exhibition of vegetables. Special emphasis was laid on the unsuitable manner in which, as a rule, good vegetables are presented for sale to consumers. With improvements in that direction the amount of vegetables consumed might be speedily doubled.

••• The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

ASPIDISTRA: *C. P.* Kindly send specimens of the insect and we will advise you.

BAMBOOS: *Constant Reader.* You will see it stated on p. 310 that Bamboos may be safely transplanted at the present season.

CELERY DISEASED: *Constant Reader.* The plants are attacked by a fungus—*Septoria petroselinii*. Burn the diseased leaves and select a fresh site, as far away from the old one as possible, for planting Celery next season.

CLUBBING IN CUCUMBER ROOTS: *H. J. G.* The galls on the roots are caused by eelworm or an allied pest. Follow the advice given to *H. J. G.*

EELWORM ATTACKING CUCUMBER PLANTS: *H. J. G.* Turn all the old soil out of the borders and bury it deeply in some out-of-the-way part of the garden. Thoroughly cleanse the house with carbolic acid in warm water, using plenty of soft soap, so that the liquid will run into the crevices. If possible, obtain your loam from a fresh source, or, if this is not practicable, stack the turf in layers and cover each layer with gas-lime and allow it to remain for one year before using it for planting.

NAMES OF FRUITS: *E. O. S.* 1, We cannot name these inferior fruits; 2, Norfolk Stone Pippin; 3, White Nonpareil; 4, Yorkshire Greening; 5, Cullen; 6, Colmar d'Été.—*J. Don.* Beurré Bosc.—*W. Baxter.* 1, Dumelow's Seedling (Wellington); 2, Fearn's Pippin.—*W. D. Ecklinville.*—*X. Y.* 1, Potts's Seedling; 2, Peasgood's Nonpareil; 3, Waltham Abbey Seedling.—*Walshaw.* Haysh's Princess of Wales.—*X. Y. Z.* Small's Admirable.—*C. B.* 1, General Todleben; 2, Marie Louise d'Ucéle; 3, Conseiller de la Cour; 4, Jubilee.—*W. E. T.* 1, Sturmer Pippin; 2, Northern Greening; 3, Lord Lennox; 5, Dutch Mignonette; 6, Prince Bismarck.—*P. J. P.* 1, Warner's King; 2, Harvey's Wiltshire Defiance; 3, Brabant Bellefleur; 4, Lord Grosvenor; 5, Franklin's Golden Pippin; 6, Court Pendu Plat.—*A. F. C.* 1 and 2, Marie Louise; 3 and 4, Doyenné du Comice; 5, Beurré Diel; 6, General Todleben.—*Postmark.* 45, Beurré Capiaumont; 45, Doyenné du Comice; 143, Fondante de Cuerne. The Plums were in a condition of pulp. The other Pears deformed, and it was impossible to name them. Soft and hard fruits should not be packed together. *F. Edgington.* 1, Bramley's Seedling; 2, Wealthy; 3, Lane's Prince Albert; 4, Welford Park Nonpareil; 5, Pine Golden Pippin; 6, Hornead's Pearmain.—*E. Smith.* 1, Beurré Hardy; 2 and 4, Beurré d'Amanlis; 3, Doyenne Boussoch; 5, Prince Bismarck; 6, Potts's Seedling.—*Bartley.* Decayed.—*W. A. N.* 1, Beurré d'Amanlis; 2, decayed.—*Constant Reader.* 1, Ribston Pippin (a well-grown fruit); 2, Grange's Pearmain.—*C. A. F.* 1, Pitmaston Duchess; 2, Court Pendu Plat; 3, Waltham Abbey Seedling; 4, Annie Elizabeth; 5, Scarlet Golden Pippin; 6, Melon Apple.

NAMES OF PLANTS: *H. W.* *Pyrus terminalis*, "Wild Service Tree" (a fine specimen, according to the dimensions you give).—*G. G.* *Argyrea hirsuta*.—*R. J.* 1, *Physalis Alkekengi*; 2, *Pyrethrum* sp.—*H. G.* 1, *Pyrus domestica* (Service tree); 2, *Ptelea trifoliata*.—*J. C. B.* *Cosmos bipinnatus*.—*H. W.* *Salvia leucantha*.—*Leigh.* *Eupatorium Weinmannianum*.—*F. W. T.* *Cupressus funebris*.—*J. W.* 1, *Bryophyllum calycinum* (it will grow readily, even in the dwelling-house); 2, *Eugenia Ugni*; 3, send when in flower.—*W. W.* One of the garden forms of *Veronica Andersonii*.—*J. W.* *Hæmanthus Kallreyeri* should, when the foliage is turning yellow, be kept perfectly dry until the spring.—*F. M.* 1, *Crataegus coccinea*; 2, send another specimen with foliage; 3, *Rhus Cotinus*; 4, *Populus albus*; 5, not recognised; send when in flower; 6, *Cotoneaster Simonsii*; 7, *Cornus sanguinea*.

NURSERY TRADE JOURNALS: *Chas. E. Nurseryman, Florist and Seedsman* (Milton House, Surrey St., Strand, W.C.); *Fruit, Flower and Vegetables Trades' Journal* (1, Mitre Court, E.C.); *Fruit Grower, Fruitree, Florist and Market Gardener* (Geo. Tucker, Salisbury Court, Fleet Street, E.C.); *Horticultural Trade Journal* (Horticultural Printing Co., Burnley); *Horticultural Advertiser* (Chilwell Nurseries, Lowdham, Notts.).

TENNIS LAWN: *H. F.* As you intend to prune the large roots as described in your letter it will be certain to make the trees less secure in the soil; therefore if the bigger branches are lopped it will render the trees less liable to be uprooted by winds.

Communications Received.—*H. M.* (Many thanks, our notice was published in the last issue).—*Mac*, (next week).—*W. H.*, *H. J. C.*, *R. G.*, *R. F.*, *H. M. V.*, *A. A. P.*, *C. E.*, *F. W. C.*, *F. NERINES IN GUERNSEY.

THESE beautiful members of the Amaryllidaceæ are generally referred to as greenhouse subjects. A few of them, however, are almost hardy bulbs, and a number may be so treated in the southern parts of England. At the same time it must be admitted that most success will be obtained by treating Nerines as cold-house plants; for, in the open beds, the bulbs do not obtain the thorough drying-off and rest which are essential to their proper flowering.

It is unfortunate that Nerines are not popular plants, and undoubtedly their habit of blooming erratically militates against their popularity; but with a little care their cultivation should offer no difficulty. In Guernsey, which may be looked upon as the European home of Nerines, and where they are far more extensively cultivated than elsewhere, nearly

everyone grows them, the Guernsey Lily, *N. sarniensis* (*Sarnia* being the old name of that lovely island) being the special favourite. Many a poet and many a writer have sung its praises, but these panegyricists are in error in describing *sarniensis* as the most beautiful of the species; it has rather earned its laurels through its hardiness and the ease with which it may be grown and flowered. The story of the introduction of the bulb to Europe is that, about the time of Charles II., a Dutch vessel was bringing a general cargo from Japan to Amsterdam, and was wrecked off the western coast of Guernsey. In the cargo was included some cases of bulbs. These were thrown up on the beach, where many took root, grew, and bloomed. The Governor of Guernsey at that time was Lord Hatton, and his son, who was an enthusiastic botanist, saw the Nerines in flower, and, greatly admiring the then quite unknown plants, collected them, sent some to English botanists, and planted others in the gardens of La Haye du Puits, a famous and beautiful old mansion, dating from Richard I.'s time, in which Prince Charlie had once been concealed in a secret hiding-hole. The self-same bed of Nerines has remained in the gardens, and is to-day about 100 yards long and some 6 feet wide; but the bulbs were frost-bitten a few years ago and have never since bloomed well. Mr. Gaspard Le Marchant, the owner, is very proud of the old bed, and a Gaspard Le Marchant lived at La Haye du Puits when the Nerines were first planted there.

Nerines need very little attention or care. The less they are disturbed the better. The soil should be sandy, mixed with a little loam, leaf-mould, some charcoal, and cow-dung, and the bulbs should be fairly thick in the pot. Only bulbs which throw up six, or occasionally five, leaves will bloom. During the period of growth and flowering water must be given freely, and some growers also keep the soil moist with moss. After flowering, the quantity of water must be gradually reduced, until all the leaves are dead; then the dried foliage should be carefully cut off, and there must be no more water given until the growth recommences, and then in small quantity at first. Some lay the pots on their sides, others stow them in the packing shed, or under the propagating bench. It is well to give a top-dressing every other year, and when the flowers are open the plants appreciate plenty of sun.

Nerines are easily hybridised and crossed, and readily raised from seed. But the length of time before first flowering is very variable. Some have flowered in four years, others have taken 10 years or more. The earliest to bloom are *N. Fothergillii elegans*, and *corusca*. They are generally fully out by the end of August. The latest to flower is *Mansellii*, which is often in full bloom in January, but it is an erratic plant. This year several growers have had flowers of *Mansellii* in the middle of September. This lovely pink bloom was brought out by the late J. Mansell, a Jurat of the Guernsey Royal Court. It was said to have been raised by him, but Mr. Mansell's head gardener, Mr. Peters, always declared that it was brought with some mixed and unnamed seedlings from Messrs. Henderson & Co. A peculiarity of *Mansellii* is that the foliage is fully developed before the flower is expanded. This year a notable discovery has been made

by Mr. W. J. Gill, of the Varendes Nurseries, Guernsey. He has been for years one of the leading raisers of new varieties, and has crossed *flexuosa alba* with *corusca major*. The hybrid bulbs have now bloomed, and Mr. Gill and others declare that they are true *N. Mansellii*. Other experts, however, contend that the colour is not quite the right tint. Mr. Gill had about a dozen of the new bulbs in flower in September.

The flowers of a Nerine are arranged in an umbel, the number of florets varying from five or six up to 12 or 20 in different kinds. *N. pudica* (white) has flowers more Amaryllis-shaped than the others. *N. crispa rosea* is more feathery-looking, the florets being erect, with twisted petals standing above the stamens and forming almost a ball. The colour is a pretty rose-pink. The stems of most Nerine flowers are about a foot to 18 inches in length. Mr. Gill has a new variety which was raised from *N. Plantii*, and which he has named *Carrei*, with stems 2½ feet in length, and 10 to 12 florets in each umbel. It is a rich crimson in colour. Mr. W. Foote, of Ashburton, the largest grower of Nerines, has many thousands of bulbs and over 100 varieties. Another good raiser is Mr. H. Smith, of Messrs. C. Smith & Sons, Caledonia Nurseries, Guernsey. A good sort is *N. Bowdenii*, figured in *Gard. Chron.* Nov. 26, 1904, fig. 164. Mr. N. W. Priaulx, Brock Road Nurseries, has two new scarlets, from W. Le Page and Mrs. Le Page, somewhat after the type of *Fothergillii*. Messrs. Manger & Son, Brookdale Nurseries, and Messrs. Hubert & Co., Doyle Road Nurseries, catalogue many varieties. The latter firm has a good hybrid in *Excelsior*, with flowers of a rich carmine and borne in great numbers. They also grow *japonica* (syn. *Lycoris radiata*), a purplish-red of large size. Messrs. Manger's speciality is *alba*, a very beautiful flower of great purity, which should find a place in all collections. But if any one variety only is grown, then *Fothergillii major*, the most intense scarlet of all, should be the one. Like *N. sarniensis*, the flowers of *Fothergillii*, when seen in the sunlight, appear to sparkle with diamonds, and the long, crimson stamens, with pinkish-white anthers borne at right angles, like those of the Passion Flower, greatly enhance the beauty of the blooms. Mr. Frank Lilley, of Les Ménages Nurseries, has the largest export trade in Nerines. He possesses a good novelty in *Purple King*, a break from *Purple Prince*; the flowers are rich pink, with a purple flush; the umbels are large, and the flowers last very long in water. His *Salmon Queen* is a bright and sparkling flower, about the best of the deep salmons. *Sarniensis* is also a deep salmon, inclined to carmine, and not a scarlet, as it is often described.

At the Guernsey flower show, held on the 3rd and 4th inst., Nerines were one of the leading features. Mr. Foote had a trade exhibit of 50 of his own seedlings; he also took 1st prize for Nerines. Messrs. Wheadon & Sons and Mr. F. Lilley put up trade exhibits of their own seedling Nerines, while Nerines were largely used in groups for effect, in table vases, in decorated baskets, and in bouquets.

A grand seedling of Mr. Foote's is *Kathleen*, a light salmon, umbel 6 inches across, stems 2 feet long, and with 20 florets in umbel. Another is *Ashburtonii*, from *corusca major*, with quite the largest florets of any scarlet.

An unnamed bicolor of his is sure to draw attention; it is a slaty-purple with a wide magenta streak in centre. A Vier-rose seedling is also an unusual colour, and a good bicolor is deep salmon with very pale rose-pink centre stripe. Mr. Gill has a new seedling from *corusea major* crossed with *flexuosa alba*, which has three or four flower-spikes from a single bulb; the foliage is very broad and abundant, and one stem measured 3 feet and the umbel contained 22 florets. A peculiarity about *N. Bowdenii* is that the foliage does not die completely down until growth starts again. Of elegans there are two colours, the pink, which is early, and the scarlet, late flowering, which some contend is the original *corusea*. But the whole nomenclature of *Nerines* is much confused, and there are many synonyms. *Humilis*, of the *crispa* type, is unknown by some, or termed *C. undulata humilis* by others. Mr. F. Lilley's elegantissima, salmon-pink, with carmine stripe, and long, stiff stems, is one of the best.

Of the leading varieties the best are *N. delicatissima*, pink, with narrow petals and star-like flowers; *elegans*, very fine rose, rather rare, and said to be a break from *sarniensis*; *venusta*, rather dwarf with scarlet flowers; *crispa undulata*, carnation coloured, with white blotches; the *flexuosa alba*, sent by Mr. W. J. Gill, is also very beautiful; *curvifolia*, a good white, of the *Fothergillii* type; and *flexuosa pulchella*, striped red. Of hybrids there are many. *O'Brienii* is small but of good salmon hue, with long stems; *Garibaldii* an Indian red, with darker centre line and umbels very spreading; *Allenii*, a strong grower and free flowering, and *tardiflora*, shy bloomer but of graceful habit.

I was informed by the manager of Messrs. Hubert & Co.'s floral farm at Jersey, that by far their best customers for *Nerines* are the French. Not only do the French nurserymen purchase largely, but the private French visitors to Jersey are always calling and buying small quantities of bulbs. *Nerines* can be grown as well in seedling boxes as in pots. *H. S. B.*

NOTICES OF BOOKS.

* THE BOOK OF NATURE STUDY (VOLUME V.).

THE latest instalment of the *Book of Nature Study* maintains the high standard reached by the volumes already issued. The subjects dealt with are practically all botanical, and include, in chapters i.-iv., the types of vegetation met with on the sea-shore, in water and in meadows and pastures. Miss Lawrie, who is responsible for this section of the work, has given an admirably readable account of the plants typical of these situations, and has illustrated her descriptions by means of excellent photographs. The section concludes with a chapter on the weeds of cultivation. The prevalence of different weeds in certain kinds of soils is pointed out and the results of experiments and observations made at Rothamsted recorded. The chapter might have been rendered more useful if the weeds had been classified into annuals and perennials, and if their several modes of vegetative propagation—on a knowledge of which methods of eradication are based—had been described.

Chapters v.-xii., by Mr. Hemmesey, are devoted to the school garden and occupy about 100

pages. It would be too much to expect a thoroughly adequate treatment of the subject within so narrow a compass, and though, on the whole, the treatment is good and the information trustworthy, certain statements err on the side of unqualified brevity. For example, on p. 103, it is stated that "nitrogenous, phosphatic, and potassic" compounds tend to become deficient in the soil and must therefore be supplied either by means of farmyard manure or . . . artificial manures." The words which we italicise are misleading, for it scarcely needs to be said that farmyard manure is itself very deficient in phosphates. Again, the space—11 pages, chap. xii.—devoted to insect and fungoid enemies of the garden is so meagre as to make the treatment of this important subject almost valueless. Indeed, the only fungus-disease mentioned is the late blight of Potatoes, *Phytophthora infestans*. The volume concludes with an excellent account of the work of the soil by Mr. Hall, of Rothamsted. Mr. Hall's book on the soil is recognised generally as a classic, and his treatment of the subject in the present volume leaves nothing to desire.

Inasmuch as the *Book of Nature Study* is not yet complete, we shall reserve for a subsequent occasion our remarks on the work as a whole,

FIG. 141.—ONCIDIUM ABORTIVUM: FLOWERS PALE YELLOW, MARKED WITH BROWN.

and content ourselves with the observation that this delightful series of volumes reflects the greatest credit on editor, contributors, and publisher.

* THE SMALL GARDEN USEFUL.

THIS manual, intended more especially for the owners of small gardens, such as are attached to houses in the suburbs of London and other large towns, contains in its 200 pages much useful information. Being the work of a practical horticulturist, it affords precisely the kind of assistance so much needed by the non-professional gardener, including the small-holder and villa resident. The possibility of an area of land of about one-tenth of an acre providing an annual supply of vegetables for a family of six persons is dealt with; how best to arrange the crops that should be raised from seeds, or planted; and the areas each may occupy are described, and plainly shown by plans. Methods of dealing with the various kinds of soils are given; how land may be dealt with according to its nature; the kinds of manure to employ; and how to dig and trench. On all these subjects the author is most practical

* *The Small Garden Useful*, by A. C. Curtis. Large post 8vo., with four half-tone illustrations and two plans. (Smith, Elder & Co.) Price 3s. 6d.

in his instructions. The chief points insisted upon are those concerned with intercropping, otherwise successional cropping, by which no portion of ground remains without its crop for any length of time. This is the best mode of making the most of limited areas.

Every man should make his own experiments in intercropping; "so much," as the author says, "depends upon soil, position, aspect, and climate, that it is impossible to dogmatise, or, indeed, to do more than suggest. In chapter iii. we are given the yearly routine of cropping, and a list of the seeds required; nothing of importance is omitted, unless it be the Penzance Early Broccoli, which comes in so usefully in south-country gardens, following, as it does, in the south border, the last of the Cauliflowers. It is estimated that the seeds for one-tenth of an acre would cost £1. The yearly routine is simplified by division into months, and includes sowing and planting, full instructions being given for each crop.

ORCHID NOTES AND GLEANINGS.

ONCIDIUM ABORTIVUM.

WE are indebted to Sir Frank Crisp, Friar Park, Henley-on-Thames, for the opportunity of illustrating this singular and rare *Oncidium*, which was described by Reichenbach in *Linnaea*, xxii. (1849), 347, the habitat being given as Venezuela. The striking peculiarity of the species is that the greater number of the flowers on the slender paniced inflorescence are abortive, the perfect flowers being sparsely distributed amongst them. The ground colour of the flower is pale yellow, the markings chestnut-brown.

Its nearest ally is the Peruvian *O. heteranthum*, which also exhibits the peculiarity mentioned. Several other species show it in a less degree, and notably *O. Jamesonii* of quite a different group, whose rather large, yellow flowers have these curious abortive growths scattered amongst them.

CYPRIPEDIUM EVE.

A FLOWER of a very beautiful *Cypripedium* is sent, under the above name, by J. Shorland Ball, Esq., Under Fell, Burton, Westmoreland (gr. Mr. Herdman), who obtained the plant from Messrs. Sander & Sons as of unrecorded parentage. It evidently has *C. insigne* Sanderæ in its composition, and the other parent might have been *C. aureum* Surprise. The dorsal sepal, which is large and perfect in shape, is pure white with a small gamboge-yellow base on which are emerald-green lines. The lower sepals are greenish-white with a few emerald-green lines; the petals are greenish-yellow, with thin, longitudinal, green lines, a thin, pale purple line extending through the middle, and some blackish hairs at the base. The lip is pale green with slightly darker green veining. Staminate primrose-yellow with a small green boss in the centre.

CATLEYA FABIA

(LABIATA × DOWIANA AUREA).

ARRANGED with a fine group of *Cattleya labiata*, *C. Dowiana aurea* and other showy Orchids, there are, in the gardens of Mrs. Bischoffsheim, the Warren House, Stanmore, several flowering specimens of this handsome hybrid *Cattleya*. The plants were obtained from seeds sown four years ago by Mr. Taylor, the Orchid grower at the Warren House. The ordinary forms of *Cattleya Fabia* have the sepals and petals of a purplish-rose colour as in *C. labiata*. Those raised in Mrs. Bischoffsheim's gardens have white sepals and petals, and the ruby-crimson labellum has gold lines running from the base. The flowers are, moreover, delicately fragrant. A plant of *Cattleya Portia* (*Bowringiana* × *labiata*) has two spikes bearing together 16 flowers; *C. Parthenia* Prince of Wales and many other showy Orchids are also in bloom in this collection.

* *The Book of Nature Study*, edited by J. Bretland Farmer, F.R.S. (The Caxton Publishing Company). Price 7s. 6d.

TRANSPLANTING APPLE TREES.

It is surprising the improvement that can be wrought in unhealthy and unfruitful Apple trees by lifting, root-pruning, and transplanting them. I often notice fruit trees either badly cankered or making too gross wood, which, with careful treatment, might be brought into a healthy and fruitful condition. The operation is quite simple in regard to young trees, but is not so easy in the case of older and larger trees.

On taking charge of these gardens some few years ago, I found a number of the Apple and Pear trees in an unsatisfactory condition. Many bore dead leading shoots indicating that the roots were down in the clay subsoil. Though some of the trees had been planted 15 to 20 years previously, I, nevertheless, transplanted them to other stations some distance away, and with good results.

When transplanting, a good heap of compost should be prepared beforehand. I use a mixture consisting chiefly of good turfy loam (that raked from Vine borders when giving the new, annual top-dressing answers well) mixed with some hard mortar rubble and a liberal addition of wood-ashes, garden refuse and road grit.

Holes are made some 8 feet or 10 feet in diameter, according to the size of the tree. When the trees mentioned above were shifted, the top-spit of soil only was removed, the holes being dug not more than 1 foot deep. At the bottom of the holes, and resting on the clay, a layer of old roof-slates was placed, the slates being used to prevent the roots from penetrating into the clay subsoil. The bed having been prepared in this manner, a layer of about 6 inches of the prepared soil was placed on top of the slates, and part of the excavated topsoil mixed with it as the work proceeded. The trees were carefully lifted by taking out a trench all around the tree some 6 feet from the stem and gradually working the soil away, care being taken to avoid damaging the roots during the operation. The means employed to transport the tree are as follows: The tree is turned on its side, and a pole placed crossways under the stem, the former being covered with sacking where it comes into contact with the bark. Two or more men at each end of the pole easily carry the tree in this manner to its destination, other men steadying and supporting the head or branches during the journey. The tree should be placed in an upright position attached firmly to a stake before placing the soil on the roots. This is important, for if the stake is not driven in the soil until after the tree is planted the roots may become damaged by the stake.

Care is taken to cut away all damaged roots and also to shorten all strong, fibreless ones. As planting proceeds, all the roots are spread out in their natural position and covered with some of the prepared soil. When the work is finished the trees are above the level of the surrounding ground. This is necessary because our soil is wet and retentive. When all is finished a mulch of rotten farmyard manure is placed over the roots.

In this manner we have transplanted several trees during the last eight years, some of them being 15 feet to 20 feet in height, and all have survived the operation. Most have been improved thereby, and have furnished excellent crops of fruit after the first year of transplanting. October and November are the best months for this work, as the trees then have a chance of establishing themselves before winter, and thus are the better able to withstand any period of drought that may occur during the following summer. In our own case, it has only been necessary to water two or three trees out of the many we have transplanted.

Each succeeding autumn our transplanted trees receive a light dressing of basic slag, followed by a mulch of well-decayed farmyard manure or old vine-border compost to encourage the roots to grow to the surface. *Wilmot H. Yates, Rotherfield Park Gardens, Alton, Hants.*

THE HAY CROP OF 1909.

THE meteorological records of the Rothamsted Experimental Station, Hertfordshire, show that the year 1909 started with a deficiency of rainfall amounting to 284 tons of water per acre. January and February of 1909 recorded a further deficiency of 2½ inches of rain, equal to 276½ tons of water per acre. March altered the condition of things, and probably saved the Hay crop from being a complete failure by yielding 3½ inches of water, including nine falls of snow, which was 1½ inch in excess of the average for that month. This large and welcome rainfall was followed by April and May, each recording a deficiency of rain amounting to 194½ tons of water per acre. June gave an exceedingly large rainfall, measur-

age in January and April, but deficient in February, March, May and June. The first six months of the year 1909, therefore, which embraces all the growing period of the first crop of Hay, revealed in this district a deficiency of rain, a much lower than average temperature, but 80½ hours excess of bright sunshine.

Under these climatic conditions the experimental Hay crop at Rothamsted was, in each of the 24 plots under different manurial treatment, below the average yield, and in some cases very considerably below the normal bulk.

The greatest deficiency was shown on those plots which received no potash in the manurial mixture. The application of ground burnt lime, applied at the rate of 2,000 lbs. per acre two years ago to certain portions of these permanent

FIG. 142.—NEW TREE CARNATION "MAY DAY," WHICH OBTAINED THE R.H.S. AWARD OF MERIT ON THE 26TH ULT.: COLOUR, ROSE-PINK.

ing slightly over 4 inches, being 170½ tons of water in excess of the average for June for the past 57 years at Rothamsted.

Taking the first five months of the year, January to May, together, the rainfall was 179 tons of water per acre deficient, which, added to the 284 tons deficient with which the year started, made a total deficiency of 463 tons of water per acre. But the heavy rainfall of June considerably reduced this enormous deficiency, and certainly assisted the mixed herbage of Grass lands.

The bright sunshine was in excess of the average in January, February, April and May, but less than the normal record in March and June. The mean temperature was slightly above aver-

age in January and April, but deficient in February, March, May and June. The yield has in some cases been increased by the lime, to the extent of three quarters of a ton of Hay per acre, and its stock-feeding quality improved.

Taking a few of the most characteristic of the Rothamsted experimental Grass plots which have received the same manurial treatment for the past 54 years, we find that the plot of land which has had no manure whatever for the whole of this long period yielded but 6½ cwt. per acre, being 9½ cwt. of Hay less than the average for this plot. Even on this soil exhausted plot, the addition of lime to one-half the area increased

the yield by 4 cwts. per acre. Superphosphate alone at the rate of 3 cwts. per acre produced $12\frac{3}{4}$ cwts. of Hay per acre, being just about double the quantity of the unmanured plot. The addition of sulphate of ammonia, 400 lbs. per acre, to the superphosphate gave no increase over the plot receiving superphosphate alone. This fact was doubtless owing to the lack of potash, which ingredient, in such an unfavourable season as the present, appears to have considerable influence on the total yield of Hay, as well as its cattle-feeding value.

The soil of this plot, which has received for so many years superphosphate and ammonia, but no potash, has become distinctly acid, so that the vegetation, which consists mainly of shallow-rooting Grasses growing in tufts, namely, Sheep's Fescue, Sweet Vernal, smooth-stalked Meadow Grass, Common Bent, and Yorkshire Fog, has generally a rusty and unhealthy appearance, and there is an entire absence of Clovers in the herbage.

The addition of ground lime to one-half of this plot resulted in an increased amount of Hay of $11\frac{1}{2}$ cwt. per acre.

The plot receiving a complete mineral manure, of which the chief ingredients were 3 cwts. of superphosphate and 5 cwts. of sulphate potash, gave $24\frac{3}{4}$ cwts. of Hay, being 5 cwts. per acre less than average. On this plot an application of lime to one-half increased the yield of Hay by half a ton per acre. On an adjoining plot, where the potash was omitted, the weight of Hay fell to $15\frac{1}{4}$ cwts. per acre, and on this plot, with its soil-exhaustion of potash, the lime had no effect.

Superphosphate, sulphate of potash, and 400 lbs. sulphate of ammonia produced $29\frac{1}{2}$ cwts. of Hay, being $14\frac{3}{4}$ cwts. per acre less than the usual average. On the adjoining plot, where potash was omitted, the yield of Hay was reduced to 17 cwts. per acre only, being nearly a ton of Hay per acre less than the average record for this plot.

Superphosphate, potash, and 550 lbs. nitrate of soda per acre yielded $48\frac{3}{4}$ cwts. of Hay, which is very nearly the average produce for this plot.

The same amount of superphosphate and potash, with one-half the quantity of nitrate of soda, namely, 275 lbs. per acre, gave $31\frac{1}{2}$ cwts. of Hay, being $7\frac{1}{2}$ cwts. below average.

These experiments prove that on this class of Grass land nitrate of soda is a much better manure than sulphate of ammonia, more especially in a season of deficit of rainfall. The probable reason for this fact is that nitrate of soda dissolves more rapidly than sulphate of ammonia, and thus descends more deeply into the soil, whither the plant-roots follow it, for, where the food is, there go the plant-roots to feed upon it; thus a larger soil area and a greater supply of soil-moisture become available to the growing crop. *J. J. Willis, Harpenden.*

THE ROSARY.

CULTURAL HINTS FOR NOVEMBER.

Owing to the heavy rains, the ground is too wet for planting, but if it was well trenched and manured last month the excess of moisture will soon pass away, and planting can be resumed. When planting Rose trees, care should be taken to examine the roots and to cut out all thick and sucker-like growths. Standard Briars, Manetti, de la Grifferie, and Seedling Briar stocks for budding next season may be planted when the ground is in a fit condition. Standard Briars should be selected carefully, choosing those with hazel and green-tinted bark and straight stems. One-year-old suckers and those that are black and hide-bound should be thrown out. Two and three-year-old stocks are generally the best for planting; they can be had from 2½ to 5 feet in height. All the fibrous roots should be preserved,

but thick ones should be shortened, and any parts that appear likely to throw up suckers should be cut off. Plant in lines drawn 3 to 4 feet apart, allowing 1 to 1½ foot between the stocks, and place them 9 inches to 1 foot deep. Tread the ground before levelling it, and finish off with a good mulch of manure on the surface. The strongest of the dwarf stocks raised from cuttings planted last autumn, viz., de la Grifferie, Manetti and Briar should be now ready to plant out for budding the coming season. Place them 2 feet apart in the rows and 6 to 9 inches from plant to plant in the rows, well treading the roots. The Seedling Briar takes three years from the time of sowing to produce a stock of sufficient strength for budding, and an annual sowing should be made to keep up the supply. The present or a little later is a good time to gather the hips of the common Dog Rose for seed purposes. The fruits should be put in a heap, mixed with sand and lightly covered with soil until the fleshy covering rots. The seeds should be stored for sowing in drills during early spring. If the soil of the seed-bed is at all chalky or of a peaty nature it should be, as far as possible, replaced by, or mixed with, good sandy loam, and the drainage made effective. If the soil is of a retentive character, some road grit, wood-ashes, and burnt

vigorous growers and climbers such as Gloire de Dijon, W. A. Richardson, Climbing Nipheto, and Reine Marie Henriette, whilst the Manetti and Briar stocks should be used for Hybrid, Perpetual, Bourbon and similar varieties. The scion and stock should be about equal in strength and girth, so that when grafted they cover each other. When finished, a little French mastic should be placed over the union. It is best to graft when the stock is a little more active than the scion. The temperature in the frames at first should not exceed 50° to 55°, gradually increasing it after Christmas to 60°. Damp is one of the greatest enemies to the early graft, and after the first week the sashes should be left open during the early morning so as to dispel excess of moisture. The best position for the plants is under frames with movable sashes in a light span-roof house, on stages covered with iron sheets or plates covered with fine ashes, and immediately over the hot-water pipes. Manetti and other stocks rather more than 1 inch in girth may be potted up in 3-inch pots for later grafting, and can be plunged outside till after Christmas. These will come in for herbaceous grafting when established during the early months of the New Year if brought under glass a few weeks before they are required for use.

FIG. 143.—GARDEN WALL WITH SHRUBS AT OAKLANDS.

ballast mixed with it will greatly improve the texture. It is now a good time for planting cuttings, shoots for the purpose being obtained by cutting off the tops of the budded plants of last summer. Make the cuttings 9 inches in length, and disbud them to within a few eyes of the top. Plant them to two-thirds of their depth and a few inches apart in rows made 1 foot apart, and work in some sand and leaf-mould near the base of the trench. They are most conveniently planted in beds 4 feet wide. I favour shallow planting of Standard and Dwarf Roses, provided they are well secured to stakes and a mulch is afforded them.

GRAFTING UNDER GLASS.

I have dealt with this subject at some length in former issues, and I will now merely reiterate the salient points to be observed to ensure success. One important item is that the stock, whether Briar, Manetti or de la Grifferie, for dormant grafting, should have been established in a 3-inch pot and stood out-of-doors during the summer. If unestablished stocks are used for grafting early in the season the work will result in failure. Those of the Tea and Noisette sections do best on the Briar and de la Grifferie stocks. The latter stock is specially suited for

Established pot Roses brought under glass for early forcing last month will soon be breaking into growth, and the temperature may now range from 50° to 55° in the daytime with top ventilation during favourable weather and a circulation through the bottom ventilators near the hot-water pipes. For the present the top ventilators may also be opened a trifle during the night. No attempt should be made to unduly force the plants until the turn of the New Year. On bright mornings give the shoots a light spraying with clean water to keep down red spider. At other times, and during dull weather, damping the stages will suffice to maintain a humid atmosphere. On the first appearance of mildew it must be promptly checked; a warm solution of soft soap is a good antidote if well sprayed on the top as well as under the foliage.

Roses planted out under glass will now be breaking freely, and on bright mornings the heads of the plants should be syringed: the moisture will be dried up before evening. Vaporise occasionally to destroy insects. The temperature may remain at 50° with plenty of fresh air admitted during the daytime and a little from the side and top ventilators at night-time, but this must not be allowed to reduce the temperature more than a degree or so. *J. D. G.*

OAKLANDS.

THE gardens at Oaklands, near Patchway, Bristol, contain a number of interesting and well-grown plants, Mr. Hiatt Baker being a keen horticulturist and a great friend of Canon Ella-combe, whose noted garden at Bitton is the Mecca of all flower-lovers. Amongst the curiosities noted recently in the Oaklands garden were three Thistles, *Cnicus candelabrus*, from Bosnia, 9 feet in height; *C. Falconeri*, from Cashmere, with 10 or 12 towering flower-heads, and *Oporion anaticum*, a handsome Thistle, 8 feet high. *Kniphofia erecta* was very bright, with its glowing scarlet heads, and *Euphorbia Wuifenui* made a handsome plant. *Geranium Lowii* has very ornamental foliage, its leaves being deeply cut and over a foot across, but the flowers were poor. *Cistus laxus* was a pretty, white-flowered species, and *C. ocymoides* had small yellow blossoms with a dark spot on the petals, very similar to those of *Cistus* (*Helianthemum*) *algavense*. *Clematis Davidiana* was represented by a hybrid raised by Lemoine, which is better than the type and forms a good permanent bush. There was a good plant of the new *Viburnum rhytidophyllum*, and Christ's Thorn, *Paliurus aculeatus*, was flowering and fruiting. There was a good collection of the *Berberis* family, including *B. Darwinii* nana, a very dwarf form of this well-known shrub, *B. Knightii*, *B. trifoliata*, with pretty leaves; *B. Fremontii*, *B. congesta*, *B. Fortunei*, *B. nervosa*, with very decorative foliage; and *B. tolimensis*, also with handsome leafage. A pretty plant was *Polygonum cilinode*, clambering up an old Fir. Growths 20 feet in length are made in a year, and the slender, twining, red stems and clusters of tiny, white flowers had a very pleasing effect. Large plants of *Spirea Aitchisoni* had bloomed, though they refuse to flower in some gardens; but the species was considered inferior to the old and well-known *S. Lindleyana*, its flower-racemes, though of a purer white, being far smaller and less freely produced. A fine, young plant of the new *Davidia involucreta* was 8 feet in height, and specimens of *Plagianthus Lyallii*, *Exochorda pinnatifolia* and *E. Albertii macrantha* were present. *Bocconia macrocarpa* was a handsome and very stately species, 13 feet in height, with enormous leaves 2 feet across, and *B. cordata Thunbergii* was a variety of the ordinary type. *Cotoneaster Lindleyana* was a nicely-grown small tree, and others

FIG. 145.—JAPANESE BRIDGE IN THE GARDENS AT OAKLANDS.

of the same genus were *C. Foutanesii*, *C. pannonica*, and *C. angustifolia*, the last-named species having flowered freely. On the lawn was a fine specimen of *Stephanandra Tanaka*, and also a good example of *Dumorphanthus manschuricus variegatus*. *Plagianthus betuloides*, 12 feet in height, was very attractive, with its elegant growth and small, graceful foliage, and *Fagus antarctica*, from Terra del Fuego, was interesting. The soil being of limestone, it is not suited for *Rhododendrons*, and has to be removed to a considerable depth and replaced by peat where these are grown. In the positions so prepared, however, these shrubs are doing well, and Pink Pearl, *R. campanulatum*, *R. linearifolium*—most un-*Rhododendron*-like—and others, were in good health. The Venetian Sumach (*Rhus cotinus*) made a fine show with its purple, feathered plumes, and the American *R. cotinoides* was

commencing to assume its brilliant autumnal colouring, while *R. typhina laciniata* bid fair to make a tree. *Citrus trifoliata* was fruiting, *Grevillea sulphurea* was in excellent health, as was the commoner *G. rosmarinifolia*. Over a channel separating two little pools, in which Water Lilies were grown, was a Japanese stone bridge, and near by *Gunnera manicata* was looking well, though, naturally, its leaves had not attained to the dimensions the species reaches in Cornwall. The Globe Thistles were represented by the rare *Echinops Tournefortiana* and the variety of *Romneya Coulteri* known as *trichocalyx*, which is said to be far superior to the type. There was a fine bush of *Hydrangea quercifolia*, and the biennial, *Papaver caucasicum*, with flowers much like those of *P. pilosum* in colour but smaller. Masses of the pale yellow, annual *Calceolaria mexicana*, which springs up yearly from self sown seed, were very attractive, while the autumn-flowering *Perowskia atriplicifolia*, with its long, slender shoots studded with lavender blossoms, was especially charming. On the walls, *Indigofera Gerardiana* was 15 feet high, and *Solanum crispum* had reached the same height. Other wall plants included *Mandevilla suaveolens*, *Trachelospermum jasminoides*, *Pentstemon cordifolius*, *Actinidia chinensis*, and *Vitis Coignetiae*, which had clambered up into the branches of an overhanging Elm that it will, apparently, soon appropriate. There was a healthy specimen of *Veronica Hulkeana*, *Callistemon salignus* (evidently appreciating its environment) and *Polygonum sachalinense*, 14 feet in height, was in full flower. *Calceolaria Barbidgei* was also in bloom, but is very tender, and has to be treated as an annual, as it is killed by a few degrees of frost. *Colutea breviflora* was an attractive shrub with yellow blossoms, and there were good examples of *Magnolia Lennei* and *M. Kobus*. *Boehmeria nivea* was a curious shrub-like perennial. *Aragene alpina* had ascended among the branches of *Azara microphylla*, *Cornus alba* was in flower, and there were good plants of *Kniphofia Northii*, while the curious *Rubus australis*, whose leaves are reduced to sharply thorned midribs, was growing well. In a damp spot *Rodgersia podophylla* and *F. pinnata* were luxuriating, and *Podophyllum Emodi* was bearing its large, crimson fruits. *Salvia candelabrum*, from Mexico, which has a very aromatic odour, was a handsome object

FIG. 144.—VIEW IN THE GARDENS AT OAKLANDS, THE RESIDENCE OF MR. HIATT BAKER.

about 4 feet in height, and was still bearing some of its purple and white blossoms, while the new *Paonia lutea* was developing into a fine bush. Small rock-gardens were composed of porous Bath stone, and contained many interesting occupants, among which were the dwarf *Abies Sieboldii*, *Pentstemon Menziesii*, *Lithospermum graminifolium*, *L. Gastonii*, *Anacyclus formosus*, *Erinacea pungens*, the rare *Erodium supracanum*, *Yucca Parryi*, *Veronica canescens*, and *Thalictrum dipterocar-pum* with pretty lavender flowers. *Daphne blagayana*, with its shoots pressed down by stones, was extending its growth; *Omphalodes Luciliae*, generally a very difficult plant to deal with in the south, was apparently happy, and a colony of *Gentiana Karroo*, one of the rarest and most interesting plants in the garden, was exhibiting the most vigorous health and bearing numbers of deep blue flowers. *Wynndham Fitz-herbert*.

PLANT NOTES

SCHAUERIA CALYCOTRICHIA.

THIS Brazilian Acanthaceous species, like several of its allies, flowers during the autumn and winter months, and requires stove treatment. It forms a plant of a half-shrubby character, clothed with broadly-ovate leaves, which are quite glabrous. The inflorescence, which is disposed in a terminal cluster, consists of a number of tubular flowers, each of which is a little more than an inch long. The sharply-cut calyx segments are just about the same length, and thus the whole inflorescence forms a fluffy, yellow-coloured head. Beside the generic name of *Schaueria*, it is also known under that of *Justicia*, the specific title remaining the same. In common with most Acanthaceous plants, it is readily propagated by means of cuttings inserted early in the year. The plants should be grown during the summer in a compost of loam, leaf-mould, and sand, and, if potted into 5-inch pots, they will form neat, flowering examples by the autumn. These may be grown on another season, if this is thought desirable; but young examples are, as a rule, the more satisfactory. W.

MONTANOA MOLLISSIMA.

THOUGH introduced from Mexico over 60 years ago, this *Montanoa* is very little known, notwithstanding its value for the embellishment of the greenhouse or conservatory. It is a member of the Composite, and forms a free-growing, rather upright-habited specimen, 8 feet or more in height. The leaves are ovate-lanceolate in shape, and rough in texture, being whitish underneath. The flowers, borne freely and over a lengthened period, are each a couple of inches or more in diameter. The disc is yellow, and the ray florets white. This species requires the protection of a greenhouse during winter, but in summer may be given much the same treatment as a *Chrysanthemum*. It was the subject of a Supplementary Illustration in the *Gardeners' Chronicle* for January 13 1908. A second species, *Montanoa bipinnatifida*, was given an Award of Merit by the Royal Horticultural Society in December, 1907. *M. bipinnatifida* is also a native of Mexico, and a bolder-growing plant than *M. mollissima*. Apart from its flowers, which are somewhat like those of the first-named species, *M. bipinnatifida* is a handsome foliage subject, and is often seen in collections of sub-tropical subjects under the name of *Polynnia grandis*. W.

GREASE-BANDING OF FRUIT TREES.

THE simple method of attaching grease bands devised by Mr. J. Boulding, and described in the *Agricultural Gazette* of New South Wales, will recommend itself to those of our readers who practise grease-banding for the winter moth. As indicated in fig. 146, the pin is made on the same principle as the fastener used by grocers to attach their aprons, and the diagram will explain more readily than words how it should be used. With a pair of pliers and a file the bands may be made quite easily, and would find employment for members of the garden staff when the weather conditions were unfavourable for working in the open.

The Week's Work.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Early pot vines.—Vines which are expected to yield ripe Grapes at about the end of April or early in May must be placed in the forcing house at once. The proper house for this early forcing is one having a lean-to or hip span roof and a southern aspect. The heating apparatus should be ample, so that sufficient warmth may be attained at any time without having to overheat the water pipes. Artificial heat will not be required during the first two or three weeks, unless the weather happens to be very cold, and even in that case it must only be used with great care; the atmospheric temperature must not be made to exceed 50° by artificial means until the buds are showing signs of breaking into growth, but after that stage the temperature may be raised to 55° or 60°, according to the condition of the weather. The pots may be plunged in a very mild hot-bed, consisting of leaves and short litter. The materials should have been previously prepared for use by thorough mixing and turning at intervals of two or three days. The vine rods should be tied in horizontal positions along the front of the house till the buds are bursting, as this bending will assist them to break evenly. Much care must be exercised in

FIG. 146.—A SIMPLE CLIP FOR ATTACHING GREASE-BANDS.

A, the wire clip; B, the clip in position; C, showing how the band is attached by means of the clips.

applying water to the roots, remembering that the vines will require very little until they have made some growth. Syringe the roots with lukewarm water once or twice each day when the weather is fine, and damp the walls and floors in the house as often as is necessary. The best varieties for the early forcing in pots are Black Hamburgh and Foster's Seedling.

Early vines and borders.—These will need similar temperatures to those recommended for pot vines, and the date for starting them into growth will depend on what date in the coming season the cultivator wishes to obtain ripe fruits. Judgment must be exercised, however, to see that the wood is perfectly matured before forcing is commenced, or the results will be disappointing. It is not necessary to tie the rods of old vines along the front of the house, as these usually break into growth in an even manner. At the same time, they should not be tied to the trellis until the rods have been given another good washing. This washing should be done immediately before the buds burst into growth, and more than ordinary care will be necessary to prevent the buds from suffering injury in the process.

Fruit trees in buds.—Those trees which are not

needed for early forcing may now be placed in their winter quarters. The continued rains and absence of sunshine have been unfavourable for the proper maturing of the wood and fruit-spurs. Therefore it will be advisable to place the trees in a position where they will be somewhat sheltered from heavy rains, and at the same time be exposed to light and air. Such a position is found, for instance, at the base of a south wall or a wall facing to the west. The trees may be placed quite closely together and the pots plunged in Bracken or leaves. Any trees affected with American blight should be placed on their sides and given a thorough dressing with some approved specific before being plunged.

Fig trees at present out-of-doors must be brought into a cool house, where they will be protected from frosts.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Pruning and training.—These important operations should be proceeded with in favourable weather. Although the ground is in a sodden condition, it is possible, in the case of wall trees, to place planks where the operators are to stand, and thus the condition of the soil will not be much affected, whilst some degree of comfort will be secured to those engaged in the work. It is the more necessary to push these operations forward, because so long as the ground is in its present condition, it is impossible to plant, or even to root-prune. If the ground becomes drier the pruning may be left for a time, and all available strength put to the planting.

Morello Cherries.—Where summer pinching and pruning are systematically practised there is not much winter pruning necessary, but in many cases it is impossible to get this work done in the summer; therefore, advantage should be taken of the present time to thoroughly overhaul the trees. Pruning should be commenced in the first place by sawing out any of the main branches which have become useless, afterwards going carefully over the whole of the tree, cutting out all rough and useless wood, and any specially weak shoots, but leaving enough fruiting wood to cover the space when trained at about 4 inches apart. The pruning should be done as far as possible before the tree is altogether loosened from the wall, as in that case the workman can see the better what to take out, and what amount of wood is required to fill the space. When Morello Cherries have been neglected for some years, but are fairly good, healthy trees, much may be done to bring them into a creditable condition in a shorter period than is possible with most other wall-trained fruit trees. In such a case care must be exercised to retain every piece of young, healthy wood to take the place of the worst branches, which should be cut out, avoiding the extreme of removing too many in one season. After the pruning is completed, the trees should be unfastened and given a thorough cleansing with Gishurst Compound, or some other reliable insecticide, used strictly according to the directions published by the manufacturers. If nails and shreds have been used as the means of training, the wall will probably require stopping with cement, as these holes are most convenient breeding places for insect pests. While the trees are free from the walls it is a good time to provide the latter with wires, as was recommended in a recent Calendar.

Sweet Cherries.—These require a totally different method of pruning to that practised with the Morello. Sweet Cherries produce their fruit on spurs formed on the older wood, and in the case of wall trees that have been properly tended during the past summer, very little pruning will now be necessary. If the tree has not already filled its allotted space, about 12 inches of young wood may be trained in, following out the main branches, according to the system of training. The trees should be unfastened and cleaned, as advised for Morellos, taking care not to damage the fruit-spurs during the process of cleaning. If large branches are cut out, or the knife used unnecessarily, the disease known as gumming will most likely cause considerable damage. If the trees have been neglected in the past in the matter of pruning, proceed very cautiously, extending the cutting out over a period of at least a season or two.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardlee, Sussex.

Climbing plants on tree stems.—Since the soil about the stems of large trees is usually so much drier than land exposed to the weather, planting of climbers in these situations may be done at the present time. In most cases the soil will need to be trenched and manured. The planting should be done at a distance of about 3 feet away from the stem, and the roots placed with their growing points from the tree, the object being, whilst training the growths of the plant up the trunk of the tree, to attract the roots away from the trunk by placing manure and suitable soil where it is wished that the roots will extend. A great deal can be done in this direction by perseverance, and the effect obtained is charming. Many varieties of Roses are amongst the plants best adapted for this system of gardening. I well remember the first Crimson Rambler I planted at the base of a tree. In this case it was against a standard plant of *Kolreuteria*; the second season the effect was excellent, and it increased in subsequent years as the Rose grew higher and higher. Dorothy Perkins, Rosa Siniça, *Anemonaflora*, *Euphrosyne*, *Débutante*, *Hélène*, *Hiawatha*, *Lady Gay*, *macrantha*, *Una*, *Thalia*, *Paul's Carmine Pillar*, *Queen Alexandra*, *Mme. A. Carrière*, *Reine Olga de Wurtemberg*, and *White Pet* are suitable Roses for this purpose. The chief points to observe in cultivating Roses in these positions is to keep them perfectly clean and well supplied with water in dry weather. In addition to Roses, there may be planted *Rubus bambusarum* and *R. flagelliformis*. Some species of *Vitis* provide brilliant colour, which is effective even at a distance. Such species include *V. Henryana*, *V. Coignetie*, *V. heterophylla*, and *V. Labrusca*. Then there are *Clematis montana*, *Polygonum Baldschuanicum* and *P. multiflorum*, *Hydrangea scandens*, *Actimidia chinensis*, *A. Kolomikta*, *A. polygama*, *Wistarias*, and *Tropæolum speciosum*.

General work.—Clear away all the dead and decaying material from the herbaceous plants, especially such annuals as have flowered, and any weeds there may be in the borders; the few flowers that still remain will then be more effective. Any vacant spaces should be filled in with spring-blooming plants, such as *Iris*, *Ranunculus*, late-flowering *Tulips*, *Wallflowers*, and *Myosotis*: these should be planted carefully when the weather is dry. *Chrysanthemums* that have already flowered may be cut down to the ground level, and any plants lifted for stock that will be required for that purpose. Those remaining may be thrown away. In the cleaning operations be very careful that no labels are taken away, or even disarranged. Sweep and roll the Grass verges and paths, and make everything appear as tidy as possible. If earthworms are very troublesome on the lawn, prepare a mixture of lime and leaf-mould, and sprinkle this finely over the Grass. The top-dressing will benefit the Grass, and cause the worms to come to the surface, when they can be collected. Prune any deciduous trees that require this treatment. On wet days take the opportunity to clean the tools and machines, examine bulbs and roots in store, such as *Begonias* and *Dahlias*, and see that they are placed in a suitable position for the winter.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Preparations for winter.—Any pot plants which are intended to remain in the frame ground in the open should be plunged to their rims in ashes, so that there will be no danger of the frost breaking the pots. Mats and other covering materials should be at hand ready to place on the unheated frames when frost seems imminent, and it is as well to place similar coverings on cold nights on the glass of heated frames. This is a better plan than increasing the amount of fire-heat. Water should be sparingly given to plants in cold frames, and the mornings of fine days are the best time for its application. It is better to keep the plants somewhat on the dry side, for when their tissues are charged with moisture plants are more readily affected by low temperatures. The amount of sunlight will be very small during the dull months that are approaching, therefore every effort should be made to let the plants have the

benefit of what little there may be. Although this is not the proper time to undertake the annual cleansing of glasshouses, it will be as well to wash the glass of the roofs and fronts of the plant-houses. When doing this, give special attention to see that the accumulations of dirt are removed between the glass that overlaps, as it is these which often cause drip in plant houses. In the neighbourhood of large towns, it is a good plan to wash the outsides of the glass by means of a hose, for if this is not done the deposits of soot and matter from fogs soon shut out most of the light.

Francoa ramosa.—This plant always flowers best when it has been wintered under cool conditions. In many gardens in warm situations in the southern counties specimens in the open with-stand all but very severe frosts, therefore pot plants may be wintered with safety in a cool greenhouse in a brick pit, which should be covered with mats on cold nights. For the next four months the roots should be kept relatively dry. A few well-grown specimens in pots of *Francoa appendiculata* are useful in summer-time for the decoration of the cool conservatory.

Dielytra spectabilis.—Although known in gardens under this name, the plant should be more properly called *Dicentra spectabilis*. It forms one of the most beautiful plants for forcing into flower in the early spring. To obtain the best specimens for this purpose it is necessary to pot fresh crowns each autumn. Place these in well-drained pots in sandy loam, and house them in a cold frame until they are required for forcing. When brought into the warm house they should be placed as near to the glass as possible, and, at first, subjected to a slight amount of extra warmth, which can be increased later.

Polygonatum multiflorum.—The common Solomon's Seal is useful for forcing purposes. Good clumps should now be potted in ordinary soil and placed in a frame until the new year.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Broccoli.—This important vegetable has made abundant growth, but it is of a gross nature, being sappy and immature. In the event of severe weather, the plants in cold and low-lying districts will be likely to suffer considerable damage. There is no better method in protecting them than that known as layering, which, if done properly, will, at least, save most of the plants, notwithstanding severe frost. Take out a good trench at one end, and heel over the plants, placing their heads towards the north; arrange the soil evenly and firmly over the whole of the stem. The slight check caused to growth will be beneficial rather than otherwise. Let the work be completed, if possible, before the end of November. Should unusually severe weather occur, it may be necessary to supplement the layering by strewing over the plants some light material, such as Bracken or straw; a very little covering of these substances will suffice, and it should be removed directly the weather becomes warmer.

Peas.—In gardens where there are conveniences for cultivating early crops of Peas under glass, seeds should be sown at the present time in well-drained pots, 8 or 10 inches in diameter. The compost should be of three parts fibrous loam and one part leaf-mould or manure from a spent Mushroom bed, which has been passed through a sieve. To every bushel of this compost add one 5-inch potful of bonemeal. The pots should be about half filled with soil, and twice as many seeds should be put in them as it is intended to cultivate plants. They should be thinned out to their proper number after the plants have germinated. The seedlings should be earthed up as soon as they appear above the edge of the pots. It is best to raise the plants in a cool house or unheated frame, for the slower the growth, especially in the early stages, the better will be the results. There are many varieties of Peas of dwarf and medium heights suitable for this method of culture. The best are those that produce large pods, and have haulms which attain the height of 4 feet, such, for instance, as *Early Giant*, *Edwin Beckett*, and *Early Morn*.

Broad Beans.—If the earliest Beans are treated in the same way as recommended for Peas, not forced in any stages of their growth, but allowed

plenty of fresh air when the plants are in flower, they will give satisfactory returns. *Leviathan* is a first-rate variety for cultivating in this manner.

Parsnips.—These are much superior in flavour if lifted direct from the open ground when needed for consumption. Nevertheless, it is desirable, in case of severe frost, to lift a stock of roots and store them in moderately moist sand or ashes. If this is not done, it will be necessary to cover a portion of the bed with leaves or long litter, to prevent the frost penetrating into the ground.

Salsify and Scorzouera.—These roots may now be lifted and stored in sand or ashes under a north wall.

Mustard and Cress.—Seeds should now be sown in boxes under glass.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Buxford, Surrey.

Ceologyne cristata.—This species and its varieties are fast finishing their growths, and the earliest are showing their flower-spikes. During the growing season *Ceologyne*s need considerable quantities of water at the root, but at the present time the plants should be kept rather drier. From now until the flowering stage the plants should be given periodical, light waterings with weak, liquid cow-manure. Where a number of specimens are grown, a long succession of flowers will be afforded, particularly if some are placed in a slightly higher temperature than others. *C. elata*, *C. ocellata*, *C. barbata*, *C. ovalis*, and *C. elegans* should now be developing their flower-spikes; they will need copious waterings until the flowering period is past.

Lycaste Skinneri.—Varieties of this species will now be finishing their growth and beginning to show the flower-spikes; the plants should be kept a trifle drier at the roots than during the growing season, but on no account must the new pseudo-bulbs be allowed to shrivel. The little check they will receive from having less water will cause them to produce their flowers more at one time instead of altogether. *Lycaste Skinneri* is best potted in the spring, when growth commences. The cool house is a suitable place for the plants during winter, so long as the temperature does not fall below 50°. Keep the leaves well sponged with tepid, soft water, so as to prevent an attack of red spider.

Cypripedium.—Plants of the *Selenipedium* section of *Cypripedium*, as *C. macrochilum*, *C. grande*, *C. calurum*, *C. Sedemii*, *C. cardinale* and *C. leucorrhodum*, which may have become pot-bound, should be afforded larger pots, and any overgrown specimens may now be divided and repotted singly. Put plenty of material in the pots, and use a mixture of fibrous loam, *Osmunda* fibre, and *Sphagnum*-moss in equal proportions. Cut the *Osmunda* fibre and *Sphagnum*-moss sufficiently small that it will readily incorporate with the loam. To keep the compost porous mix plenty of small crocks with it. Keep the surface of the soil just below the rim of the pot, so as to allow plenty of room for affording water, and do not press the potting materials too firmly. Careful watering is necessary till each plant is established, after which the roots should be kept moist at all times.

Habenaria.—Among Orchids which bloom at this season is *Habenaria pusilla*, better known as *H. militaris*, its brilliant scarlet flowers being widely appreciated. While the plants are in bloom, keep them well supplied with water at the root, but when the leaves begin to show discoloration gradually reduce the quantity, so as to induce the drying down of the stems and foliage and the ripening of the newly-formed tubers. When the growths have decayed, the pots should be placed on a dry shelf, and be exposed to the light, a position near the deciduous *Calanthes*, while those plants are at rest, is the best place for them. Although in a dormant condition, *H. pusilla* must have water occasionally, or their tubers will shrivel. Examine them once a week, and afford a good sprinkling of water from a fine rose watering-can to those which are dust-dry. The rare *H. ngande* and *H. zambeziensis*, being now in full growth, require the lightest position available in the warm house, and plenty of water should be given till the flowers are fully open; afterwards, and during the resting season, treat them as advised for *H. pusilla*.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication, as well as specimens or plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, NOVEMBER 15—
Nat. Chrys. Soc. Executive and Floral Coms. meet at Essex Hall, Strand.

WEDNESDAY, NOVEMBER 17—
York Chrys. Sh. (3 days). Chester Paxton Soc. Chrys. and Fruit Sh. (2 days). Roy. Meteorological Soc. meet.

THURSDAY, NOVEMBER 18—
Scottish Hort. Soc. Chrys. Ex. in Waverley Market, Edinburgh (3 days). Barnsley Chrys. Sh. (2 days). Linnean Soc. meet. Manchester Chrys. Sh. (3 days).

FRIDAY, NOVEMBER 19—
Bolton Chrys. Sh. (2 days). Leeds Paxton Soc. Chrys. Lsh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—42.6°.

ANNUAL TEMPERATURES:—

LONDON.—Wednesday, November 10 (6 P.M.): Max. 48° Min. 38°.

Gardeners' Chronicle Office, 41, Wellington Street Covent Garden London—Thursday, November 11 (10 A.M.): Bar. 30.2; Temp. 43°; Weather—Sunshine.

PROVINCES.—Wednesday, November 10: Max. 47° Ireland S.W.; Min. 39° Yorkshire.

SALES FOR THE ENSUING WEEK.

TUESDAY—
Nursery Stock at Bury Road Nurseries, Gosport, by order of Executor of Mr. W. Legg, by Protheroe & Morris, at 12.

WEDNESDAY—
Clearance Sale of Nursery Stock at Bullhousen Farm Nurseries, Busley, by order of Mr. H. Street, by Protheroe & Morris, at 12.

THURSDAY—
Herbaceous and Border Plants, at 12. Roses, Palms, and Plants, at 1.30, at 67 & 68, Cheap-side, E.C., by Protheroe & Morris.

Sale of Nursery Stock at Thumbley Nursery, Horn-castle, Lincs., by order of Messrs. W. Crowder & Sons, by Protheroe & Morris, at 12.

FRIDAY—
Imported and Established Orchids, at 67 & 68, Cheap-side, E.C., by Protheroe & Morris, at 12.45.

**The Direct
Absorption
of
Ammonium
Salts by
Plants.**

A question of considerable scientific and also practical importance is discussed by Messrs. Hutchinson and Miller, of the Rothamsted Experiment Station, in a paper which appears in the current number of the *Journal of Agricultural Science*. The question to which Messrs. Hutchinson and Miller contribute a decisive answer, and which has been debated inconclusively during the last 20 years, is—are green plants able to take up nitrogen from the soil in the form of ammonium salts?

It is unquestioned that ammonium salts—sulphate of ammonia, for example—serve to supply plants with nitrogen. But, since nitrifying bacteria are present and active in most soils, and since these organisms change ammonium salts into nitrates, only direct experiment can determine whether the ammonium salts supplied to the soil are first

changed by the agency of these organisms to nitrates or whether salts of ammonium may be absorbed as such by the roots of plants.

General considerations, as well as previous experiments, are in favour of the view that ammonium salts may be absorbed directly. Thus it is well known that the soil under forests is deficient in nitrates, and hence it is assumed that the trees derive their supplies of nitrogen from ammonium compounds formed during the decay of humus.

The experimental grass plots of Rothamsted, manured for many years with ammonium salts, point to a similar conclusion; for the soil of these plots has become distinctly acid, and the nitrifying organisms in consequence much reduced in numbers. Hence it would appear that the nitrogen which the grass is obtaining is that of the ammonium salts of the manure. Inasmuch, however, as the experimental evidence supplied by previous workers is not conclusive, Messrs. Hutchinson and Miller have carried out a series of experiments, admirably planned and conducted, to settle the matter once for all.

The experiments, to be conclusive, must be carried out in soil or sand in which nitrification is precluded, and it is not the least interesting part of their work that the authors named have succeeded in growing various plants, such as Wheat and Peas, in media from which bacteria of all kinds were excluded. The seeds were first sterilised by means of mercuric chloride, they were germinated on sterilised agar, and, when sufficiently advanced, the seedlings were transferred to sterilised culture vessels containing soil, sand, or water, to which either ammonium sulphate or nitrate of soda, or both, was added.

The results prove that in the cases of Wheat and Peas, plants grow just as well when supplied with ammonium salts, under conditions which preclude all possibility of the nitrification of these salts to nitrates, as they do when provided with nitrogen in the form of nitrates.

Incidentally, Messrs. Hutchinson and Miller make an ingenious suggestion to account for the striking fact that leguminous crops are so much richer than others in organic nitrogen. They observe that plants supplied with nitrogen in the form of ammonium salts tend to be richer in nitrogen than those which receive nitrates. They suggest, very plausibly, that this is due to the ammonium salts being converted readily into organic compounds, such as asparagine, which substances will not interfere with further absorption of ammonium salts from the soil. When, on the other hand, nitrates are supplied, they tend to accumulate as such in the tissues of the plant, and a condition of equilibrium between soil and plant-tissues with respect to nitrates being established, further absorption of nitrates is hindered.

Applying these considerations to leguminous plants, they point out that the nitrogen supplied to the plant by the activity of the nodule-organism is probably in the form of an ammonium compound; that, as a matter of fact, asparagine occurs in considerable quantity in the tissues of the root neighbouring on the nodules; and, therefore, there is nothing to hinder the absorption by the plant of as much combined nitrogen as the nodule organism is able to provide.

Lastly, turning to the practical side of the

question, it appears to be fairly well established that not all crops are alike in their preference for a particular form of nitrogen. Potatoes thrive somewhat better when supplied with ammonium salts. Maize and Paddy Rice prefer ammonium salts during their early stage of growth, but later do better with nitrates. Mangolds and Buckwheat give a better yield when supplied with nitrates than when provided with sulphate of ammonia. Mustard, Oats, and Barley are indifferent, growing equally well with nitrates or ammonium salt.

Speaking generally, the best results are obtained when nitrogen is supplied in both forms. This last point deserves to be emphasised, for, as has been shown by Mr. Hall, the continued and exclusive use of one or other of the two chief nitrogen-containing artificial manures, nitrate of soda and sulphate of ammonia, sets up unsatisfactory soil conditions.

We welcome the work of Messrs. Hutchinson and Miller, both because of its intrinsic value and because it is a manifestation of the energetic manner in which soil, and other researches are being conducted at Rothamsted under the able direction of Mr. Hall. We should like to see the investigation extended to embrace the chief garden and field crops, and would suggest that some of the horticultural colleges should carry out the work on the lines so excellently laid down in the paper which we have been considering.

It should be the function of a station such as Rothamsted to deal, as it does, with the broad principles of the sciences of agriculture and horticulture. It should be the function of the smaller institutions to develop in detailed manner the discoveries made at the national station, so that they may yield the maximum of service to those engaged in the practice of agriculture and of horticulture.

OUR SUPPLEMENTARY ILLUSTRATION.—We have pleasure in illustrating a magnificent plant of *Calanthe Dominyi*, from a photograph recently taken in the collection at the Royal Gardens, Kew. *Calanthe Dominyi* was the first hybrid Orchid raised in Europe. It was first recorded by Dr. LINDLEY in the *Gardeners' Chronicle*, 1858, p. 4, in an article which commenced as follows:—"On October 28, 1856, Mr. JAMES VEITCH, Jun., of the Exotic Nursery, Chelsea, brought to the writer of this memorandum a flower of a *Calanthe* which combined the peculiar hairy forked spur and deeply-lobed lip of the white *Calanthe furcata*, with the violet colour and broad middle lobe of the lip of *C. Masuca*. One might have said that the flowers were just intermediate between the two in all respects. A botanist could not have referred the plant either to the one or the other of those two species. Neither on the other hand could he have regarded it as a new species. . . . It appears that it had been raised in the Exeter Nursery by Mr. DOMINY, MESSRS. VEITCH'S indefatigable and very intelligent foreman, between *C. Masuca* and *C. furcata*. The seed obtained in 1854 by crossing those two species was immediately sown, and in two years the seedlings were in flower." *C. furcata* is a white-flowered species allied to *C. veratrifolia*, and *C. Masuca* has mauve-tinted flowers. The flowers of *C. Dominyi* are of a light mauve-purple on a white ground, the flowers varying in tint with age. The plant requires to be grown in a warm rather shady situation, and to be kept moist at the roots throughout the year.

LINNEAN SOCIETY.—The next meeting will be held on Thursday, November 18. Papers will be read by Mr. W. WRSCHÉ on "A New Tipulid Sub family," and Mr. J. W. BROWN on "Fresh-water Rhizopods from the English Lake District."

NATIONAL VEGETABLE SOCIETY.—The committee of this Society, on learning recently of the intention of the Royal Horticultural Society to hold a Vegetable Exhibition next October, entered into correspondence with the Council with a view to holding a joint exhibition. The Council, however, have decided that there are material difficulties in the way of this, seeing that such a show on one of the usual Tuesdays would occupy the entire hall. In declining the proposal, the Council suggested that the National Vegetable Society should hold its exhibition on the date fixed upon, namely, Wednesday, September 23, 1910. The course will now be taken, and there is evidence that the exhibition will be one of importance.

during that long period he has been held in high esteem by gardeners and nurserymen. Many of his pupils are scattered over the British Isles and in the Colonies. A committee has been appointed, with Mr. JAS. WHYTOCK as chairman, and Mr. A. CHALMERS, 6, Melbourne Place, Edinburgh, hon. secretary. It is proposed that the subscription list should close on Tuesday, November 30.

PRESENTATION TO MR. BLACKWELL.—Mr. G. BLACKWELL, who has acted as honorary secretary of the Pitsford and District Horticultural Society since its commencement three years ago, and who is leaving Pitsford, has been presented by the members and friends with a purse of money in recognition of the valuable service he has rendered to the society.

FUMIGATION WITH CYANIDE.—In the course of a comprehensive account of experiments carried out in the Orange plantations of California on fumigation by means of hydrocyanic acid gas,

David Lyall, Jessie de Horne Vaizey, Ramsay Brereton, Helen H. Watson, and others. (The Religious Tract Society.) Price 4jd.—**Preparations for Winter Fumigation for the Citrus White Fly**, by A. W. Morrill and W. W. Yothers. Published by the United States Department of Agriculture, Bureau of Entomology.—**The Gardeners' Companion**, by Selina Randolph. (Mills & Boon, Ltd., 49, Whitecomb Street, London, W.C.) Price 2s.—**The Grapes of New York**, by U. P. Hedrick, assisted by contributors. Pp 564, being vol iii., Part II., of the fifteenth annual report of the State of New York Department of Agriculture. (New York Agricultural Experiment Station.)—**Reports on the Botanic Station, Experiment Plots, and Agricultural Education, Antigua, 1908-9** (Imperial Commissioner of Agriculture for the West Indies) Price 6d.—**Reports on the Botanic Station, Agricultural Instruction and Experiment Plots, Grenada, 1908-9**. (Imperial Commissioner of Agriculture for the West Indies) Price 6d.—**Reports on the Botanic Station, Economic Experiments, and Agricultural Education; also on Agricultural Instruction, St. Kitts-Nevis, 1908-9**. (Imperial Commissioner of Agriculture for the West Indies.) Price 6d.

MR. FRED. W. MOORE, M.A., V.M.H.

MR. F. W. MOORE.

THE Royal University of Ireland has conferred upon Mr. F. W. Moore, Keeper of the Royal Botanic Gardens, Glasnevin, the degree of M.A. *Honoris Causa*, "in consideration of his high scientific position and of the valuable assistance he has given the University for many years in connection with the practical examinations of the University." To those who are acquainted with Mr. Moore's work in the various fields of horticultural science in Ireland this recognition of long and brilliant services will afford great satisfaction. Mr. Moore holds, and has long held, the first position among Irish horticulturists. He has made Glasnevin famous for the richness of its plant collections and the excellence of their culture. Glasnevin now occupying in Ireland the same position as a teaching school of horticulture that Kew fills in England. As Keeper of the Gardens Mr. Moore's claims to respect and admiration are undisputed, and Irish botanists and gardeners are proud of him. It is, however, outside what may be termed the duties of his office that Mr. Moore has won special distinction. For years he has been actively engaged under the Irish Board of Agriculture in the promotion of high-class fruit and vegetable-culture among the farmers of Ireland, and the energy and enthusiasm with which he has pursued this work are familiar to those who have met him at fruit exhibitions and conferences in this country or on tours of inspection of our best fruit farms and nurseries. Ireland has many attractions for horticulturists interested in hardy plants of all kinds, and we are quite within the mark in describing Mr. Moore as an encyclopaedia of Irish gardens and their contents. It has become the rule for visitors to Ireland who are interested in plants to proceed first to Glasnevin in the certain belief that the courteous, genial Keeper will set them on their way rejoicing. If the occasion justifies it, Mr. Moore does not hesitate to personally conduct to the principal places of interest, such visitors as are not merely on pleasure bent, and fortunate is the person or party that he accompanies, for he knows every plant and all that is worth knowing about it. In his love of plants Mr. Moore is more artist and gardener than botanist. A well-grown specimen is his delight, the herbarium specimen having less charm for him. It is owing to this love of healthy living plants that one finds in the Glasnevin Keeper a hearty champion of the practical gardener. He has no patience with what is known as class room gardening. Anyone who has heard Mr. Moore lecture or take part in a

THE IMPORTATION OF POTATOS FROM BRITANNY.—In a note on the shipments of Potatos from St. Malo during the present year. *Le Moniteur du Jardinier* (October 20, 1909) gives the following figures:—During the season 44,000 cartloads of Potatos, representing 50,000 tons (French), were brought into St. Malo. When it is recollected that from practically every one of the innumerable little ports on the coasts of Normandy and Brittany small tramp steamers, or still smaller sailing boats, go out once or twice a week to the English ports, and that during the latter part of the summer their main cargo is Potatos, some idea may be formed of the enormous quantity of Potatos which come to this country from France.

TESTIMONIAL TO MR. JAMES GRIEVE.—It was resolved at a meeting held in Edinburgh on the 2nd inst. that suitable recognition should be made of the Jubilee of Mr. JAMES GRIEVE, Redbraes Nursery, who completes 50 years' connection with the Edinburgh nursery trade this month. Mr. GRIEVE entered the employment of Messrs. DICKSONS & Co. in the year 1859, and

Mr. R. S. WOODBURN describes an improved and simple "fumigation generator," the use of which he strongly recommends. The improvement consists of a hinged cover of stamped copper, which is so corrugated that, when it is in position over the top of the fumigating vessel, the fumes produced by the action of the acid or the cyanide escape, not in an upward direction, but more or less downward. It is claimed that, in consequence, the fumigation is far more complete than when the gas is generated in the ordinary, open vessel. The full report of these experiments, one item only of which we refer to here, should be studied by all interested in fruit culture. (See "Fumigation Investigations in California," U.S. Department of Agriculture *Bulletin* No. 79.)

PUBLICATIONS RECEIVED.—*Journal of the Board of Agriculture* (October). (R. Clay & Sons, Ltd., 7 & 8, Bread Street Hill, Queen Victoria Street, E.C.)—*Cape Colony To-Day*. Issued by the Cape Government Railway Department. (Second series.) Illustrated.—*Everybody's Story Magazine*. No. 1. A monthly magazine containing complete stories by Joseph Hocking,

discussion on any horticultural question could not fail to be impressed by his great knowledge and thoroughness. There is another feature of Mr. Moore's personality which deserves to be mentioned, namely, his geniality. We expect to find this "sunshine of life" in all Irishmen, and in Mr. Moore it is ever present. No one can be dull in his company. A day among the plants with Moore is sure to be both profitable and enjoyable, and an hour or two with him after the day's work is done not only brightens the mind, but it also gives a relish to work and life. Such men are worth a place among those on whom distinctions are conferred, whether it be in the form of an academic degree or in the admiration and affection of their associates and friends. In this respect Moore of Glasnevin occupies a conspicuous position among British and Irish horticulturists.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

APPLE HAMBLEDON DEUX-ANS.—A. D. (see p. 294) classes this variety as one of the old sorts "still widely grown." I have lived within six miles of Hambledon, where this variety originated, and have never once seen a young tree; but I have known many to be chopped down as worthless. In my opinion, the only value this Apple possesses is its long-keeping quality. But what of that? For, when kept, the Apple is comparable to dry wood, either raw or cooked. It is a useless variety, and one that, I think, it would be a mistake to perpetuate. *E. Molyneux.*

ONIONS.—In the *Gardeners' Chronicle* for April 3 last, p. 217, a method of growing Onions for market was described. Being interested in the yield, I have, for comparison, weighed my crop from seed sown in the open on April 2. From 4 rods 9 square yards I have 920 lbs. of good bulbs. The bulbs of Al and Reading Improved average in circumference 10 inches to 12 inches each, which is a useful size. The above weight will compare well with the transplanted bulbs, giving a yield of 200 lbs. per rod, and they are produced with far less expense, as the only labour entailed since sowing has been in weeding and hoeing. *G. H. H. W., Hants.*

ROSE MRS. FLIGHT.—I can endorse all that is said about this Rose in your last two issues. Mrs. Flight was the only Rambler that did any good with me this season. I have about half-a-dozen pillars of it, and it bloomed and grew splendidly; indeed, all the Ramblers have grown well this cold and wet season, but the others shed their buds early in the summer, mostly from chill and mildew, and scarcely had a bloom of any sort upon them. Mrs. F. W. Flight seemed entirely uninfluenced by a season that was too much for the others. It is a wonderfully hardy sort, and is not nearly sufficiently well-known. This place is high and bracing, with an admirable Rose soil, and the failure of the Ramblers, with this notable exception, was a surprise to me; all Roses here failed to open their buds, they were either sealed by the wet or rotted by the rain and cold, yet all have grown wonderfully. Good as I knew Mrs. F. W. Flight to be, it is even better that I thought it. *Robt. Peck Sheldon, Plumwell Grange, Hawkhurst, Kent.*

NATIONAL AURICULA AND PRIMULA SOCIETY.—This Society was established in 1875, and has held an annual exhibition in London every year since that date. The Society consists of 100 members. The Auricula has existed in Great Britain and Ireland for upwards of 300 years. Under proper treatment the plants can be grown easily. It is hoped that many who read this notice may become members of the Auricula Society. The annual subscription is 5s., and entitles members to a ticket for the Auricula Show and for the exhibition of spring flowers held by the Royal Horticultural Society. Further information and schedules of the exhibition may be obtained from Mr. T. E. Henwood, 16, Hamilton Road, Reading. *Florist.*

THE ROYAL BOTANIC SOCIETY'S GARDENS.—It has become a matter of general knowledge that, owing to a variety of circumstances, the position of the Royal Botanic Society has become so precarious as gravely to threaten its continued existence. As a Fellow of the Royal Botanic and Royal Horticultural Societies of many years' standing, and writing with the knowledge and consent of the President and Council of the Royal Horticultural Society (of which Council I have the honour to be a member), I have been surprised to learn that a letter sent by this latter Society to H.S.H. the Duke of Teck, President of the Royal Botanic Society (of which I give a copy below), has not been communicated to the Council and Fellows of the Botanic, though I believe H.S.H. the Duke intended it should be. The President and Council of the Royal Horticultural Society feel that, should the Regent's Park gardens come to an end, it would be little short of a calamity both to the great gardening interests of the kingdom and to the pleasure and enjoyment of the inhabitants of the metropolis and its visitors.

I am authorised to say that the President and Council of the Royal Horticultural Society are most anxious, if possible, to come to such an arrangement with the Royal Botanic as may ensure the continuance of the Regent's Park gardens for the future.

I am, Sir, faithfully yours,

HARRY J. VEITCH.

Royal Horticultural Society,
Vincent Square, Westminster, S.W.,
November 9.

Royal Horticultural Society,
Vincent Square, Westminster, S.W.,
October 15, 1909.

To his Serene Highness the Duke of Teck, G.C.V.O.—Sir.—The President and Council of this Society desire me to address your Serene Highness, as President of the Royal Botanic Society, in regard to the present position of that Society. They have been given to understand by reports and other statements appearing in the public Press, as well as by letters and other private communications, that there is serious danger of the gardens in Regent's Park reverting to the Department of Woods and Forests owing to financial difficulties. Should this be so, and should the Royal Botanic cease to occupy these gardens, the President and Council of this Society consider that it would be a real misfortune not only to the Fellows, but especially to the very important interests of British horticulture, and to the people in London.

Under these seemingly urgent circumstances, the Council of the Royal Horticultural Society desire me to say that, should the Royal Botanic Society wish it, they are prepared to appoint a committee of their body to meet a committee of the Council of the Royal Botanic Society to consider and discuss any proposals which may be made, with an earnest desire to help in securing, if possible, the preservation of the Regent's Park gardens for horticultural uses.

I have the honour to be your Serene Highness's obedient servant.

W. WILKS,

Secretary Royal Horticultural Society.

THE HARDINESS OF NICOTIANA (see p. 298).—On the 30th ult. we experienced 10° of frost at the Roath Park, Cardiff, and plants of *Nicotiana Sanderae* planted on a south-west border have escaped undamaged. We have just destroyed plants that have been in the open ground since the summer of 1908. The stems were destroyed by the frosts of last winter, but the plants grew again on the return of summer. The roots did not receive any extra protection, neither did they occupy the best of positions in respect to drainage and lightness of soil. *W. R.*

RICINUS COMMUNIS.—During the summer of 1908 we planted in an outdoor situation established plants of *Ricinus* which had been raised in a warm greenhouse. The plants flowered and produced seed; the seed was not gathered, but it dropped on the ground beneath the parent plants. This year several seedlings appeared, the seeds having withstood the low temperatures of last winter. This proves that these plants will grow in a much lower temperature than is usually afforded them. *F., Roath Park, Cardiff.*

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 9.—The weather on Tuesday last was beautifully fine, and there was a good display of flowers, fruits, and vegetables at the meeting held in the Society's Hall. A big group of Messrs. Veitch's hybrid Begonias, shown by Baron Schröder, provided a brilliant display of colour just inside the entrance; whilst on the other side of the doorway was a showy group of *Codiaeums*. At the platform end of the Hall a magnificent group of Ferns was shown by Messrs. J. Hill & Son, and another remarkable exhibit of these plants was seen in a collection of *Nephrolepis* from Messrs. H. B. May & Sons' nursery. Many pretty exhibits of Carnations and *Chrysanthemums* were staged. The Floral Committee conferred three Awards to new plants, including one First-class Certificate and two Awards of Merit.

Exhibits of Orchids were not so numerous as usual, although there were several good groups. The Orchid Committee granted two Awards of Merit.

The Fruit and Vegetable Committee had several important groups of fruits and vegetables to consider, and there was some excellent produce in the competitive classes for Potatoes and Onions.

At the 3 o'clock meeting in the Lecture Room a discourse on "Some Beautiful Shrubs" was delivered by Mr. Edwin Beckett, V.M.H.

Floral Committee.

Present: W. Marshall, Esq. (in the Chair), and Messrs. Chas. T. Drury, Henry B. May, John Green, G. Reuthe, Jas. Douglas, W. J. Bean, Wm. Howe, E. A. Bowles, Chas. Dixon, H. J. Jones, F. Page Roberts (Rev.), Chas. E. Shea, Chas. E. Pearson, Herbert J. Cutbush, Ed. Mawley, W. P. Thomson, E. H. Jenkins, W. J. James, E. T. Cook, Arthur Turner, James Walker, J. F. McLeod, J. Jennings, R. C. Notcutt, C. R. Fielder, and Chas. Blick.

A large floor group of flowering and foliage plants, similar to groups often seen at flower shows, was exhibited by E. H. Brown, Esq., Roehampton, Surrey (gr. Mr. R. Bradford). The exhibit was arranged as an oblong. A tall and choice specimen of *Kentia Belmoreana* dominated the back, and this was grouped about with Japanese *Chrysanthemums*, with two similar but smaller groups, one on either side. In the general body of the group were well-coloured *Cordylines*, *Codiaeums*, *Abutilons*, *Pegonias*, single-flowering *Chrysanthemums*, *Cyclamens*, *Primulas*, *Richardias*, and other flowering plants. (Silver-gilt Banksian Medal.)

Baron Schröder, Englefield Green, Egham (gr. Mr. Ballantyne), showed a large number of well-grown plants of winter-flowering *Begonias*. At the back were finely-flowered specimens of the variety Mrs. Heal, and others shown were *Success*, *Ensign*, *Elatior*, and *Winter Perfection*. The front row was composed of large, well-flowered plants of *Begonia Gloire de Lorraine*, and at either end could be seen the white-flowered variety Turnford Hall. (Silver-gilt Banksian Medal.)

Lord Hillingdon, Uxbridge (gr. Mr. A. R. Allan), showed a batch of Carnations of the Princess of Wales variety, interspersed with *Cocos Palms* and *Grevillea robusta*, with an edging of *Asplenium bulbiferum*. In the back of the group was a fine plant of *Lilium nepalense* carrying several of the yellow and chocolate-coloured flowers. The group was attractively staged, and the plants were well cultivated. (Silver Banksian Medal.)

A batch of plants of seedling *Gesneras* was shown by Adeline Duchess of Bedford, Rickmansworth (gr. Mr. J. Dickson). The plants bore fine inflorescences, but the colour was restricted to orange shades. (Bronze Flora Medal.)

An imposing exhibit of Ferns was displayed by Messrs. J. Hill & Son, Barrowfield Nurseries, Lower Edmonton. The group extended the whole width of the building at the end opposite the clock. It was remarkable for the great number of large specimen plants, and embraced 200 varieties and species. Some of the more remarkable plants were *Acrostichum viscosum*, *Davallia polyantha*, a large, fine specimen; *D. fijiensis elegans*, *Platycerium grande*, *Asplenium caudatum*, *Adiantum Hendersonii*, a rare

species; *Brainea insignis*, with coloured fronds; *Lomaria L'Herminieri*, some of the fronds being tinted red; *Nephrolepis exaltata superba*, a large plant with much crested fronds; *Polypodium inodes*, *P. giganteum*, and of tree Ferns, *Asplenium armatum*, *Dicksonia* (syn. *Cibotium*) *Schiedei*, *D. squarrosa*, and *Cyathea insignis*, a very elegant species. Of *Selaginellas*, the new *S. emiliana aurea* and *S. caulescens* were handsome. (Gold Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, showed a handsome exhibit of *Nephrolepis* in about 48 species and varieties. The elegant varieties of *Nephrolepis exaltata* were represented by such fine sorts as *N. e. Amerpohlii*, *N. e. Whitmanii*, *N. e. superbissima*, with much crested fronds, the pinnae being very broad; *N. e. elegantissima*, and *N. e. Pieronii*. Others noted were *N. rufescens* var. *Mayi*, with upright-growing fronds; *N. Duffii*, *N. pectinata concinna*, *N. ensifolia*, with long plume-like fronds, but not crested; and *N. acuta*. At one end of the exhibit was a batch of plants of the new *N. e. Marshallii*, which received a First-class Certificate. (Silver-gilt Flora Medal.)

Mr. W. H. PAGE, Nurseryman, Hampton, made a very fine exhibit of Carnations, the display being one of the brightest in the hall. Mr. PAGE cultivates these popular flowers with great skill, and the blooms on this occasion were of his usual high quality. There were many plants and vases of blooms of a new variety named *May Day* (see fig. 142, p. 323), with pale pink flowers of regular shape. Others shown well were *Beacon*, Mrs. T. W. Lawson, Mrs. Chas. Knoph, a shade deeper in colour than Mrs. Lawson; *Pink Delight*, *Beacon*, *White Enchantress*, and *Governor Roosevelt*. (Silver Flora Medal.)

Messrs. H. CUTBUSH & SONS, Highgate, London, N., showed an attractive exhibit of Carnations. All the popular kinds were presented in large bunches, including fine blooms of Mrs. T. W. Lawson, *Winsor*, *White Enchantress*, *Robert Craig*, *The President*, *Enchantress*, *Mikado*, *Victory*, and *Rose Dore*. Besides Carnations, this firm exhibited hardy flowering plants and berried shrubs. We noticed pans of *Iris alata* with light-blue flowers and *I. Vartanii* with pale opal-blue blooms. *Aconitum septentrionale* is a late-flowering species with bluish-tinted flowers. (Silver Banksian Medal.)

Messrs. STUART LOW & CO., Bush Hill Park, Enfield, displayed a number of vases of Carnations of the perpetual-blooming type. Especially good were those labelled *Royal Purple*, *Winnona*, Mrs. Crook (a seedling), *Rose Pink Enchantress*, *Rival* and *Britannia*. The group contained many seedling varieties raised at Bush Hill Park.

Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, showed small, pot plants of single and decorative *Chrysanthemums* as a table exhibit, and an imposing batch of *Codiaeums* (*Crotons*) as a floor group. The *Chrysanthemums* were splendid examples of good culture, each small pot containing a dwarf plant with numerous well-developed blooms. There were 26 varieties of the single type and six of the decorative kinds. The most attractive were (single) *Alice Crate* (rosy-pink), *Atair* (white, starry florets), *Bronze Edith Pagram*, *Ermouth* (yellow), *Lillie Godfrey* (blush), *Miss Olive Prater* (white), *Snowstorm* (white), and (decorative) *Caprice du Printemps*, *Kathleen Thompson*, and *White Cap*. The *Codiaeums* were splendidly grown, each specimen being furnished with well-coloured foliage to the base of the stem. The collection embraced no fewer than 40 varieties, with broad, narrow or spirally-twisted foliage. Especially fine were the varieties *elegantissima*, *B. Conte*, *Emperor Alexander III.*, *Warrenii*, *Hawkeri*, *Perfection*, and *Queen Victoria*. (Silver-gilt Flora Medal.)

Messrs. JOHN PEED & SONS, Nurseryman, Norwood, displayed several new varieties of single-flowered *Chrysanthemums* and a few blooms of large Japanese kinds. *Carrie Fowles* is a pretty white single variety; *Alfred Aylett* is a dark red flower of this type. Amongst the Japanese blooms we noticed *White Queen*, *Hon. Mrs. Lopes* (a remarkably fine yellow flower), *Purity* (white), and *Francis Jolliffe* (yellow).

Messrs. H. CANNELL & SONS, Swanley, Kent, showed decorative and single *Chrysanthemums*. The blooms were displayed rather formally in triangular bunches on wire stands. Very pretty were those labelled *Honeysuckle* (an appropriate name for the variety), *Gaiety* (pale terra-cotta), *Gertrude* (white), *Red Start*, Mrs. G. Bates,

Mignonette (a curious head of thread-like, yellow florets), and *Foxhunter*. A vase of the tiny-flowered *Pompon* named *Baby* was interesting; the flowers being very miniature. (Bronze Flora Medal.)

A large exhibit of single-flowered *Chrysanthemums* was shown by Sir D. GOOCH, Bart., Chelmsford (gr. Mr. D. Wilkinson). The varieties embraced most of those in cultivation, the most attractive being *Altrincham Yellow*, *Lady Inchiquin* (reddish), *Roupeil Beauty*, *Mary Richardson*, *Edith Pagram*, *White Pagram*, *Miss M. Bird* (yellow), *J. Stephenson* (pink), and *Hilda Lawrence* (Bronze Flora Medal.)

Messrs. W. WELLS & CO., LTD., Merstham, Surrey, staged a group of decorative and single *Chrysanthemums*. A new variety named *Hilda Kathleen*, of the decorative type, has Indian red florets with silver on the reverse side. The new bronze-coloured *Phosphorescens* was noticed, and other desirable varieties seen were Mrs. *Buckbee* (white), *Miss Alice Finch* (vinous red), *Innocence* (white, single), and *Dora Hercombe* (pink, single).

R. BARCLAY, Esq., Bury Hill, Dorking (gr. Mr. W. Graysmark), showed numerous seedling *Chrysanthemums* of the single-flowered type. Collectively they formed a very pretty exhibit. Some of the finer were *Iris* (white), *Miss Iris Kingsley* (rose-pink), and Mrs. J. Turner (rose-pink).

Messrs. BARR & SONS, King Street, Covent Garden, showed a small group of bulbous plants, principally species of *Crocus*. There were also plants of *Nerine corusea major*, *N. Fothergillii* major, and *N. flexuosa alba*, well in flower.

Mr. L. R. RUSSELL, Richmond, Surrey, showed a group of berried plants, with variegated-leaved *Iries*, *Eurya latifolia*, and *Eleagnus aurea marginata* interspersed. Tiny plants of *Aucuba* and *Skimmia* were abundantly berried.

AWARDS.

FIRST-CLASS CERTIFICATE.

Nephrolepis exaltata var. *Marshallii*.—A stoloniferous sport from *N. e. Amerpohlii*, with much finer divided, more densely plumed, and broader fronds than any of the plumose varieties of *N. exaltata*. Some of the fronds were 14 inches across, and one of the largest specimens shown had a spread of leaves about 3 feet. Each frond was like a dense cushion of soft moss. Shown by Messrs. H. B. MAY & SONS.

AWARDS OF MERIT.

Begonia The Gem.—The latest and best of the hybrids raised by Messrs. JAS. VEITCH & SONS, who were the exhibitors. The parents were *B. socotrana* and a semi-double-flowered, deep-rose-coloured, tuberous-rooted variety. The blooms are semi-double and of deep carmine-rose shade, about the size of those of *Winter Cheer*. The plant carried a branched inflorescence, some of the blossoms having been open for three weeks.

Chrysanthemum Lingwood's Pride.—A large, pale-pink, single-flowered variety, with a bright-yellow eye. Raised in the gardens of G. RIDGEN, Esq., Inglefield Green, and shown in Messrs. J. PEED & SONS' group.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. sec.), Sir Jeremiah Colman, Bart., de B. Crawshay, H. Little, W. Boxall, J. F. Meock, R. G. Thwaites, F. J. Hanbury, A. A. McBean, W. Cobb, W. H. Hatcher, J. Cypher, A. Dye, C. H. Curtis, H. G. Alexander, H. A. Tracy, Gurney Wilson, Wilson Potter, and R. Brooman-White.

His Grace the Duke of MALLBOROUGH, Blenheim, Woodstock (gr. Mr. Hunter), was awarded a Silver Flora Medal for a fine group of upwards of 50 excellently-grown plants of *Vanda corulea*, well furnished with stout spikes of blue flowers. Arranged with them were a good lot of orange-scarlet *Epidendrum vitellinum*, the brown and yellow *Oncidium prae-textum* and *O. Forbesii*, the whole tastefully arranged with graceful Ferns, &c. *Cypripedium Troilus* var. *Lord Nelson*, a very fine flower, was also in the group.

E. POGGERSON, Esq., Oakdene, West Didsbury, Manchester (gr. Mr. W. C. Price), was awarded a Silver Banksian Medal for a good and varied group of *Cypripediums* containing many choice varieties. The novelties in the group were *C. Hitchinsii* Oakdene variety, a large form with fine, white, dorsal sepal with spotted lines of deep

rose, and certainly one of the best of its class; *C. Arthurianum pulchellum* Oakdene variety, the colouring of which resembles that of a good *C. Thalia*; and *C. E. C. Rogerson*, a very distinct flower, with the upper part of the dorsal sepal white, the middle area, magenta rose, and the base, of a peculiar shade of green. The petals and lip are yellowish, tinged with purple.

Lieut. Col. G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander), showed a selection of fine hybrid *Orchids*, including *Cypripedium Niobe-Leaeanum*, with white dorsal sepal, having feathered lines of rose-purple, the petals and lips yellow, tinged with mahogany brown; *C. Dante magnificum* (*Euryades* × *Charlesworthii*), with white dorsal sepal coloured claret-purple at the base and with similarly-coloured blotches above; *C. Rossetti magnificum*, a good yellow flower with emerald-green lines on the dorsal sepal; *C. Darius* (*Charlesworthii* × Mrs. Mostyn), having all the fine colouring of *C. Mrs. Mostyn*, but in a larger and better flower; and *Laelio-Cattleya Coruma Westonbirt* variety (see Awards).

Sir JEREMIAH COLMAN, Bart., Gattin Park, Surrey (gr. Mr. Collier), staged a small group containing several of his new *Cattleya* *Portia corulea* (*Bowringiana lilacina* × *labiata corulea*) of a delicate lavender tint with slate-blue front to the lip; the pretty purple-spotted *Brasso-Cattleya Mary*, *Cirrhopetalum cornutum*, and *Dendrobium ericiferum*.

H. S. GOOSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), showed *Brasso-Laelio-Cattleya* *Tring Park* hybrid (*B. Digbyana* × *L. C. callistoglossa*), a pretty white flower tinted with rosy lilac, first shown by the Hon. Walter Rothschild in 1904; also *Sophro-Cattleya Doris*.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed *Cypripedium* *The Emperor* (*Beckmannii* × *Sallieri*), a large yellow flower with much of the spotting of *C. Sallieri*; *C. Fulshawense giganteum*, and *C. elatior pulchellum*, a pretty flower of fine shape, and differing from the others previously shown.

Messrs. CHARLESWORTH & CO., Haywards Heath, staged a fine group, in which both the hybrids and species were equally well represented and for which a Silver Flora Medal was awarded. The centre was of *Laelio-Cattleya luminosa*, and other *Laelio-Cattleyas*, in front of which were *Epidendrum vitellinum* and various *Odontoglossums*, including a finely-spotted *O. nebulosum* and some very promising blotched *O. crispum* raised from seed. On one side a number of *Cattleya Phrygia* (*Enid* × *Portia*) were very effective; *Sophro-Laelio-Cattleya Marathon*, a rich piece of orange-red colour; *Sophro-Cattleya Eros*, of a deep claret red; and *Odontoglossum arduisissimum xanthodes*, one of the best white *Odontoglossums*. Others noted were *Cirrhopetalum Mastersianum*, several *Bulbophyllums*, *Codogone Veitchiana* (with an elegant spray of white flowers), *Stenoglossum longifolia*, and a good selection of *Cypripediums*.

Messrs. STUART LOW & CO., Bush Hill Park Nurseries, Enfield, were awarded a Silver Banksian Medal for an excellent group, in the centre of which were two good, white *Cattleya labiata*, the variety *Louise* having a violet blotch on the lip like *C. L. Cooksoniae*, the other having the lip of a lighter tint. Behind them were a fine specimen of *C. Bowringiana*, good *C. Hardyana*, and on each side *Cypripediums* and various interesting and pretty species, including *Pleurothallis corymbosa*, *Imopsis paniculata*, *Physosiphon Loddigesii*, *Lanum Berkleyi*, and various *Masdevallias*, *Dendrobiums*, &c.

Messrs. J. CYRIL & SONS, Cheltenham, were awarded a Silver Banksian Medal for a group of *Cypripediums*, which included a selection of the yellow and other forms of *C. insignis*; *C. Mauds Young's* variety, *C. Mines Veitchii*, varieties of *C. Actonis*, *C. Titans superba*, and *C. triumphans*, both of very dark colour; *C. Mandia*, a selection of distinct forms of *C. Fairricanum*, one very dark variety being specially fine; and among the forms of *C. aureum* the variety *giganteum* was a noble flower.

Mr. E. V. LOW, Orchid Nursery, Vale Bridge, Haywards Heath, was awarded a Silver Banksian Medal for a group, in which were several white forms of *Cattleya labiata*, the *C. labiata alba Laura* being of pure white, with only a shade of sulphur yellow in the tube of the lip. *C. L. Reedleyensis*, *C. L. Anestana*, *C. L. Ulysses*, and *C. L. Kronera*, the last named having a lavender blue tint, were also included; and

Dendrobium Phalenopsis alba, D. P. Phyllis Moore, *Odontoglossum Uro-Skinneri album*, *Oncidium incurvum album*, and several good *Cypripediums*, &c., were also noted.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), sent a fine plant of the original *Cypripedium Troilus* (insigne *Sanderæ* × *nitens* Hyeannm) with three large blooms.

Monsieur MERTENS, Ghent, showed a small selection of hybrid *Odontoglossums*.

R. BROOMAN-WHITE, Esq., Arddarroch, Garelochhead, N.B., showed a number of fine spikes of *Odontoglossum crispum*, all of the very best type, and varying from pure white to rose and lilac-tinted, some being blotched varieties.

G. P. WALKER, Esq., Heatherfield, Putney (gr. Mr. McGregor), sent *Odontoglossum Jasper* (*amabile* × *crispum* roseum), a prettily-spotted flower tinged with rose on the outer parts of the segments.

AWARDS.

AWARDS OF MERIT.

Lælio-Cattleya Corona Westonbirt variety, from Lieut.-Col. G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander).—A very fine hybrid of dwarf habit, known to have been obtained from L.-C. Ingram as the seed parent, though the male parent is unknown, the record having been lost. It may have been *Cattleya Hardyana*. The flowers are of good size and shape, the sepals and petals of a bright magenta rose, the lip glowing ruby-crimson with golden lines from the base.

Lælio-Cattleya Baroness Schroder var. Mme. Henriette, from Monsieur le Comte JOSEPH DE HEMPTINNE, St. Denis Westrem, Ghent, Belgium.—It was raised between a fine *Lælio Jongheana* and *Cattleya Triane*, probably of the *Backhousiana* section. The sepals and petals are bright rose, veined with purple, and the petals bear a distinct purple feather up the middle. The lip is orange-yellow with a ruby-purple blotch on the front lobe. In colour it is the best of the cross which has appeared.

Fruit and Vegetable Committee.

Present: G. Buryard, Esq. (in the Chair); and Messrs. J. Cheal, C. G. A. Nix, P. D. Luckett, E. Beckett, H. Parr, W. Bates, A. Dean, J. Gibson, W. J. Jeffries, W. Pope, A. R. Allan, G. Hobday, J. Davis, G. Reynolds, W. H. Divers, G. Wythes, C. Foster, W. Poupert, J. Vert, H. Hooper and H. Markham.

Messrs. SUTTON & SONS, Reading, sent cooked tubers of their yellow-fleshed Potatoes Golden Ball, Golden Nugget, Golden Perfection, and Golden Star. All the varieties seemed to need longer keeping to mature: the best were Golden Nugget and Golden Perfection.

A Cultural Commendation was given to Mr. Hatch (gr. to A. B. H. GOLDSMIDT, Esq., Cavenham Park, Suffolk) for a choice dish of Veitch's Climbing French Bean.

Messrs. J. VEITCH & SONS, Chelsea, sent fruiting branches of their autumn Raspberry Queen Alexandra, to show its late cropping qualities. Messrs. J. VEITCH & SONS also staged a collection of 25 dishes of Pears grown at Tours, in France, the exhibit including several varieties not generally known in this country. Four of these were tasted by the committee: the varieties Beurré Six having soft, delicious flesh, and Beurré Cadélin having also delicious juicy flesh and rich flavour, were the best. Besides those named, there were fine examples of *Triomphe de Jodoigne*, *Triomphe de Touraine*, *Souvenir de Jules Guindon*, *Charles Ernest*, *President Dronard*, *Tardive de Solesme*, *Beurré Bachelier*, *Le Lectier*, and others. (Silver Hog Medal.)

W. VOSS, Esq., Eastwood Park, Essex, showed a collection of Apples and Pears. The best Apples were Lord Derby, Lemon Russet, Mère de Ménage, Warner's King, Scarlet Pearmain, The Queen, Duke of Devonshire, and Court pendu-plat. The best of the Pears were Beurré Hardy, Beurré Bachelier, Doyenné Boussoch, Louise Bonne de Jersey, and Pitnaston Duchess. (Silver Banksian Medal.)

The Duke of Rutland, Belvoir Castle, Grant-ham (gr. Mr. W. H. Divers), showed a collection of 42 dishes of Pears, a very meritorious exhibit, having regard to the district and the season. Easter Beurré, Duchess d'Angoulême, Beurré Fouqueray, Charles Ernest, Beurré de Jonghe, Emile d'Heyst, Beurré Superfin,

Doyenné du Comice, Durondeau, St. Luke, Beurré Clairgeau, Le Lectier, Mme. Treyve, and Beurré d'Anjou, were shown in creditable specimens. (Silver-gilt Knightian Medals.)

Messrs. FELTON & SONS, Hanover Square, London, sent two very fine Orange trees, one a dense, heavily-fruited, pyramid-trained specimen, the other a standard. Both were in 10-inch pots, and from 6 feet to 7 feet in height. They were 12 years old, and had been grown from pips sown in a pot. The pyramid plant was laden with fine fruits, and was a magnificent healthy specimen. (Cultural Commendation.)

Vegetables.—Messrs. JAS. VEITCH & SONS staged a representative collection of vegetables, in all some 50 dishes. The exhibit included good Onions of Ailsa Craig, Main Crop, Selected Globe and Blood Red varieties. Cauliflower Autumn Giant; Lyon Leeks; Potatoes Bury Hill Seedling, Crimson Beauty, Ruby Queen, and Snowdrift; Turnips Red Globe and Snowball; capital Mushrooms; Carrots Model and Early Nantes; Beets Blood Red, Dewars and Middleton Park; also Parsnips, Brussels Sprouts, Endive, Celery, Chicory, Shallots, and various other kinds. (Silver Knightian Medal.)

Messrs. SUTTON & SONS, Reading, staged a superb collection of Onions, including 31 varieties. It was one of the finest collections of this vegetable staged at any exhibition. The varieties embraced Ailsa Craig, Cocoon Selected, Perfection, with fine smooth "necks"; Bedfordshire Champion, Exhibition, A1, Giant Rocca, The Sutton Globe, Nuneham Park, Trebour, Danvers Yellow, Long Keeper, Magnum Bonum, Improved Reading and White Silver Globe. Also of coloured varieties Crimson Globe, Red Rocca, and Globe Tripoli. With the exception of one dish of Ailsa Craig variety, all were pulled from the open ground, being raised from seeds sown in the middle of March. (Silver-gilt Knightian Medal.)

COMPETITIVE CLASSES.

Potatoes.—In the class for 12 dishes of Potatoes, distinct, there were three exhibits. A superb collection, staged by the Duke of PORTLAND, Welbeck Abbey (gr. Mr. J. Gibson), was of the highest quality; they were all of best size and shape, being clean and bright. The varieties were White City, Superlative, Supreme, Windsor Castle, Ideal, Abundance, Gladiator, Ninetyfold, Epicure, Reliance, King Edward VII., and Mr. Bresse.

Countess COWPER, Panshanger, Herts. (gr. Mr. A. Staward), was placed 2nd, having choice samples of Gold Mine, Triumph, and Dalmeny Hero, Crimson Beauty and Yeoman.

In the class for six dishes of Potatoes there was only one entry, the exhibitor being Mrs. DAVISON, Berkhamsted (gr. Mr. A. J. Castle). His white varieties were Royalty, Long Keeper, Snowball and Goldfinder; and coloured, King Edward VII. and Queen of the Veldt. The 1st prize was awarded.

There was also one exhibit in the class open to trade growers for 18 dishes. It was shown by Messrs. JAS. CARTER & Co., Holborn, and included excellent tubers of Royalty, Long Keeper, Goldfinder, Monarch, Early Favourite, Factor and Snowball, King Edward VII., Mr. Bresse, Red Emperor, and Invicta, the last four being coloured varieties. The 1st prize, a Silver-gilt Knightian Medal, was awarded.

Onions.—The class for six varieties brought four collections. The Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), was well first, having fine, well-finished, clean samples, including Sutton's Selected Long, Ailsa Craig, Magnum Bonum, Sutton's Globe, and Improved Reading. Mr. C. HATCH was placed 2nd, having large, heavy bulbs, but they were somewhat spotted. These comprised Main Crop, Exhibition, The Globe, Red Rocca, Ailsa Craig, and Cranston's Excelsior.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.

OCTOBER 30.—The annual meeting was held in the Music Hall Buildings, Aberdeen, on the above date. There was a good attendance, and Mr. J. G. Burnett, of Powis, chairman of directors, occupied the chair.

The chairman submitted the annual report and financial statement of accounts, which showed that the income for the year amounted to £390

5s. 11d., and the expenditure to £456 4s. 9d., showing a deficit of £65 18s. 10d., the debit balance to be carried forward to next year being £34 2s. 9d. The annual exhibition of the society held in August last was, from a horticultural point of view, an exceedingly good one, and the financial result was due to bad weather on the last day of the show. The membership of the society unfortunately continued to show a slight decrease. The report was adopted.

A communication was read from Mr. George Hendry, secretary of the Aberdeen and North of Scotland College of Agriculture, intimating that a course of lectures on the elementary chemistry of the garden was to be given by Mr. James Hendrick, B.Sc., F.I.C., lecturer on agricultural chemistry in the college, commencing on Thursday, November 25, and that a course of lectures was also to be given by Mr. William Dawson, B.Sc., lecturer on forestry, commencing on Wednesday, November 10. After a discussion concerning the date of next season's show, the meeting proceeded to the election of officers.

ASCOT HORTICULTURAL.

NOVEMBER 2, 3.—The 24th exhibition of Chrysanthemums and other flowers, fruits and vegetables was held in the Grand Stand, Ascot. The President, Sir Edwin Durning-Lawrence, Bart., was the chief prize-winner.

In the class for a group of Chrysanthemums, arranged with suitable foliage, the 1st prize was won by Sir EDWIN DURNING-LAWRENCE, Bart. (gr. Mr. W. Lane); 2nd, Sir ARTHUR C. LUCAS, Heatherwood, Ascot (gr. Mr. W. Sargent).

Sir E. DURNING-LAWRENCE won the 1st prize for a group of Chrysanthemums with a well-arranged exhibit; 2nd, E. IVESON, Esq., The Charters, Sunningdale (gr. Mr. F. Capp).

For a group of non-disbudded plants of Chrysanthemums, Mr. IVESON was awarded the 1st prize; 2nd, Sir A. C. LUCAS.

The best exhibit of miscellaneous plants was shown by Sir E. DURNING-LAWRENCE, who staged a very pretty group, which included Orchids, Begonias and Crotons; Sir A. C. LUCAS followed closely.

The best collection of six table plants were shown by Sir E. DURNING-LAWRENCE; 2nd, Mrs. CHRISTIE BELSTON, Windlesham, Surrey; and the best six Zonal Pelargoniums by Sir A. C. LUCAS, in a strong competition.

CUT BLOOMS.

The class for 18 Japanese blooms, distinct, was open to all. The 1st prize was made in favour of C. A. PEARSON, Esq., Frensham Place, Farnham (gr. Mr. C. Moore), who had fresh, large flowers, of Mrs. C. Penford, W. F. Lever, Mr. F. Prior, Mrs. W. Knox, Marquise V. Venosta, Reg. Vallis (grand), J. H. Silsbury, V. W. Watson, Miss D. Oliver, Miss L. Thorne, The Lyon, Mrs. A. T. Miller, G. Mileham (1908)—the premier bloom in the show, Mrs. N. Davis, C. H. Broomhead, W. Beadle and White Venosta; 2nd, Mrs. LANGWORTHY, Holy Port, Maidenhead (gr. Mr. T. W. Broome).

The best exhibit of 18 Incurved blooms, distinct, was shown by Mrs. CHRISTIE, who was also awarded the 1st prize in the class for 18 Incurved and 18 Japanese blooms, distinct, being the only exhibitor.

C. H. AUSTIN, Esq., Englefield Green (gr. Mr. H. G. Worsfield), excelled in the class for 12 Japanese blooms, distinct, and Mrs. LANGWORTHY won the 1st prize for six blooms of one variety with perfect specimens of Romance.

Sir E. DURNING-LAWRENCE showed the best two bunches of Muscat of Alexandria Grapes, whilst the best two bunches of Black Grapes were shown by Mr. C. COOPER, Summinghill.

E. IVESON, Esq., had the best Pears, Mr. IVESON the best four dishes of cooking Apples, and Hon. Mrs. HILL the best dessert Apples.

Exhibits of vegetables were numerous and good, Mr. W. LANE, the president's gardener, showing excellent produce.

CHELTENHAM ROOT FRUIT AND CHRYSANTHEMUM.

NOVEMBER 3.—The annual show of this society was held at Cheltenham on this date. As a whole the show was not quite up to the average of these exhibitions. Chrysanthemums generally were not sufficiently developed to be

shown in perfect condition, and while some exhibitors were able to stage a number of beautiful cut blooms, the majority would have done better if the show had been held a fortnight later. Among the plants for table decorations were several fine specimens of Nerine from the gardens of Mr. H. J. ELWES, Colesborne, Cheltenham.

The 1st prize-winners in the Chrysanthemum classes included MESSRS. G. W. BENNETT, H. ANDREWS, E. ADLAND, H. W. RESTALL, H. J. TILLEY, WINSTONE & CO., MRS. RATCLIFF, MISS ADA DAVIS, and Miss G. HOLDER.

Carnations were best shown by MESSRS. H. ANDREWS and E. T. LEIGHTON, and plants by Mr. H. ANDREWS, MRS. RATCLIFF, and MESSRS. H. O. LORD and F. TAYLOR.

A silver cup, offered by the Mayor and Corporation of Cheltenham for six varieties of Japanese Chrysanthemums in the open classes, was won by Mr. H. G. BENNETT, Royd House, the previous holder being Mr. Mayo. A cup, given by Mr. J. Simmons for the best dish of dessert Apples, was awarded to Major SELWYN PAYNE, Badgeworth; and a special money prize for the best Chrysanthemum plant in the show, given by Alderman Skillicome, to Mr. G. J. MAYO. The certificate of the National Chrysanthemum Society was awarded to Mr. FAIRFAX RHODES for a vase of white Japanese Chrysanthemums. He showed the variety Mrs. Miller. A certificate went to Mr. HUGH ANDREWS, Cheltenham, for a collection of cut blooms.

WARGRAVE & DISTRICT GARDENERS.

NOVEMBER 3.—For the eighth time, the annual flower, fruit and vegetable show organised by the Wargrave and District Gardeners' Association was held in the Woodclyffe Hall, on the above date, in aid of the gardening charities. This year the proceeds are to be given to the Royal Gardeners' Orphan Fund. The exhibition was non-competitive. There were not so many Chrysanthemums as usual, and the attendance was not so large as could have been wished, owing to counter attractions in the neighbourhood. Exhibits were staged by those following:—A. E. HUGGINS, Esq., Wargrave Hill (gr. Mr. D. Turner); C. J. D. EVELEIGH, Esq., Wilminster Park (gr. Mr. J. T. Blencowe); S. C. DAVIS, Esq., Ramenham Hill (gr. Mr. T. Tunbridge); A. B. GILL, Esq., The Willows (gr. Mr. W. Pope); Mrs. NOBLE, Park Place (gr. Mr. T. Powell); G. STANTON, Esq., Upper Culham; J. W. RHODES, Esq., Hennerton (gr. Mr. T. Haskett); Mrs. TUCKETT, Yeldhall Manor (gr. Mr. Wm. George); C. S. HENRY, Esq., M.P., Parkwood (gr. Mr. C. Anderson); Capt. COLERIDGE, Twyford (gr. Mr. W. H. Scott); the Rev. H. M. WELLS, Scarletts Park (gr. Mr. J. Botley); F. W. NICHOLSON, Esq., The Old Vicarage, Shiplake (gr. Mr. J. Shipley); and Mr. WM. BAZETLEY, The Twyford Nurseries.

DONCASTER CHRYSANTHEMUM.

NOVEMBER 3.—The 17th annual exhibition held on this date was equal to those that have preceded it. The entries were about an average number, and the attendance was satisfactory.

The stages were well filled with excellent produce, but the centre of the spacious hall would certainly allow of larger and better grouping effects.

The exhibits in the class for a group of Chrysanthemums, interspersed with foliage plants, showed a remarkable lack of artistic arrangement, for instead of a free and easy natural display, a stiff and perfect face of colour seemed to have been the aim of the exhibitors. The 1st prize exhibit, from J. M. PETCH, Nurseryman, Bridlington, departed a little from the stereotyped method, but even it could not be described as graceful.

Much the best group of miscellaneous plants arranged for effect was shown by F. J. MONTAGUE, Esq., Melton Park, the predominant features being well-grown plants of Begonia Gloire de Lorraine, and a groundwork of Adiantums.

Greatest interest centred on the cut bloom classes. The 1st prize for 18 Japanese varieties was won by Captain LAYCOCK, Wiseton Hall (gr. Mr. G. W. Murk).

The blooms were the best shown, but could

scarcely be termed first-class although specimens of Mrs. W. KNOX variety were of exceptional merit.

The best exhibit of 12 Incurved blooms was shown by J. HARRISON, Esq., Walkley, Sheffield, who had compact blooms; "Buttercup" being especially well represented.

Exhibits of table plants lent brightness and beauty to the general effect, the 1st prize being awarded to R. J. STREATFIELD, Esq., Romington Hall (gr. Mr. T. Burroughs).

For the collection of dessert fruit the 1st prize was obtained by G. H. SHAW, Esq., Howden, Yorks. (gr. Mr. A. Blakey), whose Gros Colmar Grapes and Pitmaston Duchess Pears were excellent.

Good bunches of Mrs. Pearson Grape obtained the premier prize for two bunches of white Grapes; they were shown by F. J. MONTAGUE, Esq., Melton Park (gr. Mr. G. E. Mason).

Black Grapes were best shown by Alderman CHADWICK (gr. Mr. J. Richardson), in good examples of Mrs. Pince.

MESSRS. PENNELL & CO., Lincoln, staged an interesting group of flowers, fruits and vegetables.

LIVERPOOL HORTICULTURAL.

NOVEMBER 3, 4.—The 30th autumn show was held in St. George's Hall on these dates. The weather was unfavourable, the opening day being wet and misty.

The entries were considerably below the average in number, but the quality of the exhibits was good, and in some sections highly satisfactory.

This Liverpool show is famed for its trained plants of Chrysanthemums, but this year, owing to the unfavourable season, many were wanting in perfection of bloom.

A. EARLE, Esq. (gr. Mr. T. Hitchman), showed the best, four, trained plants, and the best, single specimen flowering plant, L. NONLETT, Esq. (gr. Mr. R. T. Bushell), led for three, trained, single Chrysanthemums, and he also had the best specimen Pompon, JOHN FINLAY, Esq. (gr. Mr. E. Wharton), had the best, six Chrysanthemum plants trained to stakes, whilst G. NICHOLSON, Esq. (gr. Mr. P. Cauce), excelled in the class for three, and Mr. T. HITCHMAN for one plant trained similarly.

J. W. WRIGHT, Esq. (gr. Mr. T. Atkin), was placed 1st for the most tastefully-arranged group.

Exhibits of cut blooms were fully up to the average at these shows. In the "Challenge Vase" class the competitors numbered six. Sir W. H. TATE, Bart. (gr. Mr. Haigh), champion in this class for three successive years, won a similar vase outright last year, and again on this occasion he beat all other competitors. The blooms shown by this exhibitor were very fine, the Japanese varieties being especially good. The best were (Incurved): Buttercup, Lady Isabel, Miss F. Ashworth, Boccace and Romance; (Japanese): Mrs. A. J. Miller, Chrys. Montigny (very fine), J. Locke, Algernon Davis, Sir Frank Crisp and Lady Talbot; 2nd, Sir GILBERT GREENALL, Bart. (gr. Mr. G. Goves); 3rd, PANTIA RALLI, Esq. (gr. Mr. G. Hunt).

The last-named exhibitor had the leading 18 Incurved blooms in not fewer than 12 varieties, and THOMAS CLARKE, Esq. (gr. Mr. J. Clarke), the best 12 blooms of this type.

MISCELLANEOUS PLANTS.

The large exhibits of Palms and Ferns usually seen were absent, therefore the show was somewhat lacking in this section. Mr. T. HITCHMAN won the 1st prize in a strong contest for six plants of Begonia Gloire de Lorraine, T. DIXON-NUTTALL, Esq. (gr. Mr. H. Roberts), staged the best four Ferns, R. L. OVEYTON, Esq. (gr. Mr. R. J. Taylor), won the 1st prize for three Orchids, having a beautiful specimen of Cattleya Gigas Saudere, and he showed the best single specimen with a noble plant of Cattleya Martinii, about 4 feet in diameter and carrying 27 spikes, bearing 124 flowers. In addition to the 1st prize, a Certificate of Merit was given to this fine plant.

FRUIT.

The Earl of DERRY (gr. Mr. E. F. Hazleton) staged the premier collection of fruit, which included white and black Grapes, a Melon, and Apples and Pears of good colour and finish. The other prize winners in this class were A. H.

BRIGHT, Esq. (gr. Mr. J. Skitt), and W. L. GLADSTONE, Esq. (gr. Mr. T. Elsworthy).

In the Grape classes, Mr. W. WILSON won with highly-coloured bunches of Black Alicante; Mrs. KENDALL (gr. Mr. R. Anderson) showed the best bunches of any other black, having Barbarossa; Mr. J. HONEY excelled in the class for Muscat of Alexandria, and Mr. WILSON for any other white Grape. Mr. HAZELTON had the best four bunches of Grapes, staging Muscat of Alexandria and Black Alicante.

NON-COMPETITIVE EXHIBITS.

Some fine exhibits were contributed in this section, for which the following awards were made:—

Gold Medals to MESSRS. MANSELL & HATCHER for a fine collection of Orchids, and Mr. J. LEE for a collection of Apples and Pears.

Silver Medals to MESSRS. DICKSONS, Chester, for Apples and Carnations; THE LIVERPOOL ORCHID Co. for Orchids; MESSRS. R. P. KER & Co. for Cyclamen, Palms, Ferns, &c.; Mr. W. ROWLANDS for Carnations, Cyclamen, &c.; Mr. H. MIDDLEBURY for retarded Liliums and Spiraeas; MESSRS. CLIBRANS, Altrincham, for Pelargoniums and Chrysanthemums, and MESSRS. THOS. DAVIES & Co. for Spiraeas and Ferns.

BRISTOL CHRYSANTHEMUM.

NOVEMBER 3, 4.—This society's annual show was held in the Drill Hall, Bristol, on these dates. Although excellent from many points of view, the exhibition did not compare favourably with those held on some previous occasions. The chief falling off was in the classes for Chrysanthemums. Orchids, stove and greenhouse plants, and Ferns were all well shown, while fruits, and especially Apples, Pears and Grapes, were of much merit. Non-competitive exhibits were numerous, and contributed towards making the show a success.

CHRYSANTHEMUMS.

In the class for 24 blooms of Japanese varieties in not fewer than 12 varieties, three growers competed. C. BAILEY, Esq. (gr. Mr. J. C. Pope), secured the 1st prize with, amongst others, good blooms of President Loubet, Norman Davis, Splendour, Mrs. W. Beadle, R. Vallis, Mrs. A. T. Miller, Leslie Morrison, Mme. P. Radaelli, and Miss A. Lunt; 2nd, W. A. TOWN, Esq. (gr. Mr. G. Sutton), who staged Mrs. R. Hooper Pearson, Bessie Godfrey, Dorothy Goldsmith, Leigh Park Wonder, and R. Vallis in good form, 3rd, D. E. TAYLOR, Esq. (gr. Mr. T. J. Coote).

In the class for 12 blooms, Dr. J. CROPPER (gr. Mr. Baker) was awarded the 1st prize for well-coloured flowers of Edith Smith, R. Vallis, Norman Davis, Mrs. A. H. Lee, Bessie Godfrey, Mrs. A. T. Miller, Mrs. F. G. Coster, Mrs. W. Beadle, Mrs. Norman Davis, and Joseph Stoning. E. WATTS, Esq. (gr. Mr. Woodward), was placed 1st and Mr. G. SUTTON 2nd.

In a class for 12 Incurved blooms, Mr. BAKER was the only exhibitor. He staged well-developed blooms of Buttercup, W. Pascoe, W. Biddle, Mrs. J. P. Bryce, Mrs. B. Hankey, Emblème Poitevine, Godfrey's Eclipse, May Phil lips, and C. J. Ellis.

VASE CLASSES.

For six blooms, any one variety, of a Japanese Chrysanthemum shown in vases there were two competitors, viz., Sir W. H. DAVIES (gr. Mr. J. T. Curtis) and Mr. WOODWARD, who were awarded the 1st and 2nd prizes respectively, each staging good blooms of the variety Mrs. A. T. Miller. For six blooms of any white variety, the 1st prize went to FRANCIS FAGART, Esq. (gr. Mr. E. H. Benfield); 2nd, Mr. WOODWARD. In a class for one bloom of any variety, there were eight competitors, Mr. BAKER taking the 1st prize with a specimen of Mrs. A. T. Miller, and Mr. S. HEMMINGS the 2nd prize, with the same variety. Four exhibits were staged in a class for six vases of distinct varieties, three blooms of each. Mr. POPE again secured the lead, having good flowers of Miss A. Hamilton, Mrs. A. T. Miller, Lilian Coppard, President Viger, R. Vallis and Miss A. Lunt. For six vases of single Chrysanthemums, each containing five sprays, five exhibits were staged, the best blooms were from the gardens of Lord Justice FARWELL (gr. Mr. F. Little); 2nd, Mr. BENFIELD.

There were three groups of Chrysanthemums, each group occupying an area of 50 square feet. The 1st prize was awarded to Mrs. STUCKEY WOOD (gr. Mr. F. A. Burt), who showed dwarf plants with large blooms and good foliage, arranged with the colours well blended, the group being edged with Adiantum Fern; 2nd, J. BUCKLAND, Esq. (gr. Mr. Hunter); 3rd, J. M. DUNLOP, Esq. (gr. Mr. S. Price).

Mrs. ST. VINCENT AMES (gr. Mr. Bannister) was the only exhibitor of a group of Chrysanthemums and ornamental-foliaged plants arranged in a space of 50 square feet. It consisted of a fine collection of Chrysanthemum relieved with Crotons, Palms, Eulalia and Grevillias, edged with Adiantum Fern.

Mr. E. H. BENFIELD showed the best Chrysanthemum bloom (Mrs. A. T. Miller) in the show, and thus gained the National Chrysanthemum Society's Silver Medal.

Mr. BENFIELD was 1st for six ornamental-foliaged plants, having large, well-grown specimens of *Areca lutescens*, *Kentia Forsteriana*, *K. Belmoreana*, *Croton Williamsii*, and *Anthurium crystallinum*; Mr. BANNISTER was a good 2nd. Mr. CURTIS was placed 1st for eight plants suitable for drawing-room decoration, and Mr. C. J. ELLIS 2nd, whilst for six specimen Ferns, Mr. BENFIELD was placed 1st and Mr. BANNISTER 2nd.

For a group of Orchids arranged in a space of 6 feet by 4 feet, two collections were staged. The 1st prize was awarded to A. G. GROVES, Esq. (gr. Mr. Gostling), whose plants consisted chiefly of varieties of *Cattleya*, *Lælia*, and *Cypripedium*, and *Odontoglossum grande*. Col. H. CARY BATTEN (gr. Mr. Spowage) was the other exhibitor. For three plants Mr. CURTIS was placed 1st with a fine variety of *Cattleya labiata*, a good variety of *Cypripedium insigne*, and *Oncidium varicosum Rogersii*. Mr. WOODWARD was placed 2nd amongst five exhibitors. For two plants Mr. A. E. MITCHELL was 1st and Mr. WOODWARD 2nd, and for one plant Mr. CURTIS was 1st and Mrs. Viner 2nd. For three plants of *Cypripedium insigne*, Mr. SPOWAGE led, followed by Mr. GOSTLING, and for a single plant of the type variety of *Cypripedium insigne*, Mr. CURTIS was 1st.

In the decorative classes a number of baskets of autumn foliage, berries and grasses made a pleasing feature. Bouquet, wreaths and sprays were likewise largely shown.

FRUIT.

Six classes were provided for Grapes, which were well represented, although in but few cases was there any variety staged in first-rate condition. G. A. GIBES, Esq., Tyntesfield (gr. Mr. Wilkinson), was a leading exhibitor.

In the class for a collection of fruits of six dishes, in not fewer than four kinds, there were four exhibits. The best was shown by Mr. WILKINSON, who had Muscat of Alexandria and Lady Downes' Grapes, Doyenné du Comice and Marie Louise Pears, Fearn's Pippin Apple, and Jubilee Melon; 2nd, Mr. BAKER.

Mr. BANNISTER took the lead amongst five competitors for six dishes of Pears with large, clean fruits of Princess, Doyenné du Comice, Charles Ernest, Fondante de Thirriott, Berrie Anjou, and Reurre Diel; 2nd, Mr. F. LITTLE, with Beurre Hardy, Emile d'Heyst, and Doyenné du Comice as his best dishes. For four dishes, Mr. LITTLE won the 1st prize, followed by Rev. Preb. LANCE (gr. Mr. H. Sambourne). In the class for one dish of Pears, Mr. BAKER was placed 1st for the variety Doyenné du Comice; Mr. P. THODAY 2nd, with same variety, and Mr. WILKINSON 3rd, with Marie Louise.

Mr. POW excelled in the class for six dishes of dessert Apples. For four dishes of dessert varieties, Mr. A. CERRY was 1st with highly-coloured fruits, amongst 12 exhibitors. Eighteen dishes were staged in the single-dish class for Apples. Mr. BAKER and Mr. C. W. OYER, being 1st and 2nd respectively, both staging Cox's Orange Pippin.

Mr. G. POW took the 1st prize for six dishes of culinary Apples, amongst 10 competitors; 2nd, Mr. H. POW; 3rd, Mr. CURRY. For one dish of culinary Apples, Mr. WILKINSON, Mr. W. P. LANG and Mr. BAKER took the four prizes in the order named, each with grand dishes of Peas-good's Nonesuch.

VEGETABLES.

Messrs. Sutton & Sons and Messrs. Webb & Son each offered prizes for a collection, the 1st prize-winners being Messrs. C. BAILEY, BANNISTER, BAKER, and SHEPHERD.

The prize offered for the most meritorious exhibit of fruit was awarded to Mr. WILKINSON for his 1st prize collection.

NON-COMPETITIVE EXHIBITS.

The following medals were awarded to non-competitive exhibitors:—Gold—to Messrs. Jas. Cypher & Sons, Cheltenham; Silver-gilt—to Messrs. Garaway & Co. and Messrs. Parker & Sons; Silver—to Messrs. Young & Co. (Cheltenham), Messrs. Wells & Co., Ltd., Messrs. Brooks & Kitley (Bristol), the British Columbia Government, and to Mr. C. J. Ellis, Weston-super-Mare.

BATH CHRYSANTHEMUM.

NOVEMBER 3, 4.—The weather was unfavourable on the opening day of this Society's fifth annual exhibition, held on the above dates. The exhibition as a whole was a success, and reflected credit on everyone concerned. The Assembly Rooms in which the show was held are spacious, and convenient for the purpose.

Groups of Chrysanthemums are always good at Bath, and these were excellent on this occasion, that which won the 1st prize award for T. R. MURRAY, Esq. (gr. Mr. Robb), being especially commendable. The quality of the blooms was superb, and the style of arrangement faultless; 2nd, Mrs. BROWN; 3rd, Dr. PATON.

Major DOHERTY, who is usually invincible in the group contests at these shows, found a rival in W. WAILES, Esq. (gr. Mr. Pierce). The latter, by a bolder style of treatment, gained the highest award.

A special feature of these shows is afforded in the staging of all cut blooms in vases, mostly furnished by the Society and of uniform height. Col. ROLLESTON (gr. Mr. Trimby) staged the best exhibit of 24 blooms, all of which were fresh and good. His best examples were F. S. Vallis, J. H. Doyle, Mme. P. Radelli, Mme. G. Rivol, Miss M. Ware, and Rose Pockett. 2nd, W. H. TUGWELL, Esq., Crowe Hall (gr. Mr. Parrott), who had slightly smaller flowers, Mrs. Knox, O. H. Broomhead, Mrs. Greenfield and Mary Mason being his best blooms. 3rd, R. E. DICKINSON, Esq. (gr. Mr. Beazer).

Undoubtedly the finest specimen blooms were the 12 shown by Mr. ROBB, those of Mrs. N. Davis, Bessie Godfrey, Lady Talbot, and Mrs. Knox being very fine. The 2nd prize in this class went to G. A. R. FITZGERALD, Esq. (gr. E. Pople), who staged fine flowers of Lady Hope-toun, Magnificent, and Mrs. A. T. Miller. 3rd, Mr. PARROTT, who also staged well.

For six white blooms of Japanese varieties, Messrs. POPLÉ and PARROTT won the 1st and 2nd prizes respectively, but their names were reversed in the class for six yellow blooms.

The classes open only to members were well filled, especially that for 18 blooms, in which Mr. ROPER excelled, and again in the 12's, where Mr. TRIMBY secured the 1st prize.

Single varieties found many admirers. R. DUCKWORTH, Esq. (gr. Mr. Sparey), contributed such good sorts for 1st prize as Miss L. Bird, Mrs. B. Fletcher, Miss E. Roberts, Mary Richardson, and Exmouth Yellow.

Bouquets, epergnes, table decorations, Carnations, and vases and baskets of autumn foliage and berries were well staged.

Exhibits of fruit made a good show. Grapes especially being above the average in quality. Mr. W. MARSH showed the best Muscat of Alexandria Grapes, winning easily from Messrs. COOTE and ASHMAN.

Mr. SPAREY's handsome clusters of Black Alicante were preferred to really good Gros Maroc from Mr. MARSH, Mr. COOTE following with the same variety.

Major EDGELL won the 1st prize for six dishes of Pears, and T. CARR, Esq., with even finer specimens, scored in the single-dish class.

Apples in six varieties brought a good entry, Messrs. EVRY, FISHLOCK, W. A. HICK-DICKENSON, and Major EDGELL sharing the prizes.

No fewer than 20 collections of vegetables were staged in the several classes provided, and keen competition resulted. The most successful exhibitors were Messrs. HORSELL,

SPAREY, ANDREWS, EVRY, HOWSE, FITZGERALD, and Capt. GILLING.

Trade exhibits added much to the interest and general effect of the show. Messrs. BLACKMORE & LANGDON showed Begonias and Carnations; Messrs. WALTERS & SON, Apples in variety; Mr. ROWLAND ADAMS, Roses as fresh as in summer; Mr. MILBURN, Weston Nurseries, and Messrs. COOLING & SONS each staged flowering plants in variety; and Apples from British Columbia showed a wealth of colour with great size.

PORTSMOUTH CHRYSANTHEMUM.

NOVEMBER 3, 4, 5.—An average display for these shows was seen in the Town Hall on these dates. The entries were fewer than in some previous years; but, for the season, the blooms were of good quality.

Six open classes were provided for cut blooms, many open to local growers only. The chief interest centred in the class for 36 Japanese Chrysanthemums, in not fewer than 18 varieties. A cup valued at £20, a Gold Medal, and £5 in money constituted the premier prize. Lord ASHBURTON, The Grange, Alresford gr. Mr. E. Garratt, won this prize with heavy, if somewhat uneven, blooms, that were well staged. Noteworthy specimens were Hon. Mrs. Lopes, Marquis of Northampton, Bessie Godfrey, G. Mileham 1908, Splendour, Henry Perkins, W. Beadle, R. Vallis, Lady Talbot, Rose Pockett, and F. S. Vallis. Mr. W. G. ADAMS, The Strand, Southsea, was placed 2nd. He showed admirable blooms of J. W. Molyneux, Hon. Mrs. Lopes, Mrs. A. T. Miller, and Lady Talbot.

There were three entrants in the class for 24 Japanese blooms in not fewer than 18 varieties, the best being staged by Mr. W. E. GILL, St. Mark's, Florence Road, Southsea, who had large, well-coloured examples of Bessie Godfrey, Lady Talbot, Splendour, Reginald Vallis, Marquise V. Venosta, and Algernon Davis. 2nd, L. J. ROSE, Esq., Holly Bank, Emsworth (gr. Mr. P. J. Palmer).

Incurved varieties were poor. Single-flowered Chrysanthemums are usually a feature at this show. For 12 varieties, Mr. C. JOANSTON, 58, Walmer Road, Portsmouth, won the premier prize with well-developed blooms of Roupell Beauty, Edith, White and Bronze Pagram, and Jessie Curtis.

Mr. J. NANCE, 98, Hampshire Street, Portsmouth, won the 1st prize for Pompon varieties, with desirable blooms of such sterling varieties as Black Douglas, W. Sabery, Maid of Kent, Perle des Beantes, Harry Hicks, and W. Westlake.

In the local classes there was spirited competition. For 12 incurveds and a like number of Japanese blooms, Mr. J. LOVE, 2, Bertie Cottages, Park Road, Cowes, was well ahead of his competitors with desirable blooms of popular varieties. Mr. GILL was placed 1st for 12 Japanese blooms, distinct. Mr. J. LOVE occupied a like place for 12 incurved varieties.

The best group of Chrysanthemums was shown by Mr. GILL, who made an effective display.

Several decorative classes, restricted to ladies, created much interest, and showed good results. For the best dinner-table decorated with Chrysanthemums and foliage, Mrs. STURT, Stanstead Gardens, Emsworth, was awarded the 1st prize.

Miss C. D. BURDEN, 17, Margate Road, Southsea, was 1st for a basket of Chrysanthemums with an admirable exhibit.

W. H. MYERS, Esq., Swanmore House, Bishop's Waltham (gr. Mr. G. Ellwood), secured the leading prizes in the vegetable classes with excellent produce.

BIRMINGHAM CHRYSANTHEMUM, FRUIT AND FLORICULTURAL.

NOVEMBER 9, 10, 11.—The 49th annual exhibition, held in the Bingley Hall, was a good one, when allowances are made for the unfavourable season. Specimen plants of Chrysanthemums were rather better than those exhibited on some previous occasions; but, unfortunately, competition in these classes remains in the hands of only two or three exhibitors. The plant groups showed excellent culture of the specimens, and skill in arranging them. Competition was keen in some of the classes for cut flowers, especially in the large

open Japanese classes, in which Lt.-Col. BEECH, of Coventry (gr. Mr. E. J. Brookes), showed uncommonly large, shapely, well-coloured flowers. The Rt. Hon. JOSEPH CHAMBERLAIN, M.P., Highbury (gr. Mr. J. Deacon), was successful in the local classes. New classes were provided for tree Carnations and Begonias, and these added much to the effectiveness of the show. Competition in the Grape classes was strong, and the quality of the fruits very good. Pears were extensively and well shown; but Apples were fewer than usual and lacking in colour. Vegetables have seldom been seen in better condition at Birmingham. Non-competitive exhibits were numerous.

SPECIMEN PLANTS.

Six classes were provided for these, and, as on previous occasions, the principal honours were divided between E. MARTINEAU, Esq., West Hill, Edgbaston (gr. Mr. O. Brasier), and J. A. KENRICK, Esq., Berrow Court, Edgbaston (gr. Mr. A. Cryer). The first-named exhibitor was awarded 1st prizes for (1) six large-flowering Chrysanthemums (Japanese excluded), (2) three Japanese, (3) one large-flowering variety (Japanese excluded), (4) one Japanese, and (5) three single-flowered varieties. J. A. KENRICK, Esq. (gr. Mr. A. Cryer), was 2nd in each of the above classes, and 1st in another class for six Japanese varieties. E. MARTINEAU, Esq. (gr. Mr. O. Brasier), was 2nd.

GROUPS OF CHRYSANTHEMUMS.

There were three classes for these, the leading one being for a group of plants occupying a space of 20 feet by 12 feet. Foliage plants were admissible. The 1st prize of £10 is given with the William Butler Memorial Silver Cup, the latter to be held by the exhibitor during the ensuing year, and when he is successful in winning it a third time it becomes his property. Last year's winner, J. A. KENRICK, Esq., has won the cup for a second year in succession. The exhibit was of superior merit from both a cultural and artistic point of view, but it is to be regretted that Mr. Kenrick's able gardener, Mr. Cryer, was allowed a "walk over" for the second time.

The next class was for a similar group, but occupying less space. Of the four contestants, T. W. PIGGOTT, Esq., Moseley (gr. Mr. R. Bullock), was placed 1st for a well-balanced group of blooms of good quality. 2nd, HUME C. PINSENT, Esq., Harborne (gr. Mr. G. Corbett). This exhibit contained some very good blooms. 3rd, H. GREEN, Esq., Gravelly Hill, Birmingham (gr. Mr. L. Fewkes).

The next group was reserved for decorative varieties, to be shown as grown, on a space of 15 feet by 10 feet. Thinning was permitted, but not disbudding to single flowers. Mr. C. H. HERBERT, Acocks Green, Birmingham, was the only exhibitor in this class, but his group was rather overcrowded.

BLOOMS SHOWN IN VASES.

The principal class required 18 varieties to be shown in six vases. 1st, Lieut.-Col. BEECH, Coventry (gr. Mr. E. J. Brookes), with magnificent flowers of Bessie Godfrey, Splendour, John Peed, Rev. R. D. Eves, Lady Talbot, Mme. G. Rivol, O. H. Broomhead, President Viger, Mrs. Norman Davis, Mme. P. Radaelli, Marquise V. Venosta, C. H. Totty, Algernon Davis, Reginald Vallis, Henry Stowe, F. S. Vallis, Valerie Greenham, and Mrs. C. Penford. 2nd, Mr. W. IGGULDEN, Frome, who had meritorious flowers of F. S. Vallis, "Magnificent," and Bessie Godfrey. 3rd, HUGH ANDREWS, Esq., Winchcombe (gr. Mr. John R. Tooley). There were seven exhibits.

For four Japanese varieties, three blooms of each, Lieut.-Col. BEECH (gr. Mr. E. J. Brookes) again led, with massive blooms of President Viger, F. S. Vallis, Lady Talbot, and John Peed. 2nd, HUGH ANDREWS, Esq. (gr. Mr. J. R. Tooley).

First prizes for (1) a vase of any pink-coloured Japanese variety and (2) a vase of any yellow-flowered Japanese variety were also awarded to Lieut.-Col. BEECH, who showed exquisite flowers of the varieties Reginald Vallis and F. S. Vallis respectively.

The winning vase of any white variety came from F. E. MUNTZ, Esq., Umberslade, Birmingham (gr. Mr. H. S. Foster). The variety was Mrs. A. T. Miller.

In a class for four varieties of single-flowered Chrysanthemums, there were six entries. 1st,

Mr. A. H. HICKMAN, Kidderminster, with large, bright coloured flowers; 2nd, Major EVERITT, Knowle (gr. Mr. W. Newton).

The best exhibit of half-a-dozen varieties of decorative Chrysanthemums, six sprays of each, was sent by Mrs. CHAPELLE, Wellesbourne Hall, Warwick (gr. Mr. T. Parry); 2nd, Major EVERITT, Knowle (gr. Mr. W. Newton).

The Rt. Hon. JOSEPH CHAMBERLAIN, M.P., Highbury (gr. Mr. J. Deacon), was awarded 1st prize in a class for 12 incurved varieties, three blooms of each. He showed excellent flowers of Buttercup, Clara Wells, and Mrs. G. Denyer.

The same exhibitor also won the 1st prize for 12 distinct Japanese varieties arranged with any foliage on a table 6 feet by 3 feet, as well as premier awards in the following local classes:—(1) Four vases of 12 varieties of Incurved Chrysanthemums; (2) two vases of Incurveds, three blooms of each; (3) 12 Japanese varieties; and (4) two Japanese varieties, three blooms of each.

In a class for single Chrysanthemums to occupy a table space of 8 feet by 4 feet, there were three good exhibits. 1st, Mr. A. H. HICKMAN, Kidderminster, with a bright assortment, in which Beauty of Airedale, Grace, and Irene Carr were of outstanding merit; 2nd F. W. GRESWOLDE WILLIAMS, Esq., Bromyard.

Of the 12 tables decorated with Chrysanthemums, the one that pleased the judges most came from F. E. MUNTZ, Esq., Umberslade Hall, Birmingham (gr. Mr. H. S. Foster), and consisted principally of single, yellow flowers, sprays of Selaginellas and crimson Japanese Acer leaves.

MISCELLANEOUS PLANTS AND CUT FLOWERS.

A feature introduced this year is a class for tree Carnations arranged on a table 20 feet long by 8 feet wide. Cut foliage and foliage plants were admissible, as well as any kind of vase or stand. The 1st prize of 12 guineas carried with it a valuable silver challenge shield, the latter to be held by the winner during the ensuing year. It was won by Mr. C. F. WATERS, Balcombe, Sussex with an arrangement of choice, well-grown flowers, displayed in vases, each vase containing one colour only. Mr. S. MORTIMER, Farham, Surrey, who was placed 2nd, had an elegantly-arranged group, but it contained fewer flowers than the exhibit that gained the 1st prize.

In a class for 12 plants of Begonia Gloire de Lorraine, grown in pots not exceeding 6 inches inside measurement, there were four splendid exhibits. The 1st prize was awarded to A. HUGHES, Esq., Knowle (gr. Mr. W. V. Wall), for bushy plants smothered with large flowers; 2nd, J. A. KENRICK, Esq. (gr. Mr. A. Cryer).

In a smaller class for six Begonias, reserved for gentlemen's gardeners and amateurs, F. E. MUNTZ, Esq. (gr. Mr. H. S. Foster), beat seven contestants with well-grown, nicely-trained and flowered specimens; 2nd, J. A. KENRICK, Esq. (gr. Mr. A. Cryer), who was awarded 1st prize for (1) six Palms, (2) three Palms, (3) one tree Fern and (4) six single-flowered Primulas.

The Rev. H. BUCKSTON, Sutton Hall, Derby (gr. Mr. A. Sharnbrook), won 1st prizes for (1) 12 Cyclamen and (2) six Cyclamen. In each class the plants were profusely flowered.

FRUIT.

In a class for a collection of British-grown fruits arranged on a space of 40 square feet there were two exhibits, the same number as last year. The 1st prize was awarded to the Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre), who showed handsome Muscat of Alexandria and Gros Colman Grapes; Ribston Pippin, Cox's Orange Pippin, Peasgood's Nonesuch, and Gasconne's Scarlet Seedling Apples; Pitmanston Duchess Pears; also Melons, Quinces, &c. 2nd, Lord BIDDULPH, Ledbury (gr. Mr. H. Cotton).

An important class was one for a collection of British-grown hardy fruits displayed on tables 12 feet by 8 feet. There were three entries. The 1st prize of £5 and a silver challenge cup, the latter given by Councillor Bevins, of Hall Green, was won by Mr. C. W. POWELL, Warham, Hereford, who now wins the cup outright, as he has won it three times in succession. His best dishes consisted of well-coloured Apples and Pears. 2nd, Mr. E. W. CADDECK, Ross.

GRAPES.

For six bunches of Grapes in three or more varieties £9 were offered in three prizes. 1st, Mrs. F. NEELD, Great Malvern (gr. Mr. F.

Jones), with shapely bunches of Muscat of Alexandria, Appley Towers and Black Alicante; 2nd, Lord BIDDULPH, Ledbury (gr. Mr. H. Cotton).

The best three bunches of Black Grapes came from HUGH ANDREWS, Esq., Winchcombe (gr. Mr. J. R. Tooley), who showed Black Alicante in wonderfully good condition; 2nd, the Earl of HARRINGTON (gr. Mr. J. H. Goodacre).

The Marquis of HERTFORD, Ragley Hall (gr. Mr. C. Harding), led for three bunches of white Muscats; 2nd, the Earl of HARRINGTON (gr. Mr. J. H. Goodacre), who was placed 1st in a class for white Grapes (Muscats excluded).

Mr. C. WINN scored in the local class for black Grapes, and the Rt. Hon. JOSEPH CHAMBERLAIN, M.P. (gr. Mr. J. Deacon), led in the local class for white Grapes.

Apples were not largely shown, the leading prizes in classes for (1) six dishes of culinary Apples, (2) six dishes of dessert Apples, and (3) four dishes of Pears were won by Lord BIDDULPH (gr. Mr. H. Cotton), who showed nice, even-sized, well-coloured fruits.

Mrs. AMER, Westbury-on-Trym (gr. Mr. W. H. Bannister), took the lead in a class for eight dishes of Pears.

VEGETABLES.

In Messrs. Sutton & Sons' class for nine distinct kinds, the 1st prize was awarded to the Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), who showed excellent examples of Ailsa Craig Onions, Tender and True Parsnips, Solid White Celery, Perfection Tomato, Autumn Mammoth Cauliflower, and Prizetaker Leek; 2nd, Mr. THOS. JONES, Ruabon.

Messrs. Webb & Sons' prizes were offered for eight distinct kinds. Mr. JOHN HUDSON, Leicester, and Earl SPENCER, Northampton (gr. Mr. Silas Cole), won the 1st and 2nd prizes with excellent collections.

Prizes were offered by Robert Sydenham, Ltd., for nine distinct kinds. 1st, Mr. T. JONES, Ruabon, with a meritorious display; 2nd, Mr. W. FOLKES, Amptill, Beds.

In Messrs. Sydenham's local classes, 1st and 2nd prizes were taken by Mr. E. DEAKIN, HENRY MILLS, and J. A. KENRICK, Esq. (gr. Mr. A. Cryer) respectively. Prizes were also offered by Messrs. Dickson & Robinson in five classes for single dishes.

AWARDS.

Certificates of Merit were awarded to each of the under-mentioned subjects:—White Incurved Chrysanthemum H. W. Thorpe, exhibited by Mr. W. J. GODFREY, Exmouth; large golden-yellow single Chrysanthemum Reginald Godfrey, exhibited by Mr. W. J. GODFREY; and Begonia Clibran's Pink, exhibited by Messrs. CLIBRAN & SONS, Altrincham.

NON-COMPETITIVE EXHIBITS.

Large Gold Medals to Messrs. WEBB & SONS, Stourbridge, for fruit and vegetables; Messrs. CLIBRAN'S, Altrincham, for vegetables; KING'S ACRE NURSERIES, Hereford, for fruit; Messrs. GUNN & SONS, Olton, for Japanese garden; Messrs. GUNN & SONS, Olton, for floral designs; Messrs. JOHN WATERER & SONS, Bagshot, for hardy shrubs; Mr. W. J. GODFREY, Exmouth, for Chrysanthemums; Messrs. YATES & SON, Birmingham, for vegetables; and Messrs. WELLS & CO., Mertham, for Chrysanthemums.

Small Gold Medals to Messrs. LAXTON BROS., Bedford, for fruit; Messrs. GEORGE MASSEY & SON, Spalding, for Potatoes and Onions; Messrs. BAKERS, Wolverhampton, for hardy shrubs; Messrs. RICHARD SMITH & CO., Worcester, for hardy shrubs; Messrs. HEWITT & CO., Solihull, for hardy shrubs; and Mr. H. WOOLMAN, Shirley, for Chrysanthemums.

Silver-gilt Medals to Messrs. W. H. SIMPSON & SONS, Birmingham, for vegetables; and Messrs. CLIBRAN & SON, Altrincham, for Begonias.

Silver Medals to Messrs. THOMSON & SONS, Birmingham, for vegetables; Mr. H. N. ELLISON, West Bromwich, for Ferns; Mr. A. GODFREY, Stourbridge, for hardy shrubs; Messrs. JAMES SIMPSON & SONS, Harborne, for hardy shrubs; Messrs. RICHARD SMITH & CO., Worcester, for Begonias; Messrs. JAMES RANDALL & SONS, Shirley, for Zonal Pelargoniums; and Miss THOMPSON, Handsworth, for Cactaceous plants.

Bronze Medals to Councillor E. A. WILSON, Edgbaston (gr. Mr. A. D. Christie), for Cactaceous plants; Messrs. BICK BROS., Olton, for Chrysanthemums; and Messrs. T. B. GROVE & SON, Sutton Coldfield, for Primula obconica.

LAW NOTES.

PORT OF LONDON RATES.

The new Port of London Authority has now issued particulars of the maximum rates which it seeks to be empowered to charge in respect of goods coming into the Port of London, and a few particulars of the rates affecting horticultural produce may prove of interest.

Plants, trees, bulbs, roots, &c., are liable to a rate of 2s. 6d. per ton, and fresh flowers to a rate of 3s. per ton. Artificial or dried flowers are chargeable at 1d. per £1 value. The charge for loam is 4d. per ton.

As regards seeds, the proposed rates vary according to their nature. They are divided into four classes with the following results:—

The rate for seeds placed in class 1 is 1s. per ton.
" " " " " 2, 1s. 6d. "
" " " " " 3, 2s. "
" " " " " 4, 2s. 6d. "

The following table will show in alphabetical order into which classes the various seeds fall.

Table with 2 columns: Class and Seed Name. Lists various agricultural and medicinal seeds like Jaffa, Jamba, Jowarce, Linseed, Lucerne, Lupin, Madder, Maw, Medicinal, Mistle, Mowra, Mustard, Niger, etc.

It should be explained that the above rates represent the maximum amounts which the Port of London seeks for power to impose, but it does not necessarily follow that at first, at all events, the maximum sums will be charged. These rates are in addition to the ordinary dock dues, and it is understood that fractions of a ton will be charged as a whole ton. Any objections to the proposed rates should be lodged without delay. H. M. I.

WORKMAN'S COMPENSATION CASE.

An action was recently brought by Emma Bass in the Waltham Abbey County Court for the death of her husband under extraordinary circumstances. It appeared that Thomas Bass had been employed as an under gardener by respondent, Mr. E. J. Wythes, J.P., of Copped Hall, Epping. Part of Bass's duty was to look after 1,000 fowls belonging to respondent. Early in October last year, while following his occupation, Bass was bitten in the arm by a cockerel. Blood poisoning set in, and the man was incapacitated from work. On October 31 the same year Bass committed suicide by drowning himself during a fit of temporary insanity, which was alleged to be the direct result of blood poisoning occasioned by the cockerel bite. In these circumstances, the widow claimed £156 compensation. Judge Tisdal Atkinson gave judgment for the amount claimed, with costs.

SCHEDULES RECEIVED.

Winchester Horticultural Society's twenty-seventh exhibition of Chrysanthemums, fruit and flowers, to be held in the Guildhall, Winchester, on Tuesday and Wednesday, November 16, 17. Hon. secretary, Mr. Chaloner Shenton, 60, Western Road, Winchester.

Obituary.

NATHAN COLE.—The death of this well-known gardener, in his 81st year, occurred at Exeter on Tuesday, November 2. Mr. Cole was for many years engaged in Kensington Gardens, and his work on The Royal Parks and Gardens of London, first published in 1877, is still widely read. Mr. Cole was one of the oldest members of the United Horticultural Benefit and Provident Society, being one of the founders of the society.

ANSWERS TO CORRESPONDENTS.

ARAUCARIA: J. W. This is not caused by fungal disease or insect, but is due to some unfavourable detail in the treatment afforded the plant.

BEGONIA: G. J. Eelworms are present in the roots and leaves. Injecting carbon bisulphide into the soil is the only means of getting rid of the pest.

CUCUMBERS: Rev. E. There is no disease present in the Cucumbers. The cracking has been caused by excess of moisture at the roots; the white patches are due to bleaching of the erupted skin after the splitting.

MUSHROOM BED: Weekly Subscriber. The Toadstool is Clitocybe dealbata, a kind that often overruns Mushroom beds. The spawn of the Toadstool was probably present in the manure.

NAMES OF FRUITS: W. L. 1, Court of Wick; 2, Searlet Golden Pippin; 3, Sturmer Pippin; 4, Pine Golden Pippin; 6, Tower of Glamis.—W. & S. 1, Court-pendù-plat.—L. L. 1, Lane's Prince Albert; 2, Harvey's Wiltshire Defiance; 3, not recognised.—Leigh. 1, specimen decayed; 2 and 4, Beurré Diel; 5, specimen decayed; 5 and 6, decayed.—Austin & McA. Prince Bismarck.—P. W. G. 1, Calville Rouge; 2, known in Kent as Bastard Blenheim and Beauty of Hants; 3, Dumelow's Seedling (Wellington); 4, Lord Lennox; 5, French Crab; 6, Queen Caroline.—W. J. B. 1, Ribston Pippin; 2, Stirling Castle; 3, specimen decayed; 4, Northern Greening; 5, Small's Admirable; 6, Green Woodcock; 7, Sturmer Pippin.

NAMES OF PLANTS: John Mavers. 1, Quercus Cerris var. longifolia; 2, Quercus Cerris; 3, probably a Viburnum, send when in flower.—W. Silcock. 1, Crataegus Crus-galli var. ovalifolia; 2, C. coccinea; 3, C. orientalis.—M. K. Somerset. Cologyne Massangeana.—R. O. 1, Aganisia lepidia; 2, Promenaea stapelioides; 3, Epidendrum evectum; 4, Dendrobium ciliatum; 5, Cologyne Parishii.—Enquirer. 1, Cobaea scandens (plant annually, the winter will kill it); 2, flowers decayed, send fresh specimen; 3, Weigela hortensis; 4, Choisya ternata; 5, Sedum spectabile; 6, Euphorbia Cyparissias; 7, Spiraea japonica (syn. Bumalda) var. Anthony Waterer; 8, cannot name from leaves; 9, Olearia Haastii; 10, Berberis stenophylla.—J. G. 1, Tamarix gallica; 2, Retinospora, pifera aupa; 3, Sciadopitys verticillata; 4, Crataegus coccinea.—Taff. 1, Ceterach officinarum; 2, probably Lastrea Filix-mas, only portion of frond sent; 3, Osmunda regalis; 4, Asplenium trichomanes; 5, Asplenium Rutenarium; 6, Athyrium Filix-femina; 7, Polystichum angulare; 8, Athyrium Filix-femina corymbifera; 9, Asplenium adiantum-nigrum; 10, Scolopendrium vulgare; 11, Lastrea spinulosa; 12, Polypodium vulgare.—Y. R. R. 1, Scolopendrium vulgare crispum; 2, Nephrolepis Mayi; 3, Gymnogramme ochracea; 4, Gymnogramme calomelanos; 5, Dennstedtia davallioides; 6, Pteris tremula; 7, Polystichum aculeatum; 8, Nephrodium molle; 9, Pteris Mayi; 10, Pteris umbrosa; 11, Pteris serrulata; 12, Maranta Massangeana.—J. M. G. 1, Epiphyllum truncatum; 2, Sansevieria Zeylanica (Bow-string Hemp); 3, Echeveria retusa; 4, Acalypha marginata; 5, Kalanchoe flammula; 6, Abutilon Savitzii; 7, Cupressus funebris; 8, Liriope (Ophiopogon) striatum.—S. A. 1, Pellionia pulchra; 2, Pellionia Daveauana; 3, specimen insufficient; 4, Lotus poliorhynchus; 5, Sempervivium tortuosum variegatum.

RIGHT TO REMOVE PLANTS: B. W. In the absence of an agreement, we are afraid you have

not the right to remove the plants introduced by yourself gratuitously to the collections of your employer. It is only fair to remember that, whilst the original plants were your property, you introduced them on your own initiative, and the cultivation since afforded them has been given at your employer's expense. It ought, however, to be possible for gardener and employer to come to a friendly arrangement, whereby the enterprise shown by the gardener should receive recognition.

SECOND GARDENER: Raven. We do not know that there is an exact difference between the meaning of this term and that of "Foreman," which is generally accepted. For our own part, we can conceive of cases in which a second gardener is not a "foreman" in the sense of being entrusted with the superintendence of other men; and others where a foreman, being one of several foremen, is not exactly a "second gardener."

SOLANUM: Cyclamen. The rust or sap-warting is caused by the presence of too much moisture in the atmosphere.

TO DESTROY MEALY BUG: J. M. D. The most effective means of destroying this pest is by fumigations of hydrocyanic acid gas. Other remedies that can be used with success include syringing with kerosene emulsion (if used in conjunction with a sponge), applications of methylated spirit by means of a soft brush, and fumigations with nicotine compounds.

TREATMENT OF CLAY SOIL FOR PLANTS: Aukward Predicament. A clayey soil can be improved by incorporating with it almost fresh, strawy, stable dung, sand, coal-ashes in a fine state, old mortar, rough peat, partially-decayed tree leaves, or any other material that will make it of a more open character. When digging such land, an inch or so of the soil below the first spit may be brought to the top in October and December, and left in the rough state as dug, so as to be exposed to frost and air during the winter. When dry enough for working in early spring, the soil should be dug over to the depth of 6 inches, thoroughly incorporating the upper layer with the lower to this depth. In each following year a little more of the lower stratum may be brought to the top to be weathered, and any of the above-mentioned lightening substances added to the whole. If a portion of the soil can be burnt, and then broken up and mixed with the upper layer it will have a very good effect in making the soil porous. The best method to carry out the burning or charring of such soil is to make first a good mass of small coal and wood and, setting this alight, to gradually add to the conical mass alternate layers of clay and coal to a height of 5 to 6 feet. The burning will occupy from four to six weeks. Near the bottom of the heaps a few holes should be left to admit air to the burning mass as is done in making charcoal. If the clay land is undrained, pipe drains should be laid 4 feet in depth and 25 feet apart, and following the slope of the land, if any; or if it be level, a fall should be given to the drains, and a good outfall drain provided, by which means the land will be made warmer, drier, and more readily workable. As the red clays contain but 0.12 per cent. of lime, freshly-burnt lime forms a good dressing for such soils. The use of ballast as a substratum in cutting pots or pans in the propagation of plants, will be found of value in the striking of the following, which are chiefly soft-wooded or succulent, viz., Pelargoniums, Cactaceous plants, Ageratum, Begonia, Bromelia, Coleus, Cytledon, Echeveria, Euphorbia, Poinsettia, Ficus, Nerium, Petunia, Pereskia, Sedum, and Conifers. The material should be broken fine enough to be passed through a 1/2-inch meshed sieve, and be surfaced with silver sand to the required depth, that is, 1/2 to 1 1/2 inch.

TULIPS UNHEALTHY: J. L. The Eucharis or bulb mite is causing the injury.

TILLED AND UNTILLED SOIL.

THE operation of tillage has, for its primary object, the stirring and loosening of the soil. When soil-particles are massed loosely, as in a tilled field or garden, spaces exist between them, and these spaces permit of free movement of air. If the particles are packed together tightly, as in pasture land where the soil cannot be loosened, there is comparatively little space between the particles, and consequently the amount of air in the soil is but small. All grass land, as compared with that under tillage, is insufficiently aerated, and in most cases the older the sod the less well ventilated it is; for, as time passes, the soil-particles become more closely packed. The ideal soil may be compared to a sponge, not only because of its capacity for holding nutritive solutions, but because of its permeability to air. There can be no question that the high productivity of well-cultivated soils is due largely to the greater amount of air available for the roots.

The presence of air ensures both oxygen and carbonic acid in the soil. Oxygen is essential to the growth and well-being of the roots of

plants, no less than to the aerial parts. Carbonic acid plays an important, though indirect, part in ensuring soil fertility by bringing inorganic materials into solution and thus augmenting the supply of mineral food-substances.

Beneficial micro-organisms are found in greater numbers and are better distributed in a cultivated soil than in compact and uncultivated soils. These lower forms of life, like the higher forms, are profoundly affected, both as to their individual well-being and as to their multiplication, by such conditions as food, air, moisture, and temperature, all of which factors are better regulated by cultivation.

One of the objects of tillage is to convert the soil into a suitable living place for micro-organisms through the increased humus, good drainage, ventilation, and higher temperature. It is not unreasonable, therefore, to assume that the greater number and better condition of the micro-organisms in a tilled orchard contributes to the well-being of the fruit trees.

There is evidence to show that all plants, to a greater or less degree, so change the soil in which they grow as to make it wholly or partially unfit for a succeeding crop of the same kind. Different crops growing in the same soil may injure each other, or the one the other. Two theories are advanced to explain these antagonisms of plants. One is that plants excrete toxins; the other is that the injurious effect is the result of bacterial activity.

Mr. Spencer Pickering, of the Woburn Experimental Fruit Farm, in accounting for the injurious effect of grass upon young Apple trees, attributes the harm done neither to competition between grass and tree for moisture and food, nor to a difference in temperature. He holds that it is due, not to a lack of air and oxygen, nor to excessive amounts of carbonic acid, but to some "actively malignant" effect on the trees, some action on them akin to direct poisoning. More recently, Mr. Pickering leaves the question open as to whether the harmful action is the effect of a poison (toxin) excreted by the roots of the grass, or whether it is the result of some change in the activity or composition of the micro-flora brought about by the grass sod. Beside these specific experiments with Apple trees and grass there have been recently several investigations with other plants to show that vegetable organisms have interdependences other than those with their physical environment. For example, investigations with Peach trees grown in pots with several other plants show that the Peach does not thrive if its roots are in close proximity to those of certain other plants.

The well-being of nearly all plants which minister to the needs of man is improved by tillage. Fruit trees not only respond to high cultivation in the nursery row, but they need good treatment after transplantation to the orchard.

In experiments to determine what are the comparative effects of tillage and grass sod on the Apple tree, it is found that tillage is generally better than sod, but it should not be expected, however, that sod will be deleterious in the same degree under all conditions.

It is reasonable to suppose, for instance,

that in a deep soil, where the Apple tree roots can escape from the grass roots, or in one containing a great amount of soil moisture, the harmful effects of the grass will not be so marked as in cases of an opposite nature. Investigations do not show that the Apples cannot be grown in sod. There are many orchards which prove the contrary. It is suggested, however, that Apples thrive in sod, not because of the soil, but in spite of it. The proof that there are many thrifty orchards in grass sod is not proof that these orchards would not do better under tillage.

The statement is often made that trees will become adapted to grass. There is nothing in the experiments conducted in this country or in the Colonies to indicate that such is the case. Trees planted in sod begin to show ill-effects even in the first year in which orchards are laid down to grass, and each succeeding year but adds to the injury. Trees can hardly be expected to become adapted to thirst, starvation, asphyxiation and poisonous excretions. *J. J. Willis, Harpenden.*

ROUND MISURINA.

In a high amphitheatre of desolation lies the little Pfalzgan Lake, surrounded on all sides but one by the northern precipices of Sorapiss and the long, steep slopes of ruin that fall yearly from the roseate pinnacles of Dolomite all round. It stands no higher, indeed, than Misurina, and at only three miles distance or so, to a flying crow. Alas, though, for those who are not flying crows, but must needs achieve the Pfalzgan on foot, by road and track! for these go winding level; along the hillsides, in and out of such deep bays and gullies that the true distance is quadrupled.

At first one drops over smooth meadow, all silvered in spring with the snow Crocus; then along through Pine woods to Tre Croci, which is the summit of the pass that leads down to Cortina and the Ampezzo Valley. Nor, though that valley, and the slopes below Tre Croci, abound, they tell me, with Cyripedium, is there one single plant or relic to be seen on this side. Lilium Martagon is rare in the woodland, and that is all, until at Tre Croci one diverges to the left from the road and enters on a level track that meanders round towards the Pfalzgan, in and out of the gullies in the northerly slopes and satellites of Sorapiss. Here is a sparse forest, its surface dappled with light and flowers—Anemone trifolia, and Ranunculus aconitifolus among the Ferns. On one huge fallen boulder like a church are Rhodothamnus and Saxifraga squarrosa; further on, by the path, an unexplained cushion of the Rhodothamnus all in flower.

Then the track goes skirting the cliffs, leaving the woodland behind. The grey, limestone-looking precipices are smooth and stark, facing north, and unvisited by the sun—so cold, indeed, that deep snowdrifts are still living in their colours and Rhodothamnus, thus low, still blossoming rosily from every chink. And in the narrow crevices I had expected abundance of Phyteuma omosum, remembering in what insistent profusion this plant haunts the cliffs behind the Ecloria Hotel at Cortina. For this Phyteuma, of all plants that live, is the collector's despair. It selects for its seed a crack of rock so microscopic as to be negligible, and this it gradually fills up with its yearly tatter-torn root stock, until the crevice vanishes and a muddy deposit of yellow wax seems to splay over the solid stone. And this is the body of Phyteuma, from which spring up defiantly its tufts of dark green, glossy leaves, and its head of monstrous, hyacinthine flower. Nor has the plant any amenities; other saxatile species, Potentilla

nitida, or Rhodothamnus, are often found between slabs of rotten, removable rock. In all my experience I have never found the Phyteuma, except in cliffs hard and impregnable. The places that it selects are positively ghastly. I now understand why it was that certain Italian collectors, whom at the time I comminated, were only able to send me mangled, mutilated trunks of this treasure. And so I was even relieved to find it quite a rarity on these northern cliffs of Sorapiss—leering at me here and there from precipices so blank and unbroken, that the Last Day, it seems, must leave the plant in situ.

So far, then, bad! I have seen nothing new except what was ungetable. Nor did a stone slope with seedling tufts of Saxifraga squarrosa do much to cheer me. But these huge Alps are incalculable in their surprises: with luck, one may hap on some undistinguished rock or bank abundant in a rarity not to be found again in all the range. So that on no expedition need one positively despair until one has got back, empty-handed, to the hotel itself. And now, as this Pfalzgan track winds up over deepening precipices round the high shoulder of the mountain, there in the sunless crannies hang long streaks and bands of Primula tyrolensis, rock-hugging, little tiny thing, twin brother in everything but ill-temper, to P. Allionii of the Mediterranean Alps. I have heard of Allionii impregnable as Phyteuma; and at first tyrolensis seems to threaten the same obstinacy. However, as we mount steadily upwards, there comes a corner where the Primula abounds on certain ledges whence it may be dislodged with only a moderate danger of death.

And soon we find ourselves in the little valley under Sorapiss. Great white ribs of bare rock stripe the ground, but are disguised by sparse woodland, whose existence at this height surprises, until we remember that, after all this trudging and tramping, we are really no higher now than Misurina, if, indeed, as high. Perched among huge boulders is the Refuge Hut, attended by a hearty old Italian Hebe almost as large as the hut itself. She is a jolly soul, with a twinkling eye and ready laugh that echoes far up and round in the grim wastes under Sorapiss. And while she flapped us up what she called an omelette, but proved to be a mere fluff of golden batter, I ferreted round and scanned the prospect. The hut stands on the last verge of kindly life. Beyond and all about there is nothing but a desolation of boulders, of skeleton torrent-beds, of shingly ridges and vast stone slopes ascending stiffly to roseate pinnacles and bastions of Dolomite. Naked, huge, and awful, Sorapiss impends immediately over a tiny emerald lake: across the unfathomed depth of the valley round which we came there stands the ridge of Misurina, and to its right the whole citadel of the Cadimense Spitze, a huddled crowd of spear points, threatening Heaven, and flowing away downwards in long skirts of scree and rubble. And here among the peaks the silence is terrible, broken only by rare little avalanches high above that fall in a dropping fire of gun-shots, ending in a soft, cascading rustle.

But this desolate land, where might be expected a hundred rarities, a select gathering of the austere little people of the hills, turned out to be surprisingly barren of interest. Rhodothamnus lavishly glowed indeed; the white stars of Anemone baldensis were silvery among the rocks; and in the highest shingles of all there were wide, fragrant cushions of Iberidella. But of nothing else a trace—that is, of nothing interesting, such as one had a right to expect. Here and there a Poppy; here and there an Edelweiss or a Clusian Gentian; but even Potentilla nitida occurred very rarely; there were no Androsaces; there were not even any new Saxifragas, except crustata; and at last, down by a torrent-bed, two or three miserable bits of oppositifolia. Now, is not this a marvel? Oppositifolia, an abundant limestone plant,

almost a typical lime-stone plant, and Aizoon, so common in all the Alps as to be even a monotonous weed—and here not to find a sign of one and only a sparse colony of the other! True it is that Aizoon riots on the granite, but who that has seen it equally rioting in every sort of garden, in every sort of soil or situation, could entertain a doubt of its flourishing everywhere in all the Alps? And yet here these promising slopes are wasted on crustata, with here and there a patch of cæsia or squarrosa. *Reginald Farrer.*

FLORISTS' FLOWERS.

CHRYSANTHEMUMS AT BATTERSEA PARK.

A good exhibition of Chrysanthemums of the Japanese, Pompon, and single-flowered sections is to be found at Battersea Park; indeed, the plants are in finer bloom than in any previous year. Of newer varieties the following were remarked on a recent occasion: Master James, Japanese, florets bright crimson, with the reverse of the florets the tint of old gold; Mrs. C. H. Totty, Mrs. W. Knox, Hon. Mrs. Acland, a rich yellow, fine for cutting; Bronze Pacram, scarlet, semi-double; Lady Henderson, a massive flower with curling petals, apricot-yellow, flushed with red; Eureka, Mrs. Norman Davis, Mme. A. Brun, an anemone-flowered variety of a creamy-white colour; Mme. Powell Cotton, with florets crimson coloured on the upper side, and dull yellow on the reverse; Mrs. H. Eland, Lady Letchworth, a yellow-flowered Japanese variety, with curling florets; Mrs. White Popham, a blush tinted flower with a white centre; Daphne, a fine yellow Japanese variety; The Lion, a flower of yellow and scarlet, with incurving florets, and Viscount Cranbourn, a showy crimson Japanese; and less modern varieties in large numbers. The shady side of the roof was bedecked with large, semi-double, single, and Pompon varieties than has been observed heretofore, with the effect of adding greatly to the attractiveness of the display.

GERMAN AS COMPARED WITH ENGLISH- RAISED DAHLIAS.

It is obvious in reading the German gardening journals that the objects of German Dahlia raisers differ in many respects from those of breeders of the flower in this country; and expression is given to the belief that we, in this country, are reactionary in preferring and improving the colouring and form of the Show, Fancy and Cactus type solely. In our modern varieties the usefulness of the flower as a decorative subject falls more and more into the background owing to the frailty of the blooms, and very often it has become of exhibition value only.

According to a report in a German contemporary of the recent Leipzig Dahlia Exhibition, the chief value of the Dahlia consists in its properties as material for bouquets and other floral devices, its decorative use as a garden flower being held to be of secondary importance. Therefore the value of the plant in Germany is estimated mainly by the colour and enduring properties of the flowers, the plant's floriferousness, and only lastly by the shape of the flower.

What is most needed amongst Dahlias for cutting purposes is not an increase of varieties, but a reduction of them, and a sorting-out of the less valuable from the mass, a work which a Dahlia society should take in hand, and carry out thoroughly. Of novelties, those of English origin are passed over in the report, for the reason that we take small or no notice of those raised in Germany.

Of collarette varieties at Leipzig, the following are mentioned, viz., Peary, a flower having a clear, violet suffusion at the margin and a violet collar; Dr. Cook, with velvety, dark

purple outer florets, and collar florets with golden points or tips; Bajadere, brownish-purple with carmine tips, and brown collar; Burgermeister Seifert, dark purple florets with a canary-coloured frill; Princess Charlotte, with blooms of the largest size, coloured deep scarlet with a yellow collar; Prinz Karneval, with white inner and outer florets, the collar florets being of port wine colour in stripes. All the varieties mentioned above form durable vase flowers, and the plants are floriferous. They were shown by Mr. Paul Süptitz, Saalfeld.

Mr. W. Knopp, Rosdorf, showed a novelty in Poesie, with long-stalked flowers. Its value would be greater if the yellow, chamomile-bordered flower was of a fresher colour. Another variety shown by Mr. Knopp, Blaustrumpf, has that colour which is rare in flowers, namely, a deep violet. In the trial ground this variety proved very decorative, every flower standing up well above the foliage.

Mr. Otto Margot, Angustusburg, showed several flowers of a new, hybrid form, which the society passed over. But, as the forerunner of a new race, between the Gloria and Collarette classes, this hybrid, provisionally named Gardenia, is worthy of attention. The outer florets are of moderate size, milk-white, and form a kind of holder, from out of which rises a diadem or crown-like filling.

Messrs. Pape and Bergmann, Quedlinburg, showed new Dahlias, including Isabella, a small, ray-like, short-floreted flower borne on a long, thick stalk; the exterior is bronze, and interior yellow. Bergmann's Silber has an ivory tinge and is worthy of attention, the shape of the flower being very fine; a complementary variety is Bergmann's Gold. Modelle, whose ground colour is waxy-yellow and, exteriorly, rose coloured, is of the most perfect form. Other desirable varieties shown by this house were Phaenomen, one of the most floriferous, that excelled all its competitors in the trial ground at Frankfurt-on-Main in this respect, and, as a decorative plant, was acclaimed the best of the year; and Kohinor, a medium-sized flower with short florets of a scarlet colour, and possessing a good stalk.

Mr. Severin, Kremen, the raiser of Königin Louise, showed Curt Engelhardt, named in honour of the business manager of the Dahlia Society. It is a fine, well-formed bloom with ray florets, not too pointed, and of a colour reminiscent of Charles Woodbridge, ruby-red in the front, with the violet colour of the reverse side showing through. Like all blue ground coloured flowers, the effect is good in the sunlight. Selma Langer is a variety bearing a resemblance to Königin Louise, only somewhat smaller, tenderer and more flesh coloured.

Giant Dutch Dahlias were shown by Mr. C. Ansorges, Klein Flottbek, the best being Sonnenblume, golden-yellow; Erfolg, white spotted with red; Marie Müller, dark, velvety-purple; and Schwan, pure white.

Mr. Otto Mann, Leipzig, showed decorative varieties, including Vulcan, a rich red-orange, moderate in size, but a prodigious flowerer, notwithstanding that the plant is only 60 cm. in height. It might succeed as a pot plant. Desdemona is a flower of sulphur-yellow, with light yellow points to the florets. Telling is an autumn tint and in florists' work of some value is Harmonie, light rosy-salmon, with a centre of bronze. Othello is a flower of chestnut-brown and has short florets of good substance; Weisse Dame is amongst the best of the pure white varieties, the effect being heightened by the greenish centre.

As a matter of fact the Cactus Dahlias have the greatest value for the florist. Of similar tints are Götterfunke and Carfunkelstein (carbuncle). The first has the larger blooms and the second the smaller and finer rays, and it is also the dwarfer plant. Elfe, sulphur-yellow with white, belongs to the lovely Serpentine class, which, for changeableness of colour, as also for their pleasing form, are to be treasured. *F. Moore.*

COTONEASTER RUGOSA HENRYI.

At a recent meeting of the Royal Horticultural Society, Messrs. James Veitch & Sons staged an interesting collection of new and rare trees and shrubs. Amongst these a fruiting specimen of *Cotoneaster rugosa Henryi* was prominent. It is a Chinese shrub, one of Mr. E. H. Wilson's introductions for the Chelsea firm. The plant is evergreen, with slender, arching shoots and bright green, lance-shaped leaves, deeply veined and feathered on each side of the mid-rib. The creamy-white blossoms are borne profusely in clusters in early summer on the

in the autumn, cut sprays keeping in a fresh condition for several days. Indeed, a spray which had been left out of water for over 12 hours looked almost perfectly fresh at the end of that time. *J. Weathers.*

NOTES ON IRISES.

IRIS ALBO-PURPUREA.

It does not seem to be generally known that the wild type of this species is one of the finest Irises of a real blue colour. The plant, origin-

leaves, which have not the distinct midrib of *I. laevigata*, and which do not clasp the base of the stem, the plants agree closely with Mr. Baker's description, and this was also the case with some double monstrosities either of a grey-blue or of a deep indigo-blue colour. This last is the albo-purpurea cornelia of the Japanese nursery firms. The method by which these double forms are obtained still remains a mystery, and at the same time it is almost incredible that the artistic sense of the Japanese can tolerate these shapeless varieties, when the wild type has beauty of form as well as richness of colour.

It is unfortunate that Mr. Baker gave a colour-

FIG. 148.—COTONEASTER RUGOSA HENRYI: FRUITS CRIMSON.

shoots of the preceding year. In due course they are succeeded by clusters of brilliant crimson fruits, as shown in the illustration at fig. 148. The individual fruits are roundish, as many as 40 to 50 are borne in each cluster, and each fruit contains two or three flattened seeds.

Grown against a wall, or worked on a tall stock to give a weeping effect, this *Cotoneaster* produces a very ornamental effect. It should prove hardy in most parts of the kingdom. A noteworthy feature is that it is excellent for decorative purposes, in vases, jars, &c.,

ally described by Mr. Baker and figured in the *Botanical Magazine* (t. 7511) as having white flowers delicately mottled or dotted with blue, always looked to me like a hybrid when I saw it growing in the tank that used to stand at the end of the herbaceous ground at Kew. After several attempts, I have at last succeeded in obtaining plants from Japan, which blossomed this summer, and produced splendid flowers of a deep blue colour, with a small, yellow signal patch at the bend of the falls. In the structure of the flower-spike and in the yellowish green

name to this species, but it is undesirable to multiply synonyms, and it seems best, therefore, to follow the Japanese authorities in keeping *I. albo-purpurea* as the name of the species, and in making the Kew plant *I. albo-purpurea* var. *Bakeri*. As to the further point of the identity of *albo-purpurea* with the *laevigata* of Fischer and Meyer, I shall hope to have more to say next year, if some plants of the latter which have just reached me from Russia are kind enough to flower. *W. R. Dykes, Charterhouse, Godalming.*

FURCRÆA BEDINGHAUSII.

THE *Furcræas*, which were formerly known as *Fomeroyas*—that title having been given them in honour of a celebrated French chemist, M. Fomeroy—are noble plants when in flower. Natives of Mexico and tropical America, they cannot be grown out-of-doors, except in the warmest spots, in these islands. They resemble *Agaves* in dying after they flower. *F. Bedinghausii* was introduced by Roezl, in 1860, and was originally named after him. It first flowered, however, in the garden of M. Bedinghaus, at Mons, and was thereupon renamed *F. Bedinghausii*. The plant represented in the accompanying illustration is the produce of a bulbil brought from Mr. Howard Fox's garden at Rosehill, Falmouth, eight years ago. The length of the stem is 16 feet 6 inches, and it has 72 branches, the longest of which is 4 feet 3 inches in length. The flowers, which are greenish-white in colour and pleasantly perfumed, are an inch and a half in diameter. The blossoms are followed by bulb-like growths, by which the plant is readily propagated. This species is often confounded with *F. longæva*, but the two are perfectly distinct. In *F. Bedinghausii* the stem rarely, if ever, exceeds 20 feet in height, but in *F. longæva* it often attains to 50 feet and the drooping branches are from 12 feet to 15 feet in length. The specimen illustrated was grown in a pot for three years and was then planted out on a steeply-sloping, grassy bank, just over the salt water at the mouth of the river Dart. *Furcræas* succeed splendidly in the Isles of Scilly, and are often to be seen in flower in Mr. Dorrien-Smith's garden at Tresco Abbey. Where the weather is too cold for their culture in the open, they form stately objects in large conservatories. There are fine examples at Kew, where they are grown with the *Agaves* in the temperate house. There are in all about 20 species of *Furcræa*, the best known of which are *F. longæva*, *F. gigantea*, which latter is cultivated largely for the sake of its fibre in India, Ceylon, and Mauritius, and has a flower-scape about 50 feet in height, and *F. cubensis*, which is also widely cultivated as a fibre plant and which has a variegated variety known as *F. Lindenii*. *Wyndham Fitzherbert*.

RENOVATION OF WALL FRUIT TREES.

It happens frequently in gardens when fruit trees are cultivated against walls, that the adjoining border is cropped with vegetables, and hence, in course of time, the cropping of the ground impoverishes the roots of the fruit trees. In such cases steps must be taken to remedy the matter. The following remarks are intended chiefly to apply to Peach, Nectarine, Pear, Plum and Cherry trees. It is well known that Apricots are not so particular as to soil; indeed, a rich soil may be detrimental to their cropping, for it frequently occurs that a Peach or Pear tree shows signs of exhaustion, whilst an Apricot tree continues vigorous and in good health in similar conditions. As regards other kinds of trees, it is a good plan to trench the border every other year and work in plenty of good manure from the farmyard. An alley of 3 or 4 feet should be allowed from the wall, and as the trenching proceeds, any large roots from the trees should be carefully cut through and the severed pieces removed from the border. This operation will not only benefit the trees and tend to make them more fruitful by inducing fibrous roots to grow, but also tend to improve the crops which may be grown in the border which, if on a south aspect, will usually be cropped with Peas, Potatoes, Spinach, &c., required early in the summer. If the trees have got into a very bad state, however, something more will be required than this. Where this is possible, they will have to be lifted and replanted. In the first place a trench must be taken out round the base of the tree, at, say, 3 or 4 feet from the stem, according to the size of the tree, and the branches should

be tied together to prevent them from breaking. The operator should then carefully fork away the soil from under the roots and, when all is clear, lift the tree out of the hole on to the border, and make it secure. Take out of the hole as much of the old soil as may be thought desirable, and work in some good lumpy turf, with a little rotten manure. In the case of stone fruits, such as Peaches, Plums and Cherries, use a good quantity of old mortar or lime rubble and a sprinkling of half-inch bones. Thoroughly mix all these materials together, and put some in the bottom for the tree to rest on, making the same very firm. The stem should be inserted a little lower than it was previously, and when the tree is placed in position, work care-

FIG. 149.—FURCRÆA BEDINGHAUSII, FLOWERING IN DEVON HIRE.

fully some of the soil between the roots and ram firmly, taking care not to injure the roots. Continue until the roots are all covered in, spreading them out as the filling proceeds. When the operation is finished, the soil should be left slightly above the rest of the border to allow for sinking. The tree should be looped up to the wall with strong twine until the soil has settled down, and it may then be nailed or tied as the case may be.

The above remarks do not apply to very large or old, horizontally-trained Pear or Plum trees, which possibly would hardly stand shifting, but more to trees trained fan-shaped, or as cordons. A light mulch of half-decayed manure should be placed round the trees when the operation is

finished, and should the weather prove dry during the ensuing season, frequent waterings will be necessary.

The best time for replanting is just as the foliage is dropping and while the ground has a certain amount of warmth in it. The branches will also require attention, and these should be cut well back, leaving as much young wood near the base of the tree as possible, and shortening each piece back to a good wood-bud. Should the trees be infested with scale or aphids, they should be well washed with some approved insecticide at least twice, and the wall should be scrubbed down. This may appear to necessitate a lot of trouble, but a tree cannot be healthy unless it is thoroughly clean. A frequent cause of red spider is poorness of the rooting medium, whereby the tree becomes starved and an easy prey to this pest.

It is desirable to syringe the trees daily when starting into growth, and also again when the fruit has been gathered. The growths should also then be untied and allowed to hang loosely, so that, being exposed to the sun and air, the shoots may have a chance to ripen, for, failing this, a full crop of fruit cannot be expected the following season. *R. Thatcher, Wistow Hall Gardens, Leicester.*

FORESTRY.

THE REPORT ON THE FORESTS OF BRITISH EAST AFRICA.

It is to be hoped that the British Government will see its way to adopt forthwith the various proposals for the preservation of, and improvement in the forests of British East Africa which are set out in the able Report of Mr. S. E. Hutchins, which was summarised in these pages on November 6. That the forests are vital to the well-being of the colony is admitted on all sides, and delay in instituting proper control over the forest areas means more destruction, which at the present moment is going on at an alarming rate.

There exist in the British East African Protectorate about 2,000,000 acres of good forest, most of which is situated in what is known as the highland, which are between 5,000 and 6,000 feet above sea-level. Judging from the value of similar forests in South Africa, the forests of the Protectorate should be worth about £20,000,000. The various causes that are at work destroying the existing forests are the grass fires that sweep the plains and the wasteful cultivation by the natives. In one forest only the natives have destroyed, in recent years, 350 square miles of forest by fires and wasteful cultivation. Wandering into the forest, they cut down or burn the trees; they cultivate the cleared patch for a few years, until the rains wash away the fertile soil, and then, moving on, make a new clearing. The coarse grass then spreads over this deserted land, and renders it useless for forest purposes in future, either by reconversion into forest by natural regeneration or even with the help of man. Mr Hutchins recommends remedies for this which are shortly set out below, and also advises no further alienation of forest land, which usually means destruction of the forest, and better management of what is known as the "railway forest zone."

This is the forest on each side of the Uganda Railway, which is kept for the supply of fuel and for other railway purposes, and he points out how important it is that this should be maintained for the use of the railway only, as no coal has as yet been found in the colony, and wood fuel is far cheaper than imported coal. On this point the writer of the Report makes the suggestion that the wood might be conveniently carbonised and made into briquettes, thus diminishing the number of fuel trains employed and increasing the calorific properties of the fuel, is

making it weight for weight and bulk for bulk superior even to coal. There would also be certain valuable by-products produced by the conversion, viz., wood vinegar, creosote and tar. He also suggests that the forest should supply, besides the entire hauling power of the railway, as it does now, its sleepers and building material, which up to the present, at great cost, have been made of imported material, chiefly metal and corrugated iron.

At the present moment the revenue of the forests amounts only to £14,000 per annum, but Mr. Hutchins estimates a large increase when more of the forest comes into use, and he suggests that the Government should spend at least £16,000 a year, which is only £2,000 in excess of the present revenue, and, considering the great interests at stake, would be money well invested.

To prevent the continuation of the two main

strongly the present method so prevalent of putting up corrugated iron houses, which in that climate he describes as "an obvious public evil," being expensive to keep up, damp, and unhealthy to live in. As to the development of the export trade, he tells us that it is to South Africa, where one and a half million pounds worth of timber is imported annually, that British East Africa must look for its chief market. Here, though we are met by two big difficulties, first the railway rate to the coast, and, secondly, the import duty in South Africa, which amounts to about 12 per cent. He suggests remedies for these in the establishment of a low railway rate for colonial and Government timber of $\frac{1}{4}$ d. and $\frac{1}{8}$ d. per ton per mile respectively on the Uganda Railway, and the admittance of the B.E.A.P. to the South African Customs Convention, so as to remove the existing import duty.

COPROSMA ACEROSA.

This genus has its headquarters in New Zealand, where it forms a large proportion of the shrubby vegetation and often makes dense, impassable thickets. The members are very variable in habit and stature, but most agree in having a disagreeable smell when bruised, which earns for them the generic name, which signifies a smell of dung. In *C. fetida* the odour is especially pronounced. With few exceptions *Coprosma* is not a genus of horticultural interest, for the flowers are inconspicuous, and many of the species are not at all hardy. *Coprosma acerosa* is one of the exceptions and for three consecutive months, September, October, and November, it is one of the prettiest plants on the Glasnevin rockery. Planted in a pocket, it forms a low, prostrate shrub hanging over the stones for about 2 feet. A perfect maze is formed by its thin, flexuous, wiry branches, which interlace one with another; but the beauty of the plant lies in the pale blue, translucent berries, which are freely produced on the wiry, brown shoots. The berries or drupes assume a violet tint before dropping. They are oval in shape, a quarter of an inch in length, and contain two seeds which lie with their flat surfaces together. The leaves are small and narrow, about a quarter of an inch long, so that the fruit is not hidden as in many berrying plants. There is, apparently, another form of this plant, which seems more abundant throughout Ireland than the one described. The berries are produced very sparsely, and therefore the main charm of the plant is lost. It has the same trailing habit, but the growths are stronger and the wood is yellow.

Another small *Coprosma*, named *C. Petriei*, recently introduced from New Zealand, is growing well in Ireland, and gives fair promise as a rock plant. It makes a dense cushion of greenery as neat as a Thyme, and should be a good plant if it will produce its purplish fruits in this country. *Coprosma Cunninghamii* and *C. lucida* are grown outside at Glasnevin against walls, and reach about 12 feet in height. The latter, with its glossy, green leaves, is an ornamental evergreen to be grown by those blessed with a milder climate than that of Glasnevin. *C. F. Ball, Glasnevin, Dublin.*

STREET TREES.

THE Lime, the Plane, and the Chestnut are three beautiful trees for avenues, but are they the most useful for the purpose of forming avenues in town streets? One has only to visit a large town during August to see how great a failure the Lime and Chestnut are when planted in the streets—many of the leaves have fallen, and the streets, so far as the trees are concerned, have almost a winter aspect. I have seen the trees in London leafless while the people under them sweltered in the early September sun. Only those who have to plant street trees know how this senseless mistake comes to be so often repeated. The subject of planting a new street comes before the town council. Mr. A. proposes Limes. Mr. B. shows a preference for Chestnuts; Mr. C. points out how well Planes grow in London. The merits of the three trees are debated and the result is usually a compromise—a few of each. These trees will suit the street, but it is never considered as to whether the street will suit the trees. Unfortunately, this seems to be the fate of every town in England—they must either have Limes, Planes and Chestnuts, or remain treeless. Some enterprising council must some day or other demonstrate to the world that there are other trees for avenue planting than the Lime, Chestnut and Plane, not better, perhaps, for forming avenues, but better suited for avenues along paved and dirty roads.

With a soot-laden atmosphere such as obtains in London, the "town forester" has very little chance: he must have trees capable of

FIG. 150.—COPROSMA ACEROSA, FRUITING ON THE ROCKERY AT GLASNEVIN.

causes at work on the destruction of the forest, namely, fire and wasteful cultivation, he suggests, first, the formation of a white settlers' zone round the best forest areas. He describes this area round the Kenia and Aberdare forests as "the pearl of the Protectorate from an agricultural point of view," and says that white men should be induced to take farms all round the forest, which would serve the double purpose of policing the forests from the natives, and showing them the advantage of permanent cultivation; and, secondly, he recommends proper demarcation of the forests with clear, well-defined boundaries to prevent further alienation.

As to the development of the forest industry in the colony, he would encourage this by putting an increased Customs duty on all imported timber and corrugated iron, for he deprecates most

He finally maps out a scheme for the reorganization of the Forest Department, which it is impossible to enter into here in detail, but the essentials of which are the formation of a forestry department, with a body of well-trained, practical foresters. In order to effect economy in the forestry management, Mr. Hutchins recommends that the buffalo and elephant should be used for the haulage of timber. The author recommends that the Forest Department should import and breed tame buffaloes and use them for forest work, as is done in Southern India, also that the African elephant should be tamed and used, as is done in Burmah.

The Report is full of the most instructive and interesting information, and, if adopted, should be of inestimable benefit to the present and future well-being of the colony.

withstanding the ungenial conditions. London must plant the Plane (why does she plant so many Limes and Chestnuts?), but it does not follow that the rural towns should confine themselves to a servile imitation of London.

There has always been a steady demand for the three orthodox trees, and naturally this demand has created the supply, with the result that when one wishes to break away and plant other trees he is confronted with the almost insurmountable difficulty of obtaining suitable trees—not of a suitable species, but trees grown in such a way as to fit them for their special positions. The street tree must have a straight clean stem of not less than 6 feet, and must therefore be specially prepared in the nursery.

Until the demand makes the supply, there will always be this difficulty. Paris, the City of Boulevards, was for years hampered by the same difficulty; she led the way out of it by growing her own trees, and is no longer governed by a nurseryman's stock. Immense municipal nurseries have been established, where the trees are grown and prepared for their special positions. She looks into the future, sees where trees will be required, takes account of the soil, aspect, &c., and sets to work to grow suitable trees for her requirements.

The stock is pruned and trained with a view to suiting its permanent quarters, and when the time arrives for transferring it to the streets, each tree is lifted carefully on a specially-constructed, transplanting wagon and taken to its final quarters. Trees thus treated may be planted of a much larger size than when they have to come from a distant nursery, the roots do not suffer from long exposure to the air, there is no damage from long and rough railway journeys, and the trees, being large and planted with a good ball, form in the first season a beautiful avenue, luxuriant and symmetrical.

The ground of these nurseries was at one time poor, arid, and sterile soil, but to-day it is one of the most fertile tracts in Europe, owing to the system of using the best of the road sweepings for top-dressing. Year after year layers of dung-laden sweepings are deposited between the trees, and become gradually part of the general compost.

Pen. (To be continued.)

The Week's Work.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslade, Sussex.

Magnolia.—The different species of *Magnolia* may be planted at the present time and, in order to ensure as long a display of bloom as possible, it will be as well to plant the trees in various positions and aspects, selecting the more protected situations for the early-blooming and more tender varieties. In most cases, but especially on heavy land, it is necessary to apply manure and lime rubble. The earliest to bloom is *M. Campbellii*, a species which has only flowered in a few gardens, but which may ultimately be more satisfactory, since it is evident it does not bloom until it has attained a considerable size. *M. Campbellii* should be planted in a sheltered border, or, if this is not available, in a position where the plant will be sheltered from cold winds. The flowers are 7 to 9 inches in diameter, and of a very pretty shade of rose-pink. *M. conspicua* and *M. stellata* flower with the greatest freedom, and are perhaps two of the most popular species. Others include *M. Kobus*, *M. Lenne*, *M. Lenne superba*, *M. tripetala*, *M. cordata*, *M. Thomsoniana*, and *M. grandiflora*, with the giant variety of the last-named species, *M. g. Goliath*, introduced by Messrs. Smith & Son, of Guernsey. *Magnolias* require to be staked very securely, in order that they may not be swayed in the least by winds, to which, owing to their large leaves, they are more than usually subject. *Magnolia glauca* is valuable for the marsh, and it flowers there very well in late summer. Pruning should be done directly after the flower season.

Tree Peonies.—*Peonia arborea* and its varieties furnish some of the most glorious flowering shrubs; they may be planted now as opportunities occur. If buds are to be planted, the soil should be enriched with some good fibrous loam, leaf-mould, and manure. The plants should be put in the soil rather deeply, that is, below the

point where the graft was inserted. Any suckers that may subsequently appear must be pulled off. If, after wet weather in spring, frosts seem likely, it will be desirable to cover the tree *Peonies* with some light material such as litter during the growing season the plants require a generous supply of water.

Herbaceous Peonies.—These may be planted in the herbaceous border or in beds, and they may be mixed with other suitable plants that will flower at a later period.

Herbaceous borders.—Frost having put an end to all the flowering plants of a soft nature, let them be cleared away, but be careful to tread upon the borders only during dry weather. If the borders contain many spring bulbs, it is necessary to clean the soil about them and apply a thin mulch of manure, taking occasion to fill any vacant spaces with fresh bulb or new plants. If any new borders are in process of making, let the planting be done in dry weather; do not allow the men to tread upon the soil without using planks. *Montbretias* may be taken up, divided, and planted in rich soil, moving the smaller bulbs to the nursery for growing on into a flowering size. If repeatedly treated in this manner, they will grow as strongly as *Gladioli*.

Protection.—Prepare in readiness such materials as Heather, dry Bracken and Peat for covering tender plants on the approach of frost. Everything appears to be ill matured this season, therefore it is more likely to suffer from frost. A good mulch placed over the roots is an excellent preventive of harm.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Early Peaches and Nectarines.—Assuming that the wood on the earliest permanent trees is thoroughly ripened, they may now be started gently into growth. For the first week or two do not use fire heat unless such heat is necessary to maintain the temperature from falling below 45°. I have mentioned before the advantages of growing the earliest Peaches and Nectarines in pots; especially is this so in a season like the present, when the wood of most trees is not so well matured as usual. The wood and buds on the pot trees are perfectly matured, and they can be placed in the forcing house without delay. This admits of postponing the forcing of permanent trees to a later date, when the risks of failure are not so great. It also lengthens the season of supply, which is a matter of much importance in districts where Peaches cannot be successfully grown out-of-doors, and in gardens where glass accommodation is very limited. When well grown, the fruit from pot trees is very little inferior to that obtainable from permanent trees. For very early forcing, trees must be used that have already been forced more or less for several years. Varieties that are known to be good forcers should be selected for this purpose. See that the trees are quite clean before placing them indoors, and any pruning that is necessary should be carried out. This latter operation will consist chiefly in shortening any extra strong shoots to a wood-bud, cutting out weak, useless branches, and regulating the fruiting wood so that light and air can penetrate through the trees. The proper symmetry of the trees must also be considered during this operation. A light house, facing south, will be most suitable for their culture; but if such a house is not available at the moment, ainery which has just been closed will afford suitable conditions until the trees come into flower.

Late Peaches.—The pruning and training of these must be persevered with whenever opportunity offers. The appearance of old-established trees may be very much improved by the judicious thinning of the old branches, and the consequent training-in of more fruiting wood. After thoroughly washing the house, loosen the branches from the trellis, and cleanse them with a solution of soft soap and sulphur. Should the trees be affected with scale, add a little slaked lime. In tying-in the trees, guard against overcrowding of the wood. When all the cleaning and tying is finished, and the walls limewashed, the borders may be carefully forked over, and about 2 or 3 inches of the old soil removed, applying afterwards a good top-dressing of loam, with a liberal addition of old lime rubble and wood-ashes mixed with it. In the case of old

trees, some crushed bones or artificial manure may also be added. The trees must be given a period of rest before starting them into growth, therefore the houses must be thrown wide open, so that they may, as far as possible, be exposed to outside conditions. The roots must not be allowed to suffer for want of moisture, and established trees will be benefited with one or two applications of drainings from the farmyard.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Buford, Surrey.

Masdevallia.—Many of these plants that were repotted during September will now be rooting freely and making fresh leaf growth; but they must be watered still very sparingly, as any excess of moisture will result in the loss of many leaves and roots. Black markings and spots are often seen on *Masdevallias*, the principal cause of these being over-saturation at the roots, or an excess of atmospheric moisture during cold, dull weather. Now that it is necessary to use a little fire-heat, care must be taken to prevent aridity in the atmosphere, but much depends upon the situation and construction of the house. Should it be in a dry, exposed position, a moderate syringing between the pots both at morning and afternoon will be necessary; but if it has a north or north-easterly aspect, only one damping in the morning should be given. *M. tovarensis* is now developing its flower-spikes of white flowers, these being arranged on the top of a stem varying in length from 4 inches to 8 inches, therefore they are held well above the green leaves. Being a compact-growing plant, and very free-flowering, *Masdevallia tovarensis* is a valuable, decorative subject. If the plants are placed in a cool, shady position in almost any house having an intermediate temperature, the flowers will remain in good condition for five or six weeks. The grower should remember to remove the plants from the house when using the X.L.-All vaporising compound, or the fill-form tops of the blooms will quickly change to pink. If the fresh spikes are not cut below the scape from which the flowers are produced, they will again send out flowers next year; but to let them remain for two seasons tends to weaken the plant, therefore, it is better to remove them as soon as the flowers fade.

Cattleya.—Among the few species of *Cattleya* which bloom at this season, *C. labiata* is undoubtedly one of the best, and now that some of the plants are passing out of flower, the amount of water at the root should be considerably reduced. After flowering, stand the plants in the cooler and best-ventilated part of the *Cattleya* house, where they may remain during their long period of rest. As regards repotting, those plants which require a larger pot should be attended to when new roots are seen pushing from the base of the last-made pseudo-bulbs; but if they are past that stage, repotting had better be postponed. The same remarks apply to *C. Gaskelliana*, a species that is now resting. Plants of *Laelia perrina*, *L. cinnabarina*, *Cattleya Bowringiana*, *C. Dowiana*, and its variety *aurea*, may also be repotted as they pass from the flowering stage. *C. Lawrenceana*, now in full growth, should be arranged well up to the roof-glass, exposed to full sunlight; small plants thrive best when suspended a few inches from the roof-glass. *C. Percivalliana* having completed its new pseudo-bulbs, should be kept moderately moist at the root.

Phalaenopsis.—Some of the *Phalaenopsis*, more especially *P. Aphrodite*, *P. amabilis* (*grandiflora*), and *P. Schilleriana* are developing their flower-spikes. These plants must now be watered with great care, large supplies being no longer needed. It is not good practice to dip the plants or otherwise saturate the compost, but rather to lightly spray the Sphagnum-moss and the sides of the basket. Specimens with long flower-spikes should not be kept too near to the roof-glass, or the ends of the spikes may decay. Our plan is to arch them over towards the light, and tie a small lead weight to each spike, so as to keep them in the required position. All the tender, green-leaved species, as *P. Luddemanniana*, *P. tetraspis*, *P. Marie*, *P. sumatrana*, *P. speciosa*, *P. rosea*, *P. Cornu-cervi*, and *P. violacea*, also require careful watering for several months to come; they should be protected from direct sunlight even in winter.

PLANTS UNDER GLASS.

By A. C. BARELETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Greenhouse Rhododendrons.—No winter-flowering, indoor shrubs are more attractive when in flower than the Javanico-jasminiflorum hybrid Rhododendrons, which are now on the point of swelling their flower-buds. To insure that the flower-trusses open freely, as well as to bring out the best colours in the flowers, the plants should be placed in a fairly warm house, and exposed to all the light available. Great care must be exercised in applying water to the roots.

Bourvardia.—The earliest batch of plants intended to flower should be allowed a temperature of 55°, and afforded fresh air as often as the weather will permit, the ventilators being opened without danger. Those plants that are on the point of flowering should be given liquid manure occasionally, and this feeding should be alternated with a little artificial manure dusted on the surface of the pots.

Salvia.—As the plants of *Salvia Pitcheri* pass out of flower their shoots should be trimmed in preparation for storing them in a frost-proof pit or greenhouse. Very little moisture will be required by this species for the present. *Salvia Heeri* and *S. gesneriflora*, neither of which will flower for some time to come, should be grown under cool conditions. Considerable warmth, however, is necessary at this season for *S. splendens* and its varieties, especially during cold and wet weather. The flowers are very liable to damp off when the plants are in a cool house. This species and also *S. rutilans* are benefited by frequent doses of liquid manure. If the old flower-spikes of *S. rutilans* are removed and the plants kept free from red spider, which often infests these *Salvias* in warm houses, a second crop of flowers will be produced in the early spring. *S. Bethellii* will continue to furnish a display of flowers for a considerable time to come if the plants are assisted with some manurial stimulant. It is best to group plants of this variety by themselves, because the colour of the flowers, although very beautiful, do not harmonise well with that of other species of *Salvia*.

Soil for potting purposes.—Arrangements should be made for securing a supply of loam for next year's use. The loam should be obtained from old pasture land, and it should be stored in stacks, placing the grass sides downwards. If it is of poor quality, a layer of decayed cow manure placed between each row of turves will be of benefit, otherwise it is better to stack the turves without any manure. A supply of leaf-mould should also be obtained. The best leaves for the purpose are those of Beech and Oak. Any twigs or branches should be thrown aside, as these are liable to introduce injurious fungal growths. It is best to place the leaves in rather thin heaps, so that there will be no heating from fermentation. The heaps should be turned periodically, in order that all the leaves may in turn be exposed to the air and rain, and thus assist decay. Unless this is done, many of the leaves in the centre of the heap will remain dry and hard, and useless for potting purposes.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Leaves.—All fall-n leaves should be collected and stored for future use. Leaves, when placed together in good beds, provide a warmth which is well suited for the bringing forward of the most early vegetables in portable frames. They do not generate an excessive heat, but are capable of retaining it for weeks or months. For preparing leaf-mould, the leaves may be turned over into a good heap, at the same time scattering a layer of freshly-slaked lime between them as the work proceeds. This will have a tendency to sweeten them and kill any insect pests. On heavy land, leaf-mould forms a valuable lightening ingredient, well suited to most kitchen-garden crops.

Potatoes.—For supplying early crops, a portion of the selected tubers should be laid out thinly, on suitable trays, on a little leaf-mould or manure from a spent Mushroom bed. These should be stood in a warm house, in a light position, and syringed daily to start them into growth. When the shoots are about an inch or 1½ inch in

length, all the weaker ones should be rubbed out, leaving only the one which is strongest. The most convenient method for the earliest supplies is to grow them in 8-inch or 10-inch pots, placing three tubers in each pot. Each pot should be made only half full, leaving the remainder portion for earthing-up later on. At this season the mixture used should be of a very light, porous character. Sharpe's Victor and May Queen are each excellent varieties for treating in this manner. Tubers for successional plantings should be selected and laid out thinly on shelves in a frost-proof room.

Carrots.—The latest sowings made under glass should now be ready for pulling. These should be stored in sand; they are generally better appreciated for cooking purposes than the larger roots.

Seakale for forcing.—This crop should be lifted, trimmed, and stored in sand or ashes ready for introducing to heat as required, taking care to preserve plenty of rootlets for cuttings for next year's supply. Lily White is generally much preferred to any other. A fairly strong heat will still be required to start the crowns into growth. They should be kept in absolute darkness, and syringed twice daily.

Asparagus.—This is much more easily forced than most vegetables; fresh supplies should be introduced about every fortnight or three weeks. A mild bottom heat should be afforded.

Mushrooms.—Continue to make up beds at intervals to ensure a continuous supply. Freshly-made beds do much to stimulate those already bearing, and the warmth from the former in ordinary weather is quite sufficient to enable the growth to be made satisfactory. Only in excessively cold weather should the hot-water pipes be brought into use. There being plenty of material, the present is a capital time for making up beds in the open, but these will require to be covered with a good thickness of long litter.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Renovating an old orchard.—In the case of an orchard which has suffered neglect for some years, the question arises as to whether the trees should be grubbed and destroyed, or an attempt made to bring them into a profitable condition. The answer must depend on the present health of the trees. Supposing them to be still strong and vigorous in growth, and of serviceable varieties, they will be likely to respond satisfactorily to judicious thinning of the wood and manurial assistance at the roots. One often sees orchards in which all the work the cultivator considers necessary is that of picking the fruit, which deteriorates from year to year until it will scarcely pay for the labour of gathering. Apart from the direct loss in value of a neglected orchard, its presence is injurious to neighbouring trees, serving, indeed, for the nursing and distribution of insect and fungus pests. The present is a capital time to take such an orchard in hand, getting the work forward before the worst of the winter weather is upon us. The first step in pruning is to clear the centre of the tree of dead and useless small wood. All pieces which cross each other should next be taken out, and the tree should be left thin enough for the sun and air to penetrate to every part. The habit of the individual tree will be the best guide as to the proper amount of wood to be removed. If the tree is an upright and sturdy grower, it is a simple matter to thin out the weakest growths; but when the tree is of pendulous habit, it is often a dense thicket of small, dead wood. Every piece of the latter must be removed, and also the weak, under branches, which should be cut back to the trunk, the workman depending on the younger wood to furnish the space thus provided. Inferior varieties will have been noted during the fruiting season. If these are fairly vigorous, they may be headed down at the present time for grafting next year, it being undesirable to cultivate any but varieties of real merit. If a tree is aged or crippled, it should be grubbed out. Where old trees have been removed, it is not advisable to plant again in exactly the same places occupied by the former specimens; but if there is not choice in the matter, the old soil must be excavated, and young

trees planted in some fresh compost. When the pruning is completed, all the prunings should be burnt at once in order to destroy the insects and their eggs lurking in the bark and crevices of the wood. The ashes should be returned to the soil as a top-dressing when finishing off the work. The trees should be thoroughly cleaned of moss and lichens. The old method of applying slacked lime on a damp day has given place to the spraying machine, of which there are several good makes on the market. By means of these machines the concentrated alkali wash should be sprayed on to every portion of the tree, repeating the operation about the end of February, to make certain of destroying all the pests. The turf under the trees should be dug in from the trunk to a yard or two beyond the spread of branches. Apply a good top-dressing of lime, following this up with a heavy mulch of farm-yard manure. If the work is done thoroughly, good results may be confidently looked for in a year or two, and will amply repay the expenditure on labour and material.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of City Parks, Cardiff.

The public rock-garden.—In many parks where collections of different classes of plants are represented, an attempt is made to reproduce the ecological conditions best suited to the successful culture of rock-loving plants. The outcome of these attempts vary in appearance from the haphazard heaping together of rough stones, clinkers or brickbats, in the form of the crude, old-fashioned rockery, to the more elaborate and realistic imitation in miniature of a ravine or a part of a mountain pass, where outcropping rocks arranged in regular strata are more or less truthfully represented. While it must be admitted that Alpines are more often than not cultivated on the former kind of stonework, it is satisfactory to note that in the majority of the botanical gardens in this country the rock-garden is constructed on fairly natural lines.

A suitable site.—In parks where a necessary site is to be obtained—preferably where a water supply can be easily brought into use—there can be no two opinions as to the great advantages of laying out a rock-garden of fair size. It is invariably found that such places when well designed and judiciously planted are not merely of interest to the enthusiastic plant lover, but are, especially in the spring months of the year, a source of great attraction and delight to the ordinary visitor who cannot even appreciate the difference between choice Alpines and ordinary border plants.

Construction.—The success of a rock-garden (whether regarded as a plant habitat or merely as a geological representation) depends upon the observance of certain well-known principles. In the construction of a rockery in a public park other factors which do not obtain in the ordinary private garden have to be taken into consideration if it is to give the greatest satisfaction. In the first place it is very essential that all the walks in the former case should be of ample width, well made and well defined. It is very much better to have one good main walk than a number of narrow winding paths leading needlessly from point to point, for these only afford visitors an excuse for wandering into places where they are not wanted. The pleasures of a rock-garden in a private establishment are greatly enhanced by the provision of rustic seats, retreats, nooks and corners, and secluded grottos, but such adjuncts in the public grounds have to be rigidly tabooed.

Management.—Again in the park rockery (when not attached to a botanical garden) the great aim is to produce a number of more or less spectacular effects in succession throughout the early part of the year, hence great quantities of the same species of plant have to be grown together, and the same kind of plant is used over and over again in different parts of the ground. As numerous visitors are naturally anxious to find out the names of the plants which arrest their attention, it is almost necessary, as far as possible, to have every different species labelled. Although labels are usually regarded as an offence to good taste, they must not only be tolerated but even encouraged in public parks.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, NOVEMBER 23.—
Roy. Hort. Soc. Com. meet. (Lecture at 3 p.m. by Mr. J. A. Alexander, on "Spices").

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—41.9°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, November 17 (6 P.M.): Max. 43°; Min. 36°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, November 18 (10 A.M.): Bar. 30.1; Temp. 45°; Weather—Sunshine.

PROVINCIALS.—Wednesday, November 17: Max. 44° Cambridge. Min. 38° Scotland N.W.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

WEDNESDAY—
Herbaceous Plants, &c., at 12; Roses at 1.20; Palms and Plants, at 5, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—
Choice Established Orchids in large variety, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Horticulturists have been accustomed to confine the term "Chinese Primulas" to the well-nigh endless varieties of *Primula sinensis*; but, since the recent introduction of so many new species of *Primula* from Western China, and because of the expectations that many more have yet to be introduced, the term "Chinese Primulas" must be extended to embrace all these attractive novelties. Our readers are already familiar with a number of Chinese and Tibetan *Primulas* introduced to Britain by Mr. E. H. Wilson, whilst travelling for Messrs. Jas. Veitch & Sons, and by Mr. George Forrest, the representative of Messrs. Bees Ltd. Two of the most striking of Mr. Forrest's introductions are depicted in our Supplementary Illustration, and others we propose to reproduce on subsequent occasions. Thus it will be possible for cultivators to form an adequate idea of the beauty of these plants in their native habitats. The following information referring particularly to their appearance and characteristics in China is based upon notes taken on the spot by Mr. Forrest.

PRIMULA LISTERI, KING.—This species was first found on the slopes of the Sikkim Himalaya, and is the *obconica* type of that region. Many years later it was rediscovered by Père Delavay on the range of mountains forming the western boundary of the Tali Valley, in the basin of the Mekong, lat. 25, 40° N. It appeared so closely allied to *Primula obconica*, hence, that M. Franchet, in his determination, placed it as a variety of that species, with the varietal name of "glabrescens." Later, the plant proving to be identical with *P. listeri*, the variety was sunk.

It is a smaller and much more graceful

plant than *P. obconica*, and, being almost completely glabrous, might be grown to advantage where *P. obconica* is discarded owing to the irritation it causes to many who handle the plants. The foliage is never more than 4 inches in height, the scapes number eight to fourteen in well-grown plants, rising as much again above the leaves. The flowers, numbering four to eight to a scape, are of large size and faintly fragrant; the whole plant has a decidedly bitter aromatic odour, somewhat resembling that of *Geranium Robertianum*.

There is great variation in the colour, all shades of rose-lilac and lavender down to the purest white being represented. This variation appears to be caused by different degrees of nourishment. Those plants bearing white flowers had much paler foliage, and were only seen in comparatively barren situations on dry limestone pasture, whilst those with flowers of the deepest shades of colour flourished on rocks where there was an abundant and constant supply of water. The figure reproduced in the Supplementary Illustration is from a photograph of one of a large mass of plants growing in such a situation on the face of a cliff, deeply embedded in moss.

The species is fairly plentiful on both the eastern and western slopes of the Tali Mountains, at altitudes varying from 7,000 to 10,000 feet. Apart from its natural beauty, the fact of its blooming so early as March or April should make it valuable to horticulturists.

PRIMULA VINCEFLORA, FR.—Amongst the *Primula* which have been introduced in recent years from Western China, those contained in the remarkable section "Omphalogramma" stand alone, distinguished alike by their beauty and unique form. The name given to the section is derived from the oval and flattened form of the seed, which has much the appearance of belonging to the *Irideae*; certainly no one with a knowledge of the form of seed usually found in *Primulas* would suppose at first sight that the seed belonged to that genus.

Three of the known species of the section have their homes on those wonderfully prolific foothills of the Himalayan system which descend into N.W. Yunnan, and form the continuations of the huge water systems of the Salwin, Mekong and Yangtze rivers. Their names are *Primula Franchetii*, Pax, *Primula Delavayi*, Fr., and *Primula vinceflora*, Fr.

The two species last mentioned were discovered by the late Père Delavay. *P. Franchetii* was found by another member of the same mission, Père Soulie, also a keen botanist and collector. Monsr. Franchet, who described most of the collections made by Père Delavay in the regions from which the above species came, was so impressed by their singular appearance and the form of the seed, that he formed of them a sub-genus, which Messrs. Pax and Knuth, in their recent monograph of the *Primulaceae*, retain as a section.

Each of the species mentioned has a distinct beauty of its own. That with the largest flowers is *P. Franchetii*. Its blooms—solitary, as in all known species of the section—are fully 2 inches in length, the expanded limb being almost 2 inches in breadth, of a deep, rich, violet colour, shading into the yellowish corolla base. The first habitat known was on

the mountains around Ta-t sien-lu, but the species has since been rediscovered on the ranges forming the watershed between the Yangtze and Mekong valleys in lat. 28° N. *Primula Delavayi*, Fr., resembles *P. Franchetii* in all sectional peculiarities, but is not nearly so imposing a plant, being smaller in every way, the deep fringing of the ruddy-purple corolla constituting its most conspicuous feature. Though local in its distribution, it is fairly common on many of the ranges in the basin of the Mekong.

Both these species are generally found growing as solitary specimens in scattered groups. *Primula vinceflora*, Fr., appears in its native habitat by far the finest of the three. It is a taller plant than the others, some specimens attaining a height of 14 inches. Also, it grows in masses of 20 to 30 plants together. The flowers are of a beautiful, deep indigo-purple shade, the tube narrowly cylindrical, yellowish at base, the limb very widely spread with the three upper lobes reflexed on the tube. This last peculiar character is not noticeable in dried specimens, and, probably for this reason, M. Franchet has not remarked on it in his description. Nevertheless it is quite constant, and is shown most perfectly in the accompanying figure of the species in situ. None of the many *Primulas* can compare in beauty with this interesting plant growing in its natural habitat, which is sheltered, grassy openings in Pine forests at an altitude of 10 to 11,000 feet.

The other two species are found at greater altitudes, generally from 12 to 13,000 feet, in moist and rocky, but not boggy, meadows, all three being commonly on limestone soil.

It is interesting to note the only other known species in the section is *P. Elwesiana*, King, from the Sikkim Himalaya. The flora of the extension of the Himalayan Mountains, from that point up to their entrance into Yunnan has, so far, been unexplored, but, almost certainly, once the country becomes opened up, we shall have other, and possibly more beautiful, species added to those mentioned.

It would naturally be concluded from the altitudes at which the above species grow that they would prove perfectly hardy in this country. Unfortunately experience proves the reverse. Though a large quantity of thoroughly ripened seed of the two last-named species was recently secured, only a very small percentage germinated, and very few of the seedlings have reached maturity.

It is most difficult to account for this, more so as the seed was in the hands of skilful propagators, and was treated in various ways; certainly our knowledge of the conditions under which those plants flourish leaves much to be desired. One thing it is impossible to give them, namely, the long rest they have during the winter on their native mountains, when, from November until May, they are buried deeply in snow.

PRIMULA POISSONII, FR.—Since its introduction to this country much has been written of this species, but to appreciate its full beauty, it must be seen in its native wilds.

It is abundant in certain localities on the mountains of N.W. Yunnan (where the photograph was taken), growing in dense masses and easily recognised, even at a distance, by its bright and rich colouring. It is essentially a moisture-loving plant, the situations generally

favoured by it being open pasture on the margins of forests and dense scrub, not boggy in the true sense of the word, but where a constant and copious supply of water is percolating through the soil, the latter consisting of gravel with a good admixture of fibre.

The description given in the *Botanical Magazine* states that the native plant is small, with small leaves, solitary scape, and few flowers. This does not fit the species as seen in Western Yunnan, where it attains an average height of 2½ feet. Solitary scapes are the exception rather than the rule, two, three, and occasionally as many as four, being borne by a single plant, each carrying from five to seven whorls of numerous flowers.

Though covering a wide range of altitude—from 5,000 to 11,000 feet—the species is not so hardy as might be supposed. The finer groups of plants are invariably found at the lower altitudes, and the higher stations are in sheltered situations having a southern exposure.

ROYAL HORTICULTURAL SOCIETY.—The next exhibition will be held in the Society's Hall, Vincent Square, Westminster, on Tuesday, November 23. At the 3 o'clock meeting in the Lecture Room an address on "Spices" will be delivered by Mr. J. A. ALEXANDER.

HORTICULTURAL CLUB.—The next house dinner of the club will take place on Tuesday, November 23, at 6 p.m., at the Hotel Windsor. Mr. JOSEPH CHEAL will give a lecture on "Canada of To-day, Horticulturally and Generally: From the Atlantic to the Pacific." The lecture will be illustrated by original lantern slides.

PERPETUAL-FLOWERING CARNATION SOCIETY.—The winter show will be held on December 8, and the annual dinner will be held on the evening of the same day in the Hotel Windsor, Westminster. Six classes are specially provided for amateurs—those who either cultivate Carnations themselves, or are occasionally assisted by a gardener. Further particulars can be obtained from the hon. secretary, Mr. HAYWARD MATRIAS, "Lucerne," Stubbington, Fareham, Hants.

THE ROYAL BOTANIC SOCIETY.—At a meeting of the Fellows of this Society, held at the Botanic Gardens on the 12th inst., the chairman, Mr. P. S. STEPHENS, K.C., stated that the letter addressed by the Rev. W. WILKS to the Duke of Teck (published on p. 350 of last issue) suggesting the possibility of an amalgamation with the Royal Horticultural Society had not then officially reached the Royal Botanic Society, and the latter was unable, therefore, to take any definite steps in the matter. Later in the proceedings, when Mr. RUBINSTEIN had spoken in favour of amalgamation, Mr. CECIL RALEIGH said he had been averse from any amalgamation or union with any other body, but there was no reason why they should not extend the facilities of their gardens to other bodies requiring them. They were prepared to appoint a committee to open up negotiations with the Horticultural Society to hear the latter's proposals, but, in his view, there was such a thing as federation as well as amalgamation. He proposed that 100 of the Fellows present should meet the present emergency by subscribing at once £5 each to meet the £500 required by the bank. In a few minutes it was announced that £379 had been raised. Since this meeting it has been announced that the Royal Botanic Society had addressed a letter to the Council of the Royal Horticultural Society thanking them for the

kindly sentiments expressed in their communication to the Duke of Teck, and suggesting that each society should appoint a committee of six persons to confer on the subject of the original letter.

SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held in the lecture hall of the institution on the 22nd inst., at 8 p.m., when a paper will be read by Mr. W. R. DAVIDGE, entitled "Town Planning Systems."

NEILL MEDALLIST.—At the November meeting of the Council of the Royal Caledonian Horticultural Society a Gold Neill Medal was awarded to the Rev. J. ATKMAN PATON, Souleseat, Castle Kennedy, in recognition of the valuable work he is doing in connection with hybridising Solanums. Mr. PATON has since 1903 been hybridising the Potato with the aim of getting a strain which would be immune to the disease (*Phytophthora infestans*). In 1907 Mr. PATON obtained tubers of *Solanum tuberosum*, a presumed wild sort which had been under more or less careful observation for about 50 years, but which had not shown disease in all that time. Mr. ARTHUR W. STUTTON, F.L.S., drew attention to this character of the plant in his well-known article on the Potato in R.H.S. *Journal*, vol. xix., pt. III., and also in his paper read before the Linnean Society (*Journal Linn. Soc.*, vol. xxxviii., February, 1909). Mr. PATON sought by crossing this type with certain commercial varieties to combine its character of immunity with desirable qualities of the other parent. He has succeeded in doing this, and in showing that the immune character is communicated to a certain percentage of the offspring. These plants have retained their foliage when all commercial varieties growing beside them have been destroyed by disease. Among other hybrids obtained are:—*S. maglia* (Chile) × *S. tuberosum* (Chile); *S. Maglia* × several commercial varieties; *S. Commersonii*, white flower (Uruguay) × *S. tuberosum* (Mexico); *S. verrucosum* (Mexico) × *S. tuberosum* (Chile); *S. tuberosum* (Chile) × *S. tuberosum* (Mexico); *S. verrucosum* × *S. tuberosum*.

HORTICULTURE IN BELGIUM.—In response to the active representations of Belgian horticulturists and to the persistent efforts of the *Tribune Horticole*, the Belgian Minister of Agriculture announced about a year ago that the Government proposed to form a special Department of Horticulture. The decision, which was recorded and commented on in these pages in the issues of March 23 and April 4, 1908, has now been carried out. By an enactment, signed by the KING OF THE BELGIANS on the 9th inst., the department has been formed and a horticultural counsel appointed. The councillors, in whose hands the work of organising Belgian horticulture has been placed, are Messrs. E. DE MEYER, E. HENRIQUELLE, and L. JOOSSENS. There can be no doubt that in securing this recognition of independence, Belgian horticulturists have done a notable service to their country. The development of the new department will be watched with great interest, not only in Belgium but also in this country. It is fitting that the country which has been the pioneer in so many branches of horticulture should be the first to organise a definite department devoted exclusively to the interests of horticulture.

PRESENTATION TO MR. A. E. GOOSEN.—After service for a period of 12 years as gardener to D. B. HALL, Esq., Burton Park, Petworth, Mr. A. E. GOOSEN, on his resignation to take up fresh duties at Naseby Hall, Rugby, was presented with a testimonial and a present, subscribed by upwards of 40 of employees and friends at Burton Park.

RETIREMENT OF MR. W. P. ROBERTS.—After a period of 30 years as gardener at Cuerden Hall, Preston, Mr. W. P. ROBERTS is retiring on pension granted by his employer, R. A. TATTEN, Esq., who has only had possession of Cuerden Hall for three years. Since Mr. TATTEN came into possession of the estate, the gardens have been greatly altered and most of the glass-houses renewed. Mr. ROBERTS will reside at Cwmystwyth, near Aberystwyth.

THE CARDIFF SHOW.—Our Cardiff correspondent points out that in his report of the recent Chrysanthemum show held in that city, he inadvertently omitted to mention a very fine exhibit of hardy fruit contributed by Mr. BASHAM, Bassaleg Nurseries, near Newport, and for which Mr. BASHAM was awarded a Gold Medal.

EXHIBITION OF COLONIAL FRUITS AND VEGETABLES.—The Royal Horticultural Society's exhibition of Colonial-grown fruits and vegetables on December 1 will be opened by H.R.H. the Princess LOUISE, Duchess of ARGYLL. Her Royal Highness will be accompanied by His Grace the Duke of ARGYLL, K.T. Free cinematograph displays at frequent intervals will be given, with lectures. At 3 p.m. Mr. ROBERT NEWSTEAD, A.L.S., F.E.S., of the Liverpool School of Tropical Medicine, will deliver a lecture on "West Indian Insect Pests."

LECTURES ON FORESTRY.—The first of a series of lectures on "Forestry" was delivered in the Aberdeen University Buildings, on Wednesday, 10th inst., by Mr. WILLIAM DAWSON, M.A., B.Sc. (Agr.), lecturer on forestry in the college. Mr. DAWSON stated that the forester's demands, so far as quality of land was concerned, were easily satisfied. In fact, it may be said that no soil was too poor for some kind of trees. Forestry began where agriculture stopped. Land on or under the margin of cultivation was the field of operation of the forester. Agricultural land was not wanted for forestry; indeed, it was, in some cases, unsuitable. Hence no scheme of afforestation need be looked upon with suspicion as likely to curtail in any way the area of agricultural land. On the contrary, it would lead to a considerable increase of it, and to increased productiveness of much of our existing agricultural land. In many parts of the Highlands of Scotland there were tracts of good land along the glens quite suitable for agriculture. These, however, were so isolated at present, and access to them was so difficult, that they never could be made to pay; but if the surrounding country were covered with wood, roads must be made to the districts opened up, there must be a population on the ground, new industries must arise, and the good land would naturally become agricultural land. All over Europe small holdings and forestry went hand in hand. With regard to soil, forestry was the complement of agriculture, and the poor land was what fell to the forester's lot. The question as to the influence of the forest on climate was a much-discussed one. The actual effect was small. So it was with the influence on temperature. The action of forest was, however, certainly beneficial in minimising the effects of winds. The direction of the wind was altered, and its intensity diminished. In this respect, forests were of the greatest benefit to a country, and particularly to its agriculture. Another real benefit which an extensive forest brought with it was that it minimised the danger of flooding. In districts where the upper reaches of rivers had been cleared of wood, floods were much more common, and, in this respect, the lecturer gave examples in Aberdeenshire, where, since the clearing of the woods, flooding had been much more frequent.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

ROSES IN SOUTH-WESTERN SCOTLAND.—I am greatly obliged to Sir Herbert Maxwell for supplementing my observations on this subject by emphasising, on p. 315, the value of Mme. Abel Chatnay as one of the finest of the Hybrid Teas. I have grown it frequently in my garden, and admired it greatly for its highly-distinctive colour, its fragrance and floriferousness. I may add that, among Hybrid Teas of more recent introduction, two of the most charming are Elizabeth Barnes and the famous Lyon Rose. I can also highly recommend Prince de Bulgarie and Antoine Rivoire. *David R. Williamson.*

APPLE HAMBLEDON DEUX-ANS.—I can corroborate Mr. E. Molyneux's statement (p. 330) as to the worthlessness of this Apple. I planted a pyramid-trained tree of the variety in 1886, and have never had a crop of Apples from the tree during twenty years. Needless to say, it has been removed, and something more profitable planted. Other varieties of Apples planted the same year on the Paradise stock, and which have been very disappointing, are Betty Geeson, Small's Admirable, and Lady Henniker. Probably if these were worked on the Crab stock, and the growth left unrestricted, they would be more satisfactory. *D. Roberts, Prestwood Gardens, Loughboro'.*

—This variety is still largely grown in an old orchard at Hackwood Park, where there are some large trees. It is less a question of quality than of constitution, and this Apple, apart from many others, shows that there are varieties which can endure for generations. At Hackwood Park this old variety is far from being despised, because it often produces heavy crops when other varieties fail. That it may not be grown about Hambledon now is no indication of its value in other localities. That it had the prefix Hambledon attached to it was a mere accident, and Rogers, writing of it in 1834, refers to it simply as the French Deux-ans. It is doubtful if to-day we should find very many of even the famous Blenheim Pippin about Woodstock. Even good old Apples come in with the prophets in getting stoned. How many of the Apples introduced during the past 40 years will be in existence 50 years hence, or to the age of the old Deux-ans? *A. D.*

NICOTIANA SANDERÆ TO FLOWER IN APRIL

—Seeds should be sown in a pan in the last week in July, and the pans placed in a cool house or frame. When the seedlings are large enough to handle, they should be pricked off into small pots, and later be potted on as they require more room, never allowing them to become root-bound until they are put in their final pots, which should be 6 inches in diameter, in the first week in October. After the final potting stand them in a cold frame, admitting plenty of air whenever necessary, and all sunlight. Protect them from severe frosts during winter and at the beginning of March take them into the greenhouse. Treated in this manner they should flower in the second week of April. My plants have varied in height from 3 to 5 feet. *L. Johnson.*

LIME-LOVING PLANTS.—My article (see p. 246) was limited in scope, and intended, as Mr. Jenkins suggests (see p. 290), more as a list for working purposes than a statement of definite rules applicable to every condition. It was founded on a long series of planting experiments, and upon observation of the plants under various conditions. Mr. Jenkins refers to the Alpine Pinks and the hardy Cyclamen, which will, undoubtedly, do well in many places without lime, but which I have never seen so floriferous as when provided with lime. They will flourish in many places without this, while in others they require it if they are to give the greatest satisfaction. The value of some plants lies in their floriferousness, rather than in freedom of growth, which may sometimes be secured without a corresponding increase in the quantity of bloom. In many cases we find that plants are vigorous without lime, but produce few flowers, and that the addition of lime causes them to flower with greater freedom, while making less foliage. This is rather a drawback in the case

of the rarer Sempervivums, which frequently flower too freely on limestone, and when only one or two rosettes are procured the plants are often lost the first year through excessive floriferousness. The instances of *Coronilla iberica* are valuable, but without knowing the precise conditions of exposure and climate it cannot be affirmed that it is lime or its absence which is responsible for the difference between the plants referred to by Mr. Jenkins. *Lithospermum prostratum* is often a puzzle. In many places, however, it is quite a success in limestone. I entirely agree with your correspondent that lime must not be regarded as essential for any particular class of plants. Some individual species will not thrive without it, and some are accommodating enough to thrive upon unaccustomed fare, but, as a rule, those which like it in their native homes will be found to prefer it with us. *S. Arnott.*

—Agreeing as I do with Mr. Jenkins that there are many plants indigenous to limestone regions and not found wild elsewhere, which flourish vigorously in cultivation without lime, I yet think that there are some, such as the encrusted section of Saxifragas, which will not develop their full beauty of foliage unless they have access to lime. Others, again, like some of the Bellflower Order and *Gentiana acaulis*, when grown in rich loam and peat, make vigorous leaf-growth at the expense of the floriferous qualities, which are their chief charm. The flora of chalk and limestone formations appears to consist largely of plants which are able to accommodate themselves to soil-constituents discouraging to or prohibitive of plants requiring richer nutriment. Many chalk and lime-loving plants would doubtless grow wild on other soils if they got a fair chance, but they are choked by ranker vegetation. Others, again, like the Saxifragas aforesaid, have assimilated themselves so closely to their environment that lime has become an indispensable part of their diet, or, at least, if deprived of it, they will tend to revert to a primitive type and lose some of the characteristics which most commend them to us. I may add that in my experience *Lithospermum prostratum* hates lime, which causes its foliage to turn yellow and the plant to shrivel away. The other European Gromwells thrive luxuriously with or without lime, but I have not yet succeeded with the American species. *Herbert Marx R.*

SOCIETIES.

SOUTHEND-ON-SEA AND DISTRICT HORTICULTURAL.

NOVEMBER 2, 3.—The annual exhibition of Chrysanthemums, fruit, vegetables, &c., was held in the spacious banqueting rooms and winter garden of the Palace Hotel, on the above dates, and, all things considered, the event was a success.

In the Chrysanthemum group classes, Mr. POLLARD was awarded the 1st prize, which included a silver cup, for a group that would have been better had dwarfier plants been employed in the outside circular row.

The Rev. R. STUART KING, Leigh-on-Sea, had the best group of miscellaneous plants; 2nd, Mrs. MILLER, Leigh House, Leigh-on-Sea (gr. Mr. A. Epps); 3rd, Mr. R. PEELING.

In the cut bloom classes, one of the hitherto largest and most successful exhibitors at the Southend show was absent. On this occasion he was showing at the Crystal Palace. However, a good lot of blooms were staged in the several classes set apart for them, the most successful exhibitor being Mr. A. EPPS, who staged the best 24 blooms of Japanese varieties, and the best 12 blooms of incurved Chrysanthemums. This exhibitor was also to the front in the classes for six blooms of Japanese and six blooms of incurved varieties, as well as winning the 1st prize for three vases of Japanese blooms, showing good-sized, fresh, even blooms in each class. Mr. H. E. CAMPKIN had the best six vases of Japanese blooms, Mr. Epps being a good 2nd. Mr. A. POLLARD was also a 1st prize-winner in these classes.

In the classes for amateurs, open to all comers, there was good competition. Mr. P. E. WISEMAN was placed 1st for 12 Japanese blooms, his stand including good blooms of F. Greenfield,

Bessie Godfrey, Mrs. R. Hooper Pearson, Mrs. J. Davis, and F. S. Vallis. Mr. WISEMAN was likewise 1st for 12 incurved blooms, showing good specimens of Mrs. J. P. Bryce, Miss Southam, Lady Isabel, and F. Trestian. Mr. WISEMAN was also 1st in four other cut bloom classes.

In the cut bloom classes confined to growers living within a radius of 10 miles of Southend Post Office, Mr. H. E. CAMPKIN secured four 1st prizes. Mr. G. W. HEATON, Armstrong, and Mr. S. S. TOMLIN, Leigh-on-Sea, were also winners of 1st prizes in these classes.

FRUIT CLASSES.

Grapes were not largely shown. Mr. EPPS had the best two bunches of white Grapes, and Alderman J. C. INGRAM staged the best two bunches of black Grapes.

Apples and Pears were well represented. The most prominent examples of the former were the six dishes of culinary varieties. The 1st prize collection, staged by Mr. F. LONGMAN, consisted of extra large, well-selected fruits (five to a dish) of Lane's Prince Albert, Warner's King, Peasgood's Nonesuch, New Hawthornden, Stirling Castle, and Bismarck—a grand exhibit. Mrs. G. MURRELL, Barling, near Southend, was a good 2nd; and Mr. H. B. HERBERT, Eastwood, near Rochford, was a close 3rd.

Mr. H. B. HERBERT was placed 1st for six dishes of dessert Apples, and Mr. W. A. VOSS was 1st for three dishes.

Mr. EPPS was awarded the 1st prize for six dishes of Pears; 2nd, Mr. HERBERT; and Mr. S. TAYLOR, Rayleigh (who staged six dishes of perfectly clean, high-quality fruits, and undoubtedly the best exhibit in the class), was accorded a 3rd place.

ISLE OF THANET CHRYSANTHEMUM.

NOVEMBER 3, 4.—The 23rd show of this society was held, for the first time, at Ramsgate, on these dates, in the Royal Victoria Pavilion. Mrs. Powell-Cotton, of Quex Park, Birchington, presented the prizes, which the judges, in some cases, found a difficulty in awarding, so close was the competition. Such was the excellence in a class for a collection of vegetables, of nine kinds, one being Potatoes that they suggested that four extra prizes should be awarded.

Before the distribution of prizes, Mr. Reeve, whose father has been the hon. treasurer of the society since its formation, stated that the number of entries was 386, an increase of 53 over last year, and that, since the formation of the society, it had distributed £1,400 in prizes.

GUERNSEY CHRYSANTHEMUM.

NOVEMBER 3, 4.—This society's exhibition was held in the four Market Halls, which were well filled with exhibits. The two special features were the exceedingly large number of *Nerines* exhibited and the exhibits of single Chrysanthemums. The trade exhibit of Mr. F. LILLEY contained a collection of seedlings of single Chrysanthemums including Beaming (pink), Cinnamon Rosette (deep pink), White Doré (the finest single white), Brillancy (bright yellow), Belting (crimson and terra cotta), Elusive (amaranth), Charming (bright red), and Beatific. Mr. J. M. BICHARD had a fine display in his prize class of single Chrysanthemums, Ladysmith being prominent.

The champion cup for Japanese Chrysanthemums was won by MAITLAND HERIOT, Esq. (gr. Mr. Hayson), in which Magnificent, Norman Davis, Mrs. R. H. Pearson, and Reg. Vallis were very fine. Mr. J. PEAK was 2nd. The silver cup for the best group of Chrysanthemum plants was taken by Messrs. PEEL & Co. (gr. Mr. F. West); 2nd, Mr. J. M. BICHARD.

The special prize offered for 18 Japanese blooms went to Mr. O. MARQUAND. For six vases of single varieties the special and 1st prize were won by J. M. BICHARD, Esq. (gr. Mr. W. Balshaw). Other important classes with the principal prize-winners were as follow:—Best group of Chrysanthemums arranged for effect: 1st, Mr. F. WATSON; 2nd, General LE COQ. Eighteen blooms of Japanese Chrysanthemums in six vases: 1st, Mr. J. SANGON; 2nd, Mr. J. BOURGAIZE. Vase for table decoration: 1st, Mrs. W. J. PRIAULX; 2nd, Mrs. R. ALLEN.

In the fruit classes prominent exhibitors were Mr. E. BACHMANN, Mr. W. WHITFIELD, Mr. RICHARDS, Mr. W. FORTE, Col. LE MOTTE, Mr. J. MANGER, Mr. J. BRISON, Mr. H. BRITTEN, and Mr. COYDE.

The 1st prize for a collection of six vegetables was won by Mr. WHITFIELD; 2nd, Mr. ROUSSELL.

Mr. W. P. VANDEN, Roseville, had a fine trade exhibit of Tomatoes, of Century Japanese Beans a yard long, and seeds of Vandin's Improved Lawrenson and Vandin's Secret Tomatoes.

Messrs. MANGER & SON showed trained fruit trees.

**FOREST GATE AND STRATFORD.
CHEYSANTHEMUM.**

NOVEMBER 4, 5, 6.—The 13th annual exhibition was held on this date in the Town Hall, Stratford. The exhibition resulted in a good average display. Some fine groups of Chrysanthemums were staged in competition for the Duchess of Marlborough's Cup, which was won by Mr. THOMAS SMITH, Mr. C. ENNIS being 2nd, and Mr. A. TUTTLEBY 3rd.

A cup was offered by Messrs. Barry & Brown for an exhibit of six Japanese and six incurved blooms. This trophy was secured by Mr. A. WILLETT, the secretary, Mr. A. J. PALMER following.

Mr. J. A. WARD showed the best group of Chrysanthemums in a class open to those members who cultivate fewer than 150 plants; and there were similar classes for growers of 100 plants, of 75 plants, and of 50 plants respectively. There were classes for Japanese and incurved blooms in each of these sections; the flowers generally were of good quality.

**MANCHESTER AND NORTH OF
ENGLAND ORCHID.**

NOVEMBER 4.—*President*: Messrs. E. Ashworth, R. Ashworth, Arthur Ashton, Cowan, Holmes, Keeling, Leemann, Parker, Shill, Sander, Thorp, Ward, Warburton, and Weathers, hon. sec.

Mrs. S. WOOD, Moorfield, Glossop (gr. Mr. Gould), staged a fine group of plants, for which a Silver-gilt Medal was awarded. *Cattleya* × *Alicia* (C. × *labiata* × C. *Iris*), C. × Col. *Sidebottom* (C. × *Hardyana* × C. *Gaskelliana*) and C. × *Annie Kershaw Wood* (C. × *Adula* × *Dowiana aurea*) all received Awards of Merit.

A. WARBURTON, Esq., Haslingden (gr. Mr. Dalgleish) was awarded a Gold Medal for a charming group of Orchids, which contained many choice *Cattleyas*, including good forms of *Cattleya labiata* var. *alba*, C. × *Fabia* *alba* Warburton's variety received an Award of Merit.

N. GALLOWAY, Esq., Great Horton, Bradford, was awarded a Bronze Medal for a group composed principally of well-known *Cypripediums*.

J. McCARTNEY, Esq., Bolton (gr. Mr. Holmes), staged a showy exhibit of *Cattleyas* and *Lælio-Cattleyas*. *Cattleya* × *Armstrongiae* var. "J. McCartney," C. × "Alice" (C. *Gaskelliana* var. *alba* × C. *Parthenia* var. *Prince of Wales*), *Lælio-Cattleya* × *rubens* var. *Donald* (L. *praestans* × C. *Hardyana*), and *Cattleya labiata* var. "Miss J. McCartney" received Awards of Merit. (Silver Medal.)

J. T. CLIFTON, Esq., Lytham Hall, Lytham (gr. Mr. Float), had a large number of interesting botanical specimens. In addition to these, the exhibit included a splendid collection of showy plants. (Silver-gilt Medal.)

R. LE DOTX, Esq., West Derby (gr. Mr. Fletcher), was given Awards of Merit for *Cypripedium* × Mrs. S. Hignett, and *Odontoglossum* × *anabile* *Marfield* var.

Mr. J. RONSON, Altrincham, received First-class Certificates for *Cattleya labiata* var. *Daphne* and C. l. var. *Schofieldiana*, two very beautiful albino forms.

R. ASHWORTH, Esq., Newchurch (gr. Mr. Gil-den), exhibited *Cypripedium* × *Amesii* var. "Black Watch," to which was given an Award of Merit.

W. R. LEE, Esq., Heywood, received Awards of Merit for *Cypripedium* × *Aurora*, C. × *nitens magnificum* *Balls* var. × C. × *Actæus* var. *langleyense*.

E. ROGERSON, Esq., Didsbury (gr. Mr. Price), exhibited *Cypripedium* × *Chesterianum* (C. × *Thalia* × C. *insigne* var. *Sunderø*).

J. H. CRAVEN, Esq., Keighley (gr. M. Corney),

was awarded a First-class Certificate for *Cattleya labiata* *Harefield Hall* var., a white form of first-rate quality.

CLIVE COOKSON, Esq., Wylam-on-Tyne (gr. Mr. Chapman), exhibited a small collection of Orchids. *Cypripedium* × "Fairo Maude," C. × *Sanaedera* var. *Cooksonii*, *Odontioda* × *Bradshawia* var. *Cooksonii*, *Calanthe* × *Cooksonia* × *Angela*, were awarded First-class Certificates, and *Calanthe* × *Bryan*, *Cattleya* × *anabilis* *Oakwood* var., and *Cattleya* × *Fabia* var. *Cooksonia* Awards of Merit.

Messrs. KEELING & SONS, Bradford, exhibited a small group of miscellaneous plants. (Bronze Medal.)

Mr. F. HERRIOT, Cawley Priory Lodge; 3rd, T. WELLER POLEY, Esq.

Begonias were best staged by T. WELLER POLEY, Esq., who was awarded the 1st prize; G. BUCHANAN, Esq., Lavington Park (gr. Mr. S. Ely), following very closely.

In the class for black Grapes some fine bunches of *Black Alicante*, shown by Mrs. DOUGLAS HENRY (gr. Mr. W. Matthews), were placed 1st.

Among the chief features in the open classes were the exhibits of vegetables, there being a superb lot staged in each class. In that for nine varieties for prizes offered by A. Byerley & Co., Chichester, there were six competitors, the 1st prize being awarded to W. B. M. BIRD, Esq.

FIG. 151.—CHRYSANTHEMUM MARY FARNSWORTH; COLOUR, A SHADE OF BUFF.
Granted the R.H.S. Award of Merit when shown recently by Messrs. James Stredwick & Son.

**CHICHESTER AND WEST SUSSEX
CHRYSANTHEMUM.**

NOVEMBER 4.—The 2nd annual show of this society was held in the Corn Exchange, Chichester. The quality of the exhibits was excellent, and the entries greatly in excess of those of the previous year. Competition was keen in nearly every class. The society was formed mainly to encourage horticulture amongst cottagers, and the flowers, fruit, and vegetables shown in this division were of first-rate quality.

In the open classes Col. HENRY, Avisford House, Arundel (gr. Mr. G. Harris), was awarded the 1st prize and a challenge cup for 24 Japanese blooms, the 2nd prize going to W. B. M. BIRD, Esq., Earham House (gr. Mr. A. Gooding). For a semi-circular group of Chrysanthemums arranged for effect, W. B. M. BIRD, Esq., was awarded the 1st prize for a fine, bold group; 2nd,

In the class for six varieties the prizes offered by Messrs. Sutton & Sons, Reading, W. B. M. BIRD, Esq., was again awarded the 1st prize. Prizes for a collection of six varieties were offered by Mr. J. D. Webster, nurseryman, Chichester, and the 1st prize in this class was won by W. B. M. BIRD, Esq.

The nurserymen of the district put up some meritorious exhibits. Mr. J. D. WEBSTER staged a group of Palms and *Begonias*, with a floral design at each end. Messrs. R. HOOPER & SON also had a fine group of Palms, interspersed with autumn-tinted foliage and cut flowers. Mr. C. W. SUDHAM, specialist in Ferns, staged a splendid collection of these plants. Mr. MOORE staged a group of plants, cut flowers, and floral designs. THE BARNHAM NURSERY CO., Barnham had a choice collection of Apples; and Messrs. A. BYERLEY & CO. exhibited a good collection of fruits and vegetables.

PUTNEY AND WANDSWORTH CHRYSANTHEMUM.

NOVEMBER 4. 5.—The 32nd annual exhibition of the Putney and Wandsworth District Chrysanthemum Society was held at Cromwell Hall, Putney, on the above dates. Considering the very bad season, the show was a good one, but there was a slight falling off in the number of entries.

The principal feature was a class for groups of Chrysanthemums and foliage arranged in spaces of 12 feet by 6 feet. This was won by GEO. FORES, Esq., Blenheim, Raynes Park (gr. Mr. C. Pullen), with a very neatly-arranged group. He was closely followed by A. J. PICKETT, Esq., Keswick Lodge, Putney (gr. Mr. W. Limmer), whose plants bore very heavy blooms, but were not so well arranged.

The 1st prize for a group of miscellaneous plants was taken by J. D. CHARRINGTON, Esq., Gifford House, Roehampton (gr. Mr. J. Prentice), with a very pretty group, the 2nd prize going to F. S. JAY, Esq., Putney Hill (gr. Mr. Carter.)

The best exhibit of eight vases, each containing three blooms of one variety, was won by Mme. STUART, The Convent (gr. Mr. A. Smith), with very large blooms of Leigh Park Wonder, Miss Miriam Hankey, F. S. Vallis, Mary Inglis, Mrs. Norman Davis, Reginald Vallis, Mr. Eric Crossley, and Mrs. A. T. Miller. This exhibit contained the premier bloom in the show.

The same exhibitor was also 1st in the board classes for 24 Japanese blooms, distinct, 12 blooms distinct, six yellow blooms and six white blooms. He had also the best Salvias, Pears and Apples.

One of the leading features of the show were the fine displays of winter-flowering Begonias. The 1st prize for six plants was won by M. S. NAPIER, Esq., Bath House, Putney Heath (gr. Mr. S. Mynett).

The competition for six varieties of vegetables was keen, and the 1st prize was won by J. A. YOUNG, Esq., Stone House, West Hill, Putney (gr. Mr. G. Street), who was also successful in several other classes.

Primula sinensis and Primula obconica were well shown in large numbers, as were also black and white Grapes, Apples and Pears. Two very heavy bunches of Black Alicante Grapes were shown by Sir W. J. LANCASTER (gr. Mr. F. H. Goddard). The same gentleman was also successful with table plants.

The non-competitive exhibits were very fine, especially a group of foliage and flowering plants from Messrs. JAS. VEITCH & SONS. Other exhibitors were Mr. L. RUSSELL, Richmond (group of foliage and berried plants, also table plants), Mr. R. NEAL, Wandsworth (group of foliage plants and baskets), and Messrs. WALBORN, MAHOOD, and MANN, all of Putney (floral designs). A small group of Orchids was shown by A. HUTH, Esq., Oakley House, West Hill, Putney (gr. Mr. Fisher).

SALTAIRE, SHIPLEY, AND DISTRICT ROSE.

THIS society has enjoyed a successful year. The provincial show of the National Sweet Pea Society was held in conjunction with the Rose show in July last, and the exhibition proved a record for the society, the gate money and the profits resulting from the show being larger than in any previous year. The gross income for the year was £493 18s. 11d., and expenditure £409 16s. 10d. The society's assets are estimated at £361 18s. During the year there has been 17 committee meetings, with an average attendance of 18 members.

COVENTRY AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 4. 5. 6.—The Lord Lieutenant of Warwickshire, the Marquis of Hertford, opened the 15th annual exhibition of the society in the presence of a large assembly including the Mayor of the city, Alderman Lee. A marked feature of the show was the display of fruit and vegetables. In each department increased competition was seen. In the open classes the successful exhibitors included:—F. FOSTER, Esq. (gr. Mr. J. Miller), H. STURMEY, Esq. (gr. Mr. H. Hollick), C. YERNOX PUGH, Esq. (gr. Mr. Kemp), HUGH ROTHERHAM, Esq. (gr. Mr. G. Griffiths),

T. SMITH, Esq., W. FINCH, Esq., and F. TWIST, Esq. (gr. Mr. W. Hicks). Several of these gentlemen were also prize-winners in the classes for cut blooms, others being Colonel BEECH (gr. Mr. E. J. Brooks), Mrs. MELLOREW (gr. Mr. Teal), and J. POWERS, Esq. In the division open to gentlemen not employing more than two gardeners regularly, Messrs. F. E. FOSTER, H. MITCHELL, E. MORRIS, H. STURMEY, and T. SMITH won 1st prizes.

NEWPORT (MON.) CHRYSANTHEMUM.

NOVEMBER 5.—The coming-of-age show of the Newport Chrysanthemum Society was held on the above date in the Gymnasium of the Newport Athletic Club.

Although entries were numerous, there were very few outstanding exhibits, and there was an absence of good trade displays.

In the non-competitive displays Certificates of Merit were awarded to C. D. PHILLIPS, Esq., and Dr. BROOKE GRATTE for small but good collections of Orchids.

The National Chrysanthemum Society's Certificate, offered for the best bloom in the show, was awarded to H. I. H. Prince HATZFELDT, Draycot Park, Chippenham, and a similar certificate, awarded for the best plant, which was shown by J. A. BROOME, Esq.; whilst the N.C.S. Silver Medal, offered for amateurs employing no gardener, was won by Mr. W. H. HOLLINGDALE.

The finest feature in the show was the miscellaneous group staged by H. OAKLEY, Esq., Dewston, Caldicott, Mon. This was composed of Oncidiums, Cattleyas, Begonia Gloire de Lorraine, single Chrysanthemums and other flowers interposed with Crotons and other ornamental foliage plants.

In the class for a group of Chrysanthemum and foliage plants, occupying a space of 50 square feet, H. OAKLEY, Esq., again won the 1st prize, staging well-grown single and Japanese Chrysanthemums intermixed with Cocos Weddelliana, Crotons, and other foliage plants.

For eight vases of Japanese blooms, Mr. G. DRAKE, Cathays Terrace, Cardiff, won the 1st prize in good style, staging some excellent blooms; H. I. H. Prince HATZFELDT followed closely; 3rd, Mrs. F. S. WILLIAMS, Newport.

Mrs. F. S. WILLIAMS was placed 1st in the class for 24 blooms of Japanese varieties.

In the fruit classes H. I. H. Prince HATZFELDT won the 1st prizes in the classes for Apples and Grapes.

NOTTINGHAM CHRYSANTHEMUM.

NOVEMBER 5. 6.—This annual autumn show was held in the Mechanics' Hall, Nottingham, and the building, though large, was not nearly accommodating enough to do justice to the many excellent exhibits.

There were a few open classes, but the bulk of the exhibits were from local growers.

The show is admirably managed, the secretaries being Messrs. Skelhorn and Atkin.

CUT BLOOMS.—OPEN CLASSES.

The leading class was one for 24 Japanese blooms in not fewer than 18 varieties. Five entrants competed. A. JAMES, Esq., Coton House, Rugby (gr. Mr. A. Chandler), was placed 1st with large, heavy, well-coloured blooms, of which the following were the principal varieties: Reginald Vallis, Marquis V. Venosta, C. H. Totty, Bessie Godfrey, Mrs. W. KNOX, J. Lock, Mrs. A. T. Miller, G. Mileham (1908), Lady Talbot, Mrs. G. Mileham, Miss Hilda Rowley, F. S. Vallis, President Viger, Algernon Davis and Valerie Greenham. Mr. W. G. DRAKE, Cathays Terrace, Cardiff, was a good 2nd with slightly smaller blooms. 3rd, Sir W. BASS (gr. Mr. Nisbett).

Mr. DRAKE won the 1st prize for 12 incurved blooms with fairly good examples of popular varieties; 2nd, Mr. CHANDLER.

AMATEUR AND ARTISAN CLASSES.

Captain MOFFISON offered a challenge cup for six incurved and six Japanese blooms, distinct. In a strong competition the cup was won by Mr. W. D. PARKIN, 65, Truman Street, Nottingham, with superior blooms of Clara Wells, Mrs. G. Denyer, B. Hankley, Pantia Ralli, Buttercup, and Romance in the incurved section, and

Splendour, Lady Talbot, and F. S. Vallis among Japanese varieties.

Class 25 was confined to artisan exhibitors, and Mr. J. C. Smalls offered a challenge cup for six incurveds and the same number of Japanese blooms in not fewer than eight varieties. Mr. W. COX, 11, Cromer Road, Nottingham, was placed 1st with excellent examples of Clara Wells, Mrs. J. Wynne, and W. D. Parkins. F. S. Vallis, Lady Talbot, Reginald Vallis and President Viger were also good.

A class was restricted to artisans growing not more than 200 plants. Here the leading prize was Mr. J. SHIPTON'S cup, valued at five guineas. Mr. G. WRIGHT secured the trophy with exceedingly fine blooms of Mrs. G. Denyer, Triomphe de Montbrun, Buttercup and John Wainwright and others.

For 12 incurved blooms in not fewer than eight varieties, Mr. G. WRIGHT had the best of four exhibits with blooms of such popular varieties as Buttercup, Clara Wells, Mrs. G. Denyer, W. Pascoe, Triomphe de Montbrun, and John Wainwright fully 5 inches in diameter, and of proportionate depth.

DERBYSHIRE GARDENERS'.

NOVEMBER 5. 6.—An excellent exhibition in connection with this association was held in the Albert Hall, Derby. So numerous were the exhibits that the hall space was utilised to its fullest extent.

The group classes occupied one side of the hall, and one put up by Mr. SHAMBROOK, Sutton Hall, was composed almost entirely of the old white favourite, "Mutual Friend." The plants were grown in 6-inch pots, but the flowers were of fine size. Sir EDWIN ANN (gr. Mr. Daines) was placed 2nd, and Councillor A. R. FLINT 3rd.

Cut blooms were well shown. In the class for 24 Japanese blooms the three exhibits staged were almost equal in merit. Mr. J. EVANS, Chad-desden Hall, was placed 1st; 2nd, Mr. J. WOOD, Alveston; 3rd, Mr. W. TOPPLIS, Newhall.

For 24 incurved blooms Mr. J. HARRISON, Walkley, Sheffield, was easily 1st; Mr. J. WOOD was awarded the 2nd prize, and Mr. W. TOPPLIS the 3rd prize.

In the class for 12 Japanese blooms Mr. G. WADESON, Doveridge Hall, supplied a stand of very large flowers; one of Lady Talbot, of extraordinary size, was adjudged the premier bloom of the show. 2nd, Mr. F. MEAKIN.

For six vases of Japanese varieties Mr. G. WADESON led with particularly fine examples of Mrs. Norman Davis; 2nd, Mr. F. MEAKIN.

There were not quite so many dishes of fruit as usual, but the two bunches of black Grapes exhibited by Mr. WADESON were very meritorious.

Messrs. Sutton & Sons' special prize for a collection of vegetables was won by Mr. H. C. SMITH, and Messrs. Webb & Sons' prize by Mr. J. WOODWARD, Alveston.

Amongst trade exhibits Mr. SHAMBROOK had a splendid collection of Carnations.

Mr. SYDENHAM, of Melbourne, staged a fine collection of single Chrysanthemum blooms grown as annuals.

MARLOW CHRYSANTHEMUM.

NOVEMBER 8.—This society holds its first show in the Public Hall on the above date. The exhibition proved a great success. The schedule contained sixteen classes, Mr. R. Evans (gr. to H. F. SLATTERY, Esq., The Orchard, Marlow), was the chief winner, securing five 1sts and one 2nd prizes out of six entries. He won the silver challenge cup presented by Sir Alfred Cripps, for the best table of Chrysanthemums and foliage. Mr. T. WALLER, who met with such success at the National Society's Show, contributed some grand blooms in the class for 43 and 24 Japanese blooms. A cup was also won by Mrs. MILLER in the amateur classes. This lady was one of the chief organisers of the show.

GLOUCESTER ROOT, FRUIT AND CHRYSANTHEMUM.

NOVEMBER 9.—The 46th annual exhibition of the Gloucestershire Root, Fruit and Chrysanthemum Society was held in the Shire Hall, Gloucester, on the above date. The exhibits of fruit were very numerous, and were of excellent size

and quality. Chrysanthemums, although not so fine as upon some previous occasions, included some magnificent specimens.

For ornamental baskets of plants the principal prize-winners were Sir HUBERT PARRY, Highnam; Mr. W. GORDON CANNING, Hartpury; and Mr. J. A. FLUCK, Gloucester.

In the Chrysanthemum classes Sir HUBERT PARRY was awarded premier honours for a group, Mr. W. GORDON CANNING being 2nd; and for cut blooms Sir HUBERT PARRY secured two 1st prizes, Mr. W. GORDON CANNING and Mr. W. NEATH-BAKER, Harfield Court, being awarded equal 2nd prizes.

In the Apple classes Messrs. W. READ (Newham), W. GORDON CANNING, M. K. M. POWER (Ross), HAROLD J. PHELPS (Tibberton), J. BOTT (Hereford), S. R. COX (Ashe Leigh), ARTHUR HARRIS (Quedgeley), Sir WILLIAM WEDDERBURN (Meredith), Col. HENRY (Ledbury), ANDREW KNOWLES (Newent), and CONWAY JONES (Hucclecote) won 1st prizes; and the following secured premier awards for Pears:—Messrs. W. GORDON CANNING, CONWAY JONES, A. J. COOKE (Norton), Sir WILLIAM WEDDERBURN, and J. R. BENNETT (Claxhill).

NATIONAL VEGETABLE.

THE President, His Grace the Duke of Portland, has expressed his intention to offer a prize of 10 guineas in a President's class for vegetables at the proposed exhibition next autumn, the arrangement of the class to be determined by the committee. Valuable offers of prizes from seed firms are still coming in. A very interesting offer of a class yet to be accepted is one of £5 in five prizes for a collection of six kinds of vegetables grown by members of cottage garden societies in the county of Surrey, each society sending one collection only. Those societies must be affiliated to the Surrey Education Committee.

CLEVEDON (SOM.) CHRYSANTHEMUM SHOW.

NOVEMBER 9, 10.—The annual show was held on these dates in the Town Hall, Clevedon, the exhibition resulting in a small but interesting display. The chief interest was centred in the trade exhibits, for which the society offered Gold, Silver and Bronze Medals. There were four entries, and the chief prize was awarded to Mr. T. HOLE, Clevedon, for a stand of fruit, vegetables and flowers; 2nd, Mr. S. MURRIN, Whiteladies Road, Bristol.

A Certificate of Merit was awarded to W. H. HALE, Esq., for a group of single Chrysanthemums, Begonia Gloire de Lorraine interspersed with Crotons and other foliage plants.

In the Chrysanthemum classes open to exhibitors residing in the district, Miss J. L. WOODWARD, Clevedon, won practically all the principal prizes. This lady also won a silver cup and a Gold Medal for obtaining most points.

In the amateur classes, Mr. S. TYLER was very successful, taking four 1st prizes.

The fruit classes were well contested, and formed one of the best features of the show. Some wonderfully fine samples of King of the Pippins, Cox's Orange Pippin, and Chas. Ross Apples were to be seen; whilst Pears were also excellent.

SOUTHAMPTON CHRYSANTHEMUM.

NOVEMBER 9, 10.—This annual exhibition was held in the Artillery Drill Hall, and was a distinct success. In the Chrysanthemum classes cut blooms were fresh and of good quality, but not exceptionally large; they formed the most important feature of the show. Exhibits of Grapes, Apples and vegetables were extremely fine.

The leading class amongst Chrysanthemums was for 12 Japanese varieties, three blooms of each, distinct, arranged in vases. Three growers competed, the best exhibit being shown by Prince HATZFELDT, Draycot Park, Chippenham (gr. Mr. F. Bible), who had high-quality specimens richly coloured and well staged. The varieties were Hon. Mrs. Lopes (very choice), J. H. Doyle, Lady Talbot, Purity, Mme. P. Radiaelli, F. S. Vallis, Bessie Godfrey, Splendour, Mme. G. Rivol, J. H. Silsbury, W. Jinks and Superb; 2nd, A. TATE, Esq., Downside, Leatherhead (gr. Mr. W. Mease), with smaller yet good specimens,

blooms of Leslie Morrison, Miss L. Thorn, Mrs. W. KUOX, and J. Peed being noteworthy; 3rd, Mr. F. CHANDLER, 75, Shirley Road, Southampton.

In the class for two white-flowered varieties, three blooms of each, E. MOCATTA, Esq., Woburn Place, Addlestone (gr. Mr. Stevenson), was placed 1st with remarkably good blooms of F. W. Lever and Mrs. Norman Davis; 2nd, Prince HATZFELDT.

In a class for two varieties, other than white, three blooms of each, six growers entered, Mr. MOCATTA won the 1st prize easily with Master James (very fine) and F. S. Vallis; 2nd, Prince HATZFELDT.

In a local class for four Japanese blooms, three of each, Mrs. TRAGETT, Awbridge Danes, Romsey (gr. Mr. H. Pearce), was well to the fore with heavy blooms of popular sorts; 2nd, W. GARTON, Esq., Sarisbury Court (gr. Mr. D. Edwards).

Single-flowered varieties formed an interesting class, the blooms being individually fine. For six vases, distinct, eight exhibitors staged. Mr. C. DYMOTT, Freemantle Nurseries, Southampton, was a strong leader, having large, deeply-coloured blossoms of Roupell Beauty, Crown Jewel, Mary Richardson, Mary Anderson, and Bronze Pagram; 2nd, Prince HATZFELDT.

Decorative varieties, other than singles, arranged in vases, were of high quality. Mr. DYMOTT had the best of four exhibits: Market Red, Illuminator, Hortus Totosanus, and Mary Godfrey being especially good; 2nd, Mr. F. CHANDLER.

The class for 24 Japanese blooms in not fewer than 16 varieties, to be arranged on boards, saw four entrants. Mr. MOCATTA won the 1st prize easily with heavy, richly-coloured specimens of Leslie Morrison, F. S. Vallis, Mrs. Norman Davis, Duchess of Sutherland, J. Lock, Lady Crisp, Master James, Frank Payne, Hon. Mrs. Lopes, Lady Talbot, and C. H. Totty; 2nd, Mr. TATE, with smaller blossoms.

Six growers entered in the class for one dozen Japanese blooms, distinct, Mr. W. GARTON winning quite easily with large blooms of popular sorts; 2nd, Mrs. TRAGETT.

Incurved varieties were well shown. There were four exhibits of 13 blooms in not fewer than 12 distinct varieties. Mr. A. TATE won the premier position quite easily with medium-sized, well-shaped blossoms of Daisy Southam, Mrs. J. Wynne, Buttercup, Pantia Ralli, Romance, Mrs. G. Denyer, and Calypso; 2nd, Mr. CHANDLER.

Mr. GARTON won the 1st prize for 12 incurved blooms.

The example of Clara Wells in Mr. A. TATE's collection was adjudged the premier incurved bloom in the show, a similar honour falling to Prince HATZFELDT in the Japanese section for his flower of Hon. Mrs. Lopes.

Amateur growers made a good display. Mr. F. CHANDLER won the first prize for 12 Japanese blooms in not fewer than eight varieties, and also the subscription challenge cup, valued at £10.

Prince HATZFELDT won the Victorian Challenge Trophy, valued at £40, which is calculated by points from the open classes; the trophy carries with it a Gold Medal.

Exhibits of plants were not numerous or specially good. Mr. DYMOTT won the 1st prize in two important classes, and W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham (gr. Wm. Ellwood), had the best table plants.

Displays of fruit were numerous and good. For three bunches of Grapes, distinct, J. WILLIS FLEMING, Esq. (gr. Mr. H. C. Dredge), was well 1st with beautifully-finished examples of Mrs. Pince, Muscat of Alexandria and Gros Maroc; 2nd, Mr. W. SANDERS, Vine Cottage Nurseries, Andover. Mr. WILLIS FLEMING also won in the class for two bunches of any black Grape.

In a class for two bunches of any white Grape, L. G. PIKE, Esq., King Baron, Wareham (gr. Mr. D. Pope), was 1st with Muscat of Alexandria.

Dessert Apples in four dishes were staged by 12 exhibitors, the best display being shown by Sir RANDOLPH BAKER, Ransdon, Hamford (gr. Mr. Usher).

In a similar class for kitchen varieties, 11 competitors took part. EARL NELSON, Trafalgar, Salisbury (gr. Mr. Bessley), winning the 1st prize.

Vegetables were numerous and good. Mr. MYERS won the premier place for six dishes in both Messrs. Toogood's and Messrs. Sutton's classes; in both cases having superior Leeks, Onions, Tomatos, Potatos and Cauliflowers.

Non-competitive exhibits were interesting. A display of Apples was shown from British Columbia. Cox's Orange Pippin and Northern Spy were especially fine. Messrs. OAKLEY & WATLING, Florists, Southampton, showed floral devices and baskets of Roses and Carnations.

Messrs. LADHAM & SON, Shirley, Southampton, exhibited Alpine and herbaceous flowers. Messrs. ROGERS & SON, Southampton, showed shrubs, &c.

WOOLTON CHRYSANTHEMUM.

NOVEMBER 10.—The 11th show of this society gave evidence of a backward season. Trained plants, which are usually a fine feature of this show, were fewer in numbers than usual. In the class for three trained Japanese Chrysanthemums, ARTHUR EARLE, Esq. (gr. Mr. T. Hitchman), was awarded the 1st prize. In the classes for single specimens, W. CUNNINGHAM, Esq. (gr. Mr. W. Wilson), had the best plants of incurved, reflexed and single varieties; P. W. BARR, Esq. (gr. Mr. T. Keightley), showing the winning plants of both Pompon and Anemone varieties.

W. TOD, Esq. (gr. Mr. G. Eaton), secured the chief award for 24 Japanese blooms in not fewer than 13 varieties, with a strong exhibit, his bloom of Lady Talbot gaining the N.C.S. Certificate as being the finest bloom of a Japanese Chrysanthemum in the show. Eighteen Japanese blooms, distinct, were best shown by Sir W. H. TATE, Bart. (gr. Mr. G. Haigh); whilst the premier exhibit for 12 blooms was shown by Mr. T. KEIGHTLEY. Mr. HAIGH also excelled in the class for 13 Incurved; but for 12 Incurved, T. CLARKE, Esq. (gr. Mr. J. Clarke), led, his Souvenir de William Clibran being adjudged the premier Incurved. Mr. HAIGH showed the most tastefully arranged collection of cut blooms, and he also won the 1st prize for a decorated table. Mr. T. KEIGHTLEY showed best in the class for nine vases of single varieties, nine blooms in each vase.

Mr. W. WILSON took the lead in the classes for black and white Grapes; and Mr. J. CLARKE excelled for a collection of dessert Apples. Mr. J. McCOLL led in the single-dish class for Apples, and he had the premier dessert Pears.

Exhibits of vegetables were excellent. Mr. J. GORE secured the Farmers' Cup for a collection, and Mr. J. CLARKE was 1st in the gardeners' section.

WOKINGHAM CHRYSANTHEMUM.

NOVEMBER 10.—The annual exhibition in the Drill Hall on the above date was an excellent type of the many similar shows held at this time of year. There were only two of the ordinary Chrysanthemum plant groups, and these were of the usual heavy-looking nature. The 1st prize was awarded to L. N. ERSKINE, Esq. (gr. Mr. Earl), and the 2nd prize to Sir E. D. LAWRENCE (gr. Mr. Lane). A class for groups of plants of any varieties not disbudded was very bright and attractive. Mrs. DENNISON was the only exhibitor of a group composed only of single varieties. Mrs. CHRISTIE (gr. Mr. Wilson) won the 1st prize for 12 Japanese cut blooms, also for six blooms, distinct, and six blooms of one variety, showing, in this latter class, Bessie Cooper. In a class for a group of miscellaneous plants, Mr. LANE showed a very pretty exhibit, which included some good *Oncidiums* and *Cattleyas*; Mrs. DENNISON was placed 2nd. The best six table plants were also exhibited by Mr. LANE. Mrs. DENNISON took the 1st prize for Begonias, Mr. BARNES, of Bearwood, coming 2nd. In the class for specimen foliage plants, Mrs. DENNISON was well 1st with a fine Palm of *Arcia Intescens*; Mr. COLE was awarded the 2nd prize for a plant of *Aspidistra lurida variegata*, 4 feet through. A pretty class was the one for cut blooms of Chrysanthemums, arranged with any foliage plants, in which Mr. BARNES was well 1st. Miss JOHNSON excelled in the class for a decorated table with a pleasing arrangement of Pink Begonias and white Chrysanthemums.

In the fruit classes Mr. BARNES was in evidence, having the best four dessert Apples in Haddon, Cox's Orange Pippin, Ribston Pippin, and Allington Pippin; the 1st prize culinary Apples in Emperor Alexander, Queen, Royal Jubilee, and Peasgood's Nonesuch, and the best four dishes of Pears. Mr. H. KIPP, Aldermiston, secured the 1st prize in Messrs. Sutton & Sons' class for six kinds of vegetables.

REIGATE CHRYSANTHEMUM.

NOVEMBER 10.—The 21st annual exhibition was held in the Public Hall, Reigate, the day being fine except for some rain which fell about mid-day, and there was a good attendance of visitors. The entries were far more numerous than at any previous exhibition. The blooms of both Japanese and Incurved Chrysanthemums were very fine. Grapes also were a notable feature.

In the class for 18 blooms of Japanese Chrysanthemums in six varieties shown in vases, a challenge cup was offered as the 1st prize. This was won by Mrs. HAYWOOD (gr. Mr. H. G. Bassett), the 2nd prize being won by J. AUERBACH, Esq. (gr. Mr. W. M. Blackwood).

A cup was also offered for the best group of Chrysanthemums, and this was awarded to J. AUERBACH, Esq., who, having won it three times in succession, becomes its absolute owner; 2nd, M. MARQUIS, Esq. (gr. Mr. J. B. Mead).

Col. INGLIS (gr. Mr. F. Phillips) excelled in the class for a group of single Chrysanthemums; 2nd, Dr. PRINCE (gr. Mr. J. Stedman).

For a table of cut blooms of Chrysanthemums arranged with foliage plants, Mr. AUERBACH was placed 1st, and Col. INGLIS 2nd.

In the cut bloom classes the best exhibit of 25 blooms of Japanese Chrysanthemums in 18 or more varieties shown in vases was staged by Rev. W. EARLE (gr. Mr. C. Sewrey); 2nd, Mrs. HAYWOOD. Mrs. HAYWOOD, however, was 1st for 24 blooms, including 12 each of Japanese and Incurved varieties; 2nd, C. J. WITTINGTON, Esq. Other classes for cut blooms, with the principal winners, were as follows:—Twelve Japanese blooms, distinct, 1st, G. JACKSON, Esq. (gr. Mr. W. Hunt); 2nd, Mrs. HAYWOOD. Six Japanese blooms, distinct, 1st, G. JACKSON, Esq.; 2nd, Mrs. HAYWOOD. Twelve Incurveds, distinct, 1st, Mrs. HAYWOOD; 2nd, C. J. WITTINGTON, Esq. Six Incurveds, distinct, 1st, Mrs. HAYWOOD; 2nd, G. JACKSON, Esq. Six Incurveds, one variety, 1st, C. J. WITTINGTON, Esq.; 2nd, G. JACKSON, Esq. Six vases of singles, distinct, 1st, G. JACKSON, Esq.; 2nd, A. J. NORRIS, Esq. One vase of five white Japanese blooms, 1st, C. J. WITTINGTON, Esq.; 2nd, Rev. W. EARLE. One vase of five yellow Japanese blooms, 1st, J. T. MITCHELL, Esq.; 2nd, C. J. WITTINGTON, Esq. One vase of any other colour, 1st, F. E. BARNES, Esq.; and one vase of six Incurveds in not fewer than four varieties, 1st, C. J. WITTINGTON; 2nd, Mrs. HAYWOOD.

Amongst the plant classes the following were 1st prize winners:—(Primulas), J. AUERBACH, Esq.; (Cyclamen), H. L. SHELTON, Esq.; (Begonias), Col. INGLIS; (table plants), M. MARQUIS, Esq., and (Pelargoniums), J. AUERBACH, Esq.

BROMLEY AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 10, 11.—The 28th annual exhibition of this society, held in the Grand Hall, Bromley, Kent, proved one of the finest exhibitions of the series.

The challenge cup offered for 48 blooms of equal numbers of Japanese and Incurved varieties always creates a keen competition. This year the successful exhibitor was W. W. MAXX, Esq., Ravenswood, Bexley (gr. Mr. Simon), and he was closely followed by H. F. FLARKE, Esq., Foxbury, Chislehurst (gr. Mr. Lyne), last year's winner.

R. A. C. COOPER-MARSDEN, Esq., Wickham Road, Beckenham (gr. Mr. Rigby), carried off the Griffith Challenge Cup in the class for six vases of Japanese blooms, having especially fine flowers of Mrs. G. Mileham and Reginald Vallis, one of the latter blooms being awarded the National Chrysanthemum Society's Certificate offered for the best Japanese bloom in the show. J. I. SMAL, Esq., Warren Wood, Hayes (gr. Mr. Govier), who was the 1st prize-winner last year, was placed 2nd.

In the classes for Japanese blooms restricted to "single-handed" gardeners, Mr. RIGBY took the lead throughout.

Incurved Chrysanthemums were better represented than for several years past; all the classes were well filled, and there was a refinement in the blooms. The National Chrysanthemum Society's Certificate for the finest Incurved bloom in the show was awarded to Hanwell Glory, exhibited by Mrs. CHALMERS, Farrants, Bickley (gr. Mr. Hudd.)

The two classes for single varieties were well contested. There were no fewer than 120 vases, and these occupied a terraced stage the whole width of the hall.

Fruit and vegetables, although well represented, were not so numerous or so fine in quality as last year.

STIRLING CHRYSANTHEMUM.

NOVEMBER 10, 11.—The annual show was held on these dates in the Albert Halls, Stirling. Compared with last year there was an increase of entries, resulting in the best show held under the auspices of the society. Nevertheless, it failed financially.

The principal class for cut blooms was one for six vases of as many varieties, each vase containing three blooms. Mr. MORTON, Cullen House, Banffshire, secured the premier award, which consisted of the President's Cup, with clean, well-finished blooms of good size, those of Algeron Davis, Lady Talbot, Mrs. A. T. Miller, and Mme. G. Rivol being prominent. The judges had no light task in awarding the prizes, so close was the competition. Mr. McLEAN, Alloa, was placed 2nd, and Mr. CARMICHAEL, Stirling, 3rd. Both the classes for twelve and for six blooms respectively brought good competition, Mr. HENDERSON, Larbert House, showing grandly in both classes. He showed Mrs. A. T. Miller especially good.

The Corporation Cup, offered for the best four disbudded Japanese Chrysanthemum plants, distinct, was somewhat easily won by Mr. JAS. WOOD, Dunmore, his plants being typical examples, carrying highly-coloured blooms. Chrysanthemums grown in 6-inch pots were again a feature of the show, Mr. H. GRAY leading for both budded and naturally-grown specimens.

A capital entry was seen in the miscellaneous plant section, Mr. JAS. K. MESTON, Stirling, being the most successful exhibitor in this section.

Exhibits of fruit were numerous. Grapes were well shown by Mr. MITCHELL, Airthry Castle, Mr. MESTON, and Mr. PALMER, Alloa. Mr. MITCHELL led in the class for dessert Apples and for Pears. Mr. McISAAC, Stirling, secured somewhat easily the 1st prize for culinary Apples, showing Warner's King, Pasgood's Nonesuch, Bismarck, and Newton Wonder.

Vegetables were a meritorious display both in numbers and quality. Mr. SHAW, Boquhan, Kippen, had the best collection of ten kinds. Mr. JOHN OGILVIE, Larbert, was placed 2nd, and Mr. MESTON 3rd. Mr. GEO. WATSON, Kippen, was awarded the 1st prize for a collection shown by an amateur.

Honorary exhibits were shown by Messrs. DRUMMOND & SONS, Stirling, who displayed 50 varieties of Apples grown out-of-doors; Mr. CRAIG, Stirling, in a table of flowering and foliage plants and floral design, and Messrs. GEO. BUNYARD & Co., Maidstone, who showed a collection of highly-coloured Apples.

NORTHAMPTONSHIRE CHRYSANTHEMUM, FRUIT AND VEGETABLE.

NOVEMBER 10, 11.—This society held its 36th annual show, on these dates, in the Corn Exchange, Northampton. The entries were above the average in number, and some excellent exhibits were staged. The feature of the show was a new class introduced by the president, C. W. PHIPPS, Esq. This was for a circular group of single-flowered Chrysanthemums and Ferns; five splendid exhibits were staged in the centre of the hall and were much admired.

In the class for a circular group of miscellaneous plants with cut blooms of Chrysanthemums, J. MANFIELD, Esq., Weston Pavell (gr. Mr. F. G. Bull), won the 1st prize easily with a pleasing arrangement of well-grown plants of winter-flowering Begonias, Carnations, Bouvardias, Cyclamens, Salvias, &c., interspersed with foliage plants and Ferns, with a few dot plants of Oncidiums and Cattleyas; 2nd, Sir T. HESKETT, Bart., Easton Neston (gr. Mr. G. F. Hallett).

In the class for a circular group of single Chrysanthemums and Ferns, the 1st prize was won by Mr. F. G. BULL; 2nd, T. CHURCH, Esq., Cliftonville (gr. Mr. G. Garton).

Winter-flowering Begonias were best shown by Mr. F. G. BULL; 2nd, Mrs. H. A. ATTENBOROUGH, Catesby (gr. Mr. A. Child).

The best stand of 18 Japanese blooms displayed on boards were shown by Earl SPENCER, K.G., Althorp (gr. Mr. Silas Cole); 2nd, Marquis of NORTHAMPTON, K.G., Castle Ashby (gr. Mr. A. R. Searle). In the class for 12 Japanese blooms, the same two exhibitors were again placed in this order.

In the class for 12 Incurved blooms, distinct, the 1st prize was won by Mr. A. R. SEARLE; 2nd, Mr. A. CHILD.

The best arranged basket of single-flowered Chrysanthemums (for ladies only) was shown by Mrs. C. W. PHIPPS, Cliftonville, and the best arranged bowl of these flowers by Mr. A. R. SEARLE. In both these classes the competition was very keen, some 12 exhibits being staged.

In the class for two bunches of black Grapes, the 1st prize was won by Mr. A. R. SEARLE, who showed splendid bunches of Black Alicante; 2nd, Mr. A. CHILD, who was 1st for two bunches of white Grapes, having choice bunches of Muscat of Alexandria; 2nd, Lady KNIGHTLEY, Fawsley (gr. Mr. E. Cox).

The 1st prize for a collection of culinary Apples was won by Mr. A. R. SEARLE; 2nd, Mr. G. F. HALLET. Mr. SEARLE also excelled in the class for dessert varieties, being followed by Mr. F. T. BEETON, Ramsey, Hunts.

In the class for a collection of vegetables of eight distinct kinds, Mr. SEARLE won with a superb collection, closely followed by Mr. S. COLE, Althorp. Mr. SEARLE also won the special prize for a collection of vegetables offered by Messrs. Webb & Sons, Stonbridge; 2nd, Mr. G. F. HALLET.

The special prize for 12 Onions, offered by Messrs. Sutton & Sons, Reading, was won by Mr. F. G. BULL; 2nd, Mr. G. F. HALLET.

DEVON & EXETER HORTICULTURAL.

NOVEMBER 11, 12.—The 208th exhibition of this society, held in the Market Halls, Exeter, was one of the best of these autumn shows for many years. The entries greatly exceeded in number those of former years, but the attendance was not commensurate with the attractions of the show.

The leading features were the Chrysanthemums in vases and stands (cut blooms) placed in competition for Messrs. Sanders and Biss's Challenge Cup—which was won for the second time by Rev. T. SHEEPSHANKS, Chudleigh, with an exceptionally fine lot of blooms. Another feature of the show was the large number of decorated dinner tables.

The challenge cup for a collection of fruit was won by Captain MORRISON BELL, M.P., Lady DUCKWORTH KING being a remarkably close 2nd.

Exhibits of Begonias, Bouvardias, Cyclamens, Poinsettias and Solanums were good, but not extraordinary. Miscellaneous table plants were not largely shown.

CHRYSANTHEMUMS—CUT BLOOMS.

As stated, the silver challenge cup (value £30) presented by Messrs. Saunders and Biss, Horticultural Builders, Exeter, to be won three times before becoming the property of any competitor, was carried off by last year's winner, Rev. T. SHEEPSHANKS, Chudleigh (gr. Mr. Dunkley). The schedule required 12 vases of Japanese blooms, four vases of Incurveds and eight vases of single Chrysanthemums, distinct. Amongst Mr. SHEEPSHANKS' best Japanese blooms were Lady Talbot, Mme. G. Rivol, Miss Elsie Fulton, Mrs. A. T. Miller, F. S. Vallis, Florence Penford and Lee Park Wonder. Of Incurveds, he showed fine specimens of Mrs. J. Hygate and Clara Wells, the latter being awarded the Silver Medal for the best Incurved bloom in the show. This exhibit also won the National Chrysanthemum Society's Medal offered for the best exhibit; 2nd, Mr. W. ORROCK, Parkerswell (gr. Mr. W. Rowland).

In the class for 24 Japanese blooms in 18 varieties, E. C. NORRISH, Esq., Barnstaple (gr. Mr. H. Reynolds), won the 1st and the Rev. T. SHEEPSHANKS the 2nd prize. Mr. NORRISH's best blooms were F. S. Vallis, Mary English, John Peed, and Mrs. A. T. Miller.

For a collection illustrating the different sections of Chrysanthemums arranged on a table 8 feet by 4 feet, Mr. E. C. COLLINGWOOD, Exeter, won the 1st prize easily. Mr. COLLINGWOOD also took the N.C.S. Certificate and large Silver Medal for the best amateur exhibit in the show.

Rev. T. SHEEPHANKS was 1st for six white blooms of a Japanese variety, showing Mrs. A. T. Miller and Mrs. C. Beckett in good form.

Mrs. GIDLEY, Exeter (gr. Mr. W. R. Baker), was 1st for six yellow blooms, his best being Geo. Mileham (1908) and Lady Talbot, the latter gaining the Silver Medal offered for the best Japanese bloom in the show.

Rev. T. SHEEPHANKS was 1st for six blooms of any other colour for six Incurveds, and for 12 vases of single Chrysanthemums.

FRUIT AND VEGETABLES.

Grapes.—The best three bunches of Black Alicante were shown by Sir Wm. FERGUSON DAVIE, Creedy Park (gr. Mr. W. Seward); the best White Muscats by Captain MORRISON BELL, M.P., Chudleigh (gr. Mr. A. Worth), and the best three bunches of any other kind by Lady DUCKWORTH KING, Countess Wear (gr. Mr. Sidney Baker).

The challenge cup for a collection of fruit was won by Captain MORRISON BELL, Lady DUCKWORTH KING just missing winning it, for the third time and securing it outright.

The 1st prize for 24 sorts of Apples—12 dessert and 12 culinary kinds—was won by Miss CLEAVE, Crediton (gr. Mr. G. Lock), Sir Wm. FERGUSON DAVIE was an exceedingly close 2nd.

Miss CLEAVE was also 1st in the classes for six dessert varieties, and for six culinary varieties.

The best dessert Apple shown was Rival, and the best culinary variety Byford Wonder.

Miss CLEAVE showed the best exhibit of nine varieties of Pears, distinct, six dessert and three culinary.

The vegetable classes were keenly contested, some fine exhibits being staged.

Premier honours went to Mrs. GIDLEY, Exeter (gr. Mr. W. R. Baker), both in the open class and for Messrs. Robert Veitch & Sons' special prize, the kinds staged being Autumn Giant Cauliflower, Renton's Monarch Leek, Cranston's Excelsior Onion, Veitch's Red Garden Globe Turnip, Factor Potato, Veitch's Exhibition Sprouts, Perfection Tomato and Lulham Prize Pink Celery. Lady DUCKWORTH KING was an easy 1st prize-winner in the class for six Onions.

Special prizes were given by Messrs. Robert Veitch & Son, Sutton & Sons, James Carter & Co., and Jarman & Co., which brought good competition.

There were several trade collections of much merit, notably those of Messrs. ROBERT VEITCH & SON, Exeter, and Messrs. JARMAN & CO., Chard. The BEEKEEPERS' ASSOCIATION and Messrs. SAUNDERS & BISS, Horticultural Builders, also showed exhibits.

Mr. A. Harold Ward, the honorary secretary, is to be congratulated on this, his first effort at organising a flower show.

WESTON - SUPER - MARE CHRYSANTHEMUM.

NOVEMBER 12.—A highly-successful show was held in the Knightstone Pavilion, Weston-super-Mare, on the above date. This show has been held annually for 23 years, and never before has such a fine exhibition been seen, the number of entries and the quality of the exhibits all round beating all records.

At the foot of the concert platform some very fine groups of miscellaneous plants were arranged, whilst around the sides were accommodated groups of Chrysanthemums, pot plants, and trade exhibits. Amongst these latter, Mr. Wm. Brooks, Whitecross Nursery, Weston, and Mr. C. J. ELLIS, Knightstone Road, Weston, exhibited floral designs.

A choice stand of single Zonal Pelargoniums was arranged by Mr. VINCENT SLAIDE, Taunton, Somersetshire, and Mr. G. ROBERTS, Manor Nursery, Weston, displayed winter-blooming Carnations.

In the competitive classes the principal prize-winners were as follow:—Group of Chrysanthemums arranged for effect—1st, H. CORNELIUS, Esq., Weston; 2nd, Mr. W. BROOKS, nurseryman, Weston.

Group of miscellaneous plants.—1st, Mr. C. J. ELLIS, Weston; 2nd, H. CORNELIUS, Esq.

Foliage plants.—1st, Sir W. HOWELL DAVIS, M.P., Stoke Bishop, Bristol; 2nd, C. J. ELLIS.

Three Orchids in bloom.—1st, W. M. APPLETON, Esq., Weston; 2nd, Sir W. H. DAVIS, M.P.

Twelve Incurved Chrysanthemum blooms.—1st,

H. E. MURRAY ANDERTON, Esq., Taunton; 2nd, Right Hon. WALTER LONG, M.P., Rood Ashton.

Twenty-four Japanese blooms.—1st, H. E. M. ANDERTON, Esq.; 2nd, Mr. W. IGGULDEN, Lock-hill Nursery, Frome.

In the open fruit classes some very fine samples were staged. Black Alicante Grapes were best shown by Sir W. H. DAVIS, M.P., and G. A. GIBBS, Esq., M.P., showed the best white Grapes.

CORN EXCHANGE CHRYSANTHEMUM.

NOVEMBER 12.—The annual show of Chrysanthemums and fruit in the Pillar Hall, Mark Lane, was held on this date. These exhibitions are held in aid of the funds of the Corn Exchange Benevolent Society. A considerable number of exhibits was staged, the flowers and fruits being sold by auction at the close of the show for the benefit of the charity.

The principal class was for 12 blooms of Japanese Chrysanthemums, distinct. It was open to all. Three prizes were offered in addition to two silver challenge cups, one given by the members of the Corn Exchange, and the other by friends. The 1st prize and silver cup was awarded to E. MOCATTA, Esq., Addestone (gr. Mr. T. Stevenson), for an excellent exhibit, including splendid flowers of F. S. Vallis, Walter Jinks, Leslie Morrison, Reginald Vallis, Mrs. N. Davis, Algernon Davis, Master James, Splendour, and O. H. Broomhead. The 2nd prize was awarded to C. B. GABRIEL, Esq., Cardale, Hor-sell, Surrey (gr. Mr. J. Hillier). W. R. CLARK, Esq., Debden Hall, Loughton (gr. Mr. F. King), won the 3rd prize and the silver cup offered to members of the Corn Exchange.

THE LATE G. W. TIFFEN.

BRADFORD CHRYSANTHEMUM.

NOVEMBER 12.—The 23rd annual exhibition was held on this date in St. George's Hall, Bradford. The show was not quite so large as on some previous occasions, but a fine exhibition resulted, and competition in the classes was good. In the class for 24 Japanese blooms in not fewer than 18 varieties the 1st prize was won by Mr. C. JONES, Bromborough, Cheshire, with the following varieties:—Lady Talbot, G. J. Bruzard, Frank Payne, Reginald Vallis, Paul Randet, Bessie Godfrey, W. J. Davis, Mrs. W. Knox, Valerie Greenham, W. A. Etherington, G. Rivel, Mrs. Charles Penford, W. R. Church, North Pole, Yellow Etherington, Walter Jinks, White Barkley, and Mrs. Barkley; 2nd, Mr. A. CHANDLER, Rugby.

In the class for Incurveds, Mr. DRAKE, Cardiff, easily carried off chief honours with 24 blooms that were models of compact and symmetrical form. Mr. CHANDLER's group, which took 2nd prize, was much inferior. He was very successful, however, on the whole, carrying off one 1st and four 2nd prizes.

In the local class for 18 blooms, including no fewer than 12 varieties, for which the Lord Mayor's Cup is given, Mr. JOHN THORNTON, of Drighlington, who has won on at least two previous occasions, was this year beaten by Messrs. H. CLARK & SON, Rodley, who staged a fine group, all the blooms being well grown. The most striking specimens in the collection were Bessie Godfrey, Mrs. A. T. Miller, and Mrs. G. Mileham. Messrs. CLARK & SON were worthy winners of a cup given by Mr. James Hill.

In other classes they were beaten by Mr. THORNTON, Mr. P. GUDGEON, and Mr. THOMAS BIRD, Windhill. Amongst other successful exhibitors were Mr. M. BROOKE and Mr. JOHN BROOKE (the former of whom took five 1sts for bouquets, the latter being 2nd in most instances), Mr. R. EICHEL, Bingley, and Mr. F. HOWLAND. There was an excellent show of single Chrysanthemums.

The National Society's Certificate for the premier Japanese bloom was awarded to Mr. CHARLES JONES for Lady Talbot; and for the premier Incurved variety Mr. G. W. DRAKE was successful with Mrs. F. Judson; while a certificate for a single variety was given to Mr. WILLIAM MOORBY, Shipley.

Obituary.

GEORGE W. TIFFEN.—We regret to record the death of Mr. George William Tiffen, which occurred at his residence, Willow Grange, Keston, Kent, on the 11th inst., after a long and painful illness extending over three years. Mr. Tiffen, who was born at Burnham-on-Crouch in 1851, was engaged in the fruit trade the whole of his life, succeeding his brother Thomas Tiffen, who had several fruit businesses in the City of London. Mr. Tiffen was highly respected in the wholesale and retail fruit trades, and his genial presence will be much missed in Covent Garden and the City. He conducted a high-class trade, supplying fruit to the principal City companies and merchants. The funeral at Streatham on the 15th inst. was attended by a representative gathering of the trade. Deceased leaves a widow and three young children. Mr. Tiffen was generous in his gifts to philanthropic societies, and was a life subscriber to the Royal Gardeners' Orphan Fund.

W. W. POLDEN.—We regret to announce the death of Mr. W. W. Polden, who was, for nearly 40 years, a representative of Messrs. Hurst & Son, Seedsmen, Houndsditch. Mr. Polden had been in failing health for some considerable time, and he was compelled to relinquish his duties with Messrs. Hurst about four years ago. His death took place on the 16th inst., at the age of 70 years. Mr. Polden was well known to gardeners in the Southern and Midland counties, and in Wales.

JOHN ERNEST HARTNUP.—The death of Mr. John Hartnup, gardener at Pixham Firs, Dorking, occurred on the 4th inst. from accidental gas-poisoning under peculiar circumstances. The gas pendant in a room beneath deceased's bedroom cracked, and the fumes passed through the ceiling into his bed-chamber.

JOHN C. TALLACK.—The news of the death of Mr. John C. Tallack, gardener at Shipley Hall, Derbyshire, will come as a painful surprise to his many friends. It appears that for some time past Mr. Tallack has suffered from an internal complaint, which threatened to have a fatal termination. He died from self-administered poison on the 12th inst. Deceased was a first-rate gardener, and a frequent contributor to the horticultural Press, his writings being at once practical and clearly expressed. Some years ago he wrote a weekly calendar for this journal, and from time to time he has contributed notes and photographs from the Shipley gardens. He was the author of *The Book of the Greenhouse*, published in Mr. John Lane's series of "Handbooks of Practical Gardening." Mr. Tallack was born in Cornwall, and became apprenticed to gardening in the gardens of Canon Philpotts in that county. After serving in various establishments, he was appointed head gardener at Prideaux Place, in Devonshire. Leaving this place, he served Messrs. James Veitch & Sons for two years, in their landscape department, and afterwards was appointed head gardener at Livermore Park, Suffolk, where he remained for 12 years; during part of this time, Mr. Tallack lectured on horticulture for the Suffolk County Council. About 10 years ago deceased removed to Derbyshire, to succeed the late Mr. Elphinstone as gardener to E. Miller Mundy, Esq. Mr. Tallack was a prominent supporter of the Royal Gardeners' Orphan Fund, and a member of the United Horticultural Benefit and Provident Society.

AMATEUR OR PROFESSIONAL: *A. S. T.* The question the committee has to determine is whether the exhibitor cultivates his produce for sale, or, on the contrary, merely disposes of all surplus products. This much you know, having the code of rules published by the Royal Horticultural Society at your hand. Judging from your letter it would certainly appear that the exhibitor in question would more fittingly be described as a professional or market grower. At the same time an inquiry of this kind has to be made in the locality, and the society, through its committee, ought to find little difficulty in settling the question to the satisfaction of all parties.

AMPELOPSIS VEITCHII, &c.: *H. K.* The tendrils of this plant cannot support the growths owing to the whitewash with which the rough-cast wall is coated falling away from the surface. Let the wash be removed by scrubbing with plain water, and the tendrils will cling to the rough-casting securely. Lime that has been exposed to the air for a few months has not any injurious action on this plant, or on Ivy.

APPLE CHARLES ROSS: *H. K.* We believe the Royal Horticultural Society's awards (A.M. and F.C.C.) were given this variety for its merit as a dessert fruit.

ASPARAGUS PLUMOSUS: *W. B.* The exhibit in which this plant was shown as a Fern was properly disqualified. The Asparagus is a flowering plant and not a Fern.

CELERY DISEASE: *Constant Reader.* A damp season favours the spread of most fungus diseases. No doubt your soil is infected, and you should not plant Celery on the same site again until at least a year has elapsed. Be careful to burn all the stems, root, and leaves from the affected plants. With respect to freeing the soil from the spores of parasitic fungi, the safest specific to use is potassium permanganate. Carbolic acid is efficacious, cheap, and easily employed. The preparation known as Lysol, used at the rate of one ounce to six gallons of water, may also be used for this purpose; it is a proprietary article obtainable from the sundriesmen.

EXPENSES FOR REMOVAL: *C. H.* Unless you have an agreement in regard to this matter, you cannot claim any expenses incurred by dismissal. All you can insist upon is proper notice.

FRENCH "GARDENING": *K. H. B.* Whether, at the end of 12 months' tuition you are sufficiently instructed to start a "French" garden with a capital of £100, depends largely on your own abilities. Some men can learn as much in 12 months as others can in 12 years, and make better use of their knowledge. Assuming that you are conversant with the details of the "French" system, and can produce good saleable crops early in the respective seasons, you might very well start on a capital of £100. This could be spent as follows: 200 cloches, £10; 20 frames with 60 lights, about £50; 100 mats, about £7; 80 tons of manure at 5s. per ton, £20; tools and seeds, say £5—making a total of £72, thus leaving £28 for rent, water, shed, &c. As the frames and cloches together would only cover about 4 square poles of ground, it would be possible to start in a small way with, say, half-an-acre of land, thus having something like 70 square poles for open-air crops on the natural soil, or on the old hot-bed refuse spread over a portion. The returns from the lights and cloches would probably come to about £70, while the produce from 70 poles in the open ought to realise about £40, always assuming the market to be in a fairly normal condition for the sale of good material at the right time. The expenses, apart from labour, the first year would be about £100; but in the second and succeeding years they would probably not amount to more than £25 to £30 for the same piece of land. Assuming the returns to average about £110 per annum for the first five years, and the total expenses, apart from labour, to be about £200 for the same period, a balance of

£350 would be left, or an average of £75 a year. One man should be able to attend to all the details of 200 cloches and 60 lights, and the remaining portion of the land, so that all profits should go into his own pockets. The profits, or the reverse, depends entirely upon the cultural skill and business abilities of the grower himself. You would find *French Market Gardening*, by J. Weathers, or *French Gardening*, by T. Smith, useful. The volumes may be obtained from our publishing department.

NAMES OF FRUITS: *A. G.* 1, Gooseberry Apple; 2, French Crab; 3, Court pendu-plat; 4, Beurre Diel; 5, Calebasse, not Grosse Calebasse.—*Edmondson.* Some authorities consider the spots to be caused by the fungus of canker.—*P. E.* 1, Manks Codlin; 2, Dumelow's Seedling; 3, Waltham Abbey Seedling; 4, this is probably a local variety; 5, Orange Goff; 6, specimen decayed.—*W. G. B.* 1, Brabant Bellefleur; 2, Hanwell Souring; 3, Cockle Pippin; 4, Scarlet Golden Pippin; 5, Reinette de Granville; 6, Flower of Herts.; 7, too small to name; 8, Amie Elizabeth.—*T. W.* Pit-maston Duchess.

NAMES OF PLANTS: *W. Morgon.* Clitoria ternatea.—*A. B. C.* 1, Picea excelsa var. pygmaea; 2, Thuja (Biota) orientalis.—*W. T. N.* 1, Cattleya maxima; 2 and 5, Cattleya labiata; 3, Cyrtopodium Charlesworthii; 4, C. Spicerianum.—*J. F. M.* 1, Osmunda gracilis; 2, specimen insufficient, probably Osmunda regalis; 3, Pellaea falcata; 4, Polypodium aureum; 5, Selaginella viticulosa; 6, Selaginella casia; 7, Pteris hastata.—*F. H.* 1, Brassia brachiata; 2, Odontoglossum crocidipterum; 3, Oncidium pubes; 4, Oncidium flexuosum.—*W. S.* 1, Davallia platyphylla; 2, Polypodium aureum.—*Brygn.* 1, Pandanus Veitchii; 2, Dracena marginata; 3, Acalypha musaica; 4, Carludovica atro-virens; 5, Panicum variegatum; 6, Cissus discolor.—*J. M. G., Sussex.* 1, Abutilon megapetalum variegatum; 2, Fittonia Verschaffeltii Pearcei; 3, F. V. argyrea; 4, Aloe Socotrana; 5, Maranta illustris; 6, Polystichum angulare; 7, Cyrtopodium Charlesworthii; 8, Phyllocactus speciosus; 9, Aloe verrucosa.—*A. H.* Ruscus Androgynus.

RAISING OAK, BEECH, ETC., FROM SEED: *J. T. S.* As soon as the Acorns are ripe they should be either sown immediately or stored carefully for sowing in the following spring. If kept through the winter they must be stored in a dry and cool place out of the way of squirrels or other creatures that would eat them. The best plan, however, is to sow them, as soon as they are gathered, in ground which has previously been well dug and prepared, placing them about 2 inches below the ground, allowing a distance of about 15 inches between each row, and 5 inches apart in the row. The Beech nuts should be gathered about October or November, and they can be sown immediately, but this is not the best practice. It is preferable to mix the seeds with a quantity of dry sand and allow them to remain until the following March, when they may be sown in a light soil, covering them scarcely more than $\frac{1}{2}$ inch deep. Sow them in rows made 18 inches apart, and place the seeds 4 inches apart in the rows. Ash seeds germinate best after they have been kept for a year. They should be mixed with a quantity of dry sand or light, dry earth, so that the outer coat will decay. It is necessary to turn the heap once every three months. Sow them evenly in rows the second March after they are gathered. Sycamore seeds should be sown immediately after they are gathered in September or October, but they can also be kept in dry sand and sown in the following spring, if this is desired.

ROSES FROM CUTTINGS: *A. P.* Most Roses will bloom the second or third year from cuttings. Are you quite sure the cuttings you inserted were really Rose cuttings, and not growths from the stock on which a Rose had been budded?

SHOT-HOLE DISEASE: *H. R.* It is too late in the season to do much to combat this disease, but be careful to gather and burn all the affected leaves. Next spring spray the plants with the following specific:—Put 8 lbs. of good quicklime into a barrel, add one gallon of water, and

when the lime begins to slake add 8 lbs. of powdered sulphur. Stir well until the lime is thoroughly slaked, then add water to make 50 gallons of the mixture. This should be kept stirred during its application to the trees. The specific is most efficacious just when the leaves have first expanded, but its use should be continued at intervals.

SOIL FOR A VINE BORDER: *Mac.* The best soil for a vine border is one composed of turfy loam cut from old pasture land. Some old mortar rubble, wood-ashes, and bones or bonemeal should be incorporated with it. The turves should not be cut into small pieces, as the fibre lasts longer and the soil remains sweet and wholesome over a longer period if it is not broken up too finely. Proper drainage should be provided before attempting to form the border. See also notes on making borders in *Gardeners' Chronicle*, September 18, p. 195.

TREES AND SHRUBS FOR AUTUMN EFFECT: *Mac.* Of those trees and shrubs which produce good colour effects in autumn those enumerated below are likely to succeed in your soil and district. *Trees:* Crataegus Crus-galli, C. C.-g. prunifolia, C. coccinea; Acer circinatum, A. tataricum, A. platanoides Schwedleri, A. rubrum, A. japonicum aureum; Quercus coccinea (Scarlet Oak), Q. palustris (Marsh Oak). *Amelanchier canadensis* (Snowy Mespilus); *Liriodendron tulipifera* (Tulip Tree) and *Liquidambar styraciflua* (Sweet Gum tree). *Shrubs:* Euconymus europaeus, E. e. atropurpureus, Rhus Cotinus (Venetian Sumach), R. cotinoides, R. typhina (Stag's Horn Sumach), Cornus alba (Dogwood), C. a. Spathii, Berberis Thunbergii, B. virescens, B. Aquifolium; Viburnum Opulus (Guelder Rose); Cotoneaster horizontalis, Spiraea prunifolia fl. pl., and Acer palmatum atrosanguineum.

VINES AND MEALY BUG (COCCUS ADONIDUM): *L. W.* This insect, being an introduction from warmer countries than these islands, is unable to withstand a severe degree of cold. If you could turn out-of-doors the entire growth of the vines at this season, letting them remain till it is time to give them their final pruning, the bug would probably be destroyed; the rougher portions of the bark being first removed with the hand and a wooden scraper. The spurs should be shortened to 8 or 10 inches, and the trimmings burned and the rods fastened to stout stakes, to which they may remain till the final pruning in January, or later in the year. The vines may be dressed after peeling off the rough bark with Gishurst compound soap—3 ounces to the gallon of warm water; with Fir tree oil, or paraffin. The paraffin must not be used stronger than one wineglassful to three gallons of water, and the mixture must be kept stirred during its application. A second dressing may be applied just previously to taking the vines indoors. The surface soil of the viney should be carefully removed out of the house, and the hot-water pipes washed with soap and water. Be careful to cleanse the lower parts of the rods to an inch or two below the ground level. Linewash the walls; fill up crevices in the woodwork and glasses. Even with the utmost care taken in cleansing a viney some few insects may escape, and a sharp look-out for them should be maintained the following season.

VIOLETS: *G. H. H. W.* We can only suppose that putrifying bacteria had entered the flower-stems at the cut ends. This might account for the disagreeable smell after long confinement in a box, although the leaves or flowers themselves appeared still perfectly fresh.

WEEDS ON LAWNS: *E. W.* It would not be safe to sprinkle the turf with kerosene, for, although it would kill the weeds, it would also destroy the grass, and probably the latter first. If you employ a lad to pierce the crown of each Plainain, or Dock, with an iron skewer dipped in the kerosene, or, better still, in some strong acid, this would rid your lawn of them. Endeavour to promote a luxuriant growth in the grass by applications of nitrogenous manures. The grass may then crowd out the weeds.

"THE CURIOUS GARDENER."

THE title of this old work is too lengthy to quote in full. "*The Curious and Profitable Gardener*. By John Cowell, of Hoxton. Adorn'd with Curious Figures. London, MDCCXXX." may perhaps suffice. The book is in two parts, the pages of each part numbered separately, and in my copy Part I. occupies the place the second ought to occupy, while the latter follows the contents. The curious reader will not be disappointed by a perusal of the work. The author, a simple-minded man with no great education, provides a sufficiently quaint book, which seems to have been primarily produced to chronicle the accomplishments of an American Aloë, which flowered in his nursery in 1729. We can hardly comprehend the excitement caused by this event, his nursery being visited by thousands, who paid 6d. each to see the wonderful plant which its owner had been careful to protect by a case with an inside stair, from which the visitor could comfortably inspect the whole 20 feet of spike, with its many branches and its circumference of 7 inches "at the bottom." Only a few specimens had flowered in England previously, and though Houghton credits one at least with having done so satisfactorily, Cowell declared every

one to have been in a lesser or greater degree a failure. He traces the history of his plant to the time of Sir W. Raleigh, who seems to have imported its grandparent from America, and though he had been in possession of the plant only 12 years it had been an inmate of the nursery for quite 72 years. But not only did he write up the Aloë, for someone having surreptitiously published a print of it in mezzotint in September, 1729, he went to the expense of publishing it with other curious plants that were in his garden in their proper colours that the curious may no longer be impos'd upon." He entertains the reader with an account "of a detestable piece of Malice and Abuse that was offered me when this Aloë was flowering in my garden and gave me the fairest prospect of possessing an easy Fortune for my Life, from the vast Concourse of people that daily resorted to my house to see it." "Three men habited like Gentlemen" tried to destroy the spike, and on rushing to the assistance of a servant he was "kick'd" on the head, "pull'd" by the legs and wounded with a sword, with the result that he was "devoid of attending the curious persons who came to his garden." "However," concludes the recital, "they have paid pretty well for that," which was gratifying to one who had just lost an "easy fortune."

The "Torch Thistle" (*Cerens hexagonus*) flowered at the same time as the Aloë, and Cowell seems to have considered his plant to have flowered next after that of Bishop Compton, but if so he was mistaken. This flower he also had painted, and exhibited the picture along with the Aloë. Then he had a specimen of the Glastonbury Thorn, which flowered at Christmas and again in May. He fills many pages with matter connected with this, at one time, marvellous plant. He made a trade of supplying "Sprigs of it in Blossom at Christmas time," and to account for this precarious blossoming he seems to agree with one of his correspondents that Joseph of Arimathea would naturally carry his staff from Judea with him, and that, true to its upbringing, when the staff was thrust into the ground it would bud and flower at the same time as the other Thorns in its native land.

In Part (I.) there is not so much curious information. Mention must be made of the Banana, of which he gives a "draught," but Cowell had only heard of the plant, though a year later Miller fruited it in in the Chelsea Botanic Gardens. Concerning Pineapples, Cowell advised the construction of larger stores than were usual, and of which many had been built subsequent to the success achieved by Sir Matthew Decker's gardener. He advocated free ventilation, a cultural expedient that seems to have been neglected then and for long afterwards. It is obvious he had a leaning towards the cultivation of tender, exotic plants, but the number of species he was acquainted with was painfully few. Of these mention may be made of the wild Pine, or "Penguin" (*Bromelia Pinguin*), but as he had only seeds when his book was written it is not surprising that he should confound it with another plant, and, since it bore fruit the size of a Melon, which hung down from the branches, he may have confused it with the Papaw-tree (*Carica Papaya*), an account of which fol-

lows. He had raised several Papaws from seeds, and had sold the plants "to good Advantage." Of the Guava tree (*Psidium pomiferum*) it is reputed that the first fruit was produced at Bodmanton on a tree 16 feet high, but generally the species had failed to fruit in other gardens. "The Mangos, or Mango, or Indian Honey Plum," the *Mangifera indica* mentioned by Parkinson, but perhaps not cultivated till the Hampton Court plant about 1690, is also briefly mentioned. It had passed out of cultivation in 1730, though two specimens had been imported two years previously. Cowell relates a "notable" story of how the Indians raise a Mango from seed, the seedling in the course of half an hour becoming a full-grown tree. This not improbably refers to the trick Indian jugglers still perpetrate, and, as then, it may still be said that it "has hitherto been a Surprise, and not known." Talking about surprises, he mentions that it was customary to cultivate Pomegranates for table decoration. "Surely nothing can be more dazzling," he remarks, "than to see a little tree of this sort not above a foot high, covered with its fine Crimson Blossoms; or can be more pleasant than to have such a Dwarf brought to Table with half a Dozen ripe Fruit upon it." Equally surprising is it to know that the Pomegranate was cultivated "against walls," and actually ripened fruits "as at Sir Gregory Page's at Greenwich, and at Kne-Green."

His "Curious Remarks relating to Flowers" are introduced by a letter sent him on the naming of flowers in the way customary on the Continent, where the "Flowerists" by the initial letters indicated the colours of the particular flower; thus, if it were crimson and purple it might be, according to the proclivities of the florist remembered, in "*Charming Phyllis or the Curious Ptolemy*." In the same way "*Victorious Orlando or the Virtuous Oredo*" would bring before the mind violet and orange, while in the *Beautiful Rodolinda* or the *British Rover* we have examples of blue and red. It will be patent to the interested "Flowerist" of to-day that this is a method not for an age but for all time, though perhaps like Cowell he will betray little enthusiasm for this old but novel mode of nomenclature. His dissertations on florist's flowers are commonplace, and we there meet him disrobed of the wonder and admiration which accompanied his remarks on "Curious" plants. Tulips, Ranunculi, and Anemones were the objects of his greatest regard, but many more plants were briefly noted, a double, white Hepatica amongst them. The double, yellow Rose is mentioned with the despair usual to all the old writers. Cowell's cultural receipt was to cut down the plant "after its blowing season" and to shelter it from wet when it approaches the time of Roses. A Mr. Heather, of Twickenham, "an excellent Florist and polite Gentleman famous for Gardening," is mentioned as a successful Yellow Rose-man. "It may be remarked that it flowers profusely every year in a garden near to Mr. Heather's, yielding lovely blooms of a yellow shade peculiar to itself." The remainder of this part is taken up with "Extraordinary Observations concerning the Management and Pruning of Fruit-trees." Cowell recommended root pruning in May to induce fertility, and other

means to the same end included tying wire round the stem and notching the bark. It was customary "to plant a great part of our gardens with Espalier or Hedges of Fruit," and these were as much for ornament as utility. Here, as in all the books written by practical men or persons of observation, no matter at what period they wrote, the directions are very much the same; they may to a certain extent be influenced by the practices of the time, but the rule is that suitable methods are recommended. Cowell was a very likable man, and the reader gets quite interested in him before closing his book. His publications as a whole were: *Account of the Aloe in Blossom, Torch Thistle, and Glastonbury Thorn: 1729 and 1730*, bound, as above stated, with the *Curious and Profitable Gardener*. In 1732 it was republished under the title of *The Curious Fruit and Flower Gardener*. Cowell appears to have retired in 1730, for in that year Switzer refers to him as "late of Hoxton." R. P. Brotherton.

NOTES FROM A "FRENCH" GARDEN.

THE recent cold, bright weather has favoured the growth of the young Lettuces under the cloches. The variety "Little Black Gott" is growing fast, and, whenever the weather allows, the cloches are opened day and night. Those of the "Passion" variety are also doing well, and the crop promises to be well forward by Christmas. The Cos Lettuces, Flat Green and Grey of Paris, have been transplanted a second time. We shall keep them in a close atmosphere for a few days till they are thoroughly re-established. Plants of the Cos Lettuce, known as Paris White, are not so much advanced; they will remain under glass till the middle of March, and then be planted out.

The frost at night-time and the bright sunshine during the past few days have kept the plants healthy, and have minimised the danger from mildew which generally appears at this time of the year.

In gardens where all the cloches will not be utilised for forcing Cos Lettuces in the spring, a sowing of Lettuce "Georges" should be made on a mild hot-bed. This variety forms a good intermediate crop between those of the "Little Black Gott" and the "Passion." The seedlings are pricked out on another hot-bed late in December, where they remain till March, to be afterwards planted three under each cloche on a well-sheltered border.

The Parisian growers raise at this season on a hot-bed a batch of Lettuce "Passion" or "Palatine," and also a batch of Cos Lettuce "Paris White." These are grown as explained above, and planted outside in March.

We have planted the Ox-Heart Cabbages 18 inches apart each way, in drills made 2 inches deep. The plants were set deeply in the ground. Soil was sprinkled plentifully around the plants, as slugs have been troublesome.

We are completing the digging operations as fast as possible, as we intend to start making the hot-beds late in December. It is not advantageous to form the hot-beds too early, as the extra profit thus obtained does not compensate for the extra labour and increased quantity of manure required. Though the middle of January is generally the best time to begin this work, the grower must be guided largely by the strength of the Lettuce plants, the condition of the old, decayed manure which is to form the soil for filling the frames, and the situation of the garden.

When starting the hot-beds before Christmas, it is customary to place as many as 50 Lettuces in each light, as they do not grow very large. Radishes are not sown with this crop, as their leaves hinder the growth of the Lettuces. P. J. Pultis.

NEW OR NOTEWORTHY PLANTS.

CALLISTA AMABILIS LOUR.

COINCIDENCES of discoveries in art and science are not uncommon, and are often very curious. I have now to relate two recent discoveries of plants, half forgotten for many years, but possessing great scientific interest. The first exists in one living, the other in one herbarium specimen. As may be seen from a recent issue of the *Kew Bulletin*, the *Asclepiad Fockea capensis*, till now the pride of the Imperial Garden at Schönbrunn, near Vienna, has been rediscovered in the neighbourhood of Prince Albert, in South Africa. To-day we have to welcome one of the most critical Orchids, *Callista amabilis* Lour., known only from the type specimen of the author Loureiro himself, a well-hidden treasure in the South Kensington collection. I received the upper part of a stem bearing one flower and a photograph showing that the plant bears two or three flower-spikes. The possessor of the plant is Dr. H. Goldschmidt-Essen, a.d., Ruhr (Germany). The plant, on the whole, has exactly the size and habit of a true *Dendrobium*, and bears the flower on the leafless stem of last year. The flowers, however, show a very curious feature, they have no mentum (or prolongation of the side sepals) as in *Dendrobium*; the lip is deeply sacculate at the base, entire, i.e., without any trace of side lobes, but divided into a hollow hypochil and a triangular epichil; the column is not elongated into what botanists call "pes gynostemii." The colour is pure white in fresh flowers, changing into the lightest lilac on fading. The anther shows a deep mauve colour, the diameter of the flower when fully open is about an inch. On the reverse of the white sepals, which are united at their base, there is one, vivid, pea-green spot. The plant is certainly very pretty, and in older times, when a *Cypripedium* of more than modest description was honoured by the specific name "Venusium," a happy discoverer may name this perfectly lovely species "Amabilis." A venial sin after all.

But the plant has still another special interest for botanists. It was described by Dom João de Loureiro, in the *Flora of Cochin China* (Lisbon, 1799): the description is good and accurate for a time when there were no recognised technical terms for Orchids flowers and even the name *Dendrobium* was still unknown. About 10 years later Olaf Swartz, of Upsala, published some papers about Orchids, and established the genus *Dendrobium*, but with such a vague diagnosis, that *Maxillarias*, *Lycastes* and even *Pleurothallids* were brought under this name, together with three genuine *Dendrobiums*. The new genus he illustrated by a very bad figure of a *Lycaste*, probably *L. tetragona*. By far the worst circumstance was that Swartz passed over in absolute silence *Callista*, whilst he discussed another plant of Loureiro (quoted on the same page of the book) *Ceraia*. Afterwards the name *Callista* was omitted in botanical works or quoted as a synonym. I do not know why Loureiro's type specimen became inaccessible to Lindley, to Bentham and Hooker: the only thing I can state is that even in the *Genera Plantarum*, iii., 493 (1835), we read: "*Ceraia* Lour, *Callista* Lour, ex Reichb., charactere utriusque generis imperfecto." The only botanist who knew of the existence of this plant in London, and who had examined it, was Reichenbach; on the sheet to which it is affixed we find, in his handwriting, the remark "Est *Dendrobium*," but he never published a word about it. So it happened that this specimen had a forgotten nebulous existence for more than a century. The specimen itself, gathered in the last quarter of the 18th century, is in rather good condition. Several years ago I wrote a diagnosis exhausting all particulars. On my request, the authorities of the South Kensington Herbarium had the kindness to allow Miss Smith, of the Kew Herbarium, to make a

drawing of the plant; both description and drawing were required for a monograph of the *Dendrobium* in Prof. Engler's *Pflanzenreich*. This work is now in the press. Meanwhile, the indefatigable Dr. Otto Kunze, raking botanical literature for old names, found the sins of omission of both Swartz and Reichenbach, and he promptly renamed all *Dendrobiums* known to him, calling them *Callista*. Now the question is this, if *Dendrobium* and *Callista* are identical. Dr. Kunze is right in renaming *Dendrobium* in spite of all councils and their decrees, for the plant in question is by no means a doubtful one. Fortunately, in this special case, the names of hundreds of species can be maintained, *Callista* representing (for the moment) a monotypic genus. The generic definition is not so well founded as might be desired, but the dilemma is either to establish a monotypic tribe of *Dendrobium* itself, or to admit a genus next to it. I have preferred to restore the old genus and the old name.

The plant is found in Annam, near Tourane, on the East Coast. Dr. H. Goldschmidt purchased it at Antibes (Southern France) by exchange from a gentleman who had no special interest in it. The specimen was in a very bad and withered condition. It is to be hoped that under the skilful care with which the plant is now cultivated, it will produce next year stems as vigorous as those in Loureiro's specimens. The inflorescence in that specimen is about six-flowered and has bracts which are not present in Dr. Goldschmidt's rather small plant. F. Kränzlin.

NOTICES OF BOOKS.

* STUDIES IN FOSSIL BOTANY.

WHEN Dr. Scott published the first edition of the *Studies in Fossil Botany* in 1900, the book contained a concise account of what was known in regard to fossil plants at that time. The present volume, Part II. of the second edition, published in the spring of this year, has required, owing to the rapid growth of knowledge, such drastic revision, that it is, to quote the author, to a great extent a new book. Not only are many fresh facts recorded, but a knowledge of these has suggested an entirely new point of view with regard to several of the groups of seed-bearing plants with which this volume deals.

Facts suspected in 1900 have now become established truths, and large groups of fossil plants have been shifted to new positions in the vegetable kingdom. Incidentally, the gaps which exist between some of the groups of living plants have been more completely bridged, and indications of links between others are not wanting.

The importance of the conclusions reached justify a short summary of the discoveries of the past few years. As everyone knows, among the most common fossils of coal-seams are impressions, often very beautifully preserved, of large fronds, resembling those of our modern tree Ferns. Among living plants, the Ferns and Fern-allies or Pteridophyta, form a rather detached group of plants, distinguished from the Mosses, on the one hand, by the independence and greater vegetative development of the spore-bearing individual, or Sporophyte, and from the Spermaphytes, or seed-bearing plants on the other, by the absence of any structure at all resembling a seed, if we exclude the suggestions of a seed-bearing habit found in a few living species of *Selaginella*. Among the Ferns proper, no trace of the origin of such a structure as a seed occurs, and the transition among living plants from the modern, seedless Ferns to the lowest group of seed-bearing plants, the Cycads, is quite abrupt.

Towards the bridging of the gulf between Mosses and Ferns, the discoveries of fossil

botany have helped not at all; but the work of the palaeobotanist made evident some years ago the existence of a group of Palaeozoic plants, the Cycado-filices, the members of which show points of agreement with both Ferns and Cycads.

There has been for some time good anatomical evidence for referring *Lyginodendron* *Oldhamium*, one of the commonest fossils of the English coal measures, to the Cycado-filices.

FIG. 153.—THE SEED OF THE FOSSIL PLANT *LYGINODENDRON*. A CONNECTING-LINK BETWEEN FERNS AND SEED-BEARING PLANTS.

But up to the year 1902 our knowledge was practically limited to the vegetative organs. Any previous observations bearing on the mode of reproduction were then of uncertain significance. *Lyginodendron* was known to be a plant with slender, probably straggling, stems, on which were borne large, branching fronds, quite like those of a modern Fern. Anatomically, it exhibited curious points of agreement with both Ferns and Cycads. We know now that this Fern-like plant bore seeds—large, well-differentiated seeds, not differing materially from those of recent Cycads, albeit somewhat more complicated in structure.

The male organs, however, were essentially Fern-like, consisting of clusters of elongated sporangia, borne on the underside of the pinnules, and producing microspores or pol-

FIG. 154.—SEED CUPULES OF *LAGENOSTOMA SINCLAIRI*.

len grains, according as we use the language of Ferns or of the higher plants. Curiously enough, both seeds and sporangia had been previously described, although their association with *Lyginodendron* was not realised. Wilkinson named the seed *Lagenostoma Lonaxi*, but did not publish any account of it, and in 1883 Zeiller described a sporangial fructi-

fication associated with Fern foliage which he named *Crossotheca*, and regarded as the sporangia of a Fern showing affinities with the living family Marattiaceae.

A restoration of a seed is illustrated in fig. 153, which figure, together with figs. 154 and 155, we are enabled, by the courtesy of Messrs. A. & C. Plack, to reproduce from the volume under review. The curious stalked glands borne on the boles of the cupule (fig. 153) occur also on the stems and leaves, and were of service in the identification of the seeds as those of *Lyginodendron* *Oldhamium*.

In 1905 Mr. Kidston found similar sporangia in organic connection with the foliage of *Lyginodendron*, so that we know now that they were not the sporangia of a Fern, but the pollen-bearing organs of a seed-plant. In fig. 154, two

FIG. 155.—*SPHENOPTERIS ELEGANS* (PROBABLY THE FOLIAGE OF A PTERIDOSPERM).

such seeds are shown, still attached to the rachis of the fertile frond, and enclosed in the characteristic cupule or husk.

Other members of the Cycado-filices have since been discovered to bear seeds. A new group of seed-bearing, Fern-like plants, the Pteridosperms, has been created to include these forms, and one by one most of the characteristic Fern fronds of the carboniferous flora have been recognised as the foliage of members of this group. Some of them, like the frond of *Lyginodendron*, have been found with seeds attached; others are constantly associated with seed-like bodies. The frond of *Sphenopteris elegans*, reproduced in fig. 155, shows how strong is the resemblance between the leaves of these fossil Pteridosperms and those of a modern Fern.

The pollen-bearing structures present special difficulties. Many such sporangia had already been described, some of them so like the sporangia of living Ferns, such as *Marattia* and *Angiopteris*, that they were definitely referred to the family Marattiaceae, which was regarded

on this and other evidence as an extensive one in Palaeozoic times.

Some of these sporangia have now been definitely recognised as, and others are suspected to be, the pollen-bearing organs of Pteridosperms.

We may summarise the results of recent work in this branch of Palaeozoic botany by saying that an important feature of the coal measure flora must have been the abundance of large, Fern-like plants of varied habit—the wide range of habit and of anatomy indicating how extensive was the group—which reproduced by means of seeds borne singly on the tips of the pinnules, and which bore their pollen in large sporangia usually associated in groups like those of the living Marattiaceous Ferns. Whether true Ferns, in the modern sense, of similar habit, existed side by side with these ancient Pteridosperms remains doubtful, though, of course, possible.

For the time being, Palaeozoic Ferns are under a cloud. A small group remains, the members of which are still free from the suspicion of having been Pteridosperms; but, in a general way, we must believe that these large, seed-bearing, Fern-like plants were a dominant feature of the flora of coal measure times, and they suggest very strikingly how the seed habit arose. Bearing in mind the necessary limitations which control any efforts to unravel the past history of plants by means of fossils, our knowledge of Palaeozoic plants tends, on the whole, to increase the importance of the Ferns as a group. Dr. Scott regards them as probably the source from which many—if not all—the groups of seed plants have sprung. Recent research has also demonstrated the existence of the seed habit in the giant allies of our living Club Mosses: hence we find ourselves faced by the fact that the production of seeds, so far from being a monopoly of the most highly-developed plants of to-day, was a common feature in these ancient predecessors of modern Cryptogams.

Of equal interest is the detailed knowledge now available of the family of fossil Cycads known as the Bennettitales. These plants, which must have been a characteristic feature of the flora of the northern hemisphere in late Mesozoic times, show points of agreement with the living Cycads, but the structure of their reproductive organs indicates, on the one hand, relationship with Ferns, and, on the other, suggests, in a most striking way, how the Angiosperm habit, the distinguishing feature of the dominant group of living plants, may have arisen.

A unique feature of these ancient floras appears to have been their similarity over wide geographical areas, indicating to the geologist a uniformity of climate and physical conditions generally much greater than is now the case.

In conclusion, we may say that the work is written with the literary skill of which Dr. Scott possesses the secret, and that, as the figures we reproduce indicate, is admirably illustrated.

THE SILPHIUMS.

THE Rosin Weeds are all tall and coarse-growing perennials, which flower in the late summer and autumn. According to Gray's *Flora of North America*, they are all found on the Atlantic side of the United States. There are twelve species, of which at the least nine are in cultivation, although only about three are generally grown. These are *S. laciniatum*, *S. perfoliatum*, and *S. terolobinacum*, all tall and handsome plants of striking appearance. They succeed readily in a deep, rich soil, and, although they do not ripen seed freely, they are

easily increased by division of the roots in autumn or spring. The roots are thick and fleshy, and they penetrate to a considerable depth. They are very effective in large groups at the back of the herbaceous border, with their handsome foliage and large, yellow flowers, while they are equally serviceable in isolated beds, or in the wild garden. The following species are all in cultivation:—

S. albidiflorum (see fig. 156).—This species is the only white-flowered member of the genus. It is somewhat tender, and needs a warm, sheltered border against a south wall, hence it is seldom seen in gardens. A native of Western and Northern Texas, it is usually found growing on cretaceous rocks. The plant only reaches a height of between 2 and 3 feet. The white flowers, about 3 inches in diameter, are borne on very rigid and scabrid stems. *Silphium albidiflorum* flowered

meter. The leaves are chiefly radical, once or twice pinnate, with strap-shaped divisions, while the stem leaves are few and smaller. The name "Compass plant" is applied to this species, because the radical leaves are said to be so disposed as to place the edges north and south.

S. perfoliatum, "Cup plant" (*Bot. Mag.*, t. 3354).—This is one of the most effective plants in the genus, with stout, square, winged stems, 6 to 8 feet high, and large leaves, opposite on the stem, forming, with their winged petioles, a large, perfoliate cup, which is the origin of the common name. The flowers are produced freely, and are about 3 inches in diameter. The plant grows in rich, alluvial soil, and is somewhat variable in habit, which explains the several names, *S. connatum*, *S. Hornemannii*, and *S. erythrocaulon*, under which it is sometimes seen.

S. pinnatifidum.—This plant is a form of *S*

NOTES ON IRISES.

IRIS LÆVIGATA.

THE plant described by Regel, *Gartenflora*, 1864, p. 193, t. 442, and figured again in the *Botanical Magazine*, t. 6132, evidently differs from the *lævigata* of Fischer and Meyer, and I incline to think that I have specimens of it now growing here.

In June of this year there flowered here several plants raised from seed received as that of *I. sikkimensis*, an apparently undescribed species, said to come from the Himalayas. Of the truth of this I am not sure, but the fact remains that the flowers are extremely beautiful, of a rich, velvety, dark reddish-violet, set off with a golden signal patch. The falls are comparatively large, and sharply reflexed, while the tips of the standards and of the stigmatic crests rise to about the same level. There was no variation among the plants that flowered, and this points to the fact that we are dealing with a wild species. The capsule and seeds are both characteristic, but accurate information on these points is, unfortunately, lacking in the *Botanical Magazine* (t. 6132), where the figure of *I. lævigata* apparently represents my plants.

One reason that makes me hesitate to decide whether my plants are *I. lævigata* or an undescribed species, is the fact that there exists at Kew an Iris leaf or two, which Dr. Stapf sorted out from among the specimens of *I. Clarkei* collected on Tonglo by Sir Joseph Hooker. These leaves are distinguished by the prominent midrib, which occurs in my plants, and Dr. Stapf tells me that they agree in section also.

There, I think, the question must remain until some authentic, living specimens, or seeds of wild *lævigata*, are obtainable from Japan or eastern Asia. W. R. Dykes, *Charterhouse, Godalming*.

VEGETABLES.

SOURCES OF POTATO SEED-TUBERS

THE result of a trial at Wisley of the sources and soils from which seed tubers of Potatoes were obtained this year, has not yet been published, but it will no doubt appear in the next issue of the Royal Horticultural Society's *Journal*. The trial of the present year has been, I believe, on exactly the same lines as that of last year, when the sole variety was Up-to-Date, and the sources were: 10 tubers from England and Wales, three from Scotland, and three from Ireland. But there were 12 English or Welsh rows, because in two cases tubers grown on light and heavy soils were sent, thus there were 18 rows of 20 tubers each. All were planted on April 9 of last year, and all were lifted on the same day in the autumn. The heaviest yield was from Mallow, Ireland, the row giving 150 lbs., or 7½ lbs. per root. Next came another Irish product from Hillsborough, Co. Down, the weight being 125 lbs., Scotland following closely with 123 lbs., from Clackmannan, the soil being light, sandy loam. Ireland came fourth with 110 lbs., from a limestone soil in Co. Kildare, and Cumberland next with 106 lbs., then, most remarkable, the Wisley sand follows, but with 86 lbs., whilst 10 others from English seed tubers range from 84 lbs. down to 56 lbs. But two rows from Scotch seeds, light sandy loam and heavy black soil, gave only 63 lbs. and 56 lbs., which seems quite inexplicable, having regard to the fact that in the past Scotch tubers, grown in the south, have invariably yielded heavy crops. The sample from Clackmannan, with 123 lbs., evidently shows the value of Scotch tubers far more accurately. It was a surprise to find that seed tubers obtained from the deep sand at Wisley did so well, but it is partly explained by the fact that, for the past five years at least, because of the much lower summer temperature and moist atmosphere in England, the southern climate has produced seed tubers closely resembling those of Scotland. Seed tubers of the present year in the south have showed that character in an even greater degree. Summed up, the Irish tubers gave an average crop of 125 lbs., the Scotch 82 lbs., and the English and Welsh 72 lbs. A. D.

FIG. 156.—SILPHIUM ALBIDIFLORUM FLOWERING AGAINST A SOUTH WALL AT KEW.

in the late Mr. Thompson's garden at Ipswich in 1887, and the figure in the *Botanical Magazine*, t. 6918, was prepared from that plant. The plant now illustrated is growing against a south wall at Kew, where it flowers in September and October. It was received from Herr Max Leichtlin, of Baden-Baden, about three years ago.

S. Asteriscus grows about 4 feet high, and has ovate, coarsely-toothed, oblong leaves, the upper ones being sessile, whilst the lower have short stalks. The yellow flowers are borne on leafy branches. In its native habitat it grows on dry, sandy soil.

S. integrifolium.—This species is somewhat similar to *S. Asteriscus*, but has narrower, more entire leaves, and corymbs of yellow flowers.

S. laciniatum, "Compass plant" (*Bot. Mag.*, t. 6534).—This plant often reaches a height of 10 feet, bearing on the upper part a succession of bright yellow flowers, 4 to 5 inches in dia-

terebinthinaceum, with pinnatisect leaves, and it is sometimes placed as a variety of that species.

S. scaberrimum.—Grows about 4 feet in height. It has hispid stems and leaves, and the flowers are about 2 inches in diameter.

S. to benthianum, "Prairie Burdock" (*Bot. Mag.*, t. 5525).—This species is found in dry, open woodlands. It produces an abundance of large, handsome leaves, chiefly radical. They are each a foot or more long, and broad in proportion; they are borne on long petioles. The stems grow from 6 to 9 feet high, are much branched, and bear numerous flowers, 2 to 3 inches in diameter. This is an unusually handsome foliage plant for the wild garden or woodland.

S. trifoliatum (*Bot. Mag.*, t. 5555).—This is a more slender-growing species. It has stems 4 to 6 feet high, bearing leaves in whorls of three or four, and petioles of long, peduncled flowers of fair size. W. I.

NEW GARDEN WORMS.

It sometimes happens that the collector comes all at once upon a new plant or animal whose numbers are such that he has no difficulty in obtaining abundant material for research and identification. It was so at St. James's Garden, Malvern, when I discovered *Eisenia robusta*. But it is, perhaps, more frequently the case that the addition to science is a solitary example, and the careful biologist hesitates to give his child a name. So he waits, in the hope that new material will be forthcoming. Sometimes he is speedily rewarded in his search, while at others he has to be content to state his facts and leave the matter in uncertainty. I have more than once had to describe a new species from a single example, and, after having waited five years in the hope of obtaining further material, I am at last venturing to repeat my action.

In 1904, among some interesting annelids from the Botanic Gardens, Oxford, I found one specimen which was new to me. I, therefore, provisionally regarded it as belonging to a species concerning which the authorities have been in doubt (*Allolobophora tyrtaea*). Although it differed in various ways from the descriptions which different authors have supplied us, the uncertainty which attached to the species, and the fact that in some important points it revealed a close alliance to that species, kept me from venturing on a detailed description and a new name.

Our knowledge of the minutiae of worm anatomy has of late years been growing. New points which are of value for purposes of classification have been emphasised, and the value of the study of variation has been insisted on. For these reasons I am venturing to regard the Oxford worm as new, and am giving particulars of its external appearance.

The first writer to describe *Allolobophora Tyrtaea* was Savigny, in 1826. He called it *Enterion Tyrtaeus*, and he said that it had a girdle extending from segment 30 to 35, while the tubercula covered the four innermost. This may be represented fractionally thus $\frac{30-35}{31-34}$. Nearly all the

true species of *Lumbricus* have a similar arrangement of these parts, but they fall on different segments in an orderly series. Dugès and others, however, failed to see the species, and it was placed on the list of doubtful forms.

So matters stood till 1896, when Dr. Ribaucourt published his valuable memoir on the *Earthworms of Switzerland*. Here he says (p. 78) that he applies Savigny's name to a specimen which he found under a stone in Valais, at a height of 2,600 metres. The length of the worm was 85 mm. (or 3½ inches), its breadth, which varied little through the whole length, 4 mm., while the tail terminated somewhat abruptly. There were 133 segments, the first 15 being larger than the others, which were almost uniform throughout. It showed an iridescent play of colour, and the girdle, which had the appearance of a saddle, corresponded with that of Savigny's *Tyrtaeus*. The male pores were found on segment 15, with a cushion or swelling which pushed back without effacing the neighbouring segments. The setae were in pairs, and, what is very unusual in an *Allolobophora*, the prostomium cut entirely through the first segment, or formed a complete meristeme and tenon, as in all the true species of *Lumbricus*.

Ribaucourt sums up as follows:—"A glance at the different species of *Allolobophora* shows us that there is one species with which *A. Tyrtaeus* offers certain analogies. *A. profuga* possesses a

girdle and tubercula which may be read as $\frac{30-35}{31-34}$

but the differences are numerous. The aspect of the girdle, the length of the body, the shape of the tail, the colour, the size of the body rings, the absence of mammillae on the 22nd segment, the presence of furrows along the caudal ex-

tremitry, and the visibility of the excretory orifices may be mentioned. The arrangement of the setae also is different. Savigny having mentioned a species of worm possessing a girdle extending from the 30th to the 35th segment, with tubercula on the 31st to the 34th, at a time when no distinction was drawn between the two genera, *Lumbricus* and *Allolobophora*, I thought it right to retain the name of the present species."

In 1904, when I found a worm somewhat similar to this at Oxford, I thought it best provisionally to assume their identity, and put down the points of difference to mere variation. Since then my knowledge of the different forms of earthworms has extended, and a careful re-examination of the specimen shows me that it cannot be referred either to Savigny's or to Ribaucourt's *Tyrtaeus*. I have, therefore, decided to name it *Allolobophora intermedia*, assigning my reason hereafter. The worm is about 3 inches in length in alcohol, and a quarter of an inch in diameter. It is dark brown on the back, but grows paler towards the tail, and is slightly wider across the girdle and the tenth segment than elsewhere. The prostomium cuts one-half the

FIG. 157.—ALLOLOBOPHORA INTERMEDIA SP.N.
Pr. Dorsal view of prostomium.
(Slightly enlarged.)

first segment, and has a transverse furrow like that in *A. longa*, Ude. The setae are paired, but the tail has the octagonal appearance of *A. profuga*, and the male pores are on papillae of a similar character to those of that species. A curious point is found in the diminution of the three segments which precede that on which the male pores are situated. The tubercula are situated on segments 31-34, but the girdle begins on the 23rd and slightly affects the 27th. In this respect the worm differs from all the other species of this group, which resemble *Lumbricus* in the uniformity of their girdle and tubercula. A few examples may be tabulated to show my meaning. The numbers at the top of the line show the girdle segments, those beneath the tubercula

<i>Lumbricus rubellus</i> , Hoffm.	27-32	6
	28-31	4
	23-35	6
<i>Lumbricus castaneus</i> , Sav.	—	—
	29-32	4

<i>Lumbricus herculeus</i> , Sav.	32-37	6
	53-36	4
	29-34	6
<i>Allolobophora studiosa</i> , Mich.	—	—
	30-33	4
	30-35	6
<i>Allolobophora profuga</i> , Rosa	—	—
	31-34	4
	30-35	6
<i>Allolobophora Tyrtaea</i> , Rib.	—	—
	31-34	4

But there is another group of worms which has a different arrangement. Thus we find the following:—

<i>Allolobophora longa</i> , Ude	28-35	8
	32-34	3
	28-34	7
<i>Allolobophora caliginosa</i> , Sav.	—	—
	31 (32) 33	2-3
	29-37	9
<i>Allolobophora chlorotica</i> , Sav.	—	—
	31: 33: 35	3

It will be seen that *A. intermedia* resembles *longa* and *caliginosa* in its girdle segments more closely than the three in the *Tyrtaea* group, to which it belongs in right of its tubercula. Thus we read—

<i>Allolobophora intermedia</i> , Friend	28-35	8
	31-34	4

I think this justifies the name I have adopted, while it suggests a very important inquiry. Our knowledge of hybridity among worms is very meagre and unsatisfactory. Yet facts are continually coming to light which suggest that from time to time hybrids are produced. Is *intermedia* a hybrid? It has the prostomium, the body colour, the girdle segments, and other characteristics of *longa*, while the shape and size of the body, the tubercula, the male pores, and other features link it to *profuga* or *studiosa*. Both *longa* and *studiosa* (= *cyanea*, Sav.) occur plentifully in the Botanic Gardens at Oxford, whence *intermedia* was obtained, and it is, I think, fair to suggest that we may have, in this curious garden worm, a hybrid between two well-known but not very closely allied forms. That being so, an interesting problem awaits investigation. I shall be glad of assistance in its solution. *Hilderic Friend, St. Asaph, Malvern.*

LEAF AND FRUIT.

A dry summer compels an early fall, and usually much variety of colour and consequent beauty and profit in the leaves. When the summer is wet and cool, leaves grow almost continuously, and preserve their greenness and freshness until a frost or perishing wind arrives to chill the exterior of the tree, check the ascent of the sap, and cut off further nourishment.

Of all the millions who were expectant of the glories of autumn or dependent on fruit growing as a business, few have any idea of the natural processes which bring about the fall or how it affects the leaf- and flower-arrangement of the coming year. A long, cold winter is predicted, because berries chance to be abundant. Berries are fruit, and occur in proportion to the number and quality of leaves made on a tree or plant in the previous season.

Last year's leaves provided for this year's crops of fruit, and this year's leaves have already decided the amount of flower and possible fruit for next year. This year's abundant crop of berries is the result of the long, dry summer of a year ago. Dangerous as it may be not to prophesy good things, it is practically certain that next year will yield a very light crop of fruit, because this season's leaves will fall before attaining a proper degree of ripeness. Ripeness means chemical completeness, for, with different degrees of growth, chemical changes occur, and sap deposits are made according to the supply of water, heat, air, and light. In a dry, hard year, weak or old trees do not make leaves

sufficiently strong to provide complete flower-buds, whilst in a wet season, such as the past, trees "run so much to wood," as gardeners say; that is, make so many leaves and perfect so few of them that more leaf-buds and fewer fruit-buds are provided for the next year. Hence we shall see that comparatively weak trees will yield most next season, because they have made no overgrowth and have had the best chance to ripen their present crop of leaves. An extra early, and an extra late, fall are equally bad signs. An early fall indicates weakness due to lack of sustenance, and is usually induced by drought or a blasting wind at some time during summer, whereas a late fall shows that the leaf-growth has been almost continuous and the heat insufficient to bring about such chemical changes in the sap as lead to the formation and maturation of flower-buds.

The natural period of fall must be regarded as that when the leaves have done the work of completing some sort of bud at the base of their stalks. We say "some sort of bud" because the same leaf may yield a flower or a leaf-bud according to the amount of material it absorbs from the roots and the atmosphere, and according to the climatic conditions obtaining whilst it arranges the chemical deposit at its base. It will be news to most people that every leaf determines its own bud, and that the leaves in one part of a tree have no material influence in the making of the buds of another part. This means that if a leaf does not come to a proper degree of ripeness, the bud at its base remains imperfect. We may at this season, on looking at a tree, see by the character and colour of its leaves if it is or is not going to bear flower next spring. Of course, we must allow for frosts and such defects as are indicative of weakness or excessive strength; but, at the same time, we may come by such knowledge as will decide the method of pruning and soil-treatment necessary during winter.

The weakest parts of trees are the first to shed their leaves. In tall and exposed trees it is often the top which first shows change of colour and runs bare; but more often it is the lower and inside branches, or such parts as have received a meagre supply of sap and insufficient light. Old trees of irregular shape shed their leaves earlier than such as are young, shapely and full of vigour. No particular month may be named as best for the fall, since it is possible for more advance to take place in four months of one summer than during six of another. Steady growth of the original, spring leaves and no heavy secondary crop, such as may be induced by late summer rains, secure the finest bud-development for the succeeding year. Continuous leaf-growth is good for the young, non-bearing trees, but bad for those expected to bear a full crop of ripe leaves, and thereby leave behind them a plentiful supply of flower-buds.

To the majority who work among trees, leaves are merely leaves, and yet they are the governing factors in the life, profit and beauty of every tree. During the present autumn there has been little colour in the leaves, nor was much to be expected. The summer heat was insufficient to break up and provide the materials out of which autumn tints are formed. In such circumstances leaves are capable of changing to nothing more attractive than a weak and monotonous yellow.

Had the months of August and September proved bright and warm, the heavy, sappy leaves would have worked up a great deal of material destined to yield a plentiful variety of autumnal colour. Fruit-buds would also have been more abundant or stronger, whereas, instead, we see a majority of the more primitive leaf-buds.

Forest trees we allow to follow the course of nature, but garden and orchard trees we profess to have under our control, yet we lose much in failing to make a patient and precise study of leaves.

The life-story of a tree is as plain as day—to those who care to read it—and it is only when a man can discern its past history that he is in

a position to observe its inclination and needs. Without this insight it is impossible to plan for and regularly secure the proper proportion of wood and fruit. What comes by chance is often satisfactory, but what comes by design must be better, since it is double fortune—the result of that knowledge which is power and that gain which is the reward of reason. C. Boyce Luffmann.

The Week's Work.

PLANTS UNDER GLASS.

By A. C. BALLETT, Gardener to Mrs. Ford, Pencarrow, Cornwall.

Cytisus.—No attempt should be made, for the present, to force these cool greenhouse plants, for, if subjected to heat, they rarely furnish a good supply of flowers. They need very careful watering, and should not be given fresh moisture until the roots really need it, or the foliage will quickly turn yellow. At the same time, drought would be followed by shedding of the leaves. Large plants growing in comparatively small pots may be given weak manure water at about every fourth watering. Besides *Cytisus racemosus* and its brighter-coloured variety, *everestianus*, the elegant, white-flowered *Cytisus filipes* should be grown where spring-flowering shrubs are esteemed. The day-fragrant *Coronilla glauca* requires similar conditions to those recommended for *Cytisus*.

Richardia.—Where a considerable stock of *Richardia africana* is grown, a small batch of the most forward plants may be placed in a structure having an atmospheric temperature at night of 55° or 60° Fahr. In this heat the plants must be kept as near to the glass as possible, or they will make an undue amount of leaf-growth. Unless the spathes are required for some particular date, the remainder of the stock of plants should not be kept in a greater heat than 10° lower than that stated, under which conditions larger flowers will be produced, and the flowering period will be of longer duration. These plants, if their pots are well filled with roots, may be given fairly frequent applications of manure; but the plants in the warmer house will flower quicker if all stimulants are withheld until the tips of the spathes can be seen. Throughout the time that the *Richardias* are under glass, they will need frequent fumigations to preserve them from the attacks of aphid.

Begonia.—The plants of *B. Gloire de Lorraine* and similar varieties now in flower must be kept in a warm house, with a fairly dry atmosphere, or the flowers will lose colour and become thin in texture. Occasional applications of weak manure water and weekly waterings with clarified soot water will prolong the flowering season and maintain the foliage in good condition. *B. socotrana*, and such hybrids as *John Heal*, and others, being somewhat of an herbaceous nature, should be grown in a moderately moist atmosphere.

Camellia.—Close attention must be paid to watering these shrubs, whether they are growing in tubs or pots, or planted out in borders, for if they are allowed to become at all dry, many of the flower-buds will drop. It will be well to raise the tubs and pots by placing three thin blocks under each, so as to ensure perfect drainage. Disbudding should now be commenced, the work being done gradually, so as not to cause a severe check to the plants.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Bursford, Surrey.

*Pleione*s.—The weather during the past three months has been unfavourable for most Orchids to mature their pseudo-bulbs; but, notwithstanding the great deficiency of light and sun-heat, the lovely little *Pleione*s have produced a greater number of flowers, larger and more brilliantly-coloured blooms than in some previous years, when the weather has been more favourable to the ripening of growth. Such well-known varieties as *P. lecanaria*, *P. Wallichiana*, *P. praecox*, *P. concolor*, *P. maculata*, and its variety *alba*, which, for the last month, have been very pretty with bloom, are now passing out of flower. On careful examination, the grower will find that the green shoots from which the flowers have

spring are in reality new growths, and, under proper treatment, these will form bulbs. The shoots will already have produced from their base a number of small white roots, and, as these roots lengthen very rapidly and are easily broken when handled, the plant should at once be repotted if it is to be repotted this season. It is not necessary to repot *Pleione*s every year unless the soil becomes sour, or the plants need remaking up, for they may be grown in the same receptacles for two seasons, and produce plenty of blooms. It matters little whether ordinary pots or shallow pans are used, though, if the latter, they should be light, and therefore suitable for suspending, which is a consideration where space is limited. Pans 10 inches in diameter will hold about 20 bulbs, and are a very useful size. Pots or pans must be provided with plenty of clean crocks for drainage, it being important that the excess of water should be able to pass away quickly. Over these crocks place a thin layer of rough Sphagnum-moss. The potting compost may consist of fibrous loam, peat, and Sphagnum-moss, in equal parts, well mixing with it moderate quantities of small crocks and coarse silver sand. Last year, in place of peat, we used *Osmunda* fibre, with excellent results. The *Osmunda* should be cut up rather finely, as it mixes better with the loam than when used in a coarse, uncut state. Before repotting, turn the plants out of their pots or pans, and carefully pick out the greater part of the old soil. Remove decayed bulbs, and fix them in the new pot without dividing the bulbs, unless it be those which may have grown beyond the mass, which may be pulled off and used for increase of stock, or for filling a few bare spaces in the clump of pseudo-bulbs. By leaving the clump of bulbs entire, the check seems to be much less, the roots quickly get into the new soil, and the young growths start away with vigour, whereas very often when the bulbs are separated and made up again, the young shoots, especially those of *P. maculata*, turn black and decay. Pot the plants with moderate firmness, and, wherever it is possible, the space between the pseudo-bulbs should be filled in with the roughest of the compost. When repotting is finished, the plants should be placed with the *Cattleyas*, or near the roof-glass of any house having an intermediate temperature. For a few weeks give but a small supply of water around the inside of the pot or pan, but as the new roots enter the soil, and a corresponding amount of foliage has been made, the supply must be gradually increased, weak, liquid manure water being supplied once a week after the plants have become perfectly re-established. *P. humilis* and *P. Hookeriana* are now at rest. Keep them suspended in the cool house, and afford them enough water to prevent the pseudo-bulbs from shrivelling. They will flower in February. It may be useful to some cultivators to know that *Pleione*s, or Indian *Crocuses*, as they are sometimes called, are almost invariably found in the Himalayan zone at 3,000 to 7,000 feet elevation, growing on the moss-covered rocks, or on the lower part of the trunks of lofty trees that are grown over with moss and intermixed with decaying vegetable matter.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Late Muscat Grapes.—If a suitable room is available, these will be the better for being cut and bottled, and, furthermore, the vines may then be given attention in regard to watering. The Grapes will keep in good condition for a considerable time, provided that proper conditions are maintained in the room in which they are placed. The atmospheric temperature should be kept at about 45° without the aid of much artificial heat. Fill the bottles with rain-water, and place two or three pieces of charcoal in each bottle to keep the water sweet. Let the bottles be furnished with water before they are taken into the room, as it is important to keep the atmosphere in the room quite dry. When the Grapes have been cut the vine may be thrown wide open. Let the border have a thorough soaking with clear water, which, provided the roots are healthy and the borders well drained, may be followed by a watering with diluted liquid manure. The lateral growths may be shortened to induce the basal buds to develop and mature.

Other late Grapes.—Any Grapes which are not required for very long keeping should be cut and

bottled as advised for Muscats. It is bad practice to keep a house closed for an indefinite period for the sake of a few bunches of fruit which would keep as well in a Grape-room. So long as the bunches are allowed to hang on the vines it is impossible for the vines to get the rest which is absolutely necessary to maintain them in a fruit-bearing condition. The ventilators should be thrown wide open day and night. The utmost care will now be necessary in the management of vineries that will contain ripe Grapes for some time longer. The borders should not need any more water until the Grapes are cut. Ventilators must be very carefully managed, but, unless the outside atmosphere is warm and dry, very little air will be necessary. Cold draughts or sudden falls in the temperature must be avoided, and the house had better be closed during damp or foggy weather. Endeavour to keep an equable temperature of about 50°, except during frosty weather, when 5° lower will be more suitable. Examine the bunches frequently for bad berries, and take care that, in removing these latter, others are not damaged with the point of the scissors.

Mid-season vines.—Persevere with the pruning and cleansing of vines now at rest. In pruning young, vigorous vines, be careful not to leave too much wood. These may be pruned to two good buds. In the case of older vines, and in order to secure an even crop of bunches, it is sometimes prudent not to prune quite so hard. Young vines often bleed badly when started; this may be prevented by painting the surface of the newly-made cut with styptic. Vines that have been affected with thrip, mealy-bug, or red spider, must be cleansed rather more severely than in cases where these pests are not present. It is a good practice to burn sulphur in fruit houses when the trees are dormant, but care must be taken that the fumes do not escape into neighbouring houses containing plants. The work of renovating and extending borders must be pushed on whenever the weather will allow.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODGE, Bart., Leonardslee, Sussex.

Plants in cool frames.—The bedding plants now in unheated frames must not be allowed to suffer neglect. They require to be kept clean from pests, and have all weeds removed from the pots and from the beds in which such plants as *Calceolarias*, *Pentstemons*, *Primulas*, *Genistas*, *Veronicas* and other species are planted. Pots containing very rare plants should be plunged to their rims in fine coal-ashes. They may be plunged quite closely together, and by this means a dozen lights or so will serve to cover thousands of small pots. Remove the lights whenever the weather is dry and there is no frost, and tilt them on wet days, it being undesirable that these plants should be coddled in any way. Keep the glass of the frames clean that it may admit the sunlight. In this dull season of the year excessive damp is often more injurious than cold, therefore take means to prevent any excessive damp arising amongst the young stock. Cuttings of hard-wooded plants in frames need an abundance of air, and in these and all other cases care should be taken that the stocks of a particular kind are not excessive. If any fungal disease appears upon the Carnation layers, let them be sprayed with a fungicide directly the disease is seen.

Protecting plants out-of-doors.—An abundance of protecting material, such as Bracken or litter, should be in readiness for covering half-hardy plants on the approach of severe frosts. *Dracenas* should have the stems bound up almost directly, and some ashes or peat placed over the roots. Half-hardy climbers on walls should have a protective material spread over the roots, and in the case of more than 10° of frost a blind or some mats should be thrown over the top growth. If these details are left until frost is imminent it will frequently happen that they cannot be carried out in time to prevent injury.

Bulbs.—*Gladioli* and *Dahlias* should be stored in some dry material, in boxes, where they may be conveniently inspected from time to time. Tuberous *Begonias* may now be examined, and all the decayed leaves removed. The bulbs should be cleaned and stored in leaf-mould or cocoanut fibre refuse, and placed in a position where frost is excluded.

Specimen plants.—*Hydrangeas* and *Agapanthus*, in tubs, should be placed in a cool house or shed. If there are any of these or similar species planted out, some dry litter must be placed over them, and a mulch of litter for their roots.

Gravel paths.—Roads and paths formed of gravel have become almost grown over with green, owing to the heavy rainfall in October. Such paths should be raked with a fine toothed iron rake in fine weather, and moved daily to dry, when the moss and small weeds may be swept up. If a weed killer were used now, it would do very little good beyond turning the moss brown. When the paths have been properly cleaned and swept, let the gravel be rolled down again until it is perfectly firm.

Fallen leaves.—Collect all fallen leaves and heap them in some place in the shrubbery, where the winds will not be likely to blow them about; they will make excellent leaf-mould for next season. I am speaking now of leaves which have fallen on the lawns and paths; those which fall in the shrubberies should be left, for they are useful for the shrubs themselves. It is a mistake to rake out shrubberies, even though it be done for the sake of neatness. If the raking-out has to be done owing to the nearness of the dwelling-house, then the removal of the leaves must be compensated for by a mulch of decomposed leaf-mould or similar material.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Peaches and Nectarines.—In recent years, and probably owing to the erection of cheap glass structures, the cultivation of Peaches and Nectarines out-of-doors appears to have suffered some neglect. It should be remembered, however, that in well-appointed gardens, in favourable localities, there are usually walls with warm aspects that ought to be utilised for these choice fruits. An out-door crop provides an agreeable succession to the fruits grown under glass. The present time is a favourable one for planting trees. Let the borders be thoroughly prepared and everything put in readiness in order that the work may not be delayed after the trees are received from the nursery. In most gardens the borders under the warmer walls are in great request for the cultivation of early vegetables and salads, and, therefore, in most cases the ground where the trees will need to be planted is already properly drained, and in a good state of cultivation. Indeed, the soil may be so rich as to be unsuitable for the cultivation of the Peach trees, and it is a good plan to remove such soil and substitute a compost specially mixed for the purpose of fruit culture. There is nothing better than good, sweet loam, in which has been mixed a liberal addition of wood-ashes and lime rubble. Such a compost needs no manure added to it. In planting permanent trees, stations should be made at distances of at least 20 to 25 feet apart, but when planting smaller trees, such as will take some years to furnish the space, it is usual to plant at about half that distance in order to furnish the wall quickly and get a better return in the first few years. If this plan is adopted, the trees must be rearranged before they are sufficiently large to crowd each other. The trees that will then have to be removed can be utilised for planting under glass or in place of any Peach trees that are unsatisfactory. It is often difficult to get Peach trees delivered from the nurseries until well into the month of December, but if they are obtainable already, the work should be carried out at once. Examine the roots thoroughly before planting and cut back all those of a strong, thong-like character, and any that are damaged. This cutting will cause the roots to make a quantity of fibres. Let the ground be made quite firm underneath the stem of the tree, and in finishing the planting the soil should be left slightly higher than the surrounding level, in order to allow for the settling which will subsequently take place. It may be necessary to work in some of the finer soil amongst the roots by means of the hand. Planting is best done when the soil is in a moderately damp condition; if it is too wet or too dry, the firming cannot be carried out without leaving the soil in an undesirable condition. In the pages of this journal for September 11 last, I gave a selection of

varieties of both Peaches and Nectarines suitable for providing a succession of fruit.

General work.—Owing to cold, drying winds having succeeded the wet weather, the ground is now in a suitable condition for working; therefore push on with root pruning, planting, pruning, and training. Early planting is advantageous, for, in this case, root action may be expected to commence at once, and the trees will thus be better able to withstand extremes of weather that may occur next season. On frosty mornings wheel out the manure to the fruit quarters, placing it in small heaps in readiness for spreading when pruning and clearing up is finished. This applies to Raspberries, Currants, and Gooseberries, and to all established trees, which regularly bear fruit. Young trees growing vigorously seldom need manure.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Cucumbers.—It is not always easy to maintain a constant supply of fresh Cucumbers in winter, even when the necessary means exist for the cultivation of the plants. One of the greatest helps to successful Cucumber culture is sunshine, and it is principally the absence of sunshine in winter, often for several days together, that makes the work so difficult. The plants need a fairly high temperature now, both by day and night; but the atmosphere of the house must, nevertheless, be maintained in a moist condition. Keep the glass of the roof and sides of the house perfectly clean, in order to expose the plants to whatever sunlight there happens to be. Endeavour to induce the plants to make plenty of young fruiting wood by stopping and removing the older and more exhausted portions of the plants. In no case must the roots be allowed to become dry, and, in applying water, it should first be heated to the same temperature as that of the atmosphere in the house. The plants need occasional applications of manure water from the farmyard, and thorough syringings with clear water on sunny mornings. If there are any signs of red spider, thrip, or aphid, &c., the house had better be fumigated with the XL-All vapourising compound. If the least sign of mildew is observed, let it be prevented from spreading by applying some black sulphur. Seedlings raised last month should now be sufficiently advanced for planting out. Prepare a sweet hot-bed, consisting chiefly of Oak or Beech leaves, and in this place a compost of rather light material, containing plenty of leaf-mould. When the bed is ready for the plants, it should be only a short distance from the roof-glass. Another sowing should be made in the first week in December, placing the seeds singly in thumb pots. The seedlings should be raised on a brisk bottom heat. A capital plan is to provide narrow boxes made to fit the hot-water pipes. If these are filled with Cocoanut fibre refuse, and the little pots are plunged in this material, the seeds will very soon germinate.

Tomatoes.—Plants which were specially grown for winter fruiting will now be coming into full bearing. Every care should be taken to keep them in a perfectly healthy condition. To this end, it is necessary to avoid extreme temperatures; from 55° to 60° is a safe medium, varying from one to the other according to the conditions of the weather out of doors. Contrary to Cucumbers, Tomatoes require a dry atmosphere, especially in winter, and the air must be kept buoyant and moved by liberal ventilation whenever the weather will permit. The cultivator must be careful never to over-water the roots. Immediately the fully-developed fruits show signs of colouring, let them be cut and placed in a warm house to ripen. At this season the flowers require to be artificially pollinated, or they may not develop fruit. Successional plants should be potted and kept in about the same temperature. Another sowing of one or two varieties should be raised in a gentle heat.

Jerusalem Artichokes.—Cut down the growths of the Jerusalem Artichokes and lift the tubers, sorting out the largest and best shaped for consumption; the smaller ones may be reserved for planting next season. These Artichokes keep best when pitted in the same way as Potatoes. The improved white form is much superior in appearance and quality to the old purple tuber formerly in general cultivation.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR DECEMBER.

WEDNESDAY, DECEMBER 1—
Roy. Hort. Soc. Exh. of Colonial Produce and Preserves (4 days). (Lecture on the opening day at 3 p.m. by Mr. Robt. Newstead, on "West Indian Insect Pests.")

SA TURDAY, DECEMBER 4—
Soc. Franç. d'Hort. de Londres meet.

TUESDAY, DECEMBER 7—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. C. Herman, senr., on "The Cooking of Vegetables"). British Gard. Assoc. Ex. Council meet.

WEDNESDAY, DECEMBER 8—
Perpetual Flowering Carnation Soc. Exh. at Hort. Hall, Westminster.

MONDAY, DECEMBER 13—
United Hort. Ben. & Prov. Soc. Com. meet. Nat. Chrys. Soc. Executive and Floral Coms. meet at Essex Hall, Strand.

WEDNESDAY, DECEMBER 15—
Roy. Meteorological Soc. meet.

TUESDAY, DECEMBER 21—
Roy. Hort. Soc. Coms. meet.

SATURDAY, DECEMBER 25—
Christmas Day. Quarter Day.

MONDAY, DECEMBER 27—Bank Holiday.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—41°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, November 24 (6 P.M.): Max. 40°; Min. 30°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, November 25 (10 A.M.): Bar. 30.3; Temp. 49°; Weather—Dull.

PROVINCES.—Wednesday, November 24: Max. 46 Cornwall and N.W. Ireland; Min. 37° Sunderland.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY—
Miscellaneous Plants and Bulbs, at 12; 3,230 cases Japanese Lilliums, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 2.

WEDNESDAY—
Herbaceous and Border Plants, at 12; Roses, Azaleas, Palms, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 1.30.
Sale of Fruit Trees and general Nursery Stock, at Platt Nurseries, Borough Green, near Wrotham, Kent, by order of Mr. J. W. Todman, by Protheroe & Morris, at 11.30.
Unreserved sale of Orchids, from the Vine House Collection, at the Coal Exchange, Manchester, by Protheroe & Morris, at 2.

FRIDAY—
Border Plants and Perennials, at 12; Roses at 1.30, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

A Notable Appointment. The Council of the John Innes Horticultural Institution has announced the acceptance, by Professor Bateson, F.R.S., Professor of Biology at the University of Cambridge, of the post of Director of the new Institution. It is a most satisfactory appointment. The first director should be a man of established reputation: Professor Bateson's scientific investigations have gained for him world-wide fame. The director should be a man with powers of organisation and administration: Professor Bateson has proved in his college and university work at Cambridge that he has these powers. Above all, the director should have the faculty, essential to a commander, of infecting his colleagues and others with a zealous enthusiasm for the cause he represents: this rare power, the expression of personality, the new director possesses in a remarkable degree. We have complete

confidence that Professor Bateson will interpret the duties of his important post in the widest sense, and that he will make of the Merton establishment, not only a great plant-breeding station, but also a school of research in which all the important branches of horticulture are made the subject of experimental enquiry. He will see to it that the results achieved by workers in the institution will be not only of scientific, but also of direct and definite practical value. With Kew as the leading school of scientific botany, with Rothamsted engaged in the solution of soil and allied problems, and with the Innes Institution undertaking investigations into the causes and modes of prevention of plant diseases, into the laws of inheritance and their applications to plant breeding, and into the many obscure problems of what may be called applied plant physiology, we may well hope to develop in this country the finest

OUR SUPPLEMENTARY ILLUSTRATION.—St. Catherine's Court is believed to have been built by Prior CANTLOW at the end of the 15th century. The gardens attached to the place have always possessed considerable interest, and they remain now much in the same condition as they were half a century ago, an excellent example of English gardening during the period when the formal system largely predominated. The upper terrace is approached by steps leading from the front of the house, shown in fig. 159, and there are records which relate that above the site of the upper terrace, the priors used to cultivate vines for vintage purposes. Some of the more interesting plants in the garden include several very large specimens of Japanese Maples having stems several inches in diameter. There is an excellent specimen of *Araucaria imbricata* about 40 feet high, and some particularly good plants of *Cupressus*, especially *C. macrocarpa*. St. Catherine's is a parish containing a population of about 100 inhabitants. It is four miles from Bath, and about three miles from Bathampton Railway Station.

PROF. W. BATESON, F.R.S.

The first Director of the John Innes Horticultural Institution at Merton.

system of scientific horticulture in the world. Moreover, knowing Professor Bateson's keen sympathy for horticulture, we may also hope that he will, in co-operation with Kew, make the Institution famous as the centre for the training of men in practical gardening. If so, Professor Bateson's own words, uttered in a speech made on the occasion of the last Genetic Conference, will prove prophetic, "the scientific and the practical" will "have gone to form a fertile hybrid." It will require a level head and steady hand, to hold the balance true between the claims of research and those of teaching. The qualities which Professor Bateson possesses will secure this end. We congratulate the Council on the appointment, being convinced that, by it, they have taken the surest step to determine for the Institution the position of a school of horticulture of university rank.

One of the most interesting features of this little parish is the old, and very small, church adjoining the Court gardens. The church was partly built or restored by Prior CANTLOW.

VICTORIA MEDAL OF HONOUR.—As our pages go to press, we are informed that the president and council of the Royal Horticultural Society have appointed Mr. W. BOTTING HEMSLEY, F.R.S., Mr. J. H. GOODACRE, head gardener to the Earl of HARRINGTON, at Elvaston Castle, and Mr. A. MACKELLAR, head gardener to his MAJESTY THE KING, at Windsor, to fill the vacancies existing in the Victoria Medal of Honour in Horticulture.

KEW GARDENERS.—On Wednesday, November 17, the young gardeners held a social gathering in the Boat House, Kew. The arrangements were carried out by the members of the football team, about 130 of the staff and friends being present. In addition to dancing, a whist drive was held, the prizes being presented by Mr. ADAMSON.

"THE BOTANICAL MAGAZINE."—The issue of this journal for November contains figures and descriptions of the following plants:—

MAGNOLIA DELAVAYI, tab. 8282.—This species is from Yunnan in China, where it occurs at altitudes between 5,500 and 7,000 feet. In rocky places it is found as a mere shrub 8 feet high, but in more favourable situations it grows 15 to 30 feet high. It has large, persistent leaves, and extra large, cream-white flowers. The plant is not hardy in the open garden at Kew or at Messrs. Veitch's nursery at Coombe Wood, but it succeeds against a wall in both these places. The species was introduced for Messrs. JAS. VEITCH & SONS by Mr. E. H. WILSON during his first journey in China.

PIERIS FORMOSA, tab. 8283.—This is an old species which has been in cultivation in European gardens for half a century. It formed the sub-

CEPHALOTAXUS DRUPACEA, tab. 8285.—This species was illustrated in *Gardeners' Chronicle*, December 14, 1895, fig. 20, from specimens received from Powerscourt, Co. Wicklow.

KITCHINGIA UNIFLORA, tab. 8286.—This is a Crassulaceous plant suitable for cultivation in a pan or a suspended basket in a moist, tropical house. The solitary flowers are produced at the ends of the shoots in spring, and are reddish-purple. Dr. STAFF believes the species to be a native of Madagascar, but there is no direct testimony as to where the first plants were obtained.

NATIONAL SWEET PEA.—The annual general meeting will be held in the North Room, Hotel Windsor, Victoria Street, Westminster, at 3 p.m., on Friday, December 10. At 7 p.m. a conference will take place, when the following papers will be read:—(1) "The Imperfect Seeding and Waved Sweet Peas," by Mr. WM. CUT-

GUILDFORD, so as to reach him not later than January 15. For the Novelty Trials not fewer than 15 seeds should be sent, and for the Purity Trials, not fewer than two dozen seeds of each variety or stock. At the same time a list of the varieties, together with the amount due for trial charges, should be sent to the Hon. Sec., Mr. C. H. CURTIS, Adelaide Road, Brentford, Middlesex.

A SWEET PEA SOCIETY FOR PERTHSHIRE.—A meeting was held in Perth on November 20, for the purpose of inaugurating a Sweet Pea society for Perthshire. The Rev. JOHN S. CLARK, Dunbarney, presided. On the motion of Mr. PATERSON, Almondbank, it was agreed to form such a society. Some discussion followed as to whether it should be named the Perthshire Society or the Scottish Society, but ultimately it was decided to adopt the former name, but to allow the competitions to be open. The Rev. J. S. CLARK was appointed president, and Mr. R. S. HALLEY, 4, Rockford Terrace, Perth, secretary.

LINNEAN SOCIETY.—The next meeting will be held on Thursday, December 2, at 8 p.m., when the following papers will be read:—(1) Sir CHAS. ELIOT, K.C.M.G., "Nudibranchs from the Indian Ocean"; (2) Dr. GEORG ULMER, "Trichoptera von Hugh Scott, auf den Seychellen gesammelt"; (3) Dr. W. H. DALL, "Report on the Brachiopoda obtained from the Indian Ocean by the 'Sealark' Expedition, 1905"; (4) Professor J. STANLEY GARDINER, F.R.S., and others, "Narrative of the 'Sealark' Expedition," Part III. Exhibitions:—(1) Dr. H. DRINKWATER, water-coloured drawings of Wrexham wild flowers; (2) Mr. CLEMENT REID, F.R.S., plants in Britain introduced by the Romans; (3) Mr. G. CLARIDGE DRUCE, *Zannichellia gibberosa*, Reichb., a new British plant, and a new variety of *Orchis maculata*.

ROYAL METEOROLOGICAL SOCIETY.—At the meeting of the Royal Meteorological Society, held on the 17th inst., the president announced that the Council had awarded the Symons' Gold Medal to Dr. WILLIAM NAPIER SHAW, F.R.S., in recognition of the valuable work which he has done in connection with meteorological science. The medal will be presented at the annual general meeting of the Society on January 20, 1910.

THE SCENERY AT WINDSOR.—In order to preserve the beauty of Windsor Castle, it has been found necessary to purchase some riverside land between Alexandra Gardens and the Curfew Tower at Windsor. A subscription list has been opened for this purpose, headed by the KING with a donation of £500. At a recent meeting of the Windsor Corporation the Mayor, Alderman THOMAS DYSON, was authorised to open a subscription list for Windsor, Eton and district. The sum required for the purchase is £3,000.

MR. MAX KOLB.—The honorary director of the Royal Gardens, Munich, has received the congratulations of his horticultural confrères in all parts of the world on the attainment of his 80th year on October 29. So long ago as 1855 Mr. KOLB undertook the direction of the International Exhibition of Horticulture organised by the National Society of Horticulture of France. He remained in France, taking an active part in horticulture till 1860, and subsequently accepted the position which he now holds at Munich.

THE MUNICH ACADEMY OF SCIENCES has elected as corresponding members Dr. ARTHUR HUNT, of Oxford; Lieut. Col. PRAIN, Director of the Royal Botanic Gardens, Kew; and Professor BOWER, Regius Professor of Botany, University of Glasgow.

FIG. 159.—ST. CATHERINE'S COURT, SOMERSETSHIRE.
(See also Supplementary Illustration.)

ject of a full page illustration in the *Gardeners' Chronicle*, April 30, 1881, fig. 107.

COTONEASTER MOUPINENSIS, forma **FLORIBUNDA**, tab. 8284.—*C. bullata*, Bois, named from specimens received by M. L. DE VILMORIN, from a place near Tachienlu, are considered by Dr. STAFF to be merely a form of *Cotoneaster moupinensis*, Franch. Franchet's original description was prepared from specimens collected by the Abbé DAVID, in 1870. The specimens raised from M. VILMORIN'S seeds differed in that they contained a greater number of flowers and fruits in each corymb, which Dr. STAFF shows to be an unstable character. The plant now figured in the *Botanical Magazine* succeeds splendidly at Kew, where it is an attractive garden shrub, by reason of its large, bullate leaves and its abundant crop of brilliant berries, which ripen in September.

BERTSON, J.P.; (2) "Sweet Pea Names and Naming," by Mr. W. J. UNWIN. Dinner may be had at the hotel at 5.30 p.m., tickets 5s. each (exclusive of wine). Application for tickets should be made to the Hon. Sec., Adelaide Road, Brentford, Middlesex, not later than December 9.

—The Society will hold its annual series of trials in 1910, at the Times Experimental Station, Ladygrove Farm, near Guildford. No Awards or Certificates will be granted to Sweet Peas unless they are sent for trial. Varieties will be accepted only from the raiser or introducer; a charge of 2s. 6d. for each variety will be made. The Society will also conduct distinct trials solely for the purpose of testing correctness and purity of stocks of Sweet Peas. A charge of 5s. per variety or stock will be made. The seeds should be sent to Mr. C. FOSTER, Ladygrove Farm, near

THE LATE MR. W. W. POLDEN.—Messrs. HURST & SON point out that our brief notice of Mr. POLDEN'S death, published last week, appears to state that deceased was formerly in the habit of calling upon private gardeners, whereas the firm's dealings are, of course, with retail seedsmen.

AMERICAN ASSOCIATION OF NURSERYMEN.—We gather from the American papers that Mr. JOHN HALL has been appointed secretary of this association until the next annual election in the place of Mr. GEORGE C. SEAGER, who has resigned. Mr. HALL is also the secretary and treasurer of the Western New York Horticultural Society and has offices at 204, Granite Building, Rochester. He has filled this latter position for 21 years, and the society has a membership of nearly 1,500. Mr. HALL is also a member of the board of Park Commissioners of Rochester.

PUBLICATIONS RECEIVED.—*A History of Botany, 1860-1900*, being a continuation of Sachs's *History of Botany, 1530-1860*, by J. Reynolds Green (Published at the Clarendon Press, London.) Price 9s. 6d.—*The Cambridge History of English Literature*. (Vol. iv.) By A. W. Ward, Litt D., F.B.A., Master of Peterhouse, and A. R. Waller, M.A., Peterhouse. (Published by the University Press, Cambridge.) Price 9s.—*Bulletin of Miscellaneous Information, Royal Botanic Garden, Kew*. Addition series LX.: The Useful Plants of Nigeria. (Part I.) Price 2s.—*Examinations in Horticulture, 1910*. Royal Horticultural Society, Vincent Square, London, S.W. (Printed by Smith & Ebbs, Ltd., Northumberland Alley, Fenchurch Street, E.C.) Price 2s.—*Papers set at the Examinations in Horticulture, 1893-1909*. Royal Horticultural Society, Vincent Square, London, S.W. (Printed by Spottiswoode & Co., Ltd., New Street Square, London.) Price 2s.—*Contributions from the Laboratory of the Rothamsted Experimental Station*. (Laws Agricultural Trust.) Reprinted from the *Journal of Agricultural Science*, October, 1909. Clay & Sons, 7 & 8, Bread Street Hill, Queen Victoria Street, London).

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

CUERDEN HALL GARDENS.—I see by the paragraph on p. 345 that my old master is leaving Cuerden Hall. A short time ago I had the pleasure of visiting the gardens, where I had spent three happy years, and was pleased to see the all-round good condition there. Pineapples looked as well as ever; there were a few fruits of smooth Cayenne in 11-inch pots that would weigh 5 lbs. or 6 lbs. each. Calanthe Veitchii, in 6-inch pots, was showing strong flower spikes, and the best batch of Dendrobium nobile I ever saw had numbers of growths 2 feet long. There was also a grand lot of Begonia Gloire de Lorraine. When I was at Cuerden we grew plants of Mignonette 2 feet 6 inches high and the same in width; the flower-spikes were 20 inches long. The soil in the kitchen garden there is one of the worst, but, considering the season, the crops were good this year. C. P.

MINA LOBATA FROM HOME-GROWN SEED.—Last summer I had a very fine display of *Mina lobata*, the Mexican Climber, covering the south end of the house. It grew in masses all round my bedroom windows. I noticed, one warm moonlight night, that a great many flowers were open, and was fortunate, with the help of a paint-brush, in setting a considerable amount of seed. I have grown this plant regularly since 1891, and though I have tried every year to set seed in the daytime, have had hardly any success. Plants nearly related to this species are fertilised by night moths; it may be that is what is wanted in this case, too, and that the right moth is missing. The fruits ripened well; each contains when ripe but one seed. They were sown in heat in February. Every seed germinated; the young plants were kept in pots in a cool greenhouse till the beginning of June, when they had climbed to the top of 6-foot sticks. They were then planted out and grew rapidly, one attaining a height of 17 feet. In spite of the bad summer, three of these plants reached the roof of the house and were covered with a dense mass of flowers. Unfortunately, owing to the cold weather, I have been unable to ripen any fruit. The plants were cut down by frost at the end of October. It would be interesting to have the experiences of those who have grown *Mina lobata* from Mexican seed this year. In spite of the weather, I have never had a better show. *Rina Scott, Oakley, Hants.*

CARBOLIC ACID AND BLACK SCAB DISEASE.—The remedy which I have found effectual for some years past for sleepy and the other diseases of Tomato would, I believe, prove also a cure for Potato diseases. I notice that the affected crops referred to on p. 314 were growing in land which had previously been planted with Potatoes. That might account for the loss of the crop, as we found, when planting the variety Sir John Llewellyn twice following in the same ground, that, although the first year there was a large crop, the second year there were scarcely any tubers. I venture to suggest that, if land were treated with carbolic acid in solution before planting, the disease would be prevented. In subsequent attacks the plants should be watered with the solution, but not sprayed, and the roots in the ground will stand more of the specific than the leaves. The land should be dressed with about 3 ounces to each four gallons of water, and after planting, about one teaspoonful to four gallons of water would be strong enough. I should like to see a few tests made, and the results published. As a winter dressing for soil I think carbolic acid will supersede gas-lime and yield far better results. In the case of Tomatoes the crops are more vigorous. The benefit, apart from the value in destroying fungi, would seem to be analogous to the effect of fallow treatment, with the acid reaction resulting in soil from fermentation in the dark and as in the sludge treatment of sewage. It is also somewhat similar to the high fermentation set up in hot beds used in intensive cultivation. The healthiness and freedom from disease germs of the black soil resulting from intensive culture seems very remarkable. Is there not an acid reaction or residue noticeable in any of these cases? I do not know that there is any such thing, but it seems feasible. I am quite sure of my ground as far as Tomatoes are concerned. *F. Kitley, Oldfield Nurseries, Bath.*

DIMORPHOTHECA AURANTIACA. I quite agree with Mr. Gimbleton (p. 315) that plate 408 of Curtis's *Botanical Magazine*, entitled *Calendula Tragus*, is not a good representation of *Dimorphothea aurantiaca*, but it is considered, on good authority, to be intended for that plant. Either it must have been a pale variety or was altered by the conditions of cultivation, or the artist was at fault in the matter of colour. Climatic conditions and cultural treatment have a great effect upon other species of *Dimorphothea* from South Africa. *D. Ecklonis* and *D. aurantiaca* are both catalogued as half-hardy annuals in this country, yet the former, in its native home, is a suffruticose or half-herbaceous plant, and the latter a rigid, upright shrub, like a Lavender bush. The truly annual species are usually gathered with their roots intact, but I have seen no roots of native specimens of *D. aurantiaca*. *Calendula flaccida*, *Vent. Malin.*, t. 20, is a good representation of the plant or a form of it, for the colour there is not so exact as in the *Botanical*

Register, i. 28, where a fine plate from a cultivated plant is given under the name of *Calendula Tragus* β. The chief discrepancies between the descriptions and Messrs. Barr & Sons' plant are the annual character of the root and the smaller flower-heads of the latter, but these differences may be due to climate. Two annual species come from Namaqualand, but they are entirely different in foliage and other respects. *D. aurantiaca* originally came from Little Namaqualand. *Calendula Tragus* was first described by Aiton, *Hortus Kewensis*, iii., 271, and the plate, *Botanical Magazine*, t. 1981, seems a good representation of it. Harvey himself, in *Flora Capensis*, iii., 420, quotes this plate as a synonym of *Dimorphothea Tragus*, De Candolle. It is a handsome plant, but some other species of Cape Marigolds that seem to have dropped out of cultivation well merit reintroduction. *J. P.*

ONIONS.—No doubt *G. H. H. W.* (see p. 330) considers he has made out a good case against the transplanting of Onions when he asserts that those sown in the open ground are produced with far less expense. Having tried both methods, I find that raising them in a frame and transplanting them is the cheapest and most efficient way to obtain a good crop of Onions. *G. H. H. W.* says the only labour required after sowing in the open is weeding and hoeing. What about thinning? When the planting-out system is adopted and the seed is sown, say, the last week in February, on a gentle hot bed, it will be found that only about one-quarter the amount of seed will be required that would be necessary for sowing the bed in the open. Transplanting, which takes place about the second or third week in April, does not require so much time as is usually spent in thinning. Sowing indoors and transplanting also secures immunity from the ravages of the Onion fly; this is the greatest advantage claimed for the method, and when it becomes more generally adopted, as I believe it will, we shall hear far less of the ravages of this pest. *W. C. B.*

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 25.—The usual fortnightly meeting was held on Tuesday last in the Society's Hall, Westminster. The exhibition was a small one, but there was a good attendance of visitors. An outstanding exhibit was a group of Chrysanthemums put up in a most artistic manner. Messrs. VEITCH again made a fine display with Begonias, several firms showed Carnations of the perpetual-blooming type, and other exhibits of special interest included a collection of Selaginellas, small pot plants of Chrysanthemums, and berried shrubs. The FLORAL COMMITTEE conferred six Awards of Merit, four of these being to seedling Chrysanthemums. The ORCHID COMMITTEE had fewer groups than usual to inspect, but they conferred awards, including four First-class Certificates, three Awards of Merit, and one Botanical Certificate.

An exhibit was shown from the WOBURN EXPERIMENTAL FRUIT FARM. Some good fruits were staged in the competitive classes for Apples and Pears. The FRUIT AND VEGETABLE COMMITTEE made no award to a novelty.

At the afternoon meeting, in the lecture-room, an address on "Spices" was delivered by Mr. J. A. Alexander.

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. C. T. Drury, H. B. May, W. G. Baker, E. A. Bowles, Jas. Walker, John Green, C. R. Fielder, J. W. Barr, Robt. W. Wallace, W. J. Bean, J. F. McLeod, G. Renthe, H. J. Jones, C. Dixon, Chas. E. Pearson, Chas. E. Shea, J. T. Bennett Pod, W. P. Thomson, E. H. Jenkins, Ed. Mawley, Charles Blick, and R. Hooper Pearson.

Messrs. H. B. MAY & SONS, The Nurseries, Upper Edmonton, showed 60 species and varieties of Selaginellas, a very comprehensive collection containing many rare plants. Amongst the most decorative were *S. usta*, with upright stems and broad, Fern-like leaves, the shoots being useful for cutting; *S. erythropus*, with golden tint, this being developed only in autumn; *S. Wallichii*, a rare Asiatic plant, with elegant

foliage, borne erect on stems like a *Gleichenia*; *S. coccinea arborea*, the giant of the family (the scandent stems being 8 or 10 feet in length, with proportionately large, glaucous leaves); *S. Watsonii*, like a dwarf *Cupressus* (in spring-time the plant assumes a whitish appearance); *S. gracilis*, somewhat like a plant of *Grevillea robusta*; and *S. Poulterii*, on a column of *Sphagnum-moss*, its darker shade only distinguishing it from the moss. Amongst the "mossy" section, *S. serpens*, *S. apoda*, *S. patula*, *S. alboscapa*, *S. elegans*, *S. sarmentosa*, and *S. formosa* are all worthy of mention. (Silver Flora Medal.)

Messrs. JAMES VITCH & SONS, King's Road, Chelsea, again displayed a magnificent exhibit of winter-flowering Begonias, the large-flowered Mrs. Heal variety being especially fine. Even more remarkable were plants of *Elatior*, in 3½-inch pots, each specimen being like a little bouquet of flowers. *Ensign* and *Julius* were represented in large batches of well-grown plants. On a table opposite to the Begonias the same firm showed put plants of *Chrysanthemums*, having such decorative varieties as *Roupeil Beauty*, *Feltham White*, *Ursa Major*, *Market Red*, *Portia*, and *Nellie Rainford*, in elegant little specimens. (Silver-gilt Flora Medal.)

Messrs. STUART LOW & CO., Bush Hill Park, Enfield, showed well-grown plants of the small pink-flowered *Begonia Patrie*, and perpetual-blooming *Carnations* in most of the popular kinds. (Bronze Flora Medal.)

E. WYTHES, Esq., Copped Hall, Epping (gr. Mr. Bullock), displayed a floor-group of *Begonia Ensign*, with large trusses of semi-double, rose-coloured flowers. *Palms*, *Linopae striata*, and *Ferns* were employed as relief. (Bronze Flora Medal.)

J. A. DUNN, Esq., Coombe Cottage, Kingston Hill (gr. Mr. S. Barrell), showed several plants of *Begonia Ensign*, having large trusses of the pretty rose-pink blossoms. (Bronze Banksian Medal.)

Messrs. JOHN PEED & SON, Nurserymen, West Norwood, showed alpine plants in pots, including about 50 species of *Saxifraga*, also numbers of tiny succulent plants in little pots.

Mr. L. R. RUSSELL, Nurseryman, Richmond, showed a large group of berried plants with ornamental-leaved shrubs interspersed. At the back were large plants of *Holly* in berry, some having yellow fruits. There were also *Aucubas*, *Skimmias*, *Crataegus Lelandii*, *Cotoneasters*, *Eleagnus picta aurea*, *E. Simonii aurea*, *Eurya latifolia variegata*, and *Ivy* in great assortment. Mr. RUSSELL also showed varieties of single *Chrysanthemums*. (Silver Flora Medal.)

Messrs. SUTTON & SONS, Reading, showed varieties of *Primula obconica*. The blooms of the largest-flowered variety were a shade of rose, and not unlike the "pips" of *Primula sinensis*. A variety of crimson shade had smaller flowers, but they were of a very rich tone. Others were labelled *Pure White* and *Giant Pink*.

Messrs. W. CUTBUSH & SON, Nurserymen, Highgate, staged a charming display of *Carnations*, the varieties including, in addition to all the popular varieties, several new kinds, of which *Rosine (rosy-cerise)*, *Lady Ridley* (yellow ground, picotee edged), *C. W. Cowan* (crimson), and *Countess of Onslow* (of the same type as *Mikado*, but lighter in colour and with a pink shade at the base of the petals) were the more notable. A vase of *White Perfection* was especially good. (Silver Flora Medal.)

Carnations were also shown by Mr. A. F. DUTTON, Iver, Bucks., several vases of the new *May Day* variety being included in the exhibit.

Messrs. H. J. JONES, LTD., Hither Green, Lewisham, set up an imposing exhibit of *Chrysanthemums*, the group occupying an area of 300 superficial feet. It was made more attractive by a background and carpet of green drapery. At the back were nine tall tripods filled with large Japanese blooms of the varieties *H. J. Jones 1908* (yellow), *Mme. R. Oberthur* (white), *Buttercup* (yellow), *Mme. P. Radielli* (white), *Mrs. Burgess* (red), *Mme. G. Rivol*, and *Mrs. Trevor Williams* (cream, shading to pink). There were also large Japanese vases filled with big blooms, and numerous smaller ones containing single and decorative varieties. Highly-coloured *Crotons* also *Palms*, *Ferns* and other greenery were interspersed amongst the flowers, all of which were of excellent quality. (Silver-gilt Flora Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, showed a very artistically-grouped exhibit of

Chrysanthemums, the use of brown Beech-leaves as a ground having a good effect. The variety *Bacchus*, of the "spidery" or thread-petalled section, is curious; the much-cut florets are fringed with red; *Cannell's Crimson* is a fine single-flower of this shade; *Yellow Pagram* is another d-lightful flower of the single type, its yellow being of the clearest shade; *Mars*, rosy-bronze, very pretty when seen in artificial light; *Kathleen*, tipped with rose; and *Mrs. Chas. Will's*, magenta, are other good "singles." *Cannell's White* may be described as a Japanese single, the blooms being 10 inches across. (Silver Banksian Medal.)

Messrs. W. WELLS & CO., Merstham, Surrey, showed *Chrysanthemums* of all sections. We noticed a new Japanese variety named *Bessie G. Payne*. The colour is bronze, with paler reverse; the plant was certificated at the recent Edinburgh exhibition. *Mrs. W. Hooley*, a deep-red Japanese variety, is also new. The exhibit contained a fine selection of single *Chrysanthemums*. (Bronze Flora Medal.)

H. BARCLAY, Esq., Bury Hill, Dorking (gr. Mr. W. Graysmark), showed a pretty exhibit of single *Chrysanthemums*, but only one or two of the varieties were labelled.

Mr. FRANK BRAZIER, Nurseryman, Caterham, Surrey, showed a large bank of *Chrysanthemums*, arranged with *Michaelmas Daisies*, sprays of coloured foliage, *Ferns*, and *Palms*. In the centre were several fine blooms of the variety *Hon. Mrs. Lopes*, one of the best of the yellow *Chrysanthemums*; we also noticed the reddish *J. H. Silsbury*, *Mme. G. Rivol*, *Mrs. H. Stevens*, *Leslie Morrison*, *Hetty Wells*, *Wm. Howe*, and other large-flowering kinds. A band of a new, single, bluish variety named *Mrs. W. Parker* formed a suitable edging. (Silver Banksian Medal.)

Messrs. BUTLER BROS., Bexley Heath, Kent, showed *Chrysanthemums* in 5-inch pots, the plants being about 12 inches or 14 inches high and furnished with several excellent flowers. There were 19 varieties, representing a good variety of colours. (Silver Banksian Medal.)

Messrs. GEO. WILLIAMS & SONS, Manor House Nurseries, Cardiff, showed *Chrysanthemum* blooms in variety, a centre *epergie* being filled with a large, pink, single variety named *Caledonia*. Other *epergies* contained well-grown blooms of the large, yellow *Helen Williams*, a reflexed Japanese variety. (Bronze Flora Medal.)

Mr. FRANK LILLEY, Guernsey, showed new varieties of single *Chrysanthemums* of his raising, including *Brilliance* (yellow), *Elusive* (amaranth), *Rosette* (rose-pink), *Charming* (brick-red), and *Cinnamon*. (Bronze Flora Medal.)

Mrs. GREGORY, Shoreham Cottage, near Sevenoaks (gr. Mr. L. Lawrence), showed a pretty exhibit of single *Chrysanthemums*, interspersed with *Ferns* and *Palms*.

Messrs. R. & G. CUTBERT, Southgate, showed pans of *Hyacinths*, King of the Reds and Sir John Foxburgh, to show these bulbous flowers may be had in flower in November.

AWARDS.

AWARDS OF MERIT.

Nephrolepis splendens.—A sexually-produced sport raised from *N. Bausei* × *N. recurvata*, the first-named parent being a variety of *N. pluma* and the other a chance seedling. A pan was sown with spores of the two parents intermixed, and 70 per cent. of the young plants were of this new variety, which is of a more robust growth than either of its progenitors. The side pinnae are very much enlarged, and they overlap so as to suggest cresting. The fronds are of a deep green colour. A mature plant measures about 2 feet 6 inches in height, and the same in breadth. Shown by the raisers, Messrs. H. E. MAY & SONS.

Chrysanthemum J. B. Lowe.—This is a large single variety of rich crimson colour. Shown by Mr. H. J. JONES.

C. Meusa.—Disbudded blooms of this variety were 3½ inches across. The florets are pure white and remain perfectly flat. A very desirable variety. Shown by Mr. H. J. JONES.

C. Mrs. W. Buckingham.—This is one of the prettiest single-flowered pink *Chrysanthemums* we have seen for a very long time. The flowers are of moderate size, good form, and a charming shade of colour. Shown by Mr. L. R. RUSSELL, Nurseryman, Richmond.

C. Miss Lillian Bullivant.—This variety is a fine addition to the cream-coloured, single-

flowered type. The blooms are of good form, with flat florets in two rows, the diameter being about 2½ to 3 inches. The development of most of the buds into good flowers is a pleasing characteristic. Shown by Miss BULLIVANT, Beckenham (gr. Mr. T. Crosswell.)

Paragonium "His Majesty".—The individual blooms of this winter-flowering variety of zonal-leaved *Paragonium* are 2½ inches across. In colour they are brilliant scarlet, with a small white eye. The plants appear to flower very freely at this season. Shown by Mr. W. H. PAGE, Nurseryman, Hampton, Middlesex.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. sec.), de B. Crawslay, J. F. Alcock, W. W. Hall, W. Thompson, Stuart Low, C. H. Curtis, A. A. McBean, F. J. Hanbury, W. Cobb, A. Dye, W. P. Bound, W. H. Hatcher, J. Cypher, D. G. Alexander, H. A. Tracy, H. Ballantine, Guiney Wilson, W. H. White, W. Bolton, and Fergus Monteith Ogilvie.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, were awarded a Silver Flora Medal for an excellent group of *Cypripediums*, principally hybrids. The centre of the group was composed of a number of the yellow *Cypripedium* *insigne* *Sanderæ*, effectively arranged with *C. Fairricanum*. One end consisted of a good selection of *C. Leeanum* varieties, and the other of varieties of *C. insigne*, including good *C. l. Harefield Hall*. Others noted as exceptionally fine were *C. St. Alban* (a very dark flower), *C. Thalia*, and *C. Miso superbum*, both good forms.

Messrs. CHARLESWORTH & CO., Haywards Heath, were awarded a Silver Flora Medal for a very select group. Two of the best plants are mentioned under "Awards." Other fine things included were *Cattleya Venus* var. *King Manoel*, a lovely yellow flower, with light ruby-red lip; *C. lucida* (*Boweringiana* × *Schulleriana*), with two spikes of bright rose-purple flowers, one spike bearing 14 blooms.

Messrs. STUART LOW & CO., Bush Hill Park, secured a Silver Banksian Medal for an effective group, in which their fine strain of *Cattleya labiata* formed the chief feature, among them being *C. l. Queen Maud*, a pretty, white variety with a delicate, lavender tint. Among the *Oncidiums* was a plant of *O. varicosum* *concolor*, probably the first so-called albino of the species, and which had flowers wholly of a bright yellow colour. A good selection of *Cypripediums* was also included.

Messrs. JAS. CYPHER & SONS, Cheltenham, were awarded a Silver Banksian Medal for a fine group of *Cypripediums*. In the centre were about a dozen flowers of *C. l. Sanderæ* and other favourite kinds; also some dark forms of *C. Fairricanum*, good *C. Leeanum*, including the varieties *aureum* and *virginale*; *C. Nogi*, a pretty and little-known variety; and a representative selection of other kinds.

Messrs. J. & A. McBEAN, Cooksbridge, were awarded a Silver Banksian Medal for a compact group, in the centre of which were two grand specimens of *Cypripedium* *insigne* *Sanderæ*, the one with 12 and the other 16 fine yellow flowers, with clear, white tips to the dorsal sepals, representing this favourite *Cypripedium* at its best. Arranged with it were *C. Lord Derby*, *C. Shillanum*, and other *Cypripediums* and *Odontoglossums*.

Lieut.-Col. G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander), sent the new *Laelio-Cattleya Pauline* (*L. C. Ophir* × *C. labiata* *alba*), a pretty hybrid, with some resemblance to *C. aurea* but with more compact flowers. Sepals and petals emerald yellow; lip, rosy mauve, with gold lines from the base; *L. C. Golden Beauty*, with a grand spike of deep yellow flowers, and two others were also shown. (See Awards.)

FRANCIS WELLSLEY, Esq., Westfield (gr. Mr. Hopkins), showed *Cypripedium Waterloo* (*Mrs. Wm. Mostyn Westfield* var. × *Ranjitsinhji*), a massive flower with a glossy surface. The large, dorsal sepal has a green base, the rest being white, with rose-purple spotting, the main blotches forming lines, the rest of the flower being darkly tinted. *C. Little Gem* *Westfield* variety, a perfect model in shape and of pleasing colour; *Laelio Cattleya Lady Chance*, with bronzy-red sepals and petals. Base of the lip

white, the front and tips of the side lobes amethyst purple; and L.-C. King Manoel. (See Awards.)

G. P. WALKER, Esq., Putney Heath (gr. Mr. McGregor), showed *Brasso-Laelio-Cattleya Surprise* (C. bicolor \times B.-L. Digbyano-purpurata). Sepals and petals greenish; lip white, with some purple marks and a slight fringe. In the plant shown the flower was small.

MESSRS. ARMSTRONG & BROWN, Tunbridge Wells, staged a small group of choice Orchids, among which were *Cypripedium Thaha*, Mrs. Francis Wellesley (in great beauty), *C. Germaine Opola* Westfield variety, a fine dark *Odontoglossum Lambeauianum*, and *Dendrobium Colognyense* Armstrongiae, with a large, dark-coloured flower.

Mrs. COOKSON, Oakwood, Wylam (gr. Mr. H. J. Chapman), sent *Cypripedium Sanaedera* Cooksonii, a fine yellow and white flower, and the white *Calanthe Cooksoniae* (vestita luteo-oculata gigantea \times Harrisii).

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), sent a large specimen of *Cypripedium Ville de Paris*.

W. BOLTON, Esq., Wilderspool, Warrington, sent *Cypripedium Hitchinsiae* Bolton's variety, with a fine white dorsal sepal spotted with mauve, and the new white *C. Boltonii* (see Awards).

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), sent *Cattleya Hardypitt* (Hardyana \times Mrs. Pitt), a light rose-coloured flower with some purple on the lip.

MESSRS. WILLIAM BULL & SONS, Chelsea, showed *Cypripedium Emerald* (Salleri Hycanum \times *Leeanium giganteum*).

MESSRS. STANLEY & Co., Southgate, showed several yellow forms of *Cypripedium insigne*, the variety *Stanleyi* being wholly greenish-yellow with a white tip to the dorsal sepal and with no sign of spotting.

Mrs. MAURICE MERTEENS, Ghent, showed a small group of handsome hybrid *Odontoglossums*.

AWARDS.

FIRST-CLASS CERTIFICATES.

Laelio-Cattleya Barbarossa Westonbirt variety (C. Triana Imperator \times L.-C. callistoglossa), from Lieut.-Col. G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander).—A very showy hybrid, an improvement on L.-C. callistoglossa ignescens, and with a thicker substance in the flower. Sepals and petals bright magenta-rose; lip broadly expanded, ruby-red with a clear mauve shade; disc yellow.

Laelio-Cattleya Nelthorpe Beaulerck (L.-C. Gattoiana \times C. Enid magnifica), from Messrs. CHARLESWORTH & Co.—One of the most beautiful hybrids shown this year, and remarkable in its reversion to, and enlargement of, the best form of C. Mossiae, inherited from C. Enid. The flowers closely resemble a large C. Mossiae with very broad petals. Sepals light rose with a slight nanken tint. Petals white flushed with rose at the base and tips, and tinged with yellowish nanken in the middle. Lip large, marked with purplish crimson in front, and with orange red lines at the base.

Cypripedium Boltonii, from WILLIAM BOLTON, Esq., Warrington.—A chastely-beautiful hybrid, supposed to have C. insigne Sanderæ on the one side, the other being doubtful. In form it somewhat resembles C. Venus, but is larger and taller. Flowers wax-like and of the purest white, with a few very minute dark dots on the lower part of the dorsal sepal.

Cirrhopetalum longissimum (?).—Under the above name SIR TREVOR LAWRENCE showed a most elegant *Cirrhopetalum*, said to have been imported from Java, and probably nearest to the C. grandiflora of Ceylon. The plant bore a slender scape surmounted by a short raceme of seven flowers arranged almost in an umbel, and gracefully drooping, each being about 9 inches in length, the closely-approached lateral sepals terminating in slender tails. The upper sepal is arched over the lip, white with purple lines, the small petals being similarly coloured. Lateral sepals white with rose lines.

AWARDS OF MERIT.

Cattleya Dives superba (Vulcan \times Warszewiczii), from Lieut.-Col. G. L. HOLFORD.—A pretty flower, almost wholly of a deep rosy-mauve, the lip being the darker.

Zygo-Colax Charlesworthii (Z. Perrenonii \times C. jugosus), from Messrs. CHARLESWORTH & Co.—A good dark flower. Sepals and petals closely marked with purplish chocolate. Lip violet with white margin.

Laelio-Cattleya King Manoel (parentage unrecorded), from FRANCIS WELLESLEY, Esq. (gr. Mr. Hopkins).—A gorgeously-coloured flower and a new departure in colour. The sepals and petals are bronzy flame-red on a gold ground. The base of the lip is veined with vinous-purple; the isthmus bright chrome-yellow; front ruby-crimson.

BOTANICAL CERTIFICATE.

Bulbophyllum hirtum, from GURNEY WILSON, Esq., Haywards Heath.—A singular Burmese species with a nodding raceme of small white, hairy flowers.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the Chair), and Messrs. J. Cheal, P. D. Tackett, H. S. Rivers, W. Poupard, G. Wythes, O. Thomas, H. Parr, A. R. Allan, J. Davis, G. Reynolds, E. Beckett, A. Dean, J. Willard, G. Woodward, G. Hobday, J. Harrison, and H. Markham.

A dish of rather green, medium-sized Ribston Pippin Apples, gathered from a tree which originated as a sucker from the original tree at Ribston Park, was shown by Major J. DENT (gr. Mr. J. McClelland). The old tree was blown down early in the 19th century, and from its roots sprang a sucker, the origin of the tree now fruiting.

From Mr. GUMBLETON, Belgrove, Co. Cork, came fruits of a brown Walnut, *Juglans ailantifolia*. This is the first time the tree has fruited for 50 years.

P. J. EDMONDS, Esq., Woking, sent a dish of Cox's Orange Pippin Apples grown in Holland. The specimens were of fair size, but lacked the finish seen in English fruits.

The most interesting collection before the Committee was one of numerous baskets and dishes of Apples from the Duke of BEDFORD'S Experimental Fruit Farm, Woburn, Bedfordshire. These fruits were sent to illustrate results obtained from various experiments in manuring, pruning, tilling, and of planting in grass-land. Whereas, in the case of Gascoyne's Scarlet Seedling, fruits were shown from trees grassed-down, and others not so treated, the richest colour was found on the grassed trees, due to the fact that the roots had been kept drier and warmer by the grass covering. But the fruits from the non-grassed trees were the finest. Some samples of Peasgood's Nonesuch, New Northern Greening, Golden Noble, and Yellow Ingestre, from trees growing on tilled soil for 15 years, were generally quite small for the varieties. Where grassed-down for three years, Peasgood's Nonesuch were fairly good, the rest being small and poor. Obviously, the Woburn soil seems unfitted, or is naturally too poor, for Apple culture. Weight of fruits taken from various trees of Bramley's Seedling, grown as dwarfs, were given as also showing the effects of root pruning one, two, three and four years, and various other experiments, all of which the Committee regarded as of no value, and rather leading to the retrogression of Apple culture.

MESSRS. W. SEABROOK & SONS, Chelmsford, staged a collection of 27 dishes or baskets of Apples and Pears. The best cooking Apples were Bismarck, Warner's King, Royal Jubilee, Beauty of Kent, Peasgood's Nonesuch, Lord Derby, and The Queen. Amongst dessert varieties were Allington Pippin, Lord Burghley, Royal Snow, Ribston Pippin, Charles Ross, Cox's Orange Pippin, and Gascoyne's Scarlet Seedling. Of Pears we noticed good fruits of Charles Ernest, Doyenné du Comice, and Emile d'Heyst. (Silver Banksian Medal.)

MESSRS. J. CHEAL & SONS, Crawley, showed a basket of the new and delicious Pear Beurré de Nazhan, and also a basket of their new Apple Encore.

MESSRS. A. PALMER & Co., Florists, Grosvenor Square, London, staged, with flowers, though contrary to the rules, very fair samples of Allington Pippin, Cox's Orange Pippin, Newton Wonder and Lane's Prince Albert Apples; also Beurré Clairgeau, Beurré Diel and Doyenné du Comice Pears.

COMPETITIVE CLASSES.

In the class for three dishes of dessert and six of cooking Apples, the 1st prize was won by

G. D. WILLIAMS, Esq., Tring, Herts. (gr. Mr. F. C. Gerrish), with superb fruits. His dessert varieties, specially fine and handsome, were Charles Ross, Rival and Cox's Orange Pippin. The culinary sorts were Emperor Alexander, Gloria Mundi, Bismarck, Prince Albert, Peasgood's Nonesuch, and Lord Derby. SIR MARCUS SAMUEL, Maidstone (gr. Mr. W. H. Bacon), was placed 2nd, his samples being also excellent. Extra prizes were awarded to C. H. COOMBE, Esq., Cobham Park, Surrey (gr. Mr. A. Tidy), and to C. CANN, Esq., Welwyn, Herts. (gr. Mr. J. Pateman). There were eight exhibits in this class.

In the class for two dishes of dessert and four of cooking Apples, there were two entries. The exhibitor in one case made a mistake in setting up two dishes of Bramley's Seedling, although one was named Beauty of Kent. A 2nd prize was awarded to T. CHARLESWORTH, Esq., Nutfield Court, Red Hill (gr. Mr. Herbert). He had moderate samples of (dessert) Blenheim Pippin and Gravenstein, and (culinary) Lord Derby, Stirling Castle, Warner's King, and Bramley's Seedling.

MESSRS. W. SEABROOK, Chelmsford, were the only exhibitors in the class for traders for four dishes of dessert, and eight dishes of cooking Apples, getting the 1st prize of a Silver-gilt Medal.

The Pear classes brought some fine fruits, especially in the larger class for seven dessert and two cooking varieties. Mr. A. TIDY showed very fine stewing varieties in General Todleben, and Uvedale's St. Germain, and (dessert) Beurré Diel, Beurré d'Anjou, President Barabe, Charles Ernest, Doyenné du Comice, Duchesse d'Angoulême, and Pitmaston Duchess; 2nd, Mr. BACON. There were but five collections.

In the class for six dishes, the 1st prize exhibit included the varieties Charles Ernest Alexander Lucas, Josephine des Malines, Emile d'Heyst, Doyenné du Comice, and Catillac, but the exhibitor's name cannot be given, as the card had disappeared. 2nd, Viscount ENFIELD, Wrotham Park, Middlesex (gr. Mr. H. Markham), who had good fruits of Duchess, Durondeau, Soldat d'Labourer, Glou Moreau, and Uvedale's St. Germain. In this class Mr. ALLAN, of Gunton Park, staged some of the finest fruits, but he was disqualified for staging Beurré Diel as a stewing Pear. He was awarded an extra prize. There were five exhibits in this class.

Scientific Committee.

NOVEMBER 9.—Present: E. A. Bowles, M.A., F.E.S., F.L.S. (in the Chair), J. T. Bennett Poë, A. W. Hill, R. A. Rolfe, W. E. Ledger, W. Hales, J. Douglas, and F. J. Chittenden (hon. sec.).

Variation in blue *Primroses*.—From the garden of Sir ARTHUR HORT, Bart., came red flowers of *Primroses* which in the spring bear blue flowers. It was suggested that the change may be due to the cell sap being acid in reaction instead of alkaline, owing, perhaps, to some variation in external conditions such as temperature. Attention was drawn to the fact that several *Primulas* had varied in the same directions as *P. sinensis*, particularly noting the fimbriation of the edges of the petals which occurred in *P. obconica*, *P. japonica*, *P. Sieboldii*, and now in *P. x Kewensis*. He enquired whether any member of the Committee had noticed similar variations in the common *Primrose*, *P. acaulis*. Mr. CHITTENDEN said he had once seen a plant with the edges both of the petals and sepals much cut in a cottage garden at Chelmsford, but no other member of the Committee had noticed any. Mr. DOUGLAS and Mr. FRASER pointed out that if seedlings showed signs of roughness at the edges of the petals they would be discarded immediately by florists, and no record would be kept. The Committee would be glad to hear of instances of parallel variations in different species of *Primula* under either natural conditions or when cultivated. For instance, double forms of *P. acaulis* are well known in gardens, but appear to be very rare wild, and there seems to be only one record of their being raised from seed (by Mr. MURRAY THOMSON, *in litt.*), while doubling of a similar nature has occurred in *P. sinensis*.

Scilla socialis.—Mr. W. E. LEDGER showed a specimen of this uncommon Natal plant, flowering profusely. It was figured by the late Mr. WILSON SAUNDERS in *Refugium Botanicum*, t. 160, and the present plant appeared to be a

direct descendant of the plant originally figured. When treated liberally, it appears to increase fairly rapidly, though slow to grow when starved, numerous plants forming under the central one.

Frost, plant injured by.—Mr. J. FRASER showed specimens to illustrate the damage done by frost acting under varying conditions, e.g., Bracken growing in the open (near London) became quite black, while under an Oak tree it remained green. *Solanum nigrum* varied considerably in the extent to which individuals suffered, the pernicious weed, *Galinosa parvifolia*, originally from Peru, now too common in market gardens in Surrey and Middlesex, was blackened by 4° to 5° of frost, while *Chrysanthemum frutescens* from the Canaries was uninjured. While *Datura Stramonium* was killed, its fruits were uninjured, and it persists as a weed in this country partly on this account, but also because the seeds from any particular pod do not all germinate in the same season.

Malformed Orchids.—Mr. G. WILSON, F.L.S., showed malformed *Lycaste Skinneri*, *Odontoglossum* and *Cattleyas*, upon which Mr. Rolfe, who examined them, reported as follows:—"The flower of *Lycaste Skinneri* has a free, dark purple filament, $\frac{3}{4}$ inch long, opposite to one of the side lobes of the lip, and as the latter has lost its colour and become like the petals in texture, it is an evident case of replacement. There are three flowers of *Cattleya labiata*, one in which the lip has reverted to a simple petal, giving a regular perianth, while the column is straight and has an additional perfect anther, showing that one side lobe of the lip has been developed as an anther, while the other has been suppressed. In a second flower the sepals have become petal-like in shape and colour. In the third flower there are two sepals, two petals, and a slender column and anther, the lip being totally suppressed, and the flower dimerous. The other is a three-flowered inflorescence of *Odontoglossum crispum*, in which the column is abortive in each case, and the lip rather full, though otherwise normal."

Trifolium hybridum malformed.—Mr. H. T. GÜSSOW, of the Central Experimental Farm, Ottawa, Canada, sent some specimens of *Trifolium hybridum*, which were sent to the botanical division of the Experimental Farms, Ottawa, Ontario, Canada, by a farmer whose crop showed a peculiar development throughout. The heads were produced in axillary, compound, long-peduncled umbels. The umbels measured from $\frac{1}{2}$ to 1 inch in breadth and were 8 to 26 rayed. The pedicels were from 2 to 4 mm. long, flattened, and 1 mm. broad. Involucres none, or reduced to several scale-like bracts, 1 mm. long, acutely linear; involucre, scale-like, membranous bracts $\frac{1}{2}$ to 2 mm. long, umbellets 6 to 12 flowered. The flowers, unfortunately, could not be examined, as they had not sufficiently developed. Any botanist might have been puzzled to identify the plant if the inflorescences only had been sent. The plant at first sight looked more like an umbelliferous than a leguminous plant.

LINNEAN SOCIETY.

NATURAL INCLUSION OF STONE IN WOODY TISSUE.

NOVEMBER 4.—Mr. CECIL CARUS-WILSON, F.R.S.E., F.G.S., exhibited specimens and lantern-slides, showing the natural inclusion of stones in woody tissue. He said: About twenty-three years ago a gravel-pit was started in the valley-gravels occurring between Syndale and Newham, some three miles from Faversham, in Kent. Part of a wood, chiefly Oak trees, covered the deposit; as the work progressed these were felled, and the stumps and roots dislodged.

The gravel consists of subangular, water-worn flints, large nodules less worn, and occasional blocks of Sarsen-stone; the whole being mixed with flint grit and quartzose sand, and forming a compact and somewhat coherent mass. Several Paleolithic implements and part of a skull of *Bos longirostris* have been found in the deposit.

The roots and stumps referred to were distributed promiscuously over the surface of the ground as the gravel in which they were embedded was removed. The work of excavating ceased in this particular part of the valley about ten years ago, so the roots still remaining have been exposed for that length of time, the others having been cut up for fuel by the cottagers in the neighbourhood.

Most of those now found there were left intact because of the large number of stones enclosed in the wood. Not only did these resist the work of saw and axe, but when burnt they burst asunder with considerable force, becoming a source of danger to those within range of the flying fragments.

The stones are actually embedded in the solid Oak, and not merely included within forked portions which may have grown together subsequently. The tissue of the wood appears to have grown around the stones and enveloped them, indicating that the process was carried on under conditions of considerable pressure. There are dozens of stones embedded in some of these roots, or snags, so that the substance might be described as "a conglomerate formed of flints enclosed in a woody matrix."

The examples at Syndale are, however, as far as I know, unique, and if trees can enclose stones in such quantities, and retain them within their substance so tenaciously, we have transporting agents capable, under certain conditions, of distributing terrigenous material over sea-beds to an extent not hitherto appreciated.

LEAF-BUDS REPLACING FLOWER-BUDS IN HEATHER.

Dr. A. B. RENDLE, F.R.S., showed a specimen of Heather (*Erica cinerea*) found near Axminster in which the flowers were replaced by dark red leaf-buds of about the same size as the flowers. One side, or about half of a clump of Heather, was affected; the other side bore normal flowers and the two sorts were not mixed. The red leaf-buds, which occupy the position of flowers, consist each of a number of short, strongly ascending leaves closely arranged in superposed whorls of four; the four lines have often a strong spiral twist in the upper part of the bud. The leaf arrangement therefore resembles that of the flower, not of the foliage leaves, which are in whorls of three. The leaves of these special buds also differ in form from the foliage leaves in that they are upwardly concave with a bluntly keeled back, recalling the sepals of a typical flower. They are 32 or more in number, and thus considerably outnumber the parts of a typical flower (24 including bracteoles). The tip of the bud was always damaged, but in many of those examined a shrivelled or more or less mis-shapen pistil or its parts were present, and sometimes below this semifoliateous stamens were found. The appearance suggested insect injury, but Mr. C. O. Waterhouse was unable to find any animal organism; he pointed out, however, that the appearance suggested the work of a Phytoptus, which in the normal course of events would have already deserted the buds. Dr. Rendle has, however, been able to find no record of Phytoptus in connection with our Heather. The specimen is of interest as resembling a teratological form of *Erica cinerea* described by Maxime Cornu in 1879, where the flowers were replaced by vegetative buds apparently very similar in appearance to those on our specimens, but in which the arrangement of the foliage leaves was maintained (the leaves being in rows of six), while the bud contained no trace of floral organs or of damage by any animal organisms.

A discussion followed in which the following engaged:—Mr. E. M. Holmes, Dr. O. Stapf, and the President; Dr. Rendle replying.

Prof. H. H. W. PEARSON, Sc.D., F.L.S., then gave a lecture, illustrated by a long series of lantern-slides, entitled—"Types of the Vegetation of Bushmanland, Namaqualand, Damaraland, and South Angola (A Preliminary Report of the Percy Sladen Memorial Expedition in South-West Africa, 1908-1909)."

SHEFFIELD CHRYSANTHEMUM.

NOVEMBER 12.—This annual show was held in the spacious Corn Exchange, and made a very imposing display. The classes for Chrysanthemum groups were omitted from the schedule owing to lack of support in recent years. An endeavour, however, is being made to replace the class by providing space on the stages for Chrysanthemums interspersed with foliage plants.

In the class for four vases of large-flowering Japanese Chrysanthemums, Lieut.-Col. BEECH, Drandon Hall, Coventry (gr. Mr. E. J. Brooks), won the 1st prize easily with magnificent blooms of Lady Talbot, President Viger, John Peed, and F. S. Vallis. The blooms of this last named

variety formed the outstanding feature of this class.

Only three exhibits were staged in the class for two vases of Incurved blooms. With five beautifully compact blooms of C. H. Curtis and Mrs. G. Hifan, Mr. G. W. DRAKE, 44, Cathays Terrace, Cardiff, was awarded the premier position. Lieut.-Col. BEECH won in the class for one vase of a yellow Japanese Chrysanthemum, his vase of F. S. Vallis being of very high quality. For six vases of Incurved Chrysanthemums, Mr. G. W. DRAKE won the 1st prize with fine blooms of G. F. Evans and May Phillips. In the similar class for six vases of large-flowering Japanese Chrysanthemums, Lieut.-Col. BEECH again secured the 1st prize, his blooms of Lady Talbot and F. S. Vallis being particularly fine. One exhibit in this class included a vase of the variety Magnificent, the dark red petals and bronze undershading of which shone out conspicuously.

In the class for 12 Incurved blooms shown on boards Mr. DRAKE was placed 1st with flowers of rather uneven size, but all showing excellent culture. For 12 Japanese blooms shown on boards Lieut.-Col. BEECH was 1st, which position he certainly deserved, although one bloom of John Peed, with rather a poor centre, detracted somewhat from the otherwise perfect exhibit. Splendour was here represented by a magnificent bloom.

COLLECTIONS OF FRUIT.—Out of five exhibitors G. H. SHAW, Esq., Howden, E. Yorks. (gr. Mr. A. Blakey), was awarded the 1st position with some fine fruit of Gros Colman and Muscat of Alexandria Grapes, Pitmaston Duchess and Beurré Clairgeau Pears, and Worcester Pearmain and Blenheim Pippin Apples.

For Messrs. Sulton & Sons' special prize for a collection of vegetables, the Duke of PORTLAND, Welbeck, Worksop (gr. Mr. J. Gibson), was placed 1st.

The district classes were all well represented, and some fine plants and blooms were staged. Indeed, the long tables of varied colours were the best we have seen at Sheffield.

Amongst non-competitive exhibitors were MESSRS. ARTINDALE & SON, MESSRS. HIRAM SHAW & SON, MESSRS. SEGRAVE & CO., W. WOOLMAN, and MESSRS. USTONE.

DUNFERMLINE CHRYSANTHEMUM.

NOVEMBER 12, 13.—This show was superior to the one held last year. The Chrysanthemum blooms were the best ever seen at a Dunfermline show. The principal class was for 18 blooms of Japanese varieties. Mr. DAN CARMICHAEL, Stirling, led with a grand exhibit; 2nd, Mr. JAS. PROCTOR, Dunfermline. MESSRS. J. PROCTOR, J. LAING, D. CARMICHAEL, J. WALDIE, and J. BROWN led in the other classes for cut blooms.

Pot plants, as usual, were a strong feature, but, owing to a change of date—the show was held a fortnight earlier than originally arranged—the blooms were scarcely developed. MESSRS. J. REID and NEIL McLEAN, both of Dunfermline, shared the leading honours in this section.

The vegetable classes were strongly contested. Mr. SHAW, Boquhan, led with a fine collection, having good Celery, Leeks, Beet and Potatoes; 2nd, Mr. WALDIE, Dollarberg.

MESSRS. JAS. CAMPBELL and JAS. CURRIE were the most successful exhibitors of floral decorations, also bouquets, sprays, baskets, and other works of floral art.

Amongst non-competitive exhibits Messrs. WM. DRUMMOND & SONS, Stirling, exhibited some excellent Apples and Pears in more than 60 varieties.

WINCHESTER CHRYSANTHEMUM.

NOVEMBER 16, 17.—An exceedingly fine display was seen in the Guildhall, Winchester, on these dates, the occasion being the twenty-seventh autumn exhibition of the society. Nowhere this year has keen competition taken place in the various classes set apart for cut blooms, the quality of the exhibits being exceptionally good. Chrysanthemum plants, as well as groups of miscellaneous plants arranged for effect, were also well shown. Vegetables were a notable feature. The arrangements were of the best. Mr. Chaloner Shenton, hon. secretary, aided by his assistant, Mr. A. E. Saunders, and the staging manager, Mr. Axford, being responsible

PLANTS.—Groups of Chrysanthemums arranged in a space of 8 feet by 7 feet were staged by five exhibitors. Mr. M. HODGSON, Morton House, Kingsworthy (gr. Mr. A. J. Marsh), won the 1st prize easily with plants carrying high-quality blooms and good foliage; 2nd, C. R. SCHWERDT, Esq., Old Alresford House (gr. Mr. A. Mackay), with dwarf plants having slightly smaller blooms.

This society gives much encouragement to the growing of plants suitable for conservatory decoration, i.e., plants that are dwarf, possess good foliage, and carry specimen blooms. They are grown in pots, which must not exceed 9½ inches in diameter. In the class for nine distinct plants there were three entries. J. A. FORT, Esq., 69, Kingsgate Street, Winchester (gr. Mr. G. Consens), was awarded the 1st prize for dwarf plants of such varieties as F. S. Vallis, Niveum, J. H. Silsbury, Mrs. F. W. Vallis, and Embleme Poitevine, each furnished with about eight high-class blooms. Colonel F. A. DICKENS, Winchester (gr. Mr. G. Adams), was a close 2nd.

In a similar class for white and yellow varieties there were again three competitors, and Mr. FORT excelled with choice plants of F. S. Vallis, Niveum, Embleme Poitevine, C. H. Curtis, Mrs. Judson and Mme. Oberther. Colonel DICKENS again followed closely.

In a local class for six similar plants, Mr. E. YARROW, 38, North Walls, Winchester, was awarded the 1st prize, having freely-flowered specimens of popular varieties.

For a group of miscellaneous plants arranged for effect on the floor, A. G. RALLI, Esq., Twyford Lodge, Winchester (gr. Mr. J. Hughes), was 1st with a pleasing arrangement of Orchids, Crotons, Ferns, &c.; 2nd, F. BIRCH, Esq., Clovelly, Winchester (gr. Mr. E. Long); in the centre of this group was a Palm much too large for the position.

CUT BLOOMS.—The leading class was for 36 Japanese blooms in not fewer than 24 varieties. The best of six exhibits was shown by E. MOCATTA, Esq., Adlestone (gr. Mr. T. Stevenson), who had choice examples, of which the following were noteworthy: Lady Talbot, Purity, Leigh Park Wonder, F. S. Vallis, Duchess of Sutherland, J. H. Silsbury, Mrs. F. W. Vallis, Edith Jameson, Mrs. A. M. Faulkner, Mrs. C. Penford, Maud Jeffries, Mme. P. Radaelli, and Mrs. C. H. Totty. 2nd, C. A. PEARSON, Esq., Frensham Place, Farnham (gr. Mr. C. Moore); 3rd, B. HANKEY, Esq., Fetcham Park, Leatherhead (gr. Mr. W. Higgs). The 2nd and 3rd prize groups were very close in point of merit. Four growers entered in a class for 24 Japanese blooms in not fewer than 18 varieties. Major WYNDHAM PAIN, Bransgore House, Christchurch (gr. Mr. H. Lloyd), was the most successful exhibitor, and Captain WEINER was placed 2nd.

Japanese varieties in vases made a fine show arranged on a low table down the centre of the hall. For six varieties, three blooms of each sort, there were six competitors. Mr. MOCATTA won easily with high-quality blooms, having Lady Talbot, Mrs. G. Mileham, Algernon Davis, J. H. Silsbury, F. S. Vallis, and Edith Jameson; 2nd, Mr. H. LLOYD.

INCURVED VARIETIES were very good. For 36 blooms, in not fewer than two dozen sorts, there were four entrants. Mr. B. HANKEY easily secured the premier place with large, well-finished examples of Clara Wells, Embleme Poitevine, Mrs. E. Denyer, Daisy Southam, Buttercup, Frank Triston, Le Peyson, W. Higgs, Triomphe de Montbrun, C. H. Curtis, W. Pascoe, Godfrey's Eclipse, and Mrs. J. Wynne. Mr. MATTHEW HODGSON was a good 2nd with slightly smaller blooms; and Lord ASHBURTON, The Grange, Alresford (gr. Mr. C. Garratt), was placed 3rd.

In the class for 18 blooms, in not fewer than 12 varieties, W. GARTON, Esq., Salisbury Court (gr. Mr. J. Edwards), excelled; A. P. RALLI, Esq., Twyford Lodge, Winchester (gr. Mr. J. Hughes), being 2nd.

Single-flowered varieties made a great show. For six bunches, distinct, not disbudded, W. H. MYERS, Esq., Swannore House, Bishop's Waltham (gr. Mr. Ellwood), won with full-sized bunches of good blooms, well displayed. Roupell Beauty, Edith Pagram, Eureka, Mrs. E. Roberts and Crown Jewel were very fine; 2nd, A. P. RALLI, Esq.

Mr. A. E. TAYLOR, 3, Hillside Terrace, Winchester, had the best six bunches of decorative varieties in bunches not disbudded, among nine exhibitors. F. C. BIRCH, Esq., Clovelly, Christchurch Road, Winchester (gr. Mr. E. Long), was second with smaller bunches.

Exhibits of fruit were numerous. W. H. MYERS, Esq., won the 1st prize for two bunches of black Grapes, with long, tapering bunches of Mrs. Pince.

Lord SWAYTHLING, South Stoneham House, Southampton (gr. Mr. T. Hall), showed the best white Grapes, having Muscat of Alexandria, and he also won the 1st prizes offered for three varieties of dessert Apples, for culinary Apples, and for three varieties of Pears.

In the vegetable classes W. H. MYERS, Esq., won the two chief prizes offered by Messrs. Sutton & Sons and Messrs. Toogood's.

NON-COMPETITIVE EXHIBITS.—A gold medal was awarded to Messrs. S. BIDE & SONS, Alma Nursery, Farnham, for a display of floral designs, and a similar award was made to Messrs. HILLIER & SON, Winchester, for exhibits of Apples, shrubs and flowering plants.

CARDIFF AND COUNTY HORTICULTURAL.

NOVEMBER 17.—This society, having decided some time ago to justify its name and existence by doing something more than merely holding an annual flower show, has arranged to give a series of lectures on horticultural subjects in Cardiff during the present winter. The first of these lectures was given on the above date at the Y.M.C.A. Hall, when Mr. S. T. Wright gave a very interesting address on the Wisley Gardens. A large and appreciative audience was present, and was presided over by Mr. W. Treseder, the chairman of the Cardiff Horticultural Society. The lecture was illustrated by a fine set of lantern slides, which depicted the beauties of the wild and aquatic gardens. Mr. Wright incidentally referred during the course of his lecture to the great generosity of the late Sir Thomas Hanbury, whose love for gardening and appreciation of the work carried on by the R.H.S. resulted in his presenting Wisley Gardens to that Society when it was in great need of a suitable ground.

The lecturer pointed out the plants of greatest interest in each picture, and, while doing so, imparted much useful information regarding their treatment and culture. Some of the most noteworthy pictures were those of *Wistaria multi-juga*, *Cerasus sinensis* var. *pendula* (*Prunus* *Chamaecerasus* var. *pendula*), stated to be about 40 feet high; *Alnus glutinosa* var. *imperialis*, which was described as being one of the best and fastest-growing trees suitable for water-side planting; also masses of *Iris Kämpferi* and *Water Lilies*. The lecturer ascribed the success achieved in the culture of *Water Lilies* at Wisley to the fact that, once they have become established, the water is lowered in the ponds every year or two, and about two-thirds of the crowns removed, thus giving plenty of room for the remaining ones to develop.

YORK CHRYSANTHEMUM.

NOVEMBER 17, 18, 19.—The 30th autumn show was held in the exhibition building on these dates. In some respects the exhibition was superior to those of recent years, and especially was this noticed in the classes for cut blooms. Groups showed a decided falling off in point of merit, probably owing to the prizes being reduced. At these autumn shows the public, as well as exhibitors, are yearning yearly for greater variety—a difficult matter to obtain!

PLANTS.—There was only one entry in a class for a group of Chrysanthemums arranged for effect. The exhibitor was Mr. J. W. HIELD, Acomb, York, an amateur grower, but who is nevertheless a proficient cultivator. His group contained dwarf plants, each carrying good blooms.

Pillar groups, 17 feet high, of decorative Chrysanthemums, interspersed with foliage plants, made a pleasing feature arranged down the sides of the large hall. Mr. G. COTTAM, Alma Gardens, Cottingham, Hull, easily won the 1st prize with well-grown plants of a bright character, effectively arranged; 2nd, Mr. J. KEY, Clifton Nursery, York.

For a pillar group of miscellaneous plants, the base, 6 feet high, to be furnished with Chrysanthemums and the remainder to be decorated with other plants, five growers competed. Mr. F. H. WARD, Seacroft Nursery, York, was placed 1st with a bright display of small-flowered varieties arranged tastefully with well-grown foliage plants; 2nd, Mr. COTTAM.

CUT BLOOMS.—The leading class was for 36 Japanese blooms in not fewer than 24 varieties. Nine groups were staged. A. JAMES, Esq., Cotton House, Rugby (gr. Mr. A. Chandler), showed a trifle the best, and was awarded the 1st prize. He staged heavy, somewhat irregular blossoms, the best being Lady Talbot, F. S. Vallis, Splendour, Mrs. A. T. Miller, J. Lock, O. H. Bromhead, J. H. Silsbury, Mme. P. Radaelli, Edith Jameson, and Reginald Vallis; 2nd, Lord HOWARD DE WALDEN, Audley End, Saffron Walden (gr. Mr. J. Vert). This exhibitor showed a remarkable bloom of Miss Hilda Rowley; Mrs. W. Knox, J. H. Doyle, and Mme. P. Radaelli were also noteworthy; 3rd, the Marquis of NORTHAMPTON, Castle Ashby (gr. Mr. A. R. Searle).

In the class for three blooms, each of four varieties, five competed. The best dozen, a very fine lot, was contributed from the gardens of Lord FEVERSHAM, Duncombe Park, Helmsley (gr. Mr. D. Williams). Mrs. A. T. Miller, Reginald Vallis, J. H. Silsbury, and F. S. Vallis were the varieties staged. Mr. W. IGGULDEN, Lock's Hill Nurseries, Frome, was placed 2nd. Mr. IGGULDEN was successful in securing the 1st prize offered for three blooms each, of a white and a yellow variety.

Incurred varieties were well shown. For 12 blooms in not fewer than six varieties six exhibits were staged, the Marquis of NORTHAMPTON gaining the premier award with medium-sized well-finished examples of popular varieties. Baron DE FOREST, Londesborough Park, Market Weighton (gr. Mr. J. McPherson), was second with smaller specimens.

The Marquis of NORTHAMPTON also won six blooms of *Incurred*, with neat examples.

Single-flowered varieties in vases each containing three sprays of six varieties were shown by seven entrants. Mrs. GUTCH, Holgate Lodge, York (gr. Mr. E. Everard), was 1st with such varieties as *Altrincham* (yellow), *Mis. E. Roberts*, and *Metta*. The Hon. H. W. FITZWILLIAM, Wiggintorpe, York (gr. Mr. A. Alderman), was 2nd with an almost equally good exhibit.

For 12 varieties of any decorative sorts, three sprays of each variety, there was a spirited competition. Mr. F. STYAN, Rawcliffe Lane, York, was 1st with good bunches of such varieties as *Bessie Chapman*, *Mary Richardson*, *La Triomphe*, *Soleil d'Octobre*, and *Source d'Or*. 2nd, the Hon. H. W. FITZWILLIAM.

Amateurs were few in number in both the plant and the cut bloom classes. Mr. HIELD secured the premier prizes in both sections.

Besides Chrysanthemums there were exhibits of floral designs, fruits, and vegetables.

A Gold Medal was awarded to Messrs. CLIBRAN & SONS, Altrincham, Cheshire, for a non-competitive exhibit of Chrysanthemums and collection of vegetables. A Silver-gilt Medal to Messrs. J. BACKHOUSE & SON, York, for exhibits of Apples, flowering plants, and floral decoration, and a First-class Certificate to Mr. H. WEEKS, Shrimpton Gardens, for Chrysanthemum Mrs. John Cumberland, Japanese *Incurred*, yellow bloom suffused with bronze.

MANCHESTER ROYAL BOTANICAL.

NOVEMBER 18, 19, 20.—This Society held a Chrysanthemum show in the Ball Room of the White City on these dates. The exhibition was a good one, the blooms being of excellent quality.

Chrysanthemums in pots, however, were hardly up to the average. JAMES BROWN, Esq. (gr. Mr. J. Smith), as usual took the place of honour in the class for nine plants in which Mme. Ferlat and *Souvenir de W. Clibran* were conspicuous. The other prize-winners in this class were J. ROYLE, Esq., Sale, and L. BRESLAUER, Esq. (gr. Mr. J. Siddall). Mr. BROWN also excelled in the class for six plants of Japanese Chrysanthemums, Messrs. J. ROYLE and G. WILD following, and Mr. BROWN was also 1st for six *Pompons*, A. R. KELLY, Esq. (gr. Mr. H. Brocklehurst), being 2nd. Mr. BROWN was the only exhibitor in the class for a group of miscellaneous plants: he showed *Phoenix Palms* splendidly.

CUT BLOOMS.—For 24 Incurved, and 24 Japanese blooms Sir W. H. TATE, Bart. (gr. Mr. G. Haigh), won the 1st prize, having many noteworthy blooms, the chief varieties being (Japanese) F. S. Vallis, Mrs. A. T. Miller, Mary Inglis, Leigh Park Wonder, Mme. P. Radaelli, Hon. Mrs. E. Lopes, and Mrs. Barkley; (Incurved) Buttercup, Miss F. Ashworth, Pantia Ralli, Amber Gem, G. F. Evans, Clara Wells, Daisy Southam, and Romance. 2nd, PANTIA RALLI, Esq., Epsom (gr. Mr. G. Hunt).

For 36 miscellaneous blooms of Chrysanthemums Mr. G. HAIGH again took the lead, his Anemone-flowered Descartes and reflexed Cullingfordii being very good. Lieut. Col. J. B. GASKELL, Woolton (gr. Mr. J. Stoney), followed.

The best exhibit of 36 Japanese blooms was shown by E. MOCATA, Esq., Addlestone (gr. Mr. T. Stevenson), who showed blooms of splendid colour, the finest blooms being F. S. Vallis, Purity, Algernon Davis, Master James, and Lady Talbot. 2nd, Lady ASHERTON, Romsey (gr. Mr. G. Hall).

For 18 Japanese blooms the prize-winners were Messrs. T. STEVENSON, W. JGGULDEN, Frome, and G. HALL in the order of their names; whilst for 12 blooms the 1st and 2nd prizes went to Messrs. T. STEVENSON and G. HALL.

The winners in the class for 24 Incurved blooms were Messrs. G. W. DRAKE, G. HUNT, and Sir GILBERT GREENALL, Warrington (gr. Mr. C. Goves), who were placed 1st, 2nd and 3rd respectively. For 12 blooms Messrs. G. W. DRAKE, J. HUNT, and G. HAIGH were placed as named.

In the local class the chief prize-takers were Messrs. C. GOVES, G. HAIGH, and J. STONEY.

Primulas and Cyclamens were best shown by Mr. G. BRAMWELL.

Messrs. TOOGOOD & SONS, Southampton, were awarded the Society's Gold Medal for a display of vegetables tastefully arranged. THE GOVERNMENT OF BRITISH COLUMBIA also received a Gold Medal for a collection of Apples.

SCOTTISH HORTICULTURAL.

NOVEMBER 18, 19, 20.—The annual Chrysanthemum show of this Society was held in the Waverley Market, Edinburgh, on these dates. The entries were more numerous than last year, but many intending exhibitors did not compete owing to the severe frost which prevailed, over 20° being registered in many parts of Scotland. There was the additional difficulty that the large building, constructed chiefly of iron, glass and cement, is unheated. The latter drawback was, however, to a certain extent overcome by the use of a large number of paraffin stoves, distributed in the building so as to raise the temperature in the vicinity of the more tender exhibits.

In the premier class for cut blooms of Japanese Chrysanthemums, in which the City of Edinburgh Queen Victoria Memorial is awarded, there were six entrants, and the 1st prize of £15, with the City of Edinburgh Cup, which is held for one year, but becomes the property of the winner after he has won it three times, fell for the first time to the Dowager Countess of SEAFIELD, Cullen House, Banffshire (gr. Mr. Alex. Morton), the aggregate number of points obtained being 139½ out of a possible 180. In this class 15 vases in 15 varieties are asked for, three blooms in a vase. The maximum points allowed for each variety is 12, and the highest pointed flowers in the lot were Mrs. A. T. MILLER (11), Mme. P. Radaelli and Edith Jameson (10½), Lady Talbot, Algernon DAVIS, and W. Beadle (10), Reginald Vallis, Miss Hickling, and J. H. SILSBURY (9½), Lady Conyers (9), Bessie Godfrey and Mme. G. RIVOL (8½), Victoria and Albert and Elsie FULTON (8), and Geo. MILEHAM (7). As was the case last year, Messrs. BELL, Rossie, Forgandenny (gr. Mr. D. Nicoll), took 2nd place, their aggregate being but two points lower than those obtained by Mr. Morton. The highest pointed blooms in the 2nd prize exhibit were: The Hon. Mrs. Lopes and Purity (10½), Mme. P. Radaelli and F. S. Vallis (10), and Mme. G. RIVOL and J. H. SILSBURY (9½). 3rd, the Hon. Mrs. ARMISTEAD, Castle Huntly, Longforgan (gr. Mr. J. Beisant), with an aggregate of 131 points, her highest pointed variety being Reginald Vallis with 10 points. 4th, Mr. W. JGGULDEN, Frome, Somerset, with an aggregate of 127½ points.

In the Scottish Challenge Cup class, confined to Scottish gardeners and amateurs, in which the

1st prize is £8, with the cup for one year, competition was much stronger. No fewer than 17 growers entered, though only 15 staged. In this class eight vases are required, in eight varieties, three blooms of each, and entrants in the foregoing class are debarred from competing in this. Mr. BROWN, Summerhill, Shandon (gr. Mr. Finnie), won the 1st prize and cup, with an aggregate of 75 points out of a possible 96. His varieties were Mrs. F. W. Vallis, Marquise V. Venosta, Bessie Godfrey, Reginald Vallis (9½ points each), F. S. Vallis, Lady Talbot, Mrs. A. T. Miller (9 each), and J. H. SILSBURY (8 points). Mr. L. McLEAN, Greenfield, Alloa, was placed 2nd with 71 points, and in his lot were Mrs. A. T. Miller (10), Mrs. E. Crossley (9½), Jumbo (9), Marquise V. Venosta (9), Lady Conyers (9), Bessie Godfrey (8½), A. Davis (8), J. H. SILSBURY (8). Lord NINIAN 'CRICHTON-STUART, Falkland Palace, Fife (gr. Mr. Wm. Young), was 3rd with 70½ points, his flower of Mrs. L. Thorn obtaining the highest number of points (10). 4th, Mr. BAILLIE, Dochfour, Inverness (gr. Mr. Roderick Mackenzie), whose aggregate was 69 points.

In the class for six vases of Japanese Chrysanthemums in six varieties, three blooms of each, confined to private gardeners and amateurs, the 1st prize was won by Mr. JAMIESON, St. Markock's, Dublin (gr. Mr. J. L. McKellar); the 2nd by Mr. DUNCAN MACRAE, Viewbank, Lasswade; the 3rd by Mr. L. McLEAN, Greenfield, Alloa; and the 4th by Mr. JAS. FRASER, Bonaly Tower, Colinton.

This year a new open class for 24 Chrysanthemum blooms in not fewer than 18 varieties on boards, was included in the prize list, and there were nine entrants. The 1st prize fell to Mr. J. L. McKellar, the 2nd to Mr. D. NICOLL, and the 3rd to Mr. A. MORTON.

The other prizes for cut blooms of Chrysanthemums included those following:—Confined to growers within the municipal boundaries of Edinburgh and Leith.—Two vases Japanese Chrysanthemums, in two varieties, three blooms in each vase—1st, Mr. ADAM STENHOUSE, Morningside Asylum; 2nd Mr. JOHN MACDONALD, Stratham House, Morningside; 3rd, Mr. RICHARD GRIFFIN, Bringlee.

Four vases Japanese Chrysanthemums, 12 distinct varieties, three blooms in each vase—1st, Mr. A. MORTON; 2nd, Mr. DAVID NICOLL; 3rd, Mr. ALEXANDER MCKELLAR.

Four vases Japanese Chrysanthemums, in four varieties, three blooms in each vase—1st, Mr. HUGH MACKSKIMMING, Auchinault; 2nd, Mr. ANDREW BRUCE, Gala House, Galashiels; 3rd, Mr. PETER McLAUCHLAN, Gracemont, Liberton.

The Silver Medal offered for the best bloom in the show was won by Mr. D. NICOLL with a bloom of Mrs. A. T. Miller.

The association's Silver Medal for a new Chrysanthemum not in commerce fell to Messrs. W. WELLS & Co. for a light terra-cotta flower named Jessie G. Payne; the Bronze Medal was awarded to Mr. L. McLEAN, Alloa, for Mrs. W. Hookey, a deep crimson flower with bronze reverse.

In the class for three vases of Chrysanthemums, in three varieties, not more than 12 sprays in each vase, the 1st prize was won by Mr. A. E. TODD, Stonybank, Musselburgh; 2nd, Mr. WILLIAM GALLOWAY, Gosford; 3rd, Mr. ADAM BRYDON, Tweedbank, Innerleithen.

For six vases of single Chrysanthemums, in six varieties, Mr. WILLIAM G. PIRIE, Dalhousie Castle, was placed 1st, and Mr. WILLIAM P. BELL, Bothwell Castle Gardens, 2nd.

PLANT CLASSES.

In the class for six plants of Chrysanthemums, in as many varieties, but excluding single and pompon kinds, the 1st prize was won by Mr. W. PULMAN, Colinton Road, Edinburg; 2nd, Mr. JAS. FRASER, Bonaly Tower, Colinton. The best four plants of Japanese Chrysanthemums were shown by Mr. WM. MICHE; 2nd, Mr. JAS. FRASER. These exhibitors were also again 1st and 2nd respectively in the class for two plants of Chrysanthemums. Mr. PULMAN won the medal for the best plant in the show, and he also showed the best six Chrysanthemums in 7-inch pots, but he was placed 2nd to Mr. MICHE in the class for six Pompon Chrysanthemums in pots of this size.

In the classes for plants other than Chrysanthemums, the following were the more important:—Six Palms, in not fewer than three kinds—1st, Mr. ALEXANDER McMILLAN, Douglas Castle; 2nd, Mr. B. W. ANDIE,

Inveresk. Three specimen Palms—1st, Mr. ALEXANDER McMILLAN, Six Dracenas, distinct—1st, Mr. W. P. BELL; 2nd, Mr. ADAM KNIGHT. Six plants of Primula sinensis, pots not to exceed 6 inches—1st, Mr. ROBERT D. KERR, Langton Duns; 2nd, Mr. WILLIAM PYPER, Liberton. Six Primula obconica—1st, Mr. G. D. KERR. Six table plants (Ferns excluded)—1st, Mr. ALEXANDER McMILLAN, Hardy Ferns—1st, Mr. JAMES TURNBULL, Penicuik. Six Ferns for table—1st, Mr. ALEXANDER JOHNSTON, Trinity. Six Salvia splendens—1st, Mr. ROBERT WHANNEL, Gilmerton. Six pots of Roman Hyacinths—1st, Mr. JAMES McNEIL, Craigerne, Peebles. Three pans of Lily of the Valley—1st, Mr. ADAM KNIGHT. Six Cyclamens—1st, Mr. JAMES BEISANT. Eight decorative stove or greenhouse foliage plants—1st, Mr. A. KNIGHT; 2nd, Mr. A. McMILLAN. Four decorative stove or greenhouse foliage plants—1st, Mr. JAMES McNEIL, Begonia Gloire de Lorraine, or its varieties—1st, Mr. A. WILLIAMS, with specimens of B. Gloire de Lorraine 5 feet high and 3 feet broad. Three winter-flowering Begonias, other than "Gloire de Lorraine" and its varieties—1st, Mr. D. McLEAN.

AMATEUR CLASSES.

CUT BLOOMS.—Four vases Japanese Chrysanthemums, not fewer than four varieties, three blooms in each vase—1st, Mr. JAMES STEWART, Whins, Alloa; 2nd, Mr. D. MILLER PRYDE, Buckhaven.

A Bronze Medal, offered for the best plant, was won by Mr. THOS. BELL.

There were many classes devoted to floral designs, and although the exhibits were not so numerous as last year, they represented fine examples of the florist's art.

FRUIT CLASSES.

There were only two entries in the class for a collection of 18 dishes of fruit (excluding Pineapples), in not fewer than nine distinct kinds, on a space 10 feet by 5 feet. The use of plants, cut flowers, or foliage, or any combination of these, was permitted. Effective arrangement, quality, and suitability of the kinds to their various uses, were considered by the judges in preference to mere size of fruit or number of kinds. The highest points (nine) were offered to Grapes, and then followed Peaches, Nectarines, dessert Pears, and Melons with eight, and so on. The 1st prize of 10 guineas was presented by the Right Hon. the Lord Elphinstone, honorary president of the association, and was won by his gardener, Mr. D. KIDD; 2nd, the AMERICAN AMBASSADOR, Wrest Park, Bedfordshire (gr. Mr. Geo. McKinley). Mr. KIDD also excelled in the class for four bunches of Grapes, distinct varieties; 2nd, Mr. JAMES BEISANT, Castle Huntly. For four bunches of Grapes, two of Appley Towers and two of Lady Hunt, Mr. JAS. BEISANT was awarded the 1st prize; 2nd, Mr. JAS. McNEIL; Craigerne, Peebles. Two bunches of Grapes (one black and one white)—1st, Mr. THOS. MACPHAIL, Archerfield, Dirliton; 2nd, Mr. JAS. LAW, Inveroil, Dirliton. Two bunches of Muscat of Alexandria Grapes—1st, Mr. THOS. MACPHAIL, Black Alicante Grapes were best shown by Mr. JOHN HIGGATE, Yester; Gros Colman by Mr. JOHN SHELLES, and Lady Downes by Mr. D. KIDD. Two bunches of Grapes (any variety other than those specified above)—1st, Mr. WM. G. PIRIE, Dalhousie Castle, Bonnyrigg. In the class for 18 varieties of Apples (grown in Scotland), six of each variety, ripe or unripe, Mr. ROBERT G. SINCLAIR, Congalton Gardens, Drem, won the 1st prize, whilst for 18 varieties of Apples, four of each, ripe or unripe, the 1st prize was won by Mr. MCKELLAR, Portmahonck, Ireland; 2nd, Mr. ROBERT G. SINCLAIR. Eight dishes of Apples and four dishes of Pears (grown in an orchard house), not more than two dishes of any one variety—1st, Mr. MCKELLAR; 2nd, Mr. GEO. MACKINLAY.

VEGETABLE CLASSES.

The most important class was for a collection of 12 kinds. The 1st prize was won by the Duke of PORTLAND, Welbeck Abbey (gr. Mr. James Gibson); 2nd, Mr. ROBERT STUART, Thirlestane Castle, Lanark. In the smaller class for six kinds, the 1st prize was taken by Mr. JOHN GRAY, Middlewood, Uddingstone.

The following awards were made to non-competitive exhibitors: A Gold Medal to Messrs. J. & A. Glass, Edinburgh. Silver-gilt Medals to Messrs. Wells & Co., Merstham; Messrs. William

Thomson & Sons, Clovenfords; Professional and Civil Service Supply Association, Edinburgh; the British Columbian Government; Messrs. Sutton & Sons, Reading; Messrs. Storrie & Storrie, Glencarse. Silver Medals to Messrs. John Forbes, Ltd., Hawick; Messrs. George Williams & Sons, Cardiff; Mr. H. N. Ellison, West Bromwich; the Canadian Government; Messrs. Tillie, White & Co., Edinburgh; Messrs. William Brown & Co., Edinburgh, and Messrs. Young & Co., Cheltenham. Bronze Medals to Messrs. Wilson & Co., Prestonfield; Mr. Redbourne, Edinburgh; Messrs. Richard Sankey & Sons, Nottingham; the Patent Safety Ladder Company, Peterborough, and Messrs. H. Pattison & Co., Streatham, London.

NORWICH CHRYSANTHEMUM.

NOVEMBER 18, 19, 20.—This annual exhibition was held in St. Andrew's Hall, being again a success. The entries, 606, were more numerous than last year, but fewer than in previous years, and 52 below the average of the past five years.

There were three exhibitors in the class for 48 cut blooms of Japanese varieties, Mr. T. A. RISING showing best, his exhibit being awarded the 1st prize for the silver medal offered for the best exhibit in the exhibition; Miss LANGWORTHY followed.

The 1st prize in the class for 36 blooms was won by Mr. F. J. O. MONTAGU, Lynford, but Mr. EDMUND REEVE, Catton Grange, was only beaten by very few points, so good were the blooms in both stands. The class for 24 blooms brought only two competitors, Mr. G. J. HACKER, Ormesby, showing much the better specimens. For six white blooms of a Japanese variety, Mr. MONTAGU took 1st place with the popular variety "Mrs. A. T. Miller." Each of the seven exhibitors in this class staged this variety. For six blooms of a variety other than white, Mr. I. B. COAKS, Thorpe, showed Reginald Vallis, with which he won 1st prize.

There were three groups. Mr. I. B. COAKS for the second time took the 1st prize in the competition for the cup, which was presented by Mrs. E. Reeve, Catton Grange.

In the class for miscellaneous cut flowers the premier award was won by Mr. ROBERT FELLOWS, Shotesham Park. The class for six bunches of exotic flowers brought out a spirited competition. The winner of the 1st prize was Sir F. ADAIR, while the 2nd prize was secured by Mr. G. E. WHITE.

The following awards were made to non-competitive exhibitors:—Mr. R. C. Nottent, Bronze Medal; Hobbies, Ltd., Silver Medal; Messrs. Seabrook & Sons, Silver Medal; Messrs. Holmes & Co., Bronze Medal; Messrs. F. Smith & Co., Certificate of Merit; Messrs. Daniels Bros., Silver Medal; Messrs. Sutton & Sons, Silver Medal.

BOLTON CHRYSANTHEMUM.

NOVEMBER 19, 20.—This exhibition was held in the Albert Hall, and fully sustained its high reputation.

For a miscellaneous group, arranged in a circular manner, JOHN HARWOOD, Esq. (gr. Mr. W. Burgess), secured the leading award. J. W. MAKANT, Esq. (gr. Mr. H. Shone), was 2nd, with a good display.

Mr. W. BURGESS was again to the fore for a group of naturally-grown Chrysanthemums, having brightly-flowered plants in good variety; 2nd, CHARLES TAYLOR, Esq. (gr. Mr. H. Wainwright).

J. MCCARTNEY, Esq. (gr. Mr. W. Holmes), had the best table of Orchids, with a collection comprising Cattleyas, Oncidiums, Odontoglossums, and a good plant of Lycaste Skinneri alba; 2nd, Mr. H. ARTHUR. Mr. MCCARTNEY also exhibited the best table of Cyripediums.

Four classes were devoted to Roman Hyacinths, the 1st prize-takers being Messrs. W. HOLMES, C. WEAVER, D. WILSON, and JOS. TREVINA.

Mr. J. LLOYD had the best Primulas; Mr. W. BURGESS the best Cyclamen; Mr. D. MCKELVIE the best Begonias; and Mr. J. LLOYD the best table plants.

In the classes for cut blooms, the 1st prize exhibit of 12 Japanese and 12 Incurved blooms was shown by Mr. G. W. DRAKE, Cardiff, who showed, amongst others, F. S. Vallis, Lady Talbot, W. Greenham, C. W. Mathews, and F. Ham-

mond; 2nd, A. JAMES, Esq., Rugby (gr. Mr. A. Chandler).

For 36 Japanese blooms, Mr. A. CHANDLER led with a collection of average flowers, President Viger and Purity being the best examples. Sir E. EVANS, Bromborough (gr. M. C. Jones), and Mr. G. W. DRAKE won the 2nd and 3rd prizes respectively.

Mr. H. SHONE had the best six vases of Singles, and also the best six vases of decorative varieties.

In the fruit section, the best two bunches of Black Alicante Grapes were shown by Mr. H. SHONE. Mrs. S. COOK, St. Helens (gr. Mr. T. Barclay), excelled for two bunches of white Grapes.

Lady HINDLE (gr. Mr. L. Bayley) showed the best Apples and Pears, and Mr. E. MITCHELL was awarded the 1st prize for a collection of vegetables.

varieties. Meanwhile, the frame lights should be withdrawn, as Daffodils in full root-growth require ample supplies of moisture.

DATURA (BRUGMANSIA) KNIGHTII, &c.: *Ama-tour, Kensington.* The protracted dull weather and occasional fogs will account for your plants dropping their leaves. You will do well to continue to keep the plants tolerably dry until the turn of the year, when they may be more freely watered, and given some weak liquid manure occasionally. It does not matter where you get the Roses from so long as you are satisfied with their condition and that they are true to variety. The Hippeastrums you name can be purchased from most of the nurserymen and seedsmen.

GERANIUM SEED: *W. L. & Co.* You do not state what species of Geranium you refer to. Perhaps you mean Pelargonium!

GLADIOLUS CORM: *K. F. R.* The corm is not diseased; the outgrowths are small corms. Their presence in such numbers is unusual, and it may be that they have been formed as the result of mechanical irritation. Bulbs and corms are frequently reproduced for commercial purposes in this manner. In the issue for May 1, 1909, p. 283, you will find an account of Hyacinths propagated in the Dutch bulb farms by means of bulbils which have been induced to form by merely scoring or notching the base of the bulbs. This method of propagation is well shown in the Supplementary Illustration in the same issue.

MUSCAT OF ALEXANDRIA GRAPE: *O. H.* The variety appears to be Muscat of Alexandria, but the flavour is very deficient. Perhaps your vine is budded orrafted on an unsuitable stock? If you cannot improve the flavour, throw out the vine and plant a fresh one.

NAMES OF FRUITS: *H. Nichol.* 1, Catillac; 2, Hvysh's Prince Consort; 3, Hacon's Incomparable; 4, Berré Hardy; 5, Lane's Prince Albert (a very fine fruit); 6, Hornead Pearmain; 7, Brabant Bellefleur; 8, Ribston Pippin.—*R. P. I.* Baxter's Pearmain; 2, Annie Elizabeth.—*E. O. S. I.* Forge; 2 and 3, Dumelow's Seedling; 4, Norfolk Stone Pippin; 5, Braddick's Nonpareil; 6, Chantamel.—*W. C.* Pear Fondante du Pansiel, Apple Summer Strawberry.—*W. H. D.* Stirling Castle.—*L. D. I.* Bedfordshire Fountling; 2, Flanders Pippin; 3, Hollandbury; 4, Blenheim Pippin; 5, Jolly Beggar; 6, Beauty of Kent.—*J. L.* The two Nuts are those of the Black Walnut (*Juglans nigra*). The other fruit is the Japanese Quince (*Cydonia japonica*).

NAMES OF PLANTS: *O. R.* 1, *Pteris longifolia*; 2, *P. tremula*; 3, *Davallia bullata*; 4, *Selaginella Kraussiana*; 5, *Adiantum tenerum*; 6, *Blechnum occidentale*.—*W. O.* *Cymbidium Mastersii* (*Cyperorchis*). *R. O. H. I.* *Oncidium flexuosum*; 2, *Calanthe Veitchii*; 3, *Oncidium pubes*; 4, *Masdevallia simula*.

RECORD CROP OF ONIONS: *E. A.* Our *Record Book* contains no entry on this subject.

ROSE SPORT: *W. S.* The flower is too small to judge of its qualities as a garden variety; the colour is pleasing and the shape is desirable. Submit specimens next season to the National Rose Society.

SCALE ON VINES: *Bath Boy.* First remove all the loose bark from the rods, then thoroughly scrub them with a solution of soft soap, sulphur and slaked lime, putting about 4 ounces of each substance in a gallon of water. Repeat this operation in the spring just before the buds break into growth, but on this second occasion more care will be necessary to prevent the buds from getting damaged. Keep a sharp look-out during the early stages of growth, and, should any scale insects appear on the young shoots, sponge the affected parts with the same mixture at about half the strength recommended above.

VINE LEAVES: *A. R.* We failed to find any insects on the leaves received for examination.

Obituary.

MRS. WILLIAM TRESSEDER.—The death of Mrs. William Treseder occurred at the Cowbridge Road Nurseries, Cardiff, on the 19th inst. Her husband—brother of Mr. Stephen Treseder, whose death was recorded in these columns a few weeks ago—predeceased her some 15 or 16 years ago. He was a highly-respected nurseryman and florist in the town, and was at one time a member of the Cardiff Corporation. Mrs. Treseder leaves a grown-up family, of whom two sons have been in the business for a number of years past.

JAMES M. LONSDALE.—The death of this florist is recorded in the American papers. He was born in Shenstone, Staffordshire, England. Before proceeding to America, Mr. Lonsdale held garden appointments at Derby and other places. A trip to Salt Lake City, U.S., led to his permanent settlement in that town, where he became a prominent retail florist.

TRADE NOTE.

MR. GEORGE NOTTAGE, for 13 years gardener at Mill House, Bourne End, has commenced business in partnership with Mr. Geo. Brown. They have taken over Mr. W. Broughton's old-established nursery and florist's business in the Norfolk Road and High Street, Maidenhead, and will continue to trade under the name of W. Broughton. Mr. Brown was formerly manager for Mr. Broughton.

Editors and Publisher.—Our Correspondents would obtain delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the *Publisher*; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the *Editors*. The two departments, Publishing and Editorial, are distinct, and such unnecessary delay and confusion arise when letters are misdirected.

ABIES AFFECTED WITH MITE: *A. G. S.* Please send samples of attacked shoots for inspection.

ASPLENIUM: *G. H.* No disease is present. The injury is due to some check to growth, probably caused by cold.

BEGONIA LEAVES ROTTING: *H. B.* There is no disease present; the trouble is due to excess of atmospheric moisture.

COMMISSION: *W. M. H.* We do not know the exact rates, but they would probably vary with individual firms.

DAFFODILS FOR MARCH: *Narciss.* You have omitted to mention the name of the variety to which your letter refers. Should it prove to be Golden Spur or the Double Daffodil (*Narcissus Pseudo-Narcissus* fl. pl.), the first week of the New Year will be early enough to introduce it to the greenhouse, but if it is Emperor, Empress, or a similar variety, the bulbs should be placed in heat some 10 days earlier. If this reply does not meet your case, please repeat the question, giving the name of the variety or

A BOTANICAL JOURNEY IN SOUTH-WEST AFRICA.

I.—BUSHMANLAND.

AMONG the objects of the Percy Sladen memorial expedition in South-West Africa was the study of the vegetation of the dry regions of Namaqualand, Little Bushmanland, Damaryaland, and South Angola. Although these regions have been to some extent botanically explored by Welwitsch, Baum, Schinz, Dinter, Schlechter, Bolus, Marloth, and other naturalists, their investigation is yet far from complete, and what little is certainly known about them is by no means common property. They present many features which must be of interest to all lovers of plants.

Little Bushmanland is an extensive region with somewhat ill-defined boundaries situated on the southern side of the lower course of the Orange River. To the west it reaches the mountainous belt of Little Namaqualand and to the east, beyond Pella, merges into Great Bushmanland. To the south it comes into contact with the high plateau region, whose vegetation is distinguished by a preponderance of Composites and which Dr. Bolus has named the "Composite" or "Upper" Region. Its rainfall is small

and remarkably fitful; but in many places a fairly abundant supply of subterranean water is reached by borings at no very great depth.

Broadly speaking, Little Bushmanland is a vast plain of reddish sand, in the south some 3,000 feet above sea level, falling gradually towards the Orange River, whose bed has here an elevation of about 1,000 feet. The intense monotony of these plains is, to some extent, relieved by abrupt hills of granite, gneiss and other ancient rocks, rising 500 feet to 1,500 feet above the general level. Their slopes are frequently of smooth, sand-polished rock and support no vegetation whatever; where, however, they are broken up, various

Bushmanland is to-day almost without permanent inhabitants, except in the vicinity of the Orange River. The bushmen, from whom it receives its name, have long ago retreated northwards, and maintain a losing strife for existence in the recesses of the Great Kalahari and Ngamiland. The limited and isolated areas which, in any season, enjoy a rainfall sufficient to revive the dormant vegetation are visited by trek-Boers with their flocks and herds from the less favoured districts of Namaqualand, who depart as soon as the new growth is exhausted. Little enterprise has yet been expended upon boring operations, and the water holes are separated by long tracts of arid sand. Where surface water is available it is usually incared for, and its conservation, and, still more, its utilisation for purposes of irrigation are neglected. Consequently, large quantities are wasted, and that which remains is commonly polluted. A very striking exception to this prevailing lack of energy and foresight is seen in the Catholic mission station at Pella. Here a copious supply of good water is pumped up from a well, 20 feet below the surface, and, by the skill of Bishop Simon and his associates, is most effectively applied to various useful purposes. A large swimming bath, probably the only institution of its kind in S.W. Africa north of Cape Town, is maintained. An extensive garden is supplied by water furrows, and contains many fruit trees—Oranges, Pears, Grapes, Dates, Plums, Figs, Pomegranates, and Loquats (Eriobotrya japonica)—and a large supply of vegetables. Owing to the nature of the underlying rock, the useful life of most fruit trees is here of short duration. A new garden has therefore been started, six miles to the north, on the banks of the Orange River. Here an area measuring 100 by 500 yards is irrigated from the river by steam pumps, using as fuel the wood of Salix capensis and other constituents of the riverside bush. Cereals, fruit trees and vegetables are grown with great success. There is at present no access to a market, and the produce is mainly used by the mission and by travellers who visit the station. At Rietfontein, about 30 miles south of O'okiep, bore-holes in the dry, sandy river bed support an extensive cultivation, while at Henkriesfontein, a few miles from the river, south of Raman's Driif, what is perhaps the best water supply in Bushmanland is used only for drinking purposes by a few bastards and their cattle.

The most prominent grass on the plains is a shrubby species of Aristida (probably A. namaquensis); with it occur short-lived species of the same genus, as well as the curious spiny-leaved Ehrharta spinosa, and a few other grasses. Associated with these is frequently a leguminous shrub or small tree, Parkinsonia atriciana, giving a characteristic aspect to extensive areas. Numerous smaller species—Indigofera, Scrophularineae, Solanums, Tribulus spp., Acanthaceae, Mesembryanthema and other Ficoideae, Zygophylla, Sarcocaulon spp., and a few other succulents

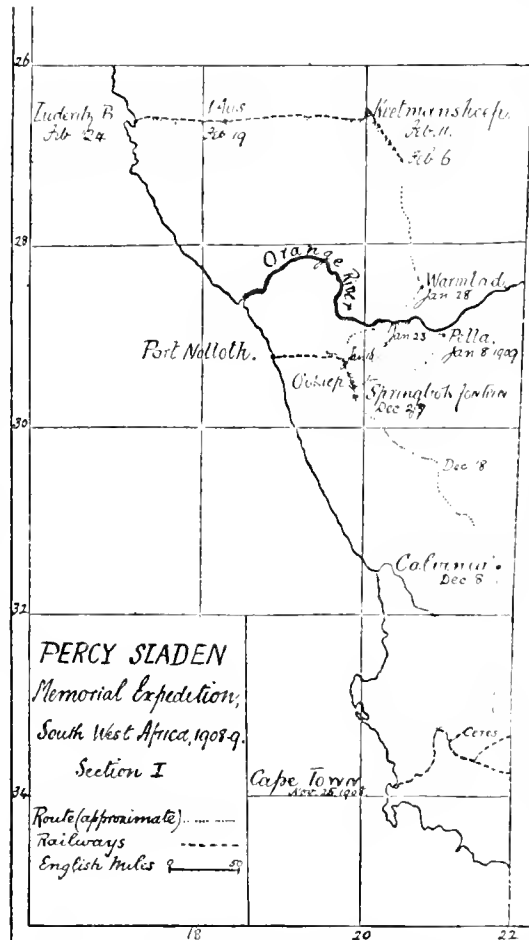

FIG. 160.—THE ROUTE OF PROF. PEARSON'S TRAVELS.

bushes (Acanthaceae, Asclepiadaceae, Compositae, &c.), succulents (Euphorbias, Asclepiads, Cotyledons, Mesembryanthema, &c.), grasses, and the well-known tree Aloe, A. dichotoma, maintain a foothold in the fissures. The plains are characterised by the presence of grasses which, if not abundant in species, yet constitute the predominant element in the vegetation. Powerful winds arise, frequently very suddenly, and sand storms are a common result; whirling columns of sand rising to great heights career aimlessly across the country and threaten the stability of tents, wagon covers and other movable objects which may lie in their path. In many places the sand accumulates in high dunes, among which travelling is extraordinarily heavy—even for Bushmanland, where it is never easy.

—are scattered about the sandy stretches which separate the clumps of grasses. Among the succulents, perhaps the most striking is the Asclepiad, *Hoodia*, *Gordonii*, whose leafless, columnar stems are frequently quite concealed by a wealth of large flesh-coloured, saucer-shaped flowers. This plant is of some economic importance on account of the large amount of water stored in its tissues. The natives eat it with avidity, and are able to subsist upon it when free water is unobtainable. Here and there the grasses and their associates are replaced by bushes of *Rhigozum trichotomum* and a species of *Hermannia*. The former, a member of the *Tecoma* family, is, in January, profusely bedecked with pink-white flowers. The *Hermannia* is a remarkably handsome bush, which would be well worth cultivating. Standing about 3 feet high, it bears hundreds of large pendent pink flowers, whose weak pedicels allow them to yield to the slightest breath of wind.

The hills of Bushmanland near the Orange River are remarkably barren, but the few species found upon them include some of quite exceptional interest. The most extraordinary of these is an Apocynaceous plant, ascribed to the genus *Pachypodium*—*P. namaquanum*, Welw. (*Adenium namaquanum*, Wyl.)—see fig. 162. It was first recorded by Lieut. Paterson, who met with it in October, 1779, and published a sketch of the top of the stem in his account of his journey*. A description and figures of flowers and leaves are given in Harvey's *Thesaurus Capensis*, from material supplied by Mr. H. Wyley. It is here stated that the plant was popularly known as "Elephant's Trunk." A Dutch transport rider recently called it a "Telegram"—presumably from the slight resemblance which it bears to a distant telegraph pole. It occurs on the very barren schistose ridges at Dabai-norup, a few miles south of the Orange River, where it is associated with *Aloë dichotoma*, a species of *Commiphora* and a few *Acanthaceae* bushes. The stout, fleshy stem emerges from rocks which daily become so heated in the sun that a thick-soled boot is quite inadequate as a protection, and the nails therein become so much enlarged that as soon as they cool down they fall out. The inner tissues store an enormous quantity of water, and the development of hard-walled cells is so slight that the whole mass can be cut through with the greatest ease by a pocket-knife. The large, yellow flowers occur in June among the lower of the leaves which crown the stem; in January the seeds are already scattered, and only vestiges of the dried-up corollas remain.

In the sandy valleys leading down to the Orange River one of the commonest plants is *Bauhinia garipensis*, a bush with scattered, mottled flowers and purple, sickle-shaped fruits. It extends far into the tropics and is quite frequently met with at the edge of the desert in South Angola. A fairly dense bush fringes the sandy banks of the Orange River. It is poor in species, the most conspicuous of which are *Salix capensis*, *Zizyphus mucronata*, *Tamarix articulata*, *Acacia horrida*, and a *Ficus*. In the summer the water level sometimes rises very suddenly, and the trunks of overhanging trees are torn away and carried down to the sea, where they are commonly found floating in the muddy water some miles from the coast. H. H. W. Pearson.

ORCHID NOTES AND GLEANINGS.

DENDROBIUM EPIDENDROPSIS.

AN inflorescence of this singular Philippine *Dendrobium* is sent by Mr. F. W. Moore, M.A., V.M.H., from the Royal Botanic Gardens, Glasnevin, Dublin. It is not a showy species, but it is specially interesting by reason of the singular Epidendrum-like appearance of the face of the flower, and especially the labellum, and the singularly large, inflated spur, about three-quarters of an inch in length, and which has the back compressed into a keel which is continued to the apex. In general appearance the short raceme of eight flowers resemble in some degree those of *D. sanguinolentum* and *D. nudum*, but they are of a pale olive-green colour slightly tinged with a bronzy hue on the outside, the labellum, recurved at the tip, being greenish-yellow and having a fleshy, bilobed crest.

AGANISIA LEPIDA.

This is a pretty species of tufted growth, and with grassy leaves about half an inch in width

which no other colour appears than the clear canary-yellow tint of the crest and the face of the column. The original *O. crispum virginale* received a First-class Certificate in 1882, and occasionally a similar variety has appeared in collection, a flower being now sent by Mr. H. Haddon, gardener to J. J. Neale, Esq., Lynwood, Penarth, who has just flowered a small plant of it out of some imported pieces recently acquired.

THE ALPINE GARDEN.

SAXIFRAGA MADIDA.

SAXIFRAGA MADIDA (see fig. 161) is a new addition to the small number of autumn-flowering *Saxifragas* received from Japan. These Japanese species, including *S. cortusæfolia* and *S. cuscuteformis*, both confined to Japan, with *S. Fortunei* and *S. sarmentosa*, which are found both in China and Japan, form a distinct section of the genus. In all four species the flowers are remarkable for possessing petals of unequal size, one or two exceeding the others by two or three times their

[Photograph by W. Irving.]

FIG. 161.—*SAXIFRAGA MADIDA* FLOWERING AT KEW.

and producing erect spikes about a foot in height and bearing on the upper part attractive, white flowers, bearing in a general way a resemblance to those of *Odontoglossum pulchellum majus*. It is a tropical American species, and has again been introduced by Mr. H. A. Tracy, of Twickenham, with whom it has recently bloomed. A good stock of it was imported by Messrs. Linden some years ago, and Messrs. Sander & Sons, of St. Albans, by crossing it with *Zygotepetalum maxillare Gantieri*, obtained the graceful bigeneric hybrid *Zygonisia Rolfeana*, which has pretty cream-white flowers blotched with violet colour, illustrated in the *Gardeners' Chronicle*, July 19, 1902, p. 30.

ODONTOGLOSSUM CRISPUM VIRGINALE.

THE blotched varieties of *Odontoglossum crispum* have had a phenomenal run of favour, and they are among the most prized in collections; but still more rare are the pure white forms on

length. Seeds of *S. madida* were received at Kew from Tokio Botanic Garden in the spring of 1907, and plants flowered in the autumn of 1908 in pots. Last spring they were planted out in a sheltered, low-lying portion of the rock-garden, where they flowered freely in October. Although considered a distinct species by Japanese botanists, *S. madida* is closely allied to *S. cortusæfolia*, of which several varieties are figured in Japanese works. It differs from the older species in having more deeply-lobed leaves, and in flowering nearly a fortnight earlier, but it has the same habit, and the flowers possess entire petals. During the past autumn *S. madida*, *S. Fortunei* and *S. cortusæfolia*, all flowered at Kew at about the same time, and were not cut down by frost until they had all produced seeds. All three species are found naturally in damp, semi-shady places, and such a position should be chosen for their planting. The plants should be covered with some light litter during the winter. W. I.

FIG. 162.—*ECHINOPIDIUM NAMAQUANUM*, WELW., GROWING IN SOUTH-WEST AFRICA.

From a photograph taken in January, 1909, at Dabamrup, in Little Bushmanland, six miles south of the Orange River. The stems are 9-15 inches in diameter, and about 5 feet in height.

NOTICES OF BOOKS.

* IN A YORKSHIRE GARDEN.

THE host of readers who have enjoyed Mr. Farrer's other gardening books will turn with feelings of expectation to his latest volume; nor will they be disappointed, for there is much in it of interest to those who garden with their heads and hearts, as well as their hands. Though there is, perhaps, nothing in the book so altogether delightful as the account in the author's first volume of the discovery of a mass of *Eritrichium nanum* in full bloom, we have something of the same kind in a minor key in the charming description of the finding of *Anemone nemorosa* in a Cornish wood, and of a "botanising" expedition in the Dolomites. These accounts of his travels add very much to the charm of Mr. Farrer's books, and there might well have been more of them in the present volume.

The author's methods and his views on gardening are such that he could hardly be expected to write sympathetically of what one generally sees in the so-called "great" gardens of this country, and he does not hesitate to express his feelings on the show places of Cornwall in the following words:—"What did I see in Cornwall? Well, I saw, as I said, the perils into which too soft circumstances and specialism can lead a gardener. But I also saw, as I have not yet said, many a spectacle of bewildering gorgeousness and splendour. Holy souls, too, did I find, holy and humble ones, that loved their flowers and tended them as friends, and caused them to rejoice. But (will my Cornish friends allow me to say it?) I saw no gardens. I saw a number of places, indeed, where a number of rare and exquisite plants were made to grow in luxury. I saw collections beyond price, and culture high beyond imagining. But of a garden I never saw a trace. Everything was aimless, formless, haphazard. Precious *Rhododendrons* dumped in a straight line through a wood, tree Ferns in a sort of square, paddock-like clearing. Bamboos in a jostle down a glade, with no attempt to show up their individual graces or masses; nowhere, in fact, the least or most elementary notion of design, neither for garden-proper nor for garden-wild."

When all is said and done, it is a question of one's point of view, and gardeners in Cornwall, who are able to grow *Camellia reticulata*, to say nothing of a host of other difficult things, so well as to draw from our author the ungrudging statement that he had never seen anything approaching it in beauty, may take in good part the criticisms of a fellow-gardener whose interests and sympathies are avowedly and obviously more with the minutiae of the Alps than with other things, and who has for his garden such a lovely natural setting as obtains at Ingleborough.

Probably the best of the many good things in the book is the account of the Ingleborough cliff garden, and here the author does no more than bare justice to a splendid idea thoroughly well carried out. The photographs, unfortunately, convey a totally inadequate idea of what, beside being in itself as exquisite a bit of scenery as is to be found in a lovely district, is possibly the only really natural piece of rock-gardening in the country, and which, under Mr. Farrer's fostering care, should, in a year or two's time, be a sight worth going a long way to see.

Mr. Farrer has come to the conclusion, as have other gardeners in different parts of the country during the past few years, that to grow the more difficult Alpine plants, a rock garden in the ordinary sense of the term, with all its artificiality and expense, is quite unnecessary. All one has to do is to choose a likely spot, and take out the ground to a depth of 3 feet; then put in drainage, and fill up with granite chippings, or what is known in the north as path granite, without

a scrap of earth in it, but with just sufficient peat dust mixed with the granite to colour it a light brown. In this mixture even *Gentiana Lawrencei* and *Eritrichium nanum* may be grown with success, provided—and this is the secret on which everything depends, and the importance of which Mr. Farrer does not seem altogether to realise—water under control can be conveyed naturally or artificially to the subsoil without necessarily wetting the surface. To make the arrangement quite perfect it is as well to arrange so that the surface may, when required, receive moisture in the form of a fine artificial rain, as is done, for example, by Professor Balfour, at Edinburgh.

In common with its predecessors, the book has, what to some will appear a defect and to others an added charm, namely, a copious discursiveness. It has, too, the waywardness and wilfulness which we have learned to associate with Mr. Farrer's manner, and the absence of which we should regret. For, and this is his supreme merit, his writing has character. Mr. Farrer not only loves plants and understands a great deal about them, but he is also an artist, with a rare gift of expression. The colours he uses may be crude, but the effects of his word-pictures are charming. By them he has permanently enriched the literature of gardening. J.

WILD FLOWERS.

THE study of wild flowers by young people, as opposed to the formation of collections of dried specimens of plants with their botanical names attached, is deserving of all encouragement, and any help in this direction is welcome. Mr. Furneaux's little book* is certainly calculated to promote a real interest in plant life, and we strongly recommend it for beginners, especially those who have not the advantage of competent teachers. It is one of a series, and is somewhat restricted in its scope; and, to prevent disappointment, it should be explained that plants peculiar to the seaside and aquatic plants are not dealt with in this volume, as they form the subjects of *Life in Ponds and Streams* and *The Sea Shore*, two other volumes of the series by the same author. Of course, this separation detracts from the general value of the work. As the author explains, the leading feature of the book is the arrangement of the plants and trees according to their seasons, habitats and habits. Much of the space has necessarily been allotted to descriptions of the plants: "but not a little has been devoted to an attempt to create an interest in some of those wonderful habits which lead us to look upon plants as living beings with attractions even more engrossing than their beautiful forms and colours."

The book may be termed complete, so far as it goes. A concise introduction on the external morphology and classification of flowering plants is followed by short chapters on the pollination and fertilisation of flowers and on climbing plants. With regard to the aerial roots or suckers of the Ivy, the author says: "If they come in contact with a bare rock, or with a surface from which no nutriment can be derived, they serve the one purpose of clinging only; but if they reach even a small amount of nutritive soil they produce absorbent fibres that are capable of extracting food." This was our opinion, based upon the vigour with which young shoots, well provided with roots, grow; but certain biologists of repute assert that they never contribute to the nourishment of the plant. "Early Spring" is the title of the next chapter, which is devoted to the description and illustration of the development of foliage and flowers from the dormant buds. The rest of the book consists of chapters or sections, illustrating the flora of waysides, meadows, cornfields, chalk downs, &c., at different seasons. The illustrations, both coloured and plain, are excellent, the only drawbacks being that their scale is not indi-

cated below the figures. The descriptions are remarkably good, without being too technical, and they are supplemented by numerous interesting facts in the life-history and properties peculiar to each subject. At the end is a short but sufficient glossarial index. W. B. H.

THE ROSARY.

CULTURAL HINTS FOR DECEMBER.

If tender varieties were not sufficiently protected during the recent severe frosts some of them will probably have suffered damage, for the frosts were unusually early and the growths were less well matured than is the case in most seasons. However, those cultivators who have not yet applied such protection should lose no time before getting it ready. The plants may be protected either by straw or by Fern, or in the case of dwarf plants, earthing them up with soil. Standards are sometimes covered with porous cloth, when frost is likely to be severe and prolonged.

During open weather continue to press forward the work of lifting and replanting, it being necessary to bring this operation to a conclusion as soon as possible. Trenched ground may be somewhat beaten down before the planting is finished, owing to the rains; therefore, it will be as well to apply a light dressing of wood-ashes, burnt earth, or ballast, and prick in this material with a fork. This is especially desirable in heavy soils, for it will render the surface more friable.

Dwarf Roses which have been budded should be planted sufficiently deep that the point where the bud is inserted is several inches below the surface. Care should be taken to remove all sucker growths that appear below the union. If sufficient Roses on their own roots are available and are of equal strength to budded specimens, then the troublesome question of sucker growth will not arise. At the same time the budded plant has this advantage, it will make growth in one season equal to that made in two seasons by a plant which is upon its own roots. In town and suburban gardens it may be preferable to defer planting after this date, until February or even March, when a better atmosphere may be expected than is usually present in towns during December or January.

Hardy climbing Roses may now have any weak and unripened shoots cut back severely, leaving the firm, matured growths their full length until February or March, unless these are too plentiful, when they may be thinned out. If packages of Roses are received from the nurserymen during severe weather, it is better not to unpack them, but place them in a cellar or other cool place until a thaw sets in. Then, if the wood is shrivelled, place the roots in a tub of water for several hours; afterwards lay the trees in a trench, well water them, and cover them with earth. In a few days the wood will be quite plump again.

Tea and other Roses in pots which were propagated last autumn and spring, and which have been kept in frames for supplying flowers for cutting, may now be brought into a cool house. If they have finished blooming they may be kept drier at the roots, which will cause the wood to mature. In February they should be shifted into larger pots, and be grown in gentle heat for giving a succession of blooms. The earliest forced Roses in pots which were started in November will now be making progress. They should have an atmospheric temperature of 50° to 55° by day, with a little top ventilation. Close the house early in the afternoon, and damp down the paths and stages at the same time. The plants may be syringed occasionally on bright mornings, provided the foliage will become perfectly dry again before evening. If insect pests appear fumigate the house with the NL-All vaporising compound.

* *In a Yorkshire Garden*, by Reginald Farrer. (London: Ed. Arnold.) Price 10s. 6d.

* *Field and Woodland Plants*, by W. S. Furneaux. (London: Longmans, Green & Co.) 1904. Price 6s. net.

The grafting of Roses under glass will now be taking place. The heat of the frame may be increased a few degrees, and by the end of December the earliest plants will have made growths an inch long and be ready for placing on the stages of the house. When these plants are removed from the frame others may be put in their places. The stock should be placed in a heated structure for a day or two before the bud is inserted.

Roses planted out under glass have made considerable progress. A gentle heat can now be given during favourable weather. Much moisture is likely to arise from soil in the beds, therefore one good syringing early in the day in bright weather will suffice. When there appears to be an excess of moisture present, the bottom ventilators as well as those at the top of the house should be opened a little. The atmospheric temperature should now be 55°.

THE JERUSALEM ARTICHOKE.

ABOUT 30 years ago the late Dr. Asa Gray, in a communication to the *American Agriculturist*,* gave his reasons for believing that the Jerusalem Artichoke of gardens had been developed from a species of *Helianthus* which grew wild in North America, then supposed to be *H. doronicoides*, but subsequently altered to *H. tuberosus*. The wild plant differed from the cultivated form only in the shape of its tubes, which were long and slender. He had cultivated this wild plant for about a dozen years, and some of its tubers were then "good Artichokes." He summed up the evidence as follows:—Jerusalem Artichokes went from Canada to Europe within a dozen years after the first settlement of Canada, viz., at Quebec; they reached England in 1617, and Italy early enough to have got their popular name there, *Girasole* being Italian for Sunflower. Sir Joseph Hooker published a figure of the wild form in the *Botanical Magazine*, t. 7547 (1897), where he states that *H. tuberosus* is indigenous in the lake region of Canada, as far west as the Saskatchewan, and from thence southward to Arkansas and the middle parts of Georgia. He adds that *H.*

tuberosus, appears to be nothing more than a form of this wild *H. tuberosus*. It is not *H. decapetalus* as known at Kew, and the only difference between it and the wild Artichoke is in the colour of the

FIG. 164.—WILD FORM OF *HELIANTHUS TUBEROSUS*, PARENT OF THE CULTIVATED ARTICHOKE: TUBERS YELLOWISH, WITH PURPLE EYES.

tubers, those of the latter being potato-yellow with a tinge of purple about the eyes, whilst the tubers of "*Helianti*" are wholly purple. Figures of both plants from examples grown at

latiflorus. This is all the more puzzling because in Gray's *Botany of the United States* there is no mention of tubers in the description of this species. There is, to my mind, strong evidence in favour of reducing all these tuber-bearing Sunflowers which have got about under such names as *macrophyllus*, *giganteus*, *decapetalus*, and *latiflorus* to the position of forms merely of *H. tuberosus*, the parent of the Jerusalem Artichoke. Dr. Asa Gray must have just missed seeing his way to this conclusion when he confused *H. doronicoides* with *H. tuberosus*.

Considering that the plant we know as the Jerusalem Artichoke was an article of food among the Indians in North America long before the arrival of Europeans, and would, therefore, be modified by cultivation and varying conditions as other plants were, the Potato for example, it is probable that all the Jerusalem Artichokes in Europe, India, &c., are descendants from the "two small roots obtained in 1617 by Mr. John Goodyer, of Maple Durham, which, being

FIG. 165.—*HELIANTHUS LATIFLORUS*: TUBERS PURPLE.

planted, enabled him before 1621 to stock Hampshire." It has varied under cultivation here, both in the shape and colour of the tubers. The purple tubers of "*Helianti*" suggest it rather than the yellow-tubered form as being the parent of the purple-tubered Jerusalem Artichoke. There appears to be an error in the *Botanical Magazine* figure of *H. tuberosus*; the tubers of that plant are never borne as they are there shown, but on the apex of long string-like roots as in the garden form. The only Sunflower grown at Kew with a root-stock like that represented in the *Botanical Magazine* figure is *H. strumosus*. The economic properties claimed for "*Helianti*" by Mr. R. de Noter are those of edible tubers, and stems and leaves good for fodder. Have the stems of the Jerusalem Artichoke ever been fed to cattle in this country? W. W.

FIG. 163.—THE CULTIVATED ARTICHOKE (*HELIANTHUS TUBEROSUS*).

giganteus, figured at t. 7555, is a near ally. My belief is that it is probably only a form of that species.

A third plant, recently brought into notice by Mr. R. de Noter, and figured and described in the *Revue Horticole*, 1907, p. 136, where it is called "*Helianti*" and is referred to *H. decapeta-*

Kew are here given, also a figure of the cultivated Jerusalem Artichoke. I have cooked and eaten tubers of all three, and could detect no difference in flavour; they were all equally good. This purple-tubered plant has been in cultivation at Kew for many years, not as a vegetable, but as a species among those grown in the botanical collection in the herbaceous garden. At Kew, however, it has always borne the name of *H.*

HARDY PLANT BORDER.

ORIENTAL POPPIES.

No perennial border plant needs less attention in culture, is more thoroughly hardy, or grows and flowers more freely than the Oriental Poppy. During May and June it provides a gorgeous display of colour in the border or shrubbery. It has been said that when the flowering season of these plants is past they leave great gaps in the borders for the remainder of the year. This can also be said of other subjects, such as Pæonies, but a thoughtful cultivator will make arrangements for the filling in of such gaps by the aid of Gladioli, Galtonias, Lobelias, Montbretias, Chrysanthemums, and annuals grown in pots for the purpose.

I have long been interested in Papaver orientale, and I grow more than 50 varieties. The culture of the plants is quite simple; the ground should be deeply trenched and mixed with manure. A stiff soil suits them best, and abundant space should be allowed for a free development of the foliage. Having thick, fleshy, deep roots, the Oriental Poppy can withstand drought remarkably well, while its weeping foliage does much to conserve moisture in the soil by shading the ground during hot weather.

October is the best month for planting, and it may be undertaken even earlier in the season if circumstances permit. Well-prepared plants in pots do well planted out in spring, but autumn planting gives the best results the following season. As a rule, the flower-stems are self-supporting, but they are best kept in place by looping up the shoots with a piece of string, for if allowed to fall about, the flower-stems grow crooked and are then much more difficult to arrange as cut blooms.

The propagation of the plant may be carried out in several ways. Pieces of the fleshy roots cut into lengths of 2 inches may be planted in rows in sandy soil in spring. But division of the roots with some of the crown attached is the quicker way when a limited number of plants are required, and if this is undertaken in July, after the flowering season is past, and the divided plants kept watered and shaded until new growth is assured, they will quickly become established, and give a crop of blossom the following season. The blooms of all Poppies should be cut when the calyx is unfolding, and not when the petals have expanded.

The blooms will last longer in a fresh condition if the cut ends of the stems be sealed by the aid of a lighted candle. When sending by post, the flowers should be packed in damp moss in a closely-fitting tin or wooden box.

The flowers possess a rather disagreeable odour, which is very pronounced in some types and varieties—notably in *P. bracteatum*, which is quite distinct from *P. orientale*, although it is stated in Nicholson's *Dictionary of Gardening* to be only a variety of *P. orientale*. I have several varieties of the bracteatum type that are totally distinct in habit of growth, stoutness of stem, shape of petal, and each with a different centre. Each bloom is subtended by a stout bract immediately under the base of the petals. Although there are many gorgeous varieties belonging to this section, I prefer the Oriental type as being less rigid in appearance and in having the disagreeable perfume less pronounced.

The following varieties embrace a choice collection, beginning with the Oriental type dating from 1714. This old variety is the earliest to flower; the petals are deep scarlet, with a deep purple blotch at the base. The variety Bobs is especially free in flowering; the blooms are developed on stiff stems, thus making them useful for cutting. In colour it is a soft, satiny rose. Lady Roseoe has blooms of a medium size. They are freely produced and have rounded petals; the colour is salmon rose. Queen Alexandra, clear rose, of good shape; Meduse, rich satiny-pink flowers, borne on stiff, erect stems of medium

growth. Mrs. Marsh is the only variety I am acquainted with that is of two colours: the petals are of a rich orange-scarlet, with dull yellow stripes. Silver Queen grows but 2 feet high; in colour it is silvery-white, slightly tinted with blush and without the dark blotch on each petal which almost all varieties possess. Hesperia has petals flushed with maroon. Psyche is a delicate rose-blush, shading to white. Tom Tit is a small-flowered variety, but most useful for furnishing cut flowers as it blossoms abundantly. The colour is deep orange-red, with a very dark blotch on each petal. The deeply-cut leaves are very pronounced. Fringed Beauty produces its rich crimson, deeply-cut flowers very early in the season. Mahony is the darkest of the varieties, being almost maroon. Rembrandt has extra large petals, which are coloured intensely red. The plant is of compact growth, and bears erect, stiff stems. Mrs. Perry, crimson with gold shading, but paler on the edge; Prince of Orange, pale orange-red; Semi-duplex, which grows less than a foot high, and has two rows of bright, salmon-red petals, bears its flowers on extra stout stems; and Goliath, with intensely red petals deeply blotched and with purple anthers, are other desirable kinds.

The following varieties belong to the bracteatum section: Duke of Teck, height 4 feet 6 inches, the flowers being dark red and with orange shading; Monarch, light orange-red, with stems of erect growth; Menelik, satiny-rose, with a dark blotch on each of the five petals; and Mogul, with six short, rounded, deep red petals. *E. Molyneux*.

FOREIGN CORRESPONDENCE.

NOTES FROM LA MORTOLA.

SCHOTIA BRACHYPETALA.

WE have several plants of this beautiful and rare shrub in the garden, one of which recently flowered. The flowers, which are of a deep crimson tint, appear along an old branch in the lower part of the shrub, several being clustered together on the top of the branchlets. Their chief characteristics are the five very tiny petals, which are only $\frac{1}{4}$ inch long and filiform, and thus are easily overlooked.

The shapes of the flowers, and also of the leaves, are somewhat different from those figured in Harvey's *Thesaurus capensis*, plate 32. The four calyx lobes are patent, almost at right angles. The stamens are nearly three times as long as the calyx lobes. The leaflets of our plants are never as entire and flat as in the plate, but more or less undulated along the margins and crenate, and also more obtuse; they are coriaceous, bright and of a shining green. They vary in size and shape, the largest leaflets being 4 inches long. According to Harvey, *Thes. cap.*, p. 21, the plant grows in Natal "in sheltered valleys, where the soil is dry and rocky, 3,000 feet." It is said to flower there in September. Our plant is growing in conditions which approach as near as possible those of its native land, in a sheltered valley, and on dry soil. Harvey calls it a very ornamental shrub, which is certainly true, but I think the plant, to be at its best, ought to be grown under better conditions, and especially that it should receive sufficient water whilst growing.

Schotia latifolia also grows at La Mortola. It is a smaller shrub than *S. brachypetala*, with smaller, strong and leathery leaves, somewhat similar to those of *Cerantonia Siliqua*, but flat and not undulated. It flowers annually in August, and ripens its large pods. The flowers are rosy, fairly numerous, in small panicles, but not very showy. The pod is rather large, about 2 to 4 inches long, and contains one or two large seeds, with a great, yellow arillus. *A. B.*

NOTES ON IRISES.

SELF-FERTILISATION IN IRISES.

It is usually supposed that Irises are a good example of Nature's provision that self-fertilisation should be impossible, and it is a plausible theory that the co-operation of insects is necessary in this genus. Having regard to the position of the stigma relatively to that of the anthers, it does seem at first sight as though fertilisation would be impossible without the intervention of insects. The latter are said to collect pollen on their backs as they brush against the anthers in their endeavours to reach the nectaries at the base of the flowers, and then to deposit the grains on the stigma of the next flower they visit. Knuth (*Handbuch der Blütenbiologie*, vol. ii., Part II.) has even gone so far as to draw up lists of the various insects that have been observed to visit each species.

Some Irises are undoubtedly fertilised by this means, but anyone who visits a garden containing a number of species of Iris cannot fail to be struck by the number of capsules of seed on such species as *pseudacorus*, *sibirica*, *versicolor*, *Hookeri* (or *setosa*), *graminea*, *ochroleuca*, *spuria*, &c. Nearly every flower seems to produce a capsule, while the larger, bearded Irises set seed only comparatively rarely, unless artificially fertilised. A little observation reveals two facts; firstly, that the ripe pollen of all the species mentioned is very easily dispersed from the anthers by the slightest movement; and secondly, that the stigma is in every case a triangular tongue, which projects downwards. The motion of the plants in the wind precipitates the pollen on to the hafts of the falls, which are touched from time to time by the pendulous stigma, and self-fertilisation is thus effected. The shape of the pollen grains of these Apogon Irises is entirely different from that of the bearded groups, and herein, apparently, lies the explanation of the phenomenon. *W. R. Dykes, Charterhouse, Godalming.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Ornithidium sophronites.—A well-grown plant of this dwarf-habited species, when covered with several hundreds of its small, scarlet flowers, is a very effective object. The plant is easy of cultivation, for even small pieces will, in a few years, under proper treatment, form neat, compact specimens. If, on the completion of their growths, they are placed in a light position, they will produce a profusion of bloom. The plants do best in shallow pans, which should be suspended in a light position in a house having a cool, intermediate temperature; when a larger receptacle is needed, it may easily be elevated near to the roof-glass by means of a large pot or Orchid stand. *Ornithidium sophronites* delights in plenty of root moisture the whole year round, and will root freely in the *Osmunda* and *Polypodium* mixture, to which plenty of small crocks are added to ensure efficient drainage.

Sophronites grandiflora.—Because of the colour of the flowers of this well-known plant, it is a suitable companion to *Ornithidium sophronites*. It is now sending up its flowering shoots from the partially-developed growths. Plenty of water will be needed at the roots till the flowers are over, but, by refraining from sprinkling the latter with water when they are open, the flowers may be kept fresh for a long time. Repotting may be performed when growth commences, or immediately after the flowers fade: a small quantity of the new Orchid compost is all that is needed. *S. cernua*, now in bloom in the cool house, thrives better in the new mixture than it did in peat and Sphagnum moss, especially if the plant is potted quite firmly. After growth is completed, it requires a long period of rest, and very little water must be afforded until growth recommences.

Oncidium cheiroporum.—The dwarf, yellow-flowered *Oncidium cheiroporum* is now opening its flowers. The plant requires a thin layer of

compost only to root into, and thrives well when suspended or stowed near to the roof-glass of the intermediate house. The flowers, however, open better if the plants are removed to a light position in the East Indian house, for, if exposed to a little sunshine at this time of the year, it assists the flowers to expand. This *Oncidium* is not a lover of much water at any time, nor does it appreciate wettings overhead, especially during the growing period, as, when damp, the tender, young growths are very liable to decay.

Cochlidium.—*C. Noezliana*, *C. vulcanicum*, *C. sanguinum*, and *C. striata* are all growing freely, and should be given a light position in the cool house, with plenty of water at all seasons. This treatment will also suit the rare *C. rosea*, formerly known as *Odontoglossum roseum*.

Vandas.—Place the *Vandas* in the lightest position available. Plants of the pretty *V. Kimballiana* which have recently passed out of bloom should be kept rather dry at the root for several months. The Sphagnum-moss on the surface of the pot should not be watered heavily, a slight sprinkling whenever it becomes fairly dry being sufficient. The pure white-flowered *V. Watsonii*, a rare and lovely Orchid, is now developing its inflorescences, and will require copious waterings at the roots till the flowers open, when the amount of moisture should be gradually lessened. After the flowering stage this plant should be treated the same as advised for *V. Kimballiana*. These *Vandas* thrive well when elevated near to the roof-glass of the Cattleya house. Plants which produced large spikes of bloom last year, and which are now showing weak inflorescences, should not be allowed to flower; a season's rest will be beneficial to them.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir FREDERICK G. LODER, Bart., Leonardlee, Sussex.

Hardy Ferns.—Let a few inches of dry, rough peat be placed over the crowns of the less hardy species and varieties. Do not remove the withered foliage of these Ferns until spring, as it forms a natural protection. Evergreen Ferns serve an excellent purpose in winter, therefore it is desirable to place some of these amongst the deciduous kinds in order that the bareness during winter may be lessened. A good collection of Ferns is more interesting and effective than many people imagine. In forming a hardy fernery, it must be remembered that, above everything else, Ferns require shade from bright sunshine, yet they must not be deprived of light. There is a great deal of difference between shade from sunshine and absence of light. Let the warmest nooks be chosen for the more tender varieties, provided they are not exposed in such positions to the sun, either early in the morning or at mid-day. The ideal fernery should afford a kind of retreat. It might be situated on a north-west bank, partly shaded by trees, and, if possible, the site should be near to water. Old pieces of rock and stone may be employed to good effect in the hardy fernery. Ferns may be planted at any time between now and the period of renewed activity in spring. The deciduous Ferns now at rest include such as *Athyrium*, *Cystopteris*, *Osmunda*, *Lastrea*, *Asplenium*, *Blechnum*, *Polypodium*, *Scolopendrium*, and *Polystichum*. Most of these require a good loamy soil, such as is often found on banks, with plenty of leaf-mould and small sandstone or pieces of rock mixed with it. The freestone chips serve to retain moisture, and the roots may usually be found clinging to them. Hymenophyllums look very pretty travelling over large pieces of stone. The hardier forms of *Lycopodium* should be planted at the foot of a rock or stone, excepting the species *L. clavatum*, which succeeds best on a bank exposed to sunshine.

Lily of the Valley.—The present is a very good time to make a fresh plantation of *Lily of the Valley*. Any that have occupied the same piece of ground for three or four years, should now be taken up and divided, the ground should be drained deeply and plenty of leaf-mould and manure added to it. If the plants are lifted from time to time in this manner, and planted in deeply-dug, well-manured soil, the flowering spikes will be very large. In replanting the crowns, it is useful to put some on south, some on west, and others on north borders, for if early the flowering period will be extended. In divid-

ing the crowns, select all the largest, those which are sure to produce flowers, and plant them by themselves, utilising the smaller ones for planting in the nursery ground or on a border by themselves. A fresh bed should be planted each year. The best way to plant the crowns is to chop down a trench by means of a spade or trowel, and in this trench place some silver sand and fine leaf-mould, upon which the crowns may be planted. Do not expose the crowns to the atmosphere for a longer time than is necessary.

General work.—This will consist of planting operations whenever the weather is fine, clearing up leaves, sweeping and rolling lawns and gravel paths, pruning and top-dressing deciduous shrubs and trees, and, during wet days, preparing stakes and labels. Clean plants in cool houses or pots, and overhaul tools, machines, and other implements.

Planting shrubs.—The present season is the best in the year for the planting of trees and shrubs. If the ground has not been made ready, however, time must be taken to prepare it. Shrubberies are too often neglected. The commonest species are allowed to crowd out the choicer specimens. Autumn is the season to put these matters right, either by transplanting or chopping out the commoner sorts. There are so many beautiful species, that most gardens can ill afford the space for numerous plants of such shrubs as Box, Laurel, and Privet, excepting when they are used for shelter or in woods. Shrubs of one kind or another may be had in flower during the whole year, either on the walls or in the open border. The fewer that flower in a particular month the greater should those few be prized, and these include *Jasminum nudiflorum*, *Chimonanthus fragrans*, *Viburnum Tinus*, *Hamanelis virginica*, and *Azara microphylla*, all of which flower in cold weather.

FRUITS UNDER GLASS.

By E. HARRISS, Fruit Foreman, Royal Gardens, Frogmore.

Pines.—It is desirable to have some kind of protective material in readiness for covering the pits at night during severe weather. By using such a covering an even temperature can be maintained in the pit with less fire-heat. Be careful not to overheat the hot water pipes, there being nothing more detrimental to the welfare of the plants. Let watering be done with careful judgment, and remember that plants now resting will be better if their roots are kept rather on the dry side. Those plants which are nearest to the water pipes will need water more frequently. All water applied to the roots should first be warmed to the same temperature as the atmosphere of the house. Plants which are swelling fruits need more heat than others. Let the atmosphere be kept moist by damping the paths in the house; especially will this be necessary during sunny weather. An effort should be made to have some ripe Pineapples for the Christmas festival. Should it be necessary to hasten the plants for this purpose, let them be placed at the warm end of the plant stove, near to the glass. For successional plants and suckers, an atmospheric temperature of not less than 60° or 65°, varying in accordance with outdoor conditions, will be suitable, but 5° more heat may be employed for plants now fruiting.

Queen Pines.—Let the house be prepared for the earliest batch of "Queens" which are expected to yield fruits early next summer. A suitable structure is a low pit well supplied with water-pipes. The plants should be plunged in a hot-bed, which may be maintained at a temperature of 80°. Let the plants be placed as close to the glass as possible without actually touching it. Select the most promising plants for early fruiting, which are those having thick collars and open centres. It is important that the plants be fully exposed to the light, therefore let the roof-glass be frequently cleaned, especially after foggy weather.

Winter Cucumbers.—For the next few weeks *Cucumber* plants will require extra care in their management, growth now being very slow; they must not be over-watered or given stimulants either too strong or too frequently. When roots can be seen on the surface, a top-dressing of fibrous loam and leaf-mould may be applied. Open the top ventilators just a little for a short time in the forenoon, whenever the weather is

favourable. Cut away old leaves and regulate and tie in the young growths, but do not train in more growths than there is ample room for. Keep the glass of the house or pit perfectly clean. A minimum atmospheric temperature of 70° will be suitable except during very severe weather, when 65° will be sufficient. Cover the roof on frosty nights with mats or tiffany. Damp the walls and paths three or four times daily to keep the atmosphere moist. Syringing had better be discontinued, especially if there is the least evidence of *Cucumber* spot, which is due to a fungus, whose spread is favoured by moist conditions.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of City Parks, Cardiff.

Bathing.—It is not always possible to have any great diversity in the attractiveness of a park, so that where special conditions do exist which tend to make it possible to provide certain kinds of pastimes, sports or other forms of amusement, it is wise to make the most of them. The presence of water in considerable quantity and covering a sufficient area is one of the greatest advantages any park can possess. Water is usually capable of providing four popular pastimes, viz., bathing, boating, fishing, and—in winter—skating. The first of these, even in places where it can be indulged in, is not encouraged by the authorities to anything like the extent it might be. As a general rule bathing is restricted to the early hours of the morning when the ordinary visitor is not taking his walks abroad. This certainly was the practice in this city until last summer, although for seven or eight years past an agitation had been going on in favour of extending the hours. The management realised that it would be altogether out of the question to allow bathing to go on during the day unless dressing-boxes were provided, for, although all the requirements of early morning bathing were met by the provision of a stage fitted up with seating accommodation for close on 200 persons, it was quite unsuitable during the time visitors were about.

Provision of dressing-boxes.—As a result of the agitation the city council decided a little over a year ago to erect 60 dressing-boxes on the site of the bathing stage, at a cost of £400. This decision was arrived at much against the wishes of a strong minority, who professed that the introduction of "all-day" bathing would spoil the amenities of the park and drive away a great many of the lady visitors. For the first time in the history of these parks bathing was permitted, from May 1 to September 30 this year, during certain portions of the day after 9 a.m. So far from this innovation detracting from the pleasures of the park it has had quite an opposite effect, for not only has it proved a boon to bathers but it has also turned out a source of interest to visitors. During the afternoon and evening of most fine days a large crowd of on-lookers was invariably to be seen enjoying the sight of bathers disporting themselves in the water.

Depth of water.—About three-quarters of an acre at the deepest end of the lake was set aside for all-day bathing. As the average depth of water at this point is over 10 feet no one but expert swimmers were allowed to bathe in it. As a good deal of boating goes on at the lake, it was found necessary to mark out the bathing ground with a line of strong lifebuoys. This prevents boats from passing into the area reserved for swimmers, and at the same time deters bathers from passing beyond the boundaries and making themselves objectionable to persons using boats.

Fees for bathing.—Prior to the introduction of dressing-boxes, bathing was free, but since these have been erected a charge—in which action we are supported by the Public Health Amendment Act, 1907—will now be made to everyone using the bathing stage. A small portion of the lake is, however, during the season still set aside for free bathing, but is not available after 9 a.m. each day. The bathing boxes are set aside one day a week for the exclusive use of ladies—a privilege that was not taken advantage of so much this year as it may be next. Notwithstanding the cold summer experienced, nearly £100 has been taken this year in bathing fees.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencaitton, Cornwall.

Violets in frames.—Any attempt to coddle these plants will be sure to result in weakly crowns and a deficient supply of flowers. The lights may be shut down on cold or stormy nights, but do not cover the frames unless more than 5° of frost is anticipated. On all other occasions ample ventilation should be afforded, remembering that a close atmosphere causes the foliage to damp off. Unless the plants are growing in heated frames, water will be rarely necessary until the New Year. Should the root need moisture in the meantime, let it be applied on a mild morning, that the plants may be left fully exposed for the remainder of the day; by this means the excessive surface moisture will evaporate before night. If Violets gathered during cold weather are placed in tepid water in an intermediate temperature for half-an-hour before being taken into the house, their perfume will be improved.

Euphorbia pulcherrima (Poinsettia).—These plants will now need a drier atmosphere, as the brilliantly-coloured bracts are approaching their full development. Manure water must soon be discontinued or the bracts will shrivel earlier than would otherwise be the case. If Poinsettia heads are required for use as cut flowers, they should be cut on the previous night, or at least several hours before they are needed for decorative purposes, and the cut ends placed in hot water in order to check the bleeding, which, if allowed to continue, would cause the leaves and bracts to flag.

Lachenalia.—Unless the plants are required to flower at a particular time, it is better not to attempt to force them. They succeed best when grown in a cool pit where frost is excluded in a position fully exposed to the light. They need a certain amount of atmospheric moisture, but this must not be excessive. Liquid manure may be applied to the roots until the first flowers open, when its use should be discontinued.

Herbaceous Calceolarias.—The most forward plants, having nearly filled the pots with roots, should be shifted into other pots of a larger size, but this work should not be carried out in very cold weather. A richer compost may be used on this occasion, and it should contain a larger proportion of sand. Let care be exercised in order to prevent the leaves being bruised during the handling which is necessary in the act of potting. No plant should be repotted except when the soil about the roots is in a medium state of moisture.

Chrysanthemums.—Cut down any of the plants on which the blooms have ceased to be decorative. Those plants which are required to furnish cuttings may be removed to a light position where, under careful attention, they will produce sturdy suckers. The prompt removal of plants which have ceased to be attractive will permit of the inclusion in the display of many later-flowering varieties, which are now coming into bloom. The latest plants should be still in a cool structure, where abundant ventilation can be employed whenever the outdoor conditions are favourable.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Planting Apple trees.—The Apple crop is usually the most important one amongst fruits in a private garden, therefore every care should be taken to have the best varieties of both dessert and kitchen kinds that will furnish a succession for the longest period. In a well-ordered garden, which has been under the same management for some years, all that will be necessary is to replace worn-out and inferior varieties by some of the better and newer kinds for trial; but in a garden that has been neglected for some years, a considerable amount of planting is often necessary. In most gardens it is convenient to plant fruit trees by the side of the paths; but in some cases it may be found best to plant the fruit trees together in breaks or quarters. When planted by the side of walks, they serve to divide up the garden, and are very convenient for pruning or any other treatment they may require, besides being more interesting to visitors, who may require to take notes as to the varieties planted. Bush or pyramid trained trees will usually be

found the most suitable; the open bush I consider to be the best form, as, in their case, every part of the tree is exposed to sunshine and air. Standard trees are out of place in the garden proper, because, when fully grown, they shade and draw the moisture from a considerable area of land, quite spoiling it for other crops. Bush trees are planted much more closely than was at one time thought practicable, and a good number may be accommodated in a garden of moderate size. They may be placed at a distance of 6 feet from the edge of the paths, and from 9 to 12 feet apart, according to the number to be planted. Currants and Gooseberries may be grown between the trees for some years. Three-year-old trees should be selected, as these grow quickly, and soon give a crop of fruits. The Apple is not very particular as to soil, and will succeed in any good garden loam; but if the ground is of poor quality, introduce some fresh loam about the roots when planting.

Varieties for planting.—The following varieties are to be recommended for planting; they will furnish fruits over a long period:—*Culture*: Early Victoria, Lord Grosvenor, Stirling Castle, Ecklinville Seedling, Golden Noble, Golden Spire, Hambling's Seedling, Tuddington Seedling, Warner's King, Gascoyne's Scarlet Seedling, Lane's Prince Albert, Sandringham, Tower of Glamis, Blenheim Pippin, Mère de Menage, Norfolk Beauty, Alfriston, Bismarck, Annie Elizabeth, Bramley's Seedling, Newton Wonder, Royal Lake Cooking, Barnack Beauty, Norfolk Beeling, Northern Greening, and Wellington. *Dessert*: Irish Peach, Mr. Gladstone, Beauty of Bath, Langley Pippin, Lady Sudeley, Worcester Pearmain, Yellow Ingestre, James Grieve, Ben's Red, King Harry, Washington, Christmas Pearmain, Charles Ross, King of the Pippins, Margil, Abington Pippin, Ribston Pippin, Adams's Pearmain, Ashmead's Kernel Wealthy, Cox's Orange Pippin, King of Tompkins County, Melon Apple, Claygate Pearmain, Lord Hindlip, Reimette de Canada, Rival, Brownlee's Russet, Paroquet, and Lord Burghley. It is sometimes contended that many varieties are not desirable, but some kinds which succeed in one garden often fail in another, and only experiment will prove which are most suitable in any given case. Besides this, a fair number of varieties generally ensures a crop from some of the kinds when the majority are not fruiting.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Manuring and tilling.—At the time of writing the weather is favourable for most kinds of kitchen garden work. Therefore, it is the proper time to push forward any extensions or alterations contemplated in the garden, and to wheel manure and other kinds of material on to the ground. The trenching of light land should be pushed forward as expeditiously as possible. If sufficient labour is available, do not hesitate to break up the subsoil to as great a depth as practicable. If this is done it may be necessary to add various ingredients to modify the nature of the lower soil now brought to the surface. These ingredients will depend partly upon the soil, whether it is heavy or light, and upon the kind of crop it is intended to cultivate. Do not make the surface of the soil smooth, but leave it in a rough condition, that as large a quantity of soil as possible is exposed to the influences of the weather.

Storage of manure.—In the proper management of a kitchen garden it is essential that some place be set apart for storing various kinds of manure, and other materials necessary for the various crops. The site should be situated in one of the most out-of-the-way places, but at no great distance from the kitchen garden. During the present month additions should be made to the heaps, and each made tidy by squaring them up, and seeing that the whole of the place is properly drained.

The root stores.—These should be carefully examined this season, especially such tubers and roots as Potatoes, Onions, Shallots, Garlic, Beet root and Carrots. If these crops are under cover, the work can be done in inclement weather. All bad specimens should be removed, but any that are not actually bad, but appear to be incapable of being kept for a considerable time, should be placed on one side for immediate use.

Turnips.—Late sowings of Turnips have succeeded excellently, consequently there has been little difficulty in maintaining a supply of first-rate roots. Any that are fully developed should be lifted and stored, pitting them quite thinly in the open. Place a little soil or fine ashes between each layer of roots and let the clump be well ventilated, as Turnips are liable to generate heat, which, if retained, would be injurious. A little soil should be pulled over partially-developed Turnips still in the ground, and, in the event of very severe weather, a little light material such as Bracken leaves, or long stable litter may also be strewn over them.

Swedes.—Though Swedes are not strictly kitchen garden crop, the forced tops are often appreciated in the winter months. Therefore, put a number of roots into boxes containing soil, and place them in a dark cellar or room. They will soon provide leaf-growth suitable for cooking purposes.

Broccoli.—Examine the Broccoli every week, and directly a plant commences to develop, the head may be protected in the open by tying together the leaves in such a way as to cover the flower. A better plan, however, is to carefully lift each plant at such a stage and place it either in a cold frame or in an open shed with a little soil about its roots.

Celery.—If the earthing-up of Celery has not been completed, this should be done at once. Get in readiness plenty of protective material in case of severe frost.

THE APIARY.

By CHLORIS.

The honey season of 1909.—In beekeeping, as in other pursuits or business, it is well at the end of the season to consider what circumstances contributed to success or failure. This season the honey crop has been a failure in many parts of the country, and in some cases from preventable reasons. In these notes I purpose stating a few of the causes of failure. In one case, a beekeeper examined his colonies very early and found everything going on in a most promising and prosperous manner. When the right time came to overhaul his stocks in the spring he discovered that several hives were queenless. There was brood, when he first examined the hives, so there is no doubt that the queen had survived the winter, and it was known in each case that a young queen of 1908 headed the colonies. But it is a great mistake to overhaul colonies too early in the season, for it seems to cause the bees to "bell" the queen and kill her. Of course, last spring was very cold, and bees ought consequently to have been examined proportionately later. Again, deferring an examination too late has a bad effect. Many colonies died in some apiaries for the want of proper attention at the right time. The bees were unable to take advantage of the early forage, and consequently the home larder was empty. In other cases the stores were very low, and the queen was not laying up to her full capacity, and when the bees ought to have been storing the crop of fruit honey, they were simply making good the arrears caused by a shortage of food, and rearing brood which ought to have been available for work in the fields.

In a third instance the bees of each hive had swarmed during June after doing excellent work in May among the fruit. One day the beekeeper went to his apiary and discovered a fairly large swarm, and at once set to work to hunt for the queen. As he was certain it was a second swarm, he was prepared to discover more than one queen, and he destroyed each as he found it. He was very much surprised to find that there had been 10 queens in the swarm. He put back the bees and was very much perplexed when he remembered the number of queens destroyed, and next day determined to overhaul his stocks. To his great grief he found that three out of eight stocks were queenless. It came to the conclusion that three queens were returning from their wedding trip and had joined the swarm just as it emerged from the hive or whilst clustering. It is not wise therefore to be in a hurry to destroy superfluous queens, if you have no nucleus colonies. This beekeeper obtained a very good result for such a season, considering he had lost the advantage of the two weeks of excellent weather in August.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens or plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, DECEMBER 7—

Roy. Hort. Soc. Com. meet. (Lecture at 3 p.m. by Mr. C. HERMAN SENN, on "The Cooking of Vegetables"). British Gard. Assoc. Ex. Council meet.

WEDNESDAY, DECEMBER 8—

Perpetual Flowering Carnation Soc. Exh. at Hort. Hall, Westminster.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—40° 9'.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, December 1 (6 p.m.): Max. 48°; Min. 39°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden London—Thursday, December 2 (10 A.M.): Bar. 29.4; Temp. 50°; Weather—Dull.

PROVINCES.—Wednesday, December 1: Max. 49° Cornwall and S.W. Ireland; Min. 36° Carlisle.

SALES FOR THE ENSUING WEEK.

MONDAY AND FRIDAY—

Herbaceous and Border Plants, at 12; Roses at 1.30, by Protheroe & Morris.

MONDAY, TUESDAY, WEDNESDAY AND THURSDAY—

Dutch Bulbs, at 67 & 68, Cheapside, E.C., at 10.30.

TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—

Fruit Trees and other Nursery Stock, at St. John's Nurseries, Worcester, by Protheroe & Morris, at 11.30.

WEDNESDAY—

Herbaceous and Border Plants, at 12; Roses and Fruit Trees, at 1.30; Palms and Plants, at 5, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—

Orchids at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The hot-water method of forcing Lilac and similar plants has been developed considerably during the last few years in Germany.

Indeed, according to the experience of Herr Löhner, quoted in *Der Handlungsgärtner*, it bids fair to replace the etherisation method in the production of winter blooms of Lilac. As our readers know, the process of etherisation, introduced a few years ago, is employed on a considerable scale for this purpose. Since, however, simple immersion of the plants in warm water, under appropriate conditions, suffices, like etherisation itself, to awaken them from their winter rest, it is not surprising that the comparatively new method of etherisation is being discarded in favour of the yet newer, hot-water process. The latter method is not only cheaper and simpler, but also more certain in its results. Experiments made at the Research Station of the Royal Society of Horticulture of Saxony show, according to Herr Löhner, that treatment with hot water gives actually better results with Lilac (Charles X.) than exposure to ether vapour. In these experiments the plants were immersed in water heated to 95° F. (35° C.) for 10 hours.

Another remarkable fact, pointed out by Dr. Molisch, the discoverer of the hot-water treatment, and confirmed by subsequent experiment, is that its effects are lasting. Plants which have been submerged may be stood for some weeks in a cold place without

losing their power of speedy response to subsequent forcing treatment. The winter-rest condition appears to be permanently interrupted, and the plants, awakened to potential activity, respond as soon as the temperature makes response possible.

Just as plants which have been "hardened" by exposure to frost force more readily than those not so exposed, so it is found that Lilacs which have been subject to the early autumn frosts respond the more quickly to the hot-water treatment; for example, Lilacs, which had been in the open and exposed to frost on several days of October and November, responded almost as well to a five-hours hot-water treatment as to a 10-hours treatment, the water in both cases being at 95°. The plants submerged for 10 hours (on November 9) flowered on December 8, and those submerged for five hours, on December 11.

The results of trials of the most suitable temperature for the hot-water bath show that though no harm is done, even if the temperature of the water is as high as 100°, there is no advantage in the higher temperature. For the plants experimented with 95° is best.

How easy the method is in application may be judged from the fact that there is no need to maintain the temperature constant during the immersion of the plants. If a large vessel is used, it suffices to wrap it round and to cover it with straw or other non-conducting material to prevent too great a loss of heat during the bath. It is, however, important not to add very hot water for the purpose of raising the temperature during the bath, for if this is done, the flower-buds are apt to be injured.

OUR SUPPLEMENTARY ILLUSTRATION.—

With respect to the natural home of *Rhododendron bullatum*, Mr. GEORGE FORREST states that the eastern slopes of the Tali Range are, above any place in Western Yunnan, the habitat of this species. The range trends almost due north and south for a distance of fully 35 miles, and is seamed on its eastern face with numerous, deeply-cut, funnel-like gorges, filled for the most part with dense scrub. This, from the level of the plain at 6,500 feet up to 8,000 feet, is mainly composed of thickets of dwarf Bamboos, but from that point up to the level of the Alpine pasture, at about 11,000 feet, the vegetation consists almost solely of Ericaceous shrubs, *Rhododendrons* predominating. The view illustrated in fig. 166 shows a gorge on the eastern flank of the Tali range, looking west towards the backbone of the range. The height of the range is 14,000 feet, and the photograph was taken at an altitude of 8,500 feet. Without considering those already known, 19 new species of *Rhododendron* were discovered on the range by PÈRE DELAVAY, who was the pioneer collector there. Since then several others have been added to the list, and, undoubtedly, many remain to be found, only very few of the side valleys having been systematically explored. Most, in fact all, of the new species mentioned, are worthy of introduction, but a few pre-eminently so, and amongst these stands the species figured, *Rhododendron bullatum*, which takes its name from the puckered or bullate surface of the foliage, clearly shown in both figures of the Supplementary Illustration. One portrays a full-sized plant in a characteristic habitat, the other a single truss of blooms on the same plant. The species is loosely branched, from 3 to 5 feet in height, with the upper surface of the leaves a dark shining green, the under surface, as well as the petioles, pedicels and the young wood, being covered with a dense

light-brown wool. The flowers are in compact umbels of three to six, and deliciously fragrant, in form widely campanulate, 2 to 2½ inches in length, and at the apex almost the same in breadth. The corolla is thick and fleshy, the interior of a pure waxy-white, with a blotch of canary-yellow at the base, the exterior white with a tinge of rose-pink, which is deepest along the centre of each segment. Unlike most in the genus, this species is not gregarious, and, though plentiful enough over a fairly extensive area, it is not to be found in large colonies as is the case with most of the *Rhododendrons* of Yunnan. It favours moist, rather than dry, shady situations, on humus-covered ledges, and along the base of cliffs at an altitude of 8,000 to 10,000 feet, or even 11,000 feet. The specimens found at the higher altitudes are generally much stunted, but bear the largest flowers.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees of this Society will take place on Tuesday the 7th inst. At the afternoon meeting of Fellows a lecture will be delivered by Mr. C. HERMAN SENN on "The Cooking of Vegetables."

THE SMITHFIELD SHOW.—We are officially informed that Lord CARRINGTON will be "At Home" to farmers at the offices of the Board of Agriculture and Fisheries, 4, Whitehall Place, S.W., on Tuesday and Thursday, December 7 and 9, from 12 to 2 p.m. and from 3 to 4 p.m. It is not possible for him to accept many of the numerous invitations he receives to attend agricultural gatherings in different parts of the country, and he hopes, therefore, that farmers, who are in London for the Cattle Show and who desire to see him, will do him the honour of calling upon him on the days mentioned. Lord CARRINGTON will visit the show of the Smithfield Club on Monday, December 6, and he has accepted invitations to be present at the annual dinners of the Farmers' Club and the Central Chamber of Agriculture on Tuesday, December 7, and of the National Farmers' Union on Wednesday, December 8.

THE NEW VICTORIA MEDALLISTS.—As was announced in these pages last week, the Council of the Royal Horticultural Society has awarded the Victoria Medal of Honour in Horticulture to Mr. BOTTING HEMSLEY, Mr. MCKELLAR and Mr. J. H. GOODACRE. On another page we publish a portrait and an appreciation of Mr. BOTTING HEMSLEY by Sir WILLIAM THISELTON-DYER. Mr. HEMSLEY has been closely connected with this journal during his long service in the Herbarium at Kew, and we are glad to say that he is still a valued contributor. Mr. MCKELLAR, who was head gardener to his MAJESTY THE KING, whilst PRINCE OF WALES, at Sandringham, is known to most of our readers as head gardener to THE KING at Windsor. A portrait of Mr. MCKELLAR, with some details of his career, was published in our issue for November 21, 1908. On that occasion we referred to the radical alterations and improvements made at Windsor under Mr. MCKELLAR's superintendence, and to the general good appearance of every part of the extensive gardens. Respecting Mr. J. H. GOODACRE, our columns frequently proclaim his victories at the competitive horticultural exhibitions up and down the country. In recent years no private gardener has won so many first prizes for choice fruits at first-class shows as Mr. GOODACRE. He has brought the Elvaston Castle Gardens into world-wide repute, and the award now made him is certainly a popular one. That we do not give our readers a portrait of Mr. GOODACRE is due to deference to the wishes of that gentleman himself.

JOURNAL OF THE R.H.S. GARDENS CLUB.—The issue for 1909, forming the second number of this journal, contains articles by members at home and abroad, including one from the pen of the President, the Rev. W. WILKS, M.A., and another by Sir TREVOR LAWRENCE, Bart., President 1908-9. Portraits of these gentlemen form the only illustrations in the *Journal*. Especially interesting is an article by the Secretary, Mr. R. J. WALLIS, entitled "Garden Staff." It contains a list of all who can be traced as having been employed in the Society's garden since 1825. The information is gathered from the *Book of the Handwriting of*

nowadays. Students were first admitted in 1866, and they were paid 2s.—afterwards increased to 2s. 4d. per day; the two first students are still alive and members of the Guild. *The Handwriting of Under Gardeners and Labourers* was an official book, in which the Chiswick employes on entering the gardens wrote a brief account of their career. From PAXTON'S entry we learn that his father was a farmer at Milton Bryant, in Bedfordshire; PAXTON commenced gardening at the age of 15, being 22 years of age when he entered Chiswick. Mr. JOHN FRASER, who was at Chiswick in the early 'eighties, writes reminiscences of Chiswick. It is amusing to

tributes an article entitled "A Day's Holiday at Vancouver." Mr. SEATON'S climb to the top of Grouse Mountain makes interesting reading. Mr. LEVASS'S contribution on the "Surrey Dragon-flies" is of interest to the entomologist. The *Journal* also contains the first records of a "Fauna and Flora of Wisley," but the lists are "wretchedly incomplete and only see light now, with the hope of stimulating further search." The doings of the Mutual Improvement Society and the clubs are of most concern to the present students, though they will doubtless be referred to in future years with increasing interest.

NATIONAL ROSE SOCIETY.—The thirty-third annual general meeting will take place at the Westminster Palace Hotel, Victoria Street, on Thursday, December 9, at 2.30 p.m. In addition to receiving the report of the committee and electing officers for the ensuing year, a number of alterations in the rules and bye-laws will be proposed at the meeting. Instead of the usual annual dinner, a *conversazione* will be held from 4.30 to 6 p.m. in the large room at the hotel. Each member will receive, on application, one free ticket, and is entitled to purchase other tickets for friends, including ladies, at 2s. each. Application for tickets must be made to the hon. secretary, Mr. EDWARD MAWLEY, Rosebank, Berkhamstead, on or before Saturday, December 4. A selection of music will be played by members of the Alexandra Orchestra, and Miss HOLBROOK, of the Guildhall School of Music, will sing. The floral decorations will be carried out by Mr. R. F. FELTON, Hanover Square.

ROYAL GARDENERS' ORPHAN FUND.—We record with satisfaction that the committee of the Bradford and District Chrysanthemum Society have sent a subscription of £7—the result of a collection made at the recent show—to this fund. May other committees do likewise!

MR. BERNARD N. WALE, B.Sc., senior lecturer on Agriculture at the South-Eastern Agricultural College, Wye, has been appointed Principal of the Seale Hayne Agricultural College in Devonshire.

THE EXHIBITION OF THE FRENCH NATIONAL SOCIETY OF HORTICULTURE.—The annual exhibition of the Société Nationale d'Horticulture, which was held in November, was amongst the most successful of those held under the auspices of the society. The exhibition was inaugurated on November 5 by the PRESIDENT of the Republic, who was accompanied by Mme. FALLIERES and by the Minister of Agriculture and of the Colonies. The Chrysanthemums shown by MM. VILMORIN-ANDRIEUX ET CIE received the well-merited recognition of a Grand Prix d'Honneur. Among other notable exhibits were those by MM. SALAMON ET FILS, vine growers (Grapes and vines in pits), which received a Grand Prix; Chrysanthemums shown by M. PININ; fruit trees and fruits by MM. MOSER ET FILS, both of which exhibits gained gold medals.

JUBILEE FLOWER SHOW, HAARLEM, 1910.—We learn that this show will be continued until May 29. The late Tulips and other May flowering bulbous plants will not be at their best before the second fortnight in May. Moreover, by prolonging the show, visitors to the Brussels International Exhibition and Congresses will be able to visit the Haarlem Flower Show, for which they will receive special invitations. We have already mentioned that three special temporary shows will be held. A fourth exhibition of this kind is now fixed for May 20-22, when the Dutch Horticultural and Botanic Society will hold its usual spring flower show in the buildings of the Haarlem Jubilee Show.

(From a photograph by George Forrest.)

FIG. 166.—HABITAT OF RHODODENDRON BULLATUM.
(Being a view in the Tali Range, Western Yunnan, China.)

Under Gardeners and Labourers, 1823-29; from the weekly pay sheets, 1834-92, and from the register of employment since 1896. The list shows the great number of celebrated gardeners who have been connected with the Society's gardens, including Sir JOSEPH PAXTON, ROBERT THOMSON, JAMES BARROW, GEO. GORDON, GEO. BROWN, ROBERT FORTUNE, F. W. BURBIDGE, ARCHIBALD BARRON, and many others. It is interesting to learn that the pay of under gardeners in 1834 ranged from 14s. to 38s. per week, which is equal to the average remuneration

read how the staff assisted with fireworks and illuminations at the fêtes and how some tumbled down the grass terraces in the dark, to the great danger of the only lucifer each was furnished with. Mr. FRASER states that when ROBERT FORTUNE was sending home consignments of new plants from Japan, the gardeners remarked on each fresh arrival, "Hallo, another Japonica," until the name stuck to the gardeners themselves, with a little alteration, as a nickname. Mr. ARTHUR HERRINGTON writes on "Gardening in New Jersey, U.S.A.," and Mr. H. SEATON con-

BRUSSELS INTERNATIONAL SHOW, 1910.—Judging from the schedule of prizes to be offered at the International Exhibition to be held in Brussels in 1910, the event is likely to be important. Altogether there will be 662 classes at the temporary exhibition taking place on April 30 to May 3 inclusive. The first section is for new plants, and includes 20 classes. In the most important class, the 1st prize includes a gold medal worth 75 francs, and the 2nd prize is a silver-gilt medal. The next section—for Orchids—includes 78 classes. For the most varied and meritorious collections of exotic Orchids, the 1st prize offered is a gold medal worth 500 francs. Then follow sections for hot-house plants, special classes for Aroids, Palms, Cycads, Pandanaces, Ferns, greenhouse plants, hardy trees and shrubs, including Rhododendrons and Azaleas, spring-flowering plants, bulbous plants, succulent plants, fruits, vegetables, and decorative or florist's arrangements. Another show will be opened on September 24 and extend to September 27. There are 119 classes. The first section is for fruit; the next is for market garden produce and vegetables. Then follows a third show, held on October 29 to November 2. A gold medal worth 500 francs will be awarded for the best collection of exotic Orchids. There are numerous classes for autumn-flowering plants, including Begonias, Chrysanthemums, Cyclamens, Primulas, Carnations, &c. Permanent exhibits may be entered in any of the 269 classes. These are for such things as landscape gardening, hardy spring flowers, flower bedding, bulbous plants, Rose trees, decorative trees, and fruit trees. Those needing further information may apply to the SECRETARY to the Horticultural Committee of the Royal Commission of the Brussels, Rome and Turin Exhibitions, 8, Whitehall Place, London.

CATALOGUE OF ROSES.—Rose cultivators will be thankful to the National Rose Society for issuing a new edition of the Society's official Catalogue of Roses, which is only one of the many valuable publications of this popular floral Society. The present edition follows the plan of the 1906 edition, and therefore is adapted to the requirements of amateur Rose growers. It contains in a convenient form a list of the more reliable varieties now in cultivation, together with a brief description of each, and the purposes for which a variety is more particularly adapted. Many of the older varieties have been eliminated, and a selection has been made from the newer sorts. At the beginning is a descriptive catalogue, in which the names are arranged alphabetically. Then follow, a list of synonyms, a list of Roses arranged according to the classes to which they belong, and selections of Roses for various purposes. We notice that a collection of the best 10 Roses for cultivation in towns is as follows:—Caroline Testout (H.T.), Gustav Grunerwald (H.T.), Hugh Dickson (H.P.), La Tosca (H.T.), Mme. Abel Chatsnay (H.T.), Mme. Isaac Pereire (B.), Mme. Ravary (H.T.), Mrs. John Laing (H.P.), Mrs. Paul (B.), Ulrich Brunner (H.P.). Copies of the Handbook may be obtained by non-members of the Society at 2s. 6d. each.

COLD STORAGE OF FRUIT.—At the recent exhibition at Geneva, MM. CHARDRET ET MOREL received a Grand Prix d'Honneur for an exhibit of 10,000 fruits which had been kept for several weeks in cold storage at the depot of the Lyons Cold Storage Company. Another similar exhibit, which included Pears, Peaches, Apricots, &c., was shown by the CO-OPERATIVE COLD STORAGE COMPANY, of Condrien (Rhône). According to the *Revue Horticole*, co-operative cold storage companies are being developed by fruit-growers in various parts of France. Such fruits as Cherries, Peaches, and Apricots appear to remain

in excellent condition for several months when kept in cold storage. Thus Peaches gathered on July 19 were found to be in a thoroughly good state when examined on September 13.

THE SO-CALLED FALSE HYBRIDS OF STRAWBERRIES.—Owing to the fact that the offspring of the cross *Fragaria virginiana* × *F. elatior* exactly resembles the male parent (*F. elatior*), doubt has been expressed as to the truly hybrid nature of the plants. Professor STRASBURGER in the course of a memoir on the inheritance of sex and allied phenomena, shows that there is no room for doubt of the hybrid nature of the descendants raised from seed of *F. virginiana* pollinated by *F. elatior*. The result is to be explained as a remarkable case of complete dominance of all the characteristics of the male parent over the corresponding characters of the seed-parent. Thus we receive yet again evidence of the importance in plant-breeding of carrying hybridisation experiments beyond the first generation.

THE ASPARAGUS FLY.—Observations made on the habits of the Asparagus fly (*Platyparea porcileptera*, Schrank) by Mr. LENSE (C.R.A.Sc., Paris, cxlviii., January, 1909) show that the means adopted to exterminate this pest, which causes such losses among Asparagus growers in the neighbourhood of Paris, are altogether insufficient. The fly produces but one brood each year. The life of the larvæ lasts only 15 days, but the resting stage of the pupæ continues for 10 months. Therefore, it is not enough to destroy the well-developed shoots which remain at the end of the season in a withered condition. The feeble shoots which soon die, and which are allowed to rot on the surface of the ground harbour the pupæ in large numbers. Therefore, all the shoots must be destroyed if the pest is to be kept in check.

TOMATO LEAVES AS INSECTICIDE.—Many observers have noted that the leaves of Tomatos are obnoxious to certain insects. Applying this idea, Mr. BOSCHER, a French grower, has experimented with decoctions of Tomato leaves, and finds, according to the *Revue Horticole*, that the extract is sufficiently poisonous to destroy green fly. By syringing Peach trees infested with these insects he succeeded in completely ridding his trees of the pest. The value of the observation lies, of course, in the cheapness of the specific, its cost (to growers of Tomatos, at all events) being far less than that of nicotine.

A NEW VEGETABLE.—Monsieur D. BOIS, assistant in the Museum of Natural History, Paris, and editor of *La Revue Horticole*, has published recently in the *Bulletin de la Société Nationale d'Acclimatation de France* (February, 1909) an account of the results of his cultural experiments on the possibilities of *Chenopodium amaranticolor* as a culinary vegetable. The plant in question, which has a Spinach-like flavour, was discovered some 30 years ago in the neighbourhood of Marseilles, where it had established itself. Its native country is unknown. According to M. Bois, the plant has good flavour, a luxuriant habit, and grows well during the summer when Spinach is out of season. The several colleagues of M. Bois who have carried out cultural experiments are all agreed that *C. amaranticolor* (*L'Aserrine amarante*) is well suited for cultivation for the purpose of producing a crop after Spinach is over, and that its flavour is practically identical with that of the latter vegetable. The new vegetable succeeds best in warm situations, and, when growing vigorously, as in the

South of France, its leaves may be gathered at intervals without detriment to the plant. In the neighbourhood of Paris, though specimens grow to a height of 6 feet, the temperature is not high enough for its seeds to ripen. The culture recommended is: sowings from mid-April to mid-May in pots in frames, the plants to be pricked out and kept under glass till about the end of May or the beginning of June, when they may be planted in the open, at a distance of about 2 feet from one another. Inasmuch as it appears that, in cool seasons, the growth of *C. amaranticolor* is slow, the plant may not, perhaps, be of much value in this country. Nevertheless, those interested in novelties might well give it a trial.

NATURE OF CHLOROPHYLL.—No plant substance has been more studied by the botanical chemist than chlorophyll, the green colouring matter of plants; yet, in spite of all that has been done, our knowledge of its constitution is but small. Perhaps the main fact hitherto established in the close similarity between the decomposition products of chlorophyll and those of hæmoglobin, the red colouring matter of blood. Whatever may be the meaning of this resemblance, the two substances differ widely in one most important respect, namely, in the nature of the metal they contain. Hæmoglobin contains a certain proportion of iron intimately bound up in its structure; it is to this content of iron that the function of hæmoglobin as a carrier of oxygen is due. Chlorophyll, on the other hand, although only formed when iron is supplied to the plant, does not contain iron. According, however, to the latest researches of Professor WILLSTÄTTER, of Zurich, a certain small proportion of magnesium is always present in the chlorophyll molecule. The all-important work of chlorophyll in forming sugar and starch from carbon dioxide and water is in some way connected with the magnesium which it contains. Magnesium has been proved to be a constant component of chlorophyll derived from every class of plant, the types studied ranging from the green alga to the dicotyledons. It is obtained in the form of magnesium oxide to the extent of 6 per cent. or more when the chlorophyll is burnt to ash. The reason that the presence of magnesium in chlorophyll had not been demonstrated previously is shown by WILLSTÄTTER to be due to the facts that, previous to his investigations, acids were always employed in the preparation of pure chlorophyll, and that acids quickly dissolve out the magnesium. The action of alkalies is less drastic, and by their aid it is possible to obtain from chlorophyll a series of brightly-coloured, well-crystallised products known to chemists as the magnesium salts of carboxylic acids. Professor WILLSTÄTTER finds that chlorophyll comprises from $\frac{1}{2}$ to 1 per cent. of the dried leaf. Thanks to his researches, we are brought a step nearer to solving the all-important problem of the mode of action of chlorophyll in effecting the manufacture of sugar in the leaves of plants.

ARSENATE OF IRON AS AN INSECTICIDE.—In recommending the use of arsenate of iron, FeHAsO_4 , as an insecticide, Messrs. VERMOREL and DANTONY (*C. R. Ac. Sc.*, cxlviii., Feb., 1909) point out that copper arsenite and copper acetate lack adhesive power, and that lead arsenite gives a white paste likely to be overlooked, and, therefore, dangerous in use. The authors state that a spray-material composed of iron arsenate, of a strength of 100-200 grams per hectolitre, is effective in destroying insects. The mixture adheres well, proclaims its presence by its dirty green colour, and does no damage, even when used in considerably greater strengths, to the sprayed plants, e.g., vines.

WILLIAM BOTTING HEMSLEY.

THE Victoria Medal of Honour in Horticulture was established by the Royal Horticultural Society to recognise the services of those who have conspicuously aided in promoting the art. But the distinction has always been awarded by the Council in a large-minded spirit. It has not been confined to those who are eminent from cultural skill; it has been awarded to men who have aided the gardener to combat disease, or to unravel the problems of hybridism; it has recognised the services of the traveller who has enriched our collections, and of the botanist who has described the new accessions, discriminated their affinities, and established their nomenclature and this has continued the tradition of history. For our English horticulture has grown out of botany. The passion to form collections of interesting plants necessitated the mastery of the difficulties of their cultivation. The fathers of the art in this country, Turner, Gerarde, and

conservators, successful men of business, writers, to say nothing of men of mark in the horticultural profession. Kew has done this because, from top to bottom, it has always kept alive a lofty ideal of some interest in life beyond mere immediate bread winning. But those who have taken advantage of it had need, on their side, of no small amount of moral fibre and patience to wait on opportunity. But this is all as old as Esau.

Hemsley, then, started at Kew in 1860, as many a boy has done before and since. Three years later he won a prize for botany at the Society of Arts. Whether from this, or because his ability had already been recognised, he was transferred to the Herbarium in some temporary capacity. There his work earned the approval of Mr. Bentham, a thing not easily won, and in 1865 he was appointed Herbarium clerk.

The title is significant. In those days the scale and equipment of the Kew Herbarium, though it was the seat of botanical work of the

bly based on the French work of Decaisne and Naudin, but was really almost entirely original. It has always been a favourite book of mine, and I have never understood why it has not run into successive editions, for it treats the contents of our gardens from a scientific point of view, as if they were the flora of a country. It spares anyone who wants to know the precise systematic facts about a garden plant the labour of consulting a whole library.

I think it must have been some time in the 'sixties of the last century that I first made Hemsley's acquaintance. I was occupied with my friend, the late Dr. Trimen, on the *Flora of Middlesex*, and Hemsley was busy collecting materials for a *Flora of Sussex*, of which he was never able to publish more than an outline in 1875. A common interest threw us together. I think there is no training more profitable to a young botanist than a thorough study of the flora of a limited district. The eye becomes educated to the minute discrimination of plants, and to their recognition in every stage of their growth. More than this, it becomes accustomed to those subtle indications of affinity which the total aspect of a plant reveals, and which can hardly be expressed in words. It must have done Hemsley good service when he was temporarily attached to Rothamsted, and accomplished the laborious task of separating the constituents of the different plots in the grass experiments. Darwin had the advantage of a thorough early training as a naturalist. He moves amongst his facts with a firm step. Huxley expressed this (I cannot quote the exact words): "Unless a man has had experience in distinguishing species, he cannot profitably theorise about their origin." I wholly agree with Wallace that much of the criticism directed against the Darwinian theory arises from lack of a naturalist's experience. I may go farther and say that this lack vitiates much recent biological work.

In 1874 Hemsley's health improved, and he was able to return to Kew as an independent worker. It was, fortunately, possible to put into his hands many considerable undertakings which could not be accomplished by the official staff. The earliest and, perhaps, the most important of these was the botany of Godman and Salvin's *Biologia Centrali-Americana*, which dealt with a sharply-defined area of extreme interest. Later on he was entrusted with the task of working out the botanical collections of the "Challenger" expedition. No botanist was attached to this expedition, but Professor Moseley undertook to make what collections were possible. It was obvious that these would be mostly only scrappy representatives of the vegetation of the countries at which the ship touched. It was therefore decided that the work would be most usefully confined to oceanic islands, and that the opportunity might be profitably used to bring to a focus all the available material for the study of their vegetation. The result is one of the most important contributions to geographical botany of the last century. At my suggestion, Hemsley worked at the contents of the crops of fruit-pigeons which Moseley had carefully preserved, as well as various collections of drift seeds in the Kew Museums. In 1882 Hemsley prepared, with all the advantage of a wide knowledge of the vegetable kingdom, an admirable guide to the North Gallery at Kew.

When, in 1878, I was engaged in preparing for the Royal Geographical Society a lecture reviewing our actual knowledge of the vegetation of the earth, I was impressed with our scanty information as to the flora of the Chinese Empire. In 1883 I made a determined attempt to remedy this, and procured from various sources considerable funds for the purpose. This enabled Hemsley to be engaged to compile the *Index Flora Sincensis*, the object of which was to bring together all the scattered notices of Chinese plants, to catalogue the material in the Herbaria of Kew and the British Museum, and

WILLIAM BOTTING HEMSLEY, F.R.S., V.M.H.

Parkinson, were botanists first and gardeners afterwards. The greenhouse in the Chelsea Botanic Garden was one of the first erected in this country.

There could be no more worthy recipient of the Society's distinction than Mr. Hemsley. For, if he found the starting point of an honourable career in horticulture, he has amply repaid the debt, and no moment could be more fitting for the award than the first vacancy which has followed his retirement from the distinguished position of keeper of the Herbarium and Library of the Royal Botanic Gardens, Kew.

As a boy, the love of plants got hold of him, and, at the age of 16, he entered Kew as a young gardener. One of the most valuable but least recognised services to the public that that great establishment is the stepping-stone it has afforded to a multitude of young men of capacity, which elsewhere might have perished for want of an outlet, to careers of the most varied usefulness. It has produced pioneers of empire, travellers, botanists, collectors, Government officials, forest

first rank, was of extreme penny. The scientific character of Kew was due to the intelligence of the Hanoverian Royal family, no doubt because it was Hanoverian. But, being so, it was exotic, and when, on the accession to the throne of the late Sovereign, Kew was disestablished as a Royal domain, the Government of the day would have swept away its scientific work. Public opinion was sufficiently enlightened to frustrate this. But governments do not like a rebuff, and ours had scant sympathy with the work and development of an institution which it would have willingly suppressed. Clerical assistance it could hardly refuse; but scientific assistance it would not recognise, and it had to be smuggled in under disguise.

Hemsley had, at any rate, got a fair start on a scientific career. But in 1867 ill-health compelled him to abandon his post. This would have been the end with most men; but "fibre" came in. I do not know how he managed, but in 1875 he produced his *Handbook of Hardy Trees, Shrubs, and Herbaceous Plants*. It was ostensi-

to describe any new species to be found in either or obtained as the work proceeded. I found that the late Mr. F. Blackwell Forbes had had a somewhat similar idea, and, in 1876, had employed Mr. Hemsley to draw up a list of names of known Chinese plants. Forbes was, therefore, first in the field; but he joined hands with us, and his name was associated with Hemsley's in the publication of the *Index*. As a matter of fact, the work, apart from the subsequent assistance of other contributors, was entirely Hemsley's, and Forbes had no actual share in it.

In 1883 official employment was again found for Hemsley at Kew as assistant for India in the Herbarium, the nomination to which appointment the Director has, fortunately, in his own hands. In 1890 he was reappointed to the permanent staff of the Herbarium as a principal assistant, and in 1899 he succeeded Mr. Baker as keeper. It became impossible for him to finish the *Index* without the co-operation of other helpers. It was at last accomplished, though the single octavo volume which had been thought sufficient had expanded into three. An impulse was given to the botanical exploration of China, of which it will be long before the harvest is completely reaped.

Space will not allow me to touch on Hemsley's numerous other contributions to botanical literature. They all bear the same mark of competent achievement. To the readers of this journal he is known as an invaluable contributor over a long period; but I may single out two notable pieces of work. Under my direction, he superintended the preparation of the second supplement to the *Index Kewensis*, and in 1897 he had the privilege, with which few systematic botanists can hope to meet, of laying before the Royal Society (into which he had been elected the previous year) the detailed definition of a new natural order—the Julianaceæ.

Here I might lay down the pen on a record—which is little more than a bald statement of fact—of a career which is not merely distinguished in its own province, but represents solid service to our science. But Mr. Hemsley will forgive me, as his old chief, if I touch a more personal note. He overlapped me at both ends of my Kew service. We are amongst the survivors of those who have seen the growth of the Kew Herbarium and Library from the meagre staff and the cramped quarters in the house of the last King of Hanover—I saw with regret that the last historic link, the long-respected wall-paper in the Queen of Hanover's room, had been swept away—to its present commodious quarters and vigorous activity. We have laboured together in many undertakings of which he has borne the principal burden. And, looking back on a past which must reach to some 40 years, I recognise throughout the same retiring and unpushful disposition and modest diffidence which I well remember when we first met. These pages will meet the eye of many young men. They may well take note of the career of a man, without backing, and with nothing to start with but character and love of knowledge, whose early education must have been slender and who throughout life had to struggle with ill-health. Yet he taught himself German from a colleague, and to write French and Latin fluently, and, in the most unassuming way, but with unwearied industry and courage, attained scientific distinction, and, within the limits of his science, a reputation which is cosmopolitan. *W. T. Thiselton-Dyer.*

PRESENTATION TO MR. T. F. CONWAY.—

After several years' service as head gardener to the Earl of DYSART, Ham House, Petersham, Surrey, Mr. T. F. CONWAY is leaving England to engage in farming duties in New Zealand. On Thursday, November 25, he was presented with an illuminated address and a purse of gold by his many friends in the Petersham district. Mr. CONWAY was, until recently, the hon. secretary of the Ham Horticultural Society.

TREES AND SHRUBS.

TWO UNCOMMON WALNUTS.

THE genus *Juglans* is conspicuous amongst ornamental trees by the long, pinnate leaves of most of the species; whilst several may be taken into account for the economic value of the fruit. In those places where Walnuts thrive they are useful trees to plant for the sake of their timber, for though it takes a long time to grow to maturity, it is very valuable when cut, especially when well marked and, therefore, suitable for veneer work. The common Walnut is met with in most gardens in the southern counties, but is less common in northern parts. There are, however, several less common species that are well worth planting. The best known of these is *J. nigra*, but two others to which special attention is directed here are *J. cinerea* and *J. cordiformis*. Both of these have a very ornamental appearance, and both are rare. *J. cinerea* is a North American tree, which is known under the names of Butternut and Grey Walnut. According to Prof. Sargent, it grows in rich, moist soil near the banks of streams, and on low, rocky hills from southern New Brunswick and the Valley of the St. Lawrence, in Ontario, to eastern Dakota, south-eastern Nebraska, and to northern Georgia and Alabama. Its largest proportions are assumed towards its northern limit, and its maximum dimensions are stated to be 100 feet in height and 9 feet in girth, with a clean trunk of 20 or 30 feet and a good sized, branched head. A very good description of the species is given in Elwes and Henry's *Trees of Great Britain and Ireland*, vol. ii., pp. 271, 272. Its probable date of introduction to this country is there given as previous to 1656, yet the largest tree recorded (in 1902) was only 52 feet in height and 4 feet 2 inches in girth, this being in the grounds of Mr. C. S. Dickens, at Coolhurst, near Horsham. The leaves are often more than 2 feet long, and they are composed of oblong leaflets which vary in number from 11 to 17. These, together with the young bark, are covered with a brownish pubescence. The staminate flowers are borne in rather dense catkins, 2 to 3 inches long, in early June, and the female flowers are borne, six or eight together, in roundish heads. They are very distinct both from the common and black Walnuts, the nuts being oval, $1\frac{1}{2}$ to 2 inches long, with rather thick shells, which are divided into numerous sharp ridges of indefinite shape. The covering of the nut is thin, and bears glandular, viscid hairs. The kernel is closer and more oily than that of the common Walnut. Trees do not appear to fruit very freely in this country, but a young tree at Kew, 30 feet in height, bore between 50 and 60 fruits this year.

J. CORDIFORMIS is a Japanese tree, which was introduced into European gardens through the St. Petersburg Botanic Garden. Seeds were sent to that institution in 1862 by Dr. Albrecht, Physician to the Russian Consulate at Hakodate. The species is said to inhabit the lowlands in the temperate regions of Japan, where it forms a tree 50 feet in height and 6 feet in girth. The leaves on vigorous examples measure as much as 2½ feet in length; they are composed of 13 large, more or less oval, or cordate leaflets. The male catkins, which are upwards of a foot in length, and composed of green flowers, have a very singular effect, as seen hanging from the branches in June. The female inflorescences are also in the form of catkins 5 to 7 inches long, and made up of 6 to 12 flowers. As many of these flowers are followed by fruit, the result is a long string of round nuts quite different from other species. A young tree at Kew bore this year six or eight catkins of fruit, made up of six or seven nuts each. The nuts are $\frac{3}{4}$ of an inch or so across the widest way, the sides being flattened. The shell is smooth for a Walnut, the markings being very shallow, and it is terminated by an acute apex. The nuts are said to be sold in the markets in Yokohama. *W. D.*

PLANT NOTES.

THUNBERGIA FRAGRANS.

THIS is a desirable climber for a small or medium-sized structure in which an intermediate temperature is maintained. Under such conditions, it will continue to flower from the early part of the summer till nearly the end of the year. It may best be described as a twining plant of moderate vigour. It is clothed with oblong leaves, heart-shaped at the base, and of a decided, deep green tint. The flowers, which are nearly 2 inches in diameter, are pure white, and contrast markedly with the deeply-tinted foliage. The species is seen to the best advantage when trained up a rafter or some similar support, the axillary shoots disposing themselves in a loose and informal manner. I have also met with it as a pot specimen, the twining shoots being allowed to ramble over some twiggy branches stuck in the pot. Notwithstanding the fact that this *Thunbergia* bears the specific name of *fragrans*, the blossoms are very little, if at all, scented. Nicholson, in his *Dictionary of Gardening*, gives the date of its introduction as 1796, so that it must be one of the oldest cultivated species. It can be readily propagated from cuttings of the young growing shoots taken during the spring and early summer months. Whilst this species is a desirable climber for a small structure, the vigorous-growing *T. grandiflora* is equally valuable for a large house. *H.*

NERINE FLEXUOSA ALBA.

AMONGST the many brilliantly coloured varieties this pure white form is very beautiful, and it flowers in October and November in a cool greenhouse. The flowering scape is some 18 or 20 inches in height, and is terminated by an umbel of a dozen or fifteen perfectly white flowers, with recurving, undulating petals. The arching leaf character reminds one of a vigorous growing *Sternbergia lutea*, though the arched character is less pronounced, and the colour a paler shade of green. The slightly glaucous colour of the flowering stem is also distinct, and the fact that the leafage is not merely contemporaneous with the appearing of the flowering scape, but decidedly in advance of it, is by no means the least interesting feature of the plant. The short-necked bulb has a decanter-shaped outline, and the outer coats or tunics are capable of being drawn out into the finest of silken threads, although, possibly, other members of the group may be similar. My own experience of *N. flexuosa alba* does not prove it to be free blooming, though firm potting and a good season of growth, followed by a long, complete rest, appears most conducive to flowering. *E. H. Jenkins.*

ALLWOOD'S PATENT PLANT SUPPORT.

THIS consists of a ring of wire with one end formed as a clip to fasten it to a stake (see fig. 168). The support when attached to the stake serves to hold the shoots in position, and is very useful in the case of such plants as Carna-

FIG. 168.

tions, the stems of which are liable to tumble out of position. The ring can be made smaller or larger by simply contracting or expanding it, one end running free with a loop. The inventor is Mr. Montague Allwood, Carnation grower at Messrs. Low's Enfield nursery.

CULTURAL MEMORANDA.

CHRYSANTHEMUMS.

The sucker-like growths that spring from the base of the plant are the best for furnishing cuttings. They should be of a stout, vigorous character, and 2½ inches to 3 inches long. December and January is the best time for striking cuttings for big bloom culture, but a later period will do for those plants which will merely supply flowers for cutting purposes. For the first batch of cuttings a pit or house with an atmospheric temperature of 45° to 50° is convenient, and the cuttings may be placed under handlights or in frames situated near the roof-glass. Cuttings inserted singly in thumb pots make the best plants. The soil should be pressed firmly round the stem, and a watering applied soon after the cutting is inserted. Place the pots on a bed of ashes in the frame, and keep the atmosphere close until roots are formed. Wipe the glass of the frame each morning, in order to prevent damping off.

Another good method of propagation is that of inserting seven or eight cuttings round the outside of a 5-inch pot; they will root freely enough, but in this case the roots have to be disturbed at the time of potting. The best compost for rooting the cuttings is one containing turfy loam and leaf-soil in equal parts, with a liberal addition of sharp sand. For the next two shifts a compost of three parts loam, one part leaf-mould, and one part dried cow manure, with a good sprinkling of wood-ashes and bonemeal, and enough sand to keep the whole porous, will be suitable. At the final potting the soil should be of a coarser character, consisting of four parts fibrous loam, pulled to pieces by the hands to about the size of a Walnut, one part leaf-mould, and about half a part of decayed manure, with a sprinkling of suitable guano, bonemeal, soot, sand, and wood-ashes. Mix these ingredients well together four or five days before potting is commenced.

When the cuttings are rooted well, place them in a temperature of 60° on a shelf in a cool greenhouse or some other suitable structure. The next shift must be into 6-inch pots before they become root-bound. They should be removed to a cold frame about the middle of March, and in April or the beginning of May let them be placed out-of-doors, keeping protecting material handy in case of frost. In June the final potting may be done, using 10-inch pots for the purpose. See the pots are crocked carefully and ram the soil very firmly round the roots, leaving a good space, from the soil to the rim of the pot, for watering. An open place should be selected for the plants for their growing quarters and good, rough stakes put to each plant, these being supported by a wire running along the top. *Chas. Herridge, Penrhyn Castle Gardens.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE WOBURN EXPERIMENTAL FRUIT FARM EXHIBIT.—In your reference (see p. 364) to the collection of Apples shown by us at the Royal Horticultural Society, your reporter represents the high colour of the fruit from trees in grass to be due to the extra warmth and dryness of the soil. Such an explanation is entirely at variance with our own experiments on the subjects; any extra warmth of soil would tend to improve the crops, whereas grass is most deleterious to them. On the strength of the size of fruits exhibited he condemns our soil as being "obviously unfitted for Apple culture." The fruits exhibited represented the relative average size of fruits, from the whole trees, throughout fifteen years, and there was nothing in the exhibit on which any opinion could possibly be based, either as to the actual size of the best fruits, or the actual

weights of the crops. That we suffer from poverty of soil was, however, disproved by one of our exhibits itself, which showed that our Apple trees have been in no way benefited by the application of manure for 15 years. Lastly, your reporter states that the committee regarded all these exhibits as of no value, and rather leading to the retrogression of Apple culture; the fact, however, is that the Council has awarded us their Certificate of Appreciation for the educational value of our show. It is not my wish or intention to enter into any controversy on the subject, but I consider that the above simple statement of facts should be made. *Spencer Pickering.*

AN ABNORMAL POTATO.—The accompanying figures are from photographs of a Potato discovered by Mr. Felles, of Cambridge, in October, 1909, among a collection of the tubers bought three months previously; it was handed to Prof. Seward as a curiosity. When discovered (fig. 169), the exterior was in the shrivelled, corky state which ensues upon germination, and a small, fresh tuber had apparently

FIG. 169.—ABNORMAL POTATO TUBER.

burst out at one side. On cutting the old tuber open it was found that a large "eye" at one end had germinated (fig. 170), and that instead of producing runners towards the exterior, a number of short runners had been formed internally. These runners had branched to some extent, and the tips were swollen into small tubers. In the process of germination the parent Potato had become hollow, owing to the loss of the reserve materials which had been transferred to

FIG. 170.—THE SAME POTATO SHOWING SHORT RUNNERS IN THE INTERIOR WITH THE TIPS SWOLLEN INTO SMALL TUBERS.

the young tubers. The result of the process is comparable with a frequent occurrence in certain bulbs, e.g., *Freesia*, which, under unfavourable conditions, germinate to produce not leafy shoots but a number of smaller bulbs. The special interest in this case is the peculiar manner in which the change is effected, namely, by the production of runners towards the interior of the tuber. *R. H. Compton.*

LIME-LOVING PLANTS (see pp. 246, 290, 346).—Although a chalk or a limestone flora is in many of its salient features totally different from, say, a granite or a peat flora, yet, as your correspondents have pointed out, lime must not be regarded as essential for any particular class of plants. Sir Herbert Maxwell seems to have hit the nail on the head when he states that "Many chalk and lime-loving plants would doubtless grow wild on other soils if they got a fair

chance, but they are choked by ranker vegetation." This correspondence only tends to substantiate the theory which Prof. Warming arrives at in his excellent book, *Ecology of Plants*, already reviewed in these pages, in concluding that the physical rather than the chemical characters of the soil are more important in determining vegetation. He reminds us that sometimes a plant flourishes under conditions which are not the most favourable for it, because those which it would prefer suit some rival species still better. Thus, "Alders attain their most luxuriant development on well-drained soil, but they are usually expelled from this by competing trees. Only in swamps, where they do not thrive so well, are they dominant. In like manner *Calluna vulgaris* flourishes upon rich soil better than on poor soil, but it is excluded from the former by competing species." This summer in Switzerland I was astonished to find, as already mentioned in the *Journal of Botany*, large clumps of the common Meadow-sweet (*Spiraea ulmaria*), growing at the foot of perpendicular limestone cliffs, some 4,500 feet above the sea, near the road to the Grand St. Bernard. A little water was dripping from the rocks, but at the base of the cliff was a steep, stony scree, only partially covered with vegetation; and yet there was no sign of any Meadow-sweet in the valley of the Drance itself, which flows a few hundred feet below; partly, I believe, because of the repeated mowing of the grass, but also because close to the stream, where one might expect the *Spiraea*, some other plants, being better suited, survived in the struggle for existence. Sir Herbert Maxwell also states that some *Campanulas* and *Gentiana acaulis*, when grown in rich loam and peat, make vigorous leaf-growth at the expense of flower. Now the true *G. acaulis* is not often seen in English gardens; it grows on some of the limestone Alps, and is less common than the larger *G. Kochiana* of modern botanists, which generally prefers the older rocks. After long and careful observation in the Alps, and notwithstanding certain differences of structure in the calyx, &c., I am inclined to think that, after all, the differences in this perplexing group of *Gentians* are chiefly a matter of soil and situation; and possibly what was originally sent to England as *G. acaulis* has gradually developed under cultivation in richer soil into what is known on the Continent as *G. Kochiana*, Perr. et Song. Mr. Reginald Farrer, in his last article on the Dolomites, laments that on reaching a spot after much toil, where might be expected a hundred varieties, there were no *Androsaces*, only three miserable bits of *Saxifraga oppositifolia*, "an abundant limestone plant, almost a typical limestone plant," and no sign of the ubiquitous *Saxifraga aizoon*. He says as *Aizoon* is seen "rioting in every sort of garden, in every sort of soil and situation, who could entertain a doubt of its flourishing everywhere in the Alps?" One would have thought that, with Mr. Farrer's experience of the Alps, he would have realised that, whether on limestone or granite soil, however likely the situation may appear to be for certain Alpine species, they are never certain to be found. Indeed, some of the commonest Alpines are either very local or quite absent from large districts where they might be expected. This applies to the common and very variable, but always beautiful, *Saxifraga aizoon* as much as to anything, and also to the *Sempervivums*. *Saxifraga oppositifolia* again, though so widely spread in Europe and in the Arctic regions, is quite local, and I have seen it more frequently in gritty, granite soil, and especially on glacier moraines, than on limestone. In Nature, Alpine plants, at least, appear to be influenced more by the physical than by the chemical properties of the soil. In my herbarium I have *S. oppositifolia* from 10 feet above the sea in Spitzbergen and from 11,500 feet on a snow-clad col in Dauphny. But the variety in the Western Alps and the Pyrenees is somewhat different, and now goes by the name of *S. Murithiana*, Tess. As to *Lithospermum prostratum*, it is indeed "often a puzzle"; but, perhaps owing to its very long roots, it grows on almost any well drained, sloping bank in loam, peat or leaf-mould and grit or sand in equal proportions. In a Bourne-mouth garden, where it flowers most of the year, it forms huge masses on a south-east slope and seems quite satisfied with its home of sandy peat and clinkers. *H. Stuart Thompson.*

LILIES.—I read the article in the issue for September 4 with keen interest. The author has the hearty thanks of one who would be a specialist, but is engaged at present in stumbling about among an assortment of troubles, climatic (I am almost in London) and otherwise. Under the circumstances, perhaps he will forgive me for troubling him in search of supplementary information on one or two points. May I, for brevity, categorise? 1. I should like to try the importation, as an experiment, of a few bulbs of *L. rubellum* and *L. Krameri* from Japan (by the new parcels post mentioned) if I could arrange with a Japanese Lily grower to send them with their roots intact in some soil and in a double box with some wet moss packing between the boxes. Does the writer happen to know such an address in Japan, or any source whence I could obtain one? 2. I have examined microscopically a large number of imported bulbs (Japanese) which have failed, and in over 80 per cent. of cases there have been either eelworm or mite or fungus, and the impression is gaining on me that the general failure of such bulbs may be due to a widespread infection of the bulbs in the market gardens of Japan, where I believe the bulbs spend a year or so prior to export. After centuries of Lily growing one can understand that practically every garden in Japan would be infected. 3. Is there any source from which I might obtain seed of *L. rubellum* or Washingtonianum? 4. Is *L. Krameri* known to carry seed? I have fertilised it every year for a long time, but failed to get any result. This would seem to be the consequence of the fact that the bulb is practically all gone by the time the plant flowers; indeed, in the race between flowering and decay the latter often gets there first, and the plant dies when in bud. 5. Are the bulbs of *L. rubellum* or other Lilies raised from seeds at Wisley and Kew, subject to the same or similar deterioration to that observed in imported specimens (from which, of course, we might infer that the deterioration was to some extent natural to the species), or are they free, in which case it would seem worth while to endeavour to take steps to improve the present conditions. *Edward W. Bottle.*

Bulbs of *L. rubellum* can be obtained by parcels post from Japan, via Siberia, from Messrs. L. Boehmer & Co., of Yokohama, or from the Yokohama Nursery Co. Whether or not exporters will fall in with your views as to packing is a matter of arrangement between you and the firm from whom you order the Lilies. The season is now too far advanced to do anything this year. The insects usually found in diseased Japanese bulbs are not eelworms but "skip jacks," but whether these are the cause of the disease or only secondary, has not been definitely settled. If seed of *L. rubellum* or *L. Washingtonianum* is not to be obtained from Kew or other botanic gardens, it may possibly be obtained by advertising for it. *L. Krameri* seeds fairly abundant in this country, provided the bulbs are planted early. Bulbs of *L. rubellum* and other Lilies raised from seed are not subject to the deterioration observed in many imported bulbs. *The writer of the article.*

MUSCAT OF ALEXANDRIA GRAPES INARCHED UPON FOSTER'S SEEDLING.—Some four or five years ago, Mr. Molyneux described in the *Gardeners' Chronicle* what he had seen in connection with Grape culture at Gunton Park. If I remember rightly, it was that he saw a splendid lot of Muscat of Alexandria Grapes, free from shanking, on vines which Mr. Allan had inarched upon Foster's Seedling. He explained that the experiment had been tried as a preventive against shanking, and was a success. At that time I was on the point of planting vines of Muscat of Alexandria, so I planted two of Foster's Seedling, and inarched the Muscats upon them, planting the other Muscats in the usual way. I now wish I had inarched the whole of the Muscats upon Foster's Seedling, for, although the vines produce rather shorter bunches, the Grapes are practically free from shanking (only about two berries in one bunch were shanked), the berries are much larger, and the colour and flavour equal to those grown in the usual way. The vines that were not inarched produced Grapes that shanked badly. I strongly advise those troubled with shanking in their Grapes, and especially in cold districts, to try the experiment. *Thomas S. H. Doren, Basing Park Gardens, Alton.*

WINTER-FRUITING SHRUBS.—I saw recently some plants of *Cotoneaster rugosa* Henry (illustrated on p. 359) growing in Coombe Wood Nurseries. The plant naturally produces one central stem, from which side shoots radiate horizontally, carrying their bright red fruits in great abundance. The plants seem to form natural, flat pyramids, and for that reason seem to be fitted for covering a wall. There are new Chinese species of *Berberis* in the nursery which will presently make first-class, winter-berried shrubs. Few perhaps would regard *Sambucus canadensis* as a winter decorative plant, as its long stems are now leafless, but its broad bract-like heads or panicles of greenish berries are very graceful, and with a little foliage would be effective in vases. The dwarf, spreading *Berberis Wilsonii*, so admirably fitted for the margin of large beds, carries a free crop of small, red fruits. Strong plants of *Retinospora obtusa*, when covered with yellowish-brown fruits at the point of the branches are also effective in winter. *A. D.*

GRASS POISONOUS TO TREE ROOTS.—Referring to the interesting subject raised by Mr. Willis on p. 357, as to the assumed poisonous exudation emitted from grass roots, is it to be assumed that such excreted toxin is a product of grass only, or are we to assume that all plants differing materially from each other, as grass does from trees, are equally offensive to each other? Seeing how freely, indeed too freely, trees and shrubs, deciduous and evergreen, hardy and tender plants of so many descriptions, bulbs, and, indeed, all sorts of things, thrive and grow together in a mixed border, is it possible that these do emit any form of excretion that is poisonous? It may be said that because the soil of the mixed border is cultivated, and hence freely aerated, that this free aeration renders any form of toxin thus produced quite inoffensive. But Mr. Willis mentions what is so difficult to follow, namely, that the roots of Peach trees in pots, the soil of which is, of course, fully aerated, are injured when brought into proximity with certain other plants. Does he mean to the plants or to the roots of those plants? Then, unless the surface soil of a pot Peach tree is covered with some carpet plant, the most unlikely thing in the world, how can other plants or their roots come into contact with the roots of the Peach tree? Then it is so difficult to understand this theory as to the emission of a poisonous toxin by grass in an orchard. Does it do the same thing in an ordinary pasture, on which there are no trees? And, if so, how is it that the most fertile of soil possible to obtain for other plants is the top spit from an old pasture? Without entering into these considerations, is it not enough to know, as is certainly the case, that grass growing near shallow tree roots does rob those roots of food and moisture, and that the best remedy is to remove the grass, fork up the soil about the trees, and feed the roots by applying good manure dressings? *A. D.*

SOCIETIES.

ROYAL HORTICULTURAL

Scientific Committee.

NOVEMBER 25.—*President:* E. A. Bowles, Esq., M.A., F.L.S. (in the Chair). *Messrs.* C. E. Shea, R. A. Rolfe, W. Hales, E. M. Holmes, A. Worsley, Spencer Pickering, F.R.S., J. Fraser, J. T. Bennett-Poe, and F. J. Chittenden (hon. secretary).

Potentilla with viviseat flowers.—Mr. E. M. HOLMES showed a flower of *Potentilla* sp., in which the carpels were leafy. He also reported that the *Acorus* which stock refused to eat, shown by Mr. BOWLES at a recent meeting, were those of *Quercus pedunculata*, and showed no morphological difference from the ordinary form characteristic of that plant.

Monstrous Apple flower.—Mr. PICKERING showed the flower of Bramley's Seedling Apple, to which he referred at a recent meeting, having 25 petals, but otherwise completely formed.

Garden Pansies.—Mr. FRASER referred to the degeneration of the flowers of garden Pansies when allowed to seed themselves in cultivated

ground. He found that bees, Cabbage butterflies, and other insects, but especially the silver Y moth, visited them with great regularity, and it seems probable that the degeneration is due to crossing.

Cattleya with diphyllous growth.—Mr. HAWKES, of Osterley Park Gardens, sent a growth of *Cattleya Gaskelliana* which had produced two leaves. This condition, Mr. ROLFE said, is probably a reversion to an ancestral type, and is occasionally seen in other monophyllous *Cattleyas*. Mr. HAWKES also sent a vigorous shoot of *Rochea (Kalosantes) coccinea*, having at the apex of the stem numerous shoots about 6 inches long, instead of flowers. The Committee thought that the condition was the result of growing the plant in a moist atmosphere, an opinion confirmed by the fact that roots had made their appearance at the apex of the main stem.

Juglans ailanthifolia fruiting.—Mr. W. E. GUMBLETON sent ripe fruits of *Juglans ailanthifolia* from his garden at Belgrove, Queenstown. This is the first time the tree has fruited since Mr. GUMBLETON planted it 50 years ago. The fruits are dark and velvety in appearance, smaller than those of *J. regia*, and are borne six to eight in a raceme. Mr. GUMBLETON said that, so far as he was aware, the tree had only once before fruited in the kingdom, at Abbotsbury, in Dorsetshire.

Bitter rot in Pears.—From Mr. R. B. ROGERS, of Hexworthy, Llanconnet, came Pears attacked by the fungus *Gloeosporium fructigenum*, causing the "bitter-rot." It was stated that "the disease seems to begin as small rounded brown patches on the outside, and, in some cases, if these are cut out, the rest of the Pear is quite good, but in other cases, although the inside of the Pear looks quite good, a strong bitter flavour goes right through it. The varieties which have suffered most are Thompson, Fondante d'Autonne, and Beurré Hardy; Louise Bonne has also suffered a good deal, and some other varieties slightly, but Durondeau not at all." The fungus is said to form canker spots on the stems, and these should be cut out, and, with the Pears, destroyed by fire. If thrown on the rubbish heap, or if the diseased fruits are allowed to rot on the ground, or are fed to pigs, there is a danger of the spores escaping and attacking the fruit next year. The spores produced on diseased fruits in the store are able to attack and cause disease in neighbouring fruits. The disease is to be kept in check by the destruction of the diseased fruits, as recommended, and the spraying of the trees with potassium sulphide or ammoniacal copper carbonate. If, however, the trees are sprayed against "scab," that operation will tend to keep the "bitter-rot" in check.

COLONIAL EXHIBITION.

DECEMBER 1, 2, 3, 4.—The exhibition of Colonial produce opened on Wednesday last by H.R.H. the Princess Louise, in the Society's Hall, Westminster, was the best of the series of these shows. The display was of a varied character, and it may be roughly divided into four sections: (1) Colonial produce proper, (2) home-grown fruits, (3) bottled fruits, jams and other preserves, and (4) miscellaneous, which ranged from winter washes to fountain pens.

A meeting in the lecture-room at 3 p.m., presided over by Sir Daniel Morris, K.C.M.G., Mr. Robert Newstead, A.L.S., F.F.S., delivered a lecture on "West Indian Insect Pests." Mr. Newstead illustrated his remarks by many excellent lantern slides. We hope to publish extracts from this paper in a subsequent issue.

Taking the Colonial exhibits first, by far the most important display was made by the GOVERNMENT OF BRITISH COLUMBIA. It comprised about one-quarter of the show and consisted almost exclusively of boxes of Apples. These were selected packages—in all, 500 cases, from about 10 growers in the colony. The fruits were in splendid condition, and the grading was much admired. In addition there were several branches of Apples, Cherries, Pears, and Currants preserved in spirit, for the purpose of showing that large crops are obtained in that colony. The collective exhibit was awarded a Gold Medal, and numerous medals of lesser value were given to the individual exhibitors.

Another large display of Apples was made from the PROVINCE OF NEW BRUNSWICK; these were also shown in boxes.

From NEW ZEALAND came remarkably fine samples of honey, there being 61 jars, each from a different apiary. This colony also showed Apples that had been kept in cold storage since March last. Other exhibits from New Zealand included wines, preserves in variety, canned fruits and vegetables, and cereals. We were informed that all these products find a ready market in the colony, and that none is at present exported.

The WEST INDIES were represented by exhibits from Dominica, Montserrat, and Trinidad. From the island of Dominica were sent a variety of fruits of the genus Citrus. This colony is noted for its Limes, and every effort was made to bring this to the notice of visitors, samples being freely distributed. There were also fine Oranges, large specimens of the Bread-fruit (*Artocarpus*), which greatly resembled in size and appearance—save colour—the common hedgehog. Montserrat also showed Limes and Oranges, together with Cotton, Arrowroot starch, citrate of Lime, and a great assortment of preserved fruits. The most varied exhibit was from Trinidad. Fresh fruits from this colony included Avocado or Alligator Pear (*Persea gratissima*), Golden Apple (*Spondias dulcis*), Mammy Apple (*Mammea americana*), Papaw (*Carica Papaya*), Shaddock (*Citrus decumana*), Grape fruit, Pineapples (*Ananas sativa*), and Granadillas; also fresh vegetables such as Dasheens and Eddoes (both species of *Colocasia*), Yams (*Dioscorea alata*), Cassava (*Manihot utilissima*), Cush-Cush (*Dioscorea trifida*), Cristophine (*Secium edule*), Egg-plant (*Solanum Melongena*), Bitter Cassava, Vegetable Sponge (*Luffa acutangula*), Karila (*Momordica sp.*), and Prickly Cucumber (*Cucumis Anguria*). There were also Nuts, spices, preserves, jellies, condiments, and other comestibles.

The WEST INDIAN PRODUCE ASSOCIATION staged a variety of conserves, sugars, fresh and dried fruits, and exotic vegetables, personal ornaments made of coloured fruits, Cocoanuts, Limes, Oranges, tobacco, tea, and other products.

The ARMY AND NAVY STORES, LTD., Westminster, made a similar display.

Home-grown fruits included displays of Apples by MESSRS. GEO. BUNYARD & CO., LTD., Maidstone, and MESSRS. JAS. VEITCH & SONS, LTD., Chelsea. The former showed 60 varieties, all highly coloured and attractively staged, Belle de Boskoop, Winter Queening, Rival, and Gascoyne's Scarlet Seedling being magnificently shown. MESSRS. VEITCH showed about 40 dishes of Apples and Pears and four pot trees of Calville Blanche, well cropped. All the fruits were excellent samples. A Silver-gilt Hogg Memorial Medal was awarded in each case.

An exhibit of Apples was shown from the Duke of BEDFORD'S Experimental Fruit Farm, at Woburn. This exhibit demonstrated the results of various experiments in Apple culture conducted by Mr. Spencer Pickering, and was similar to the exhibit contributed to the meeting on the 25th ult., when the Council awarded it a Certificate of Appreciation.

MESSRS. AMBROSE, PALMER & CO., 87, Mount Street, Hanover Square, showed Apples, Pears, Grapes, Oranges and Bananas. A Silver Bankian Medal was awarded.

A large assortment of edible Nuts was shown by MESSRS. B. SHEARN & SON, 251, Tottenham Court Road, London; also a very palatable sweetmeat called Stamant, made from ground nuts, sugar, and milk.

PRESERVED FRUITS AND VEGETABLES.

The competitive classes for preserved fruits were well contested and in addition there were several honorary exhibits of this character. Some of the finest of these preserves were shown by Mr. W. POUPART, Twickenham, who was awarded a Gold Medal for his collective exhibits. The following are the principal prize-winners:—

(A) FRUITS PRESERVED IN PURE WATER.

Home-bottled British-grown fruits.—1st, Mr. W. POUPART, Twickenham; 2nd, SWANLEY HORTICULTURAL COLLEGE.

Twenty-four bottles of British-grown fruits (including twelve different kinds).—1st, Mrs. E. BECKETT, Aldenham House Gardens, Elstree.

Twelve bottles of British-grown fruits (including six different kinds).—1st, Mr. H. TORBETT, Wallington; 2nd, Mrs. M. PALMER, Darlington.

Six bottles of British-grown fruits.—1st, Mrs. HARTSHORN, Bond Street, W.; 2nd, Mrs. W. H. PLOWMAN, Westminster.

(B) FRUITS BOTTLED IN SYRUP.

Home-bottled British-grown fruits.—1st, Mr. W. POUPART, Twickenham.

Twenty-four bottles of British-grown fruits (including twelve different kinds).—1st, Mrs. V. BANKS; 2nd, GENERAL POST OFFICE REFRESHMENT CLUB.

Eighteen bottles of British-grown fruits (including nine different kinds).—1st, Miss E. G. COOK, Ashford.

Twelve bottles of British-grown fruits.—1st, Mrs. F. L. PIKE, King's Langley.

(C) VEGETABLES.

Eight bottles (including four different kinds) of home-bottled vegetables (amateurs).—1st, Mrs. E. BECKETT; 2nd, Mrs. V. BANKS.

(D) JAMS, JELLIES, & C.

Jams in clear glass jars or bottles (jellies excluded), made of British-grown fruits only.—1st, MESSRS. W. MILES & CO., Hove, Sussex.

Eighteen 1 lb. clear glass jars or bottles of jam (jellies excluded), made of British-grown fruits.—1st, Mr. E. G. BADCOCK, St. George's Square, S.W.; 2nd, Mrs. E. BECKETT, Aldenham House Gardens.

Fruit jellies and fruit cheese in clear glass jars or bottles (open).—1st, SWANLEY HORTICULTURAL COLLEGE, Kent; 2nd, Miss COOK, Ashford Farm.

AWARDS MADE BY THE COUNCIL:—

GOLD MEDALS.—The Permanent Exhibition Committee of Trinidad, for fruits and preserves; the Government of British Columbia, for Apples; the Permanent Exhibition Committee of Trinidad, for fruits; and the West Indian Produce Association for a collection of fruits and vegetables.

SILVER-GILT HOGG MEDAL.—Messrs. James Veitch & Sons, Chelsea, for Apples, and Messrs. George Bunyard & Co., Maidstone, for Apples.

SILVER-GILT KNIGHTIAN MEDALS.—Permanent Exhibition Committee of Dominica, for a collection of fruits and vegetables; Province of New Brunswick, for Apples; Botanic Station, Dominica, for Citrus fruits; Okanagan Fruit Union, British Columbia, for Apples; Messrs. B. Shearn & Son, for Nuts; the Jamaica Agency, for a collection of fruits and vegetables; the Government of Barbados, for a collection of fresh fruits and vegetables, and the Jamaica Agency, for jams, &c.

SILVER-GILT BANKSIAN MEDALS.—Mrs. John Smith, British Columbia, for Apples; Kaslo District Association, British Columbia, for Apples; Stirling and Pitcairn, British Columbia, for Apples; and the Roseau Valley Fruit Co., for preserved fruits and jams.

SILVER KNIGHTIAN MEDALS.—The Permanent Exhibition Committee of Montserrat, for a collection of fruits and vegetables; Wall House Estate, Dominica, for Limes; Victoria District, British Columbia, for Apples; Salt Spring Island, British Columbia, for Apples; Mr. C. T. Cooney, British Columbia, for Apples; the New Zealand Government, for a collection of fruits, &c.; and the Government of Dominica, for fresh fruits and vegetables.

SILVER BANKSIAN MEDALS.—Mr. F. A. Hubbard, Burton, Sunburg Co., New Brunswick, for Apples; Mr. C. W. Peters, Queenstown, Queen's Co., New Brunswick, for Apples; Mr. H. Bilyea, Lower Gagetown, Queen's Co., New Brunswick, for Apples; Mr. J. G. de Garies, Trinidad, for Oranges; Gordon Grant & Co., Trinidad, for Limes; Mr. J. G. Haines, Trinidad, for Cocoanuts; Mr. Gordon Grant, Trinidad, for Cocoanuts; the Government of Victoria, for preserved fruits, also for vegetables; Messrs. E. Westmacott & Co., for Colonial-grown, tinned fruits; the Roseau Valley Fruit Co., for jams, &c.; Messrs. Ambrose Palmer & Co., Grosvenor Road, London, for English and Colonial fruits; Mr. W. Patinson, for Banana specialties; the Army and Navy Auxiliary Stores, Westminster, for fresh fruits and vegetables, and the Government of Jamaica for fresh fruits and vegetables.

Bronze BankSIAN MEDALS.—St. Alment Estate, Dominica, for Oranges; Eveyton Estate, Dominica, for Oranges; Corona Estate, Dominica, for Oranges; Carholm Estate, Dominica, for Limes; and Mr. J. J. Brown, Trinidad, for Cocoanuts.

BARNESLEY CHRYSANTHEMUM.

NOVEMBER 18, 19.—The 25th annual show in connection with the Barnesley Chrysanthemum Society was held in the Harvey Institute on these dates. The entries in all the classes were quite up to the average, and the show, on the whole, was a distinct success. The opening ceremony was performed by the Mayor, H. M. Walker Esq.

In the class for 18 blooms of Incurved varieties, there were four exhibits. J. W. JAMESON, Esq., North Ferraby (gr. Mr. C. Jennings), was awarded the 1st prize. He had especially choice blooms of Mme. Pascoe, Mrs. Chibran, and Lady Isabel.

Mr. JAMESON also won in the class for 18 Japanese blooms, for which a challenge trophy was offered; and for 12 Incurved Blooms, his two best specimens being Mrs. Chibran and Mme. Pascoe; and for 12 Japanese Blooms.

For six blooms of one variety of a Japanese Chrysanthemum, Sir WM. BASS, Bart., Burton (gr. Mr. R. Nisbet), staged some fine examples of F. S. Vallis variety, the colour of which was exceptionally good.

The classes for vases of Chrysanthemums were disappointing, single Chrysanthemums being almost entirely shown, and not all of these of the best quality.

FRUIT.—As at the Doncaster and Sheffield shows, G. H. SHAW, Esq., Howden, E. Yorks. (gr. Mr. A. Blakey), was awarded the 1st prize for a collection of fruit. He was also 1st in the classes for a bunch of black and white Grapes respectively.

Mr. G. H. SHAW, Howden, secured the 1st prize for a collection of vegetables, with a first-class exhibit.

LEEDS PAXTON.

NOVEMBER 19, 20.—The Albert Hall, Leeds, was brilliant in colour effect on the occasion of the Leeds Paxton Society's Chrysanthemum Show held on these dates. The entries were not quite up to the average in number, but the quality of many of the exhibits was very good. Groups of miscellaneous plants added greatly to the generally charming effect of the show; but there was only one group of Chrysanthemums, and this was awarded a 2nd prize.

J. CARR NICHOLSON, Esq., Moorfield House, Headingley (gr. Mr. J. Phillips), was awarded the 1st prize for a group of miscellaneous plants, with a most excellent collection, comprising well-grown Crotons, Begonia Gloire de Lorraine, various Orchids, Lily of the Valley, Chrysanthemums, and Palms.

The special prize offered by Messrs. Chibran for an exhibit of Roman Hyacinths was won by T. G. MYLCHREEST, Esq., J.P., Eltofts Hall, Thorne (gr. Mr. W. Crossfield).

There were two exhibitors in a class for six plants of Begonia Gloire de Lorraine, the 1st prize being awarded to J. CARR NICHOLSON, Esq.

CUT BLOOMS.—A challenge cup was offered in the class for 36 blooms of Chrysanthemums, including 18 Incurved and 18 Japanese, distinct varieties. It was won by F. W. JAMESON, Esq., Aston Hall, North Ferraby (gr. Mr. C. Jennings). G. F. Evans and Mme. Pascoe were two of the best Incurved Blooms, and Mrs. A. T. Miller and Lady Talbot were excellent amongst the Japanese varieties.

In the classes for 12 Japanese and for 12 Incurved blooms respectively, Mr. JAMESON was again awarded the 1st prize, but in these, as also in the preceding class, this gentleman had only one competitor.

FRUITS AND VEGETABLES.—The best two bunches of black Grapes were shown by G. H. SHAW, Esq., Howden, E. Yorks. (gr. Mr. A. Blakey), the variety being Gros Colman; the berries were superbly finished.

In the class for two bunches of white Grapes, ARTHUR TANNETT-WALKER, Esq., Weetwood (gr. Mr. F. Norman), was placed 1st, but the bunches were not of great merit.

G. H. SHAW, Esq., won the principal prizes in the classes for Apples and Pears, and Messrs. Suttin's prize for a collection of vegetables, Parsnips being especially good.

Messrs. Webb's prize for a collection of vegetables was awarded to W. D. CLIFF, Esq., J.P., Meanwood Towers (gr. Mr. W. N. Hague).

TRADE EXHIBITS were set up by Messrs. MANSELL & HATCHER, Rawdon, Yorks., and Messrs. E. J. BATHCHELOR & SONS, Harrogate.

HORTICULTURAL CLUB.

"CANADA OF TODAY."

NOVEMBER 25.—On this date the usual monthly dinner of the club took place at the Hotel Windsor. Mr. Chas. E. Shea presided, and Mr. Joseph Cheal gave a lecture on "Canada of To-day, Horticulturally and Generally, from the Atlantic to the Pacific," illustrating his address by a number of lantern slides from photographs taken by himself.

Commencing with a few views of New York City and of the Hudson River, he quickly passed on to Canada itself, via Niagara, giving a vivid idea as he proceeded from city to city of the marvellous rapidity with which these cities had risen to importance,

a few rude sheds by the side of a railway track being transformed in a very few years into a flourishing and populous town. Views of the wild and splendid scenery of the Rocky Mountains taken from the train and sometimes curiously evidencing the sinuous nature of the track, by including the tail end of the same train at almost right angles, interspersed with groups of settlers and natives, glimpses of fruit farms and irrigation works and of the associated buildings, vehicles and other details were shown on the screen, and a constant stream of anecdote and personal recollections added interest. Trees, 40 to 50 feet in girth and estimated at about 200 feet in height, were shown, both growing and felled in connection with the vast forests there, the views of which showed also now and again the dire effects of forest fires. Mr. Cheal had taken the opportunity of visiting some of the settlers known to him prior to their leaving the old country. Most of them had done very well, and the moral to be drawn from their experiences is, that, given a fair constitution, a fund of common-sense, and, above all, a determination to work hard, there was no better place than Canada for an energetic young man with a little capital. Mr. Cheal's advice in this connection was that the emigrant should refrain from investing until he had obtained practical experience by hiring himself out for a year or two and so making himself thoroughly acquainted with the climatic and general working conditions. The lecture was followed by a discussion, in which Mr. Griffiths, secretary to Lord Strathcona, High Commissioner of Canada, while confirming Mr. Cheal's observation, added some interesting information. This related more particularly to the vast areas of prairie land in Canada, which formed, in his opinion, one of the greatest future fields of agriculture in the world. Here there was required no laborious clearance of forest, since there were no trees. The whole level expanse of thousands of square miles consisted of rich alluvial soil, 2 to 4 feet deep, resting on clay and only requiring to be "ticked with a plough, to laugh with a harvest."

ROYAL BOTANIC.

NOVEMBER 27.—The first monthly meeting of Fellows of the above Society was held in the club-rooms on the above date. Mr. Pembroke Stephens, K.C., who presided, stated that a most courteous letter had been received from the Royal Horticultural Society, asking them to appoint a committee of six members to confer with an equal number of their own Council. This was done, and a meeting had been held at the Royal Horticultural Hall during the past week. A note of the proceedings had been received from the Royal Horticultural Society, and no time would be lost in placing the matter before the R.B.S. Council for consideration. He further stated that the most careful attention would be given to the matter, but until the whole question was settled and the result known nothing would be published. The chairman further announced that £500 of the first £1,000 required by the National Bank had been paid in, and at the present time only £100 was required to complete the second £500. This sum was thereupon subscribed by Fellows present at the meeting.

NATIONAL CHRYSANTHEMUM.

ANNUAL DINNER.

NOVEMBER 29.—The annual dinner took place on the above date at the Holborn Restaurant, the company numbering about 100. The President, Sir Albert Kaye Rolitt, LL.D., D.C.L., occupied the chair. After the usual loyal toasts had been observed, the prizes won at the recent show, including the challenge trophies, the Holmes Memorial Cups, and the President's special prizes, were presented to the winners.

Mr. E. F. Hawes proposed the next toast, "The Donors of Special Prizes," thanking those who had assisted in this matter and appealing for a continuation of their kindness. Mr. R. F. Felton, who replied, stated that it was an excellent investment for the donors.

"The Exhibitors and Affiliated Societies" was next given by Mr. J. W. Moorman, who pointed out the great indebtedness of all to those who so ably supported the exhibitions of the

Society. Mr. H. J. Jones replied for both exhibitors and affiliated societies.

The chairman next proposed the principal toast—"The National Chrysanthemum Society." He stated that the Society had grown from a small beginning into national importance, as could be judged by the magnificent show recently held at the Crystal Palace. The great palace at Sydenham was not the best place in which to hold a flower show because of its distance from town, but nevertheless the Crystal Palace possessed many advantages for the purpose. The National Chrysanthemum Society owed much to trade exhibitors, and he was sure that the decision to offer a competitive class for market blooms during the coming year would be much appreciated. Conferences such as the one recently held by the Society were also of great assistance in spreading a love of the flower, and the papers published from time to time were valuable. The financial position of the Society was in a more satisfactory condition, and the management endeavoured to work with economy consistent with efficiency. Sir Albert Rolitt concluded his remarks with an appreciation of the work of the officers and committee. Mr. T. Bevan, chairman of the Executive Committee, who responded to the toast, pointed out the valuable support trade growers had afforded the Society, and particularly in regard to the collective exhibit sent to the Continent to an international exhibition.

Other toasts included "The Ladies and Visitors," proposed by Mr. J. T. Simpson and responded to by Mr. E. J. Husey, F.C.A., the receiver and general manager of the Crystal Palace Co.; "The Chairman," proposed by Mr. J. H. Witty; and "The Press," given by Mr. D. B. Crane and responded for by Mr. G. Gordon, V.M.H.

FRENCH HORTICULTURAL.

AMONG the novelties to which Certificates of Merit have been made during the month of October of the present year are: *Aconitum volatile* var. *latisectum* (MM. Vilmorin-Andrieux et Cie). The plant was collected in China for MM. Vilmorin, and is the first and most remarkable of a group of Asiatic *Aconites* which possess a twining habit. It is regarded by Mr. Komarow as a distinct species and named by him *A. Vilmorinii*. The plant is perennial, robust, reaches 9 feet in height, and bears large blue flowers in groups of five to eight. It flowers in September and October. It is a suitable plant for trellises, pillars, &c., and is propagated from seed.

Cattleya labiata alba var. *Gilmourie* (shown by Mr. O. Doim) is remarkable in bearing a single flower 7 inches long and with a pure white perianth. The labellum, which is 3 inches by 2 inches, white, lined by yellow, centre reddish-violet, with faint white lines, column cream.

Cypripedium × *Abel* Chateau was shown by Mr. Opoix, head gardener at the Luxembourg Palace, Paris. This new hybrid is derived from *C. Gaston Bultel*, which was obtained from C. Fairriemum. It is the product of the cross *C. Gaston Bultel* × *C. Druryi* × *superbians*. The flowers of *C. Abel* Chateau are larger than those of either parent, and it is, according to the *Revue Horticole* (No. 22, November 16, 1909), one of the most beautiful hybrid *Cypripediums* obtained of recent years.

Numerous other Orchid hybrids are recorded in the *Revue*, to which those interested in the subject should certainly refer.

SHOW ITEMS.—Mr. T. Pateman, Node Gardens, Welwyn, informs us that he won the 1st prize in the competitive class for six dishes of Pears at the meeting of the R.H.S. on November 23. Our reporter was unable to supply the name, as the exhibitor's card had been removed. At the same exhibition Messrs. Ambrose Palmer & Co., Upper Halliford, Shepperton, were awarded a Silver-gilt Banksian Medal in the class for four dessert and eight culinary Apples. At the Northampton Show, held on November 10, the 2nd prize for a circular group of single Chrysanthemums was won by A. Clinwell, Esq., Cheyne Walk, Northampton. The 1st prize for 12 blooms of Japanese Chrysanthemums shown at the Stirling Chrysanthemum exhibition on November 10 was won by Mr. Carmichael, Langgarth.

DEBATING SOCIETIES.

READING GARDENERS'.—On Monday, November 22, Mr. H. G. Drew, of the Horticultural Department, University College, Reading, gave a lecture on "Insect and Fungal Pests of Fruit Trees and their Eradication." Mr. Drew said that these pests had of late years been increased, but he did not think their numbers were to be accounted for by climatic conditions. It was on record that gloomy seasons were just as prevalent 30 or more years ago. In his opinion the increase was due to many causes, including the extensive breadth of trees grown nowadays, the use of "dwarfing stocks," over-stimulation in youth, planting too closely, and too early fruiting. Mr. Drew informed his audience of the best way to combat insect and fungal enemies, emphasizing that good cultivation, proper attention to drainage and cleanliness would do much in this direction. The recent exhibition resulted in a profit of £18, and this will be given to the Royal Gardeners' Orphan Fund and the Gardeners' Royal Benevolent Institution.

BATH GARDENERS'.—At the meeting held on Monday, November 22, Mr. W. C. Wall read a paper on "Decorative Chrysanthemums." The lecturer gave details of their cultural requirements from the rooting of the cuttings to the flowering stage. He also enumerated a list of the best varieties. Mr. Wall offered prizes for six vases of decorative Chrysanthemums. A. B.

BRITISH GARDENERS' ASSOCIATION (LONDON BRANCH).—A smoking concert in aid of the Branch funds was held at Carr's Restaurant, Strand, on Saturday, November 27. Mr. E. F. Hawes occupied the chair, the company numbering nearly 100 members and friends. The late secretary, Mr. A. J. Hartless, was presented with a set of bronze figures, representing agriculture, horticulture, and commerce. The present was subscribed for by members and friends and bore a suitable inscription.

BRISTOL AND DISTRICT GARDENERS'.—A crowded and enthusiastic meeting was held in St. John's Parish Rooms on November 25, presided over by Mr. S. Shaddick. A paper on "Grapes" was given by Mr. Wilkinson, gardener to Mr. R. A. Gibbs, M.P., Tynte-field. The paper was full of cultural hints and was much appreciated. Mr. Wilkinson said the wires for training purposes should be 30 inches below the roof-glass. This would prevent much burning of foliage and scalding of berries. A border 3 feet in depth was all that was necessary, allowing 10 inches for drainage; the higher the border was made the better, as it would allow for the quicker removal of excess of water. May and June were the best months for planting; the vines being previously grown in 7-inch pots. H. W.

KINGSTON GARDENERS'.—At the meeting of this society, held on November 18, Mr. E. Scaplehorn (of Messrs. Cutbush & Sons, Highgate) gave a lecture, illustrated by lantern slides, on "Rock-gardens and Alpine Plants." The pictures included views of the rock-garden at Kew and of Sir Frank Crisp's rock-garden at Henley. Mr. Scaplehorn showed pictures of many interesting examples of improvised rock and water gardens, erected under his supervision, at the shows in the Lower Temple Gardens and Holland Park. He spoke somewhat fully upon a large number of Alpine plants, and further demonstrated by pictures the most serviceable subjects for a variety of rock-gardens. Several new members were elected.

GARDENING APPOINTMENTS.

- Mr. JAMES COMPTON, for the past 2 years General Foreman at Grove Hall, Craven Arms, as Gardener to R. J. P. THOMAS, Esq., Sharcombe Hall, Wells, Somerset.
- Mr. F. SIMMONS, for the past 2 years Gardener to W. HORN-BLOWER, Esq., Underwoods, Ectingham, as Gardener to SIDNEY HOWARD, Esq., Moulsecoombe Place, Lewes Road, Brighton.
- Mr. E. M. LANGDON, for more than 5 years Foreman to H. TUBB, Esq., Chesterton Lodge, Hchester, as Gardener to E. S. WILMOT-SWELL, Esq., Northbrook, Farnham, Surrey.
- Mr. GEORGE H. ROSE, previously at Brookfield Nurseries, Swinton Rotherham, as Gardener to D. B. HALL, Esq., Barton Park, Petworth, Sussex.
- Mr. GEORGE FERGUSON, for the past 2 years Gardener to Sir K. BROOKE, Bart., Norton Priory, Kincorn, C. Heshie, and previously Foreman and Propagator at the Royal Horticultural Society's Gardens, Wisley, Surrey, as Gardener to JACOB WAKEFIELD, Esq., Sedgwick House, Kendal, Westmoreland.
- Mr. JAMES MACHAR, for the past 6 years Gardener to Mrs. FRYER, Smeeth House, Howden-le-Wear, Durham, as Gardener to HERAM CRAVEN, Esq., The Briery, Sunderland.
- Mr. J. CHAMPION, for 23 years Gardener to Colonel SHAKERLEY, the last 3 at Glebelands, Wokingham, Berks., has removed with that gentleman to Enham Place, Andover, Hants. (Thanks for 2s. sent for R.G.O.F. Box.—Eds.)
- Mr. WANGE, for the past 4 years General Foreman at the Vice-Regal gardens, Dublin, was recently presented with a dictionary by his fellow employes on the occasion of his leaving Dublin to take up his appointment as Gardener to Lord O'NEILL, Slane Castle, co. Antrim.
- Mr. W. BECKLES, for about 5 years Gardener to the late G. B. RENNE, Esq., Denford, Hungerford, Berks, as Gardener to Captain E. H. SAWBRIDGE, at the same place.
- Mr. F. MARR, formerly Gardener to the late A. Y. LETHBRIDGE, Esq., at Trevisone, Flushing, Cornwall, and W. H. SPOTTISWOODE, Esq., at Parthgwidan, Cornwall, as Gardener to GEORGE CADBURY, Esq., jun., Primrose Hill, near Birmingham. (Thanks for contribution received for R.G.O. Fund.—Eds.)
- Mr. A. H. DOW, for the past 24 years Gardener to JAMES YOUNGER, Esq., Mount Melville, St. Andrews, N.B., as Gardener to the Marquis of WINCHESTER, Amport St. Mary's, Andover, Hants.

MARKETS.

COVENT GARDEN, December 1.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Acacia longifolia, Azalea Ghent, Bouvardia, Carnations, and others.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their prices, including Adiantum cuneatum, Asparagus plumosus, Berberis, and others.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various potted plants and their prices, including Ampelopsis, Aralia Sieboldi, Aspidistra, and others.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples (Nova Scotia), Lemons, Nuts, and others.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Asparagus, Beans, and others.

REMARKS.—American Apples continue in good demand, with increased supplies. The trade for Newtowns has improved, and prices are slightly firmer. There are only a few varieties of English Apples selling, the principal sort being Cox's Orange Pippin. Oranges are selling well, but the quantities arriving are much below the average at this season. Lemons are in good demand. Muscat Grapes, packed in bundle baskets, sell readily. The Grape trade generally is slightly improving. A consignment of Pears of very fine quality arrived from Russia last week, and the fruit was sold for good prices. Vegetables are selling freely. E. H. R., Covent Garden, Wednesday, December 7, 1909.

Potatoes.

Table listing various potato varieties and their prices, including Bedford, British Queen, Epicure, and others.

REMARKS.—There is no great demand for tubers except for those of best quality. Prices remain about the same as those of last week. E. H. R., Covent Garden, December 1, 1909.

COVENT GARDEN FLOWER MARKET.

The trade in cut flowers has been a little better during the past week, yet it cannot be recorded that there has been any great advance in prices. The bad weather has, to a great extent, checked the demand. The Chrysanthemum growers complain of "damping" in their flowers, yet remarkable bright, fresh blooms are seen in the market. Large specimen blooms are not so much in demand as medium-sized flowers on long stems. The

decorative varieties, also singles, gain in favour. They are better grown, and marketed in a more attractive manner than formerly, and consequently make better prices. Incurved varieties are also in favour. The green-flowered variety sells well, and makes higher prices than most of the others, but there is a limited demand. Roses vary; the weather has been unfavourable for their development. Prices for the best flowers have advanced; the supplies of Roses from France have decreased. Carnations have advanced in prices; they are now almost entirely confined to the American section or English varieties raised from that type. Liliuns fetch good prices and L. longiflorum is scarce. L. lancifolium is dearer. Lily of the Valley, which was over plentiful in the previous week, is not seen in such large quantities. Violets are good and plentiful. Paper White Narcissus, also N. Soleil d'Or, is selling well.

POT PLANTS.

Erica byemalis is well developed; E. gracilis is good, also the white variety "nivalis." Of Chrysanthemum, the variety innum is one of the best whites. Esme Read has also been very good. All sports from Caprice du Printemps make good pot plants. Begonia Gloire de Lorraine is more in demand, and several growers are sending in well-flowered plants. Cyclamen and Solanums are much better than they were a few weeks ago, but there may still be seen some that are inferior.

The trade for foliage plants has improved a little, and during the next week buyers will be purchasing for Christmas orders. Holly, Mistletoe, and Christmas trees (Spruce Firs) are already in the market. A. H., Covent Garden, December 1, 1909.

THE WEATHER.

THE WEATHER IN WEST HERTS.

A change to milder weather.—After a fortnight of cold weather there came a change to warmer conditions on October 28. That this change was a very marked one is shown by the fact that on the coldest night the exposed thermometer registered 11° of frost, whereas three nights later the same thermometer never fell below 41°—a difference of 20°. The ground temperatures have risen but are still 2° colder than is seasonable, both at 1 and 2 feet deep. Half an inch of rain has fallen during the week, but previous to October 27 the weather had been perfectly dry for ten days. After six days, when there was no measurable percolation through either of the soil gauges, the percolation through both of them was restarted on October 23. The sun shone on an average during the week for 1 1/2 hours a day, which is about the average duration at this period of the year. On four days no sunshine at all was recorded. Light airs and calms prevailed for the first three days, but since then the wind has been rather high. For the first time for three weeks the winds have come from some southerly point. There was about a seasonable amount of moisture in the air at 3 p.m.

NOVEMBER.

An exceptionally cold, dry and sunny November.—During the last twenty-four years there have been only three Novembers as cold. The most noteworthy feature of the month as regards temperature, was three weeks of cold weather, which lasted from the 6th to the 27th, during which period the mean temperature was on only one day above the average. On the warmest day the temperature in the thermometer screen rose only to 55°—which is with four exceptions the lowest November maximum reading I have recorded here. On the coldest night the exposed thermometer showed 15° of frost—which is in no way remarkable. Rain fell on only ten days, and to the total depth of less than an inch, or less than a third of the average quantity for the month. There have been here only six drier Novembers in the last fifty-three years. On the 14th a good deal of snow fell for the time of year, but only for a very short time was the ground completely covered. The sun shone on an average for two and three-quarter hours a day, or for an hour a day longer than is seasonable. In only one of the last twenty-four Novembers has there been a longer duration of sunshine. The winds were, as a rule, of about average strength, and in the windiest hour the mean velocity only amounted to 18 miles—direction west. The mean amount of moisture in the air at three o'clock in the afternoon exceeded a seasonable quantity for that hour by 3 per cent.

THE AUTUMN.

A remarkably cold autumn.—Taken as a whole this was a very cold and rather dry autumn. There have been only four colder autumns during the last 24 years, yet one of the three months (October) proved remarkably warm, and was also very wet. The mean duration of sunshine was rather short of the autumn average.

OUR UNDERGROUND WATER SUPPLY.

Since the winter half of the drainage year began in October the rainfall has been about average for that period. Last year at the same time there was a deficiency of 66,500 gallons per acre. E. M., Berkhamsted, December 1, 1909.

CATALOGUES RECEIVED.

- JAMES DICKSON & SONS, 16, Hanover Street, Edinburgh—Fruit Trees and Roses.
HOGG & WOOD, Coldstream and Duns, N.B.—Nursery Stock.
FOREIGN.
VILMOIRIN ANDRIEUX, ET Cie, 1, Quai de la Mégisserie, Paris, France—Seeds of Trees and Shrubs; Slow and Greenhouse Plants.
BOY ARBOR CHEMICAL Co., Paterson, N.J.—Dry and Liquid Non-Arbor Soluble Plant Life, also Radix Wound Eradicator.
DAMMANN & Co., San Giovanni a Teduccio, near Naples, Italy—Seeds.

LAW NOTE.

WATER SUPPLY FOR A NURSERY.

A CASE of interest to horticulturists, and having relation to the cost of water supply for nurseries, was discussed before his Honour Judge Bray at Brentford County Court on the 26th ult. It arose from the terms of agreement under which Mr. Joseph Darby, a nurseryman, became the tenant of about three-eighths of an acre of land at Twickenham. One clause therein provided that the amount of the water rate should be deducted from the rent, and stipulated that there should not be any waste of water. The landlord now sought to recover rent, allowing only, in deduction, an amount, estimated at 33s. per annum, which would have been chargeable as a rate for a domestic supply, and he further asked for a judicial declaration that that was the true interpretation of the clause.

On the contrary, Mr. Darby, whose water supply is regulated by meter, contended that he was entitled to deduct from his rent the amounts he was charged for water. It was stated that in six years those charges reached £65 12s., and that in the Michaelmas quarter they exceeded £9, while the gross rental for the three months was only £10.

For the plaintiff, who declared that, in any event, an excessive quantity of water had been used, bringing defendant under the stipulation that there should not be any waste, evidence was given by Mr. William Bates, a market-gardener, and Mr. Charles Philip Brookhouse, a nurseryman, both of Twickenham.

Mr. Darby denied that he had used more water than was necessary, and produced figures showing that the daily average was only half a pint to the square foot of the land, upon which there were eight glasshouses. He added that, by reason of the ground being drained into four wells, from which was obtained the water supply for some adjacent dwelling-houses belonging to the plaintiff, the quantity of water required for nursery purposes was larger than would otherwise have been the case.

His Honour remarked that the case had been complicated by the plaintiff's acceptance, without appeal, of an adverse judgment given by a deputy judge in proceedings of a similar nature some years ago, and his subsequent acquiescence in the defendant making the deductions accordingly. Judgment was reserved.

Obituary.

WILLIAM NEVE.—The death, at the age of 56 years, of Mr. William Neve, Groombridge, took place suddenly at Hastings on Monday, November 22. Mr. Neve had been staying at Hastings, and was walking to the station in order to return home when he was taken ill in the street and died almost immediately. Mr. Neve, with his brother, Mr. Albert Neve, was in business as a nurseryman at Hollamby's Nurseries. Over 40 years ago he entered as a boy the nurseries of Mr. Edwin Hollamby, and on the death of Mr. Hollamby some 15 years ago, Mr. Neve and his brother took over the business. The funeral took place at Eridge Church on Saturday, November 27.

WILLIAM GEORGE MARTIN.—We regret to record the death of William George Martin, which occurred at West Green Gardens, Winchfield, Hants., on November 25. Deceased has held appointments as head gardener and bailiff in Dorsetshire, Hertfordshire, Rutland, Essex and Hampshire. His father was for many years head gardener near Southampton, and his brother, C. E. Martin, is head gardener at the Hoo Gardens, Welwyn, Herts. The funeral took place at Mattingly Churchyard, Winchfield, Hants. Among the flowers sent was a beautiful wreath from his employer, the Duchess of Wellington. Deceased leaves a widow and family. One of his sons will succeed him as gardener and bailiff at West Green.

ENQUIRY.

AUSTRALIAN MYRTLE.—Can any reader give me the botanical name of an Australian shrub which grows freely in the gardens round Falmonth, and is locally known as Australian Myrtle. *Austral English*, a dictionary of Australian words, by Professor Morris, states that, among others, *Myoporum serratum* is known locally as Native Myrtle. Mr. S. W. Fitzherbert, in an article on the Trebah Garden (*Flora and Sylva*, vol. ii., p. 354), mentions *Myoporum laetum* as growing there, so I am inclined to believe that the Australian Myrtle is the latter plant. The plant I mean grows, I know, in the next garden to Trebah, and I think I saw it also at Trebah. *C. W. F.* [Mr. Fitzherbert informs us that, in the western counties, *Myoporum laetum* is known as the Australian Myrtle. It may be pointed out, however, that in Miller's *Dictionary of English Names of Plants* (p. 91) the Australian Myrtle is stated to be *Acmena floribunda*.—Eds.]

Editors and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the *Publisher*; and that all communications intended for publication, or referring to the literary department, and all plants to be named, should be directed to the *Editors*. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

* * * *The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.*

CYANIDING TO DESTROY MEALY-BUG: *West Sussex.* It is not essential to have a special machine for cyaniding plant-houses, but the work can be performed much better and with greater safety if one is used. We have seen a house successfully cyanided by means of ordi-

FIG. 171.—A SIMPLE APPARATUS FOR CYANIDING PLANT-HOUSES.

nary wine bottles and enamelled iron or earthenware pans. The sodium cyanide was placed in the pan and the acid in the bottle, which was tilted above the pan (see fig. 171). A string attached to the wooden support led through the keyhole of the door, and when everything was in readiness the operator went outside, locked the door, pulled the string, and the acid flowed into the pan below, causing the fumes to be given off. At or about pruning time, when the vines are quite dormant, for the destruction of vine-scale, mealy-bug, red spider, &c., two cyanidings should be given at intervals of 24 hours of 2½ ounces sodium cyanide, 5 fluid ounces sulphuric acid, 15 ounces water, exposure 50 minutes, temperature of house 50 to 55 degrees.

BEGONIAS AT KEW GARDENS: *A. T.* The Begonia house at Kew contains very many species and varieties of Begonia, so that it is difficult to know exactly to which you refer. We have noticed some decorative plants of the variety President Carnot, and perhaps this is the one to which you refer. The Kew collection also includes the beautiful hybrid winter-flowering

Begonias raised by Messrs. Jas. Veitch & Sons. These Begonias are highly decorative, most floriferous, and last in bloom for a long period.

CELERY: *W. G. J.* The wild Celery is *Apium graveolens*, the parent of all the cultivated Celery. It grows in marshy places by the sea, and near the shores in England and Ireland. In Hooker's *Student's Flora of the British Isles* one habitat is given in Scotland for this species, this being Cantire. The plant flowers naturally from June to August. As you want it for wild-fowl, we presume that the situation is near to water, in which case you will probably find little difficulty in cultivating the plant. A stock could easily be raised from seed obtained from wild specimens.

FELLOWSHIP OF THE ROYAL HORTICULTURAL SOCIETY: *T. S.* Anyone interested in horticulture is eligible for election as Fellow of this Society. Candidates for election are proposed by two Fellows of the Society. Forms for proposing new Fellows may be obtained from the Society's offices, Vincent Square, Westminster, S.W. A Fellow who subscribes only one guinea a year is required to pay an entrance fee of £1 1s., but bona fide gardeners earning their living thereby, and persons living permanently abroad, are exempt from the payment of the entrance fee. Associates who subscribe 10s. 6d. a year must be bona fide gardeners, or employés in a nursery, private or market garden, or seed establishment, and must be recommended for election by two Fellows of the Society.

FROSTING HOLLY: *R. J.* The leaves are usually dipped into some adhesive liquid such as that known as liquid glue, and the silvery material is then dusted over them while they are still wet. A suitable glue may be made with three parts gum shellac and one part india-rubber. Dissolve these materials in separate vessels in pure ether, and when they are thoroughly dissolved mix them together. If the fluid is too thick, it can be thinned down by adding more ether. Another solution can be made with equal parts of oil of turpentine and copal black; a third and perhaps the simplest method is to dip the leaves in a very thin solution of gum Arabic, sprinkling the silvery material on as before.

HIPPEASTRUM ROOTS: *J. A.* The white flocculent substances which you mistake for a fungus are insects allied to mealy-bug. Carbon bisulphide will destroy them; make holes in the soil with a stiff piece of wire, and pour into these a teaspoonful of the liquid. When the roots are bare of soil during the repotting process give them a good washing in warm water.

NAMES OF FRUITS: *Mrs. Sharman.* The Apple is Dumelow's Seedling, known in many gardens as Wellington. It is one of the very best late-keeping, cooking Apples.—*Lorraine.* 1, Nonesuch; 2, Gravenstein; 3, Beauty of Kent; 4, General Todleben; 5, Léon Leclerc; 6, Beurré d'Anjou.—*H. L.* We cannot name the Grapes from the few berries received. We suggest that you should forward a typical bunch of each variety, with a leaf or two, to the Royal Horticultural Society's Fruit Committee.

NAMES OF PLANTS: *Constant Reader.* We cannot undertake to name varieties of *Chrysanthemums*.—*Foreman.* 1, *Pracena terminalis*; 2, *Oncidium flexuosum*; 3, *Plenothallis picta*; 4, *Oncidium barbatum*; 5, *Odontoglossum Lindleyanum*; 6, *Dendrobium moniliforme*.—*A. E. P.* *Cypripedium apiculatum* (*Boxallii* × *barbatum*).—*H. A. S.* 1, *Pteris Childsii*; 2, *Nephrolepis rufescens*; 3, *Asplenium bulbiferum*; 4, *Davallia platyphylla* (*Microlepia*); 5, *Nephrolepis tuberosa*; 6, *Nephrodium molle*.—*H. E. P.* A good yellow form of *Cypripedium insigne*.—*J. F. M.* 1, *Begonia argentea*; 2, *Begonia Evansiana*; 3, *Campanula variegata*; 4, *Campanula isophylla*; 5, *Campanula fragilis*; 6, *Begonia Ingramii*; 7, *Sedum Sieboldii* variegata.

MADRESFIELD COURT.

(See figs. 172, 173 and 175, and Supplementary Illustration.)

THE Madresfield Court Grape has obtained such world-wide distinction that it has invested the home of its birth with a peculiar interest to horticulturists.

Madresfield Court is the Worcestershire residence and property of Earl Beauchamp. It is distant from Worcester about seven miles, and from Malvern Hills and town three miles. The nearest station, Malvern Link, is about two miles away. Few English homes are situated in pleasanter surroundings, for not many counties are so beautiful or so richly clothed with trees as is Worcestershire. Giant Elms are so common that the term "Worcestershire weeds" is frequently applied to them. In the home park and plantations at Madresfield some magnificent specimens of Oak and other forest trees are to be seen. One Oak which I examined measured 16 feet in girth of trunk at 5 feet from the ground, and had a spread of branches of about 98 feet. Those who have seen the many hun-

dreds of acres of Worcestershire orchards in full blossom in spring or laden with fruit in autumn, or the delightful sight of the hop-fields are not likely to forget the pleasant impressions created by these homely scenes of English rural industries. It is amongst such scenes as these that Madresfield Court is situated, but, as if these charms were not enough to invest the situation with an absorbing interest and beauty, there is on the west side, in close proximity, the glorious range of the Malvern Hills, towering high in majestic and

show their hoary beauty. The other climbers include Rose Felicite-Perpetue, Wistaria, Fig, Pomegranate, Olive, Bay, Clematis in variety, Ampelopsis, Abelia, blue Hydrangea, Escallonia langleyensis, and Jasminum. The view of the house also includes a glimpse of one of the most delightful old-time gardens I have seen. Instead of the orthodox gravel walks, there are stepping-stones or flags laid down irregularly to serve as walks between the flower-beds. [See supplementary illustration]. The soil between the stones is planted

FIG. 172.—MADRESFIELD COURT: THE STEPPING-STONE GARDEN.

(See p. 390, col. 10.)

lonely grandeur and forming a background of rare and impressive beauty to the picture.

The Court, as may be seen from the illustration in fig. 175, is a moated, creeper-clad, delightful old mansion. On the side depicted in the illustration the walls are clad with the Espiran and Muscadine vines, these varieties being well suited for wreathing windows with tints of light green in summer and warm gold and crimson in autumn, and yet to give the old bricks and stones a chance in winter to

with low-growing or sweet-smelling plants, including the following:—Saxifraga, Sempervivum, Antennaria, Thymus, Veronica repens, single Indian Pinks, Cheddar Pinks, Ionopsidium acule, Arabis, Anubria, Iberis, Thrypt, and Gentian. The beds in this garden are planted with such plants as Lavender, Rosemary, and Santolma, with groups of Lemon-scented Verbena (Aloysia citrodora), Heliotropes, Stocks, Tea and other Roses. Having viewed the garden from

beneath the windows of the private chapel. I retraced my steps and passed out through the front door facing the south-entrance carriage drive. This drive is flanked on either side by broad lawns, on which is planted a choice collection of rare and distinct Conifers, all glaucous or golden specimens. As they have been planted for a considerable number of years, it may be presumed that they are perfectly hardy. The names of the best of them may be useful to those contemplating the planting of trees for lawn effect:—*Picea pungens glauca*, *Pseudotsuga Douglasii glauca*, *Tsuga canadensis*, *T. pattoniana glauca*, *Thuja orientalis elegantissima*, *Cedrus atlantica glauca*, *C. atlantica aurea*, *C. Deodara aurea* (perhaps the finest specimen in the kingdom). It is 20 feet in height and 10 feet in diameter, a perfect specimen with an elegant, drooping habit and of a rich golden colour. *Cryptomeria elegans*, *Cupressus pisifera var. filifera aurea*, *C. Lawsoniana lutea*, *C. Lowii*, *C. macrocarpa lutea* (20 feet high), *Juniperus chinensis aurea*,

of late years, and made to appear more in harmony with the age and surroundings of the Court. The top part of it consists chiefly of sections divided by Yew hedges and scalloped out rather low in the middle, so as not to hide the flowers or the view of the home park beyond from the windows of the Court. Each of these sections form a miniature garden of itself, with beds of flowers formed on turf. Most beautiful they were when I saw them, each one disclosing some particular charm of its own. They were planted chiefly with tuberous-rooted *Begonias*, *Salvias* (blue and red), *Calceolarias*, *Verbenas*, and *Heliotropes*. A statue of Mercury stands in the centre of the garden, rising from the middle of a large basin of water, in which were growing hybrid Water Lilies.

On the side of the flower garden facing the part of the Court illustrated is a sunk terrace, extending the length of the flower garden, by the side, and level with, the water of the moat. Against the retaining wall of this terrace a border is planted with a choice collec-

tion of "Perpetual" Rose garden, backed by a Lime pergola semi-circular in shape. A short distance from this is a garden for choice bulbs which refuse to thrive in the grass; here there are grand masses of *Anemones*, *Ranunculi*, *Montbretias*, *Hyacinthus candicans*, and *Darwin* and *Cottage Tulips*, arranged in successional order; the curved walk of this garden has a border 3 feet wide of *Gentiana acaulis*, whose rich, blue flowers produce a magnificent effect. Then we come to the stepping-stone valley garden (see fig. 172), where, between each stone, a different variety of plant is found. On the water's edge many new and highly-interesting water-loving plants are to be found, and in larger openings here and there masses of bog plants, such as *Primula capitata*, *P. japonica*, *P. cashmeriana*, *Senecios*, *Cypripediums*, *Gunneras*, *Lilium giganteum*, *Iris Kämpferi*, the late Sir Michael Foster's hybrid *Irises*, and hardy Ferns innumerable.

I next passed to higher ground, passing, on the way, a bank devoted to *Saxifragas*, *Sempervivums*, hardy Pitcher plants, planted between stones. After leaving a grand collection of *Michaelmas Daisies*, growing in grass, I came to the spring garden, where all the choice hardy and half-hardy bulbs are cultivated, specially prepared pockets on the side of a valley being provided for many of them. Passing through a portion of the kitchen garden under pergolas of Pear trees and Loganberries, I reached the Peacock garden, laid out in fan-shaped, box-edged beds and planted alternately with Tea Roses and Carnations (see fig. 173), including true tree-varieties. Next is the wild garden, planted with masses of strong-growing plants, including large breadths of *Kniphofias*, *Rudbeckias*, *Hollyhocks*, *Campanulas*, *Valerians*, *Polygonums*, *Delphiniums*, *Anemone japonica*, *Yuccas*, *Papavers*, &c. Whilst crossing the cascade at the head of the stepping-stone garden I noticed splendid masses of the Royal Fern (*Welsh Polypody*), and saw *Saxifraga pedata* being splashed by the falling water. Here *Hydrangea* bushes were bearing lovely trusses of pure Forget-me-not blue flowers, the admiration of all who saw them. The secret of inducing them to come of this colour lies in getting a particular soil from North Wales, where the *Hydrangeas* always produce blue flowers. Owen Thomas.

(To be continued.)

FIG. 173.—MADRESFIELD COURT ROSE GARDEN WITH FAN-SHAPED BEDS.

J. c. albo-variegata, *J. drupacea*, *J. neboriensis* (syn. *macrocarpa*), *J. virginiana aurea*, *Retinospora plumosa aurea*, *R. pisifera aurea*, *Thuja gigantea aurea*, *Thuja occidentalis argentea*, and *Sciadopitys verticillata*.

After standing near the entrance doorway, looking towards the drive and the Conifers, I turned to the left and came in full view of the moat, the flower garden, and of the glorious landscape of the home park and trees beyond. A moat in itself cannot be termed artistic or beautiful, but here its banks are clothed in summer and autumn with a wealth of bloom which can be better imagined than described. The sides next to the Court have Dorothy Perkins and other similar weeping Roses planted in huge masses, wreathing the banks of the moat to the water's edge with brilliant colour, the side next the flower garden being planted in a similar way with other procumbent flowering plants.

The flower garden has been reconstructed

tion of hardy herbaceous and annual plants, the wall itself being draped with climbing Tea Roses and Clematis in variety, among the former are Bardon Job, Mrs. W. J. Grant, W. A. Richardson, and Mme. Alfred Carrière. On the walls of the terrace and on the stately steps which communicate with the upper garden, handsome vases are placed, containing in summer-time pink, ivy-leaved *Pelargoniums*. I saw them in glorious bloom, and, with the Rose-embowered banks of the old moat, the herbaceous border on the terrace, and the climbing Clematis and Roses on the wall, they presented, from the windows of the Court and from the terrace, as gay and beautiful a garden picture as heart could wish or mind conceive.

I must mention a few of the many distinct flower gardens which adjoin the pleasure grounds, and which are nearly hidden from view by splendid Yew hedges, of which there are miles at Madresfield. The first is near the centre of the Cedar avenue, and is an old "Hybrid

BRITISH COLUMBIA.
CORNUS NUTTALLII.
THIS attractive, deciduous tree flourishes amongst the dense growth of Conifers on the Pacific coast in British Columbia. It is common in this district of Vancouver Island, being most frequent on rocky hills and on open spaces caused by forest fires, though it often grows with lessened vigour in the deep shade of the Firs.

This *Cornus* is very hard to kill; even forest fires do not subdue it; for, in the year following after a fire, vigorous shoots will spring from charred crown and roots and grow up 5 or 10 feet, fresh and green.

It is in early May that the tree is most conspicuous; then the five or six pointed white bracts, surrounding the disc of flowers, often 4 inches across, cover the tree from top to bottom like a huge, many-branched candlestick, and look incongruous amongst the sombre Firs.

It is so conspicuous an object here when in flower, that even the ordinary settler respects it and knows its name, sparing it where he can in his clearing operations. In autumn the forest is lit up by the glow of its pale yellow and bright scarlet leaves, which last until knocked off by the torrential autumn rains for which this district is noted. *Cornus Nuttallii* often breaks again into flower in October, though not all over the tree. The tree frequently attains to a height of 50 feet. R. Glendonning, *Somerset, Vancouver Island, B.C.*

A MARKET FRUIT-GROWER'S YEAR.

THE dryness of November enabled fruit-growers to clear up a large portion of the arrears of work that should have been done in October, as well as to make good progress with that proper to the month. At my station, only a little over half an inch of rain fell up to the evening of the 27th, when the dry period came to an end. In some parts of the country there had been falls of rain or snow much more frequently than in my neighbourhood; but, generally, the month was an exceptionally dry one. It was remarkable also for much more frost than is common in November, and the extreme severity of 10° to 20° below freezing point, reported from some parts of Scotland on two or three occasions, was phenomenal for the time of year, the unfortunate result being the freezing of a large acreage of Potatoes which were in the ground.

FRUIT PLANTING.

This operation was, most fortunately, facilitated by the dry weather, so that much planting was done in the best of all months for the work. Frost hindered progress everywhere for a few hours on every morning in the latter part of the month, and, possibly, for some whole days where it was most severe; but the interruption was less than would have been caused by rainy weather. The tremendous rainfall of October had solidified the land which had been ploughed and subsoiled just before the wettest period began, so that the soil taken out in digging holes for trees turned up in a "clung" condition. In the case of a heavy soil, this was a disadvantage from the point of view of planters generally, though not from the Woburn ramming and puddling standpoint. In my own case, the lumps of consolidated loam broke finely enough when trodden over the roots, and rendered firm planting, in which I believe—though not in puddling—easier than it would have been if the field had been a mass of dry mould to the depth of a few inches. Not half the leaves were off the Apple trees when the work began, and not nearly all off some varieties up to the end of the month; but this is not of much (if any) consequence where the trees are planted immediately after being dug up.

A PLAN OF PLANTING.

Perhaps a description of the plan of planting which I have carried out for some years, and by far the best of the methods I have tried, may be of interest to some readers. It is in course of being applied to the 6½ acres of land for Apples and Black Currants referred to a month ago. After the land had been ploughed and subsoiled, before the wettest part of October set in, it was allowed to remain untouched for three weeks, to allow of the germination of weed seeds. As soon as it was dry enough, after November began, it was harrowed up and down and across, and marked out for planting. The marking was done with a ridging plough, without its breasts, and with a marker attached similar to that used for marking Potato ridges, but, of course, longer. For a start, a row of canes was set up and carefully sighted. Along this row the plough was driven to make the base line, marking the line to be followed by the plough in returning, and so on until the whole field was marked in one direction. Then the same process was repeated in the transverse direction, at right angles to the base line. The distance between the lines was 6 feet, the best to allow where horse cultivation is to be carried on up and down and across the field. Where the two sets of marks intersect each other are the places in which trees or bushes are to be set, in this case Apples and Black Currants, the former 12 feet apart and the latter 6 feet each way. Or, to be precise, the Apple trees are 12 feet apart up and down the tree-and-bush rows, and a few inches more transversely, as they are angled, a tree in one row being placed opposite to a bush in the next tree-and-bush row. It will be understood that there is a row of bushes alone between each pair of

tree-and-bush rows. Each tenth row, one of bushes only, is omitted throughout the field, in order to leave a set of roadways, which are a great convenience and saving of labour when manure has to be carted into the plantation and distributed, or when spraying is carried on with any machine other than a knapsack, or when fruit has to be carried off.

Into each cross-mark for a tree a stake is driven, the hole being afterwards dug around it. The holes are not dug until the trees are ready to be placed in them, as it is a great mistake to follow the direction of writers who advise digging the holes beforehand, possibly to be half filled up with water by rain before the trees can be planted in them. The stakes are not over 3 feet above the ground level, that being the height of the stems free from branches, as the trees are trained to grow. Much harm is often done when stakes are high enough to be among the branches, through bruising or even cutting the latter nearly asunder, as the result of repeated chafing in windy weather. Three good stakes can be made out of a stout 14-foot 110 pole, allowing for 2 feet of waste at the small end. Living in a district where woodlands are extensive, I can buy these poles at 10s. per 100 in the woods, so that, allowing for carting, cutting, and sharpening, the stakes cost only about 5s. per 100. The stakes are creosoted or tarred about 13 inches from their points. Gas tar for this purpose is much cheaper than creosote. It is not so good; but, finding that the creosote cost about three-fourths as much as the stakes, its use was discontinued in favour of gas tar.

For protection against ground game, each tree is encircled with wire netting of 1 inch mesh, 13 inches wide, and cut in lengths of 18 inches, the cut sides being slightly twisted into each other.

When the trees have all been planted, the bushes are set in the intervening spots marked, except where roadways are to be left. There are then five rows of trees and bushes and four of bushes alone on each side of every roadway. Leaving the roadways does not reduce the number of trees to the acre.

DISTANCES IN PLANTING.

For Apple trees of free-growing varieties a greater distance apart than 12 feet is desirable; but where horse cultivation is to be pursued for a good many years after planting, no less space than 6 feet between one bush and another, or a bush and a tree is suitable, and the distance of one tree from another must be a multiple of 6 feet. There cannot be any variation to allow for the different growing habits of the several varieties, unless the free growers are allowed 18 feet, which is too much in my soil. Five feet would be enough distance for the bushes, but too narrow for horse cultivation after a few years, and that great means of economising labour and expense I regard as indispensable. It is done much oftener than hand-hoeing would be, and with much better effect. A field can be horse-hoed quickly when the weather is dry and sunny; whereas the slow work of hand-hoeing is often interrupted and its effect spoiled by rain. Again, there is hardly any treading behind the horse cultivator, and a great deal behind the hand hoe. Lastly, when horse cultivation can be done late in the autumn and early in the spring, the costly work of winter forking, or digging, as it is miscalled, can be dispensed with. It is true that the small spaces left by the implement around the trees and bushes have to be hoed by hand, but that work can be done at small expense.

DEPTH OF PLANTING.

The trees are planted at about the same depth below the level of the surface as they were grown in their nursery beds. The plan of planting them almost upon the surface of the soil and mounding them up with earth appears to me a very bad one, because the roots must be almost uncovered in a year or two by repeated hoeing, un-

less the laborious operation of throwing the earth back around them is pursued. The plan is recommended chiefly for wet land; but this should be drained properly, and then surface-planting will not be needed.

AGES OF TREES.

It is hardly necessary to say that two-year-old trees are preferred for planting. This season, however, I am planting some maidens also, because I have a great many of my own raising, and the nursery plot is to be cleared. It seems better to plant the strongest and tallest in their final quarters than to transplant them for planting out next year. In the latter case, they would have two checks to growth, as compared with only one check in the former. If they could remain where they are, it would be better to leave them standing till next year; but this is not allowable, because they would not properly occupy a quarter of the space over which they would be scattered after all the two-year-old trees have been taken from among them. In the previous plantation made, some maidens planted to fill up one side of the field (about a quarter of an acre) have done remarkably well, so that no one could distinguish them from those close to them which were two years old when planted.

HOME-RAISED VERSUS PURCHASED TREES.

In previous seasons, after the first, when planting was being done, there were sufficient trees raised on the farm for the land to be planted. This year, on the contrary, a few hundreds had to be purchased. The contrast between the two sets is a striking illustration of the superiority of home-raised trees to those purchased without selecting at a high price. The former have been trained from the first for trees to branch out from single stems at the height of 3 feet from the ground level, shoots competing with the leader having been cut off the maidens, while growths low down on the stems in the second season were cut off if gross, and stopped if feeble. In commercial nurseries, on the other hand, it is common to leave the young trees to grow as they please for the first season, and to prune them, if they are to be standards or half-standards, only at the end of it, the result being much loss of vigour to the leader from shoots competing with it. By this it is not meant that side shoots should all be cut off. On the contrary, it is necessary to let short ones grow to cause the enlargement of the stem, and it is only those which would divert too much sap from the leading growth that should be shaved off. Similarly, in the second season, the trees are commonly left feathered, the result being that the young branches at the top are not as vigorous as they would be if lower shoots had been cut off or stopped. It is true that trees trained as half-standards can be bought easily enough; but these would be on stems too high to suit me.

CHEAP TREES.

A small experiment in purchasing some cheap advertised trees is enough for a lifetime. They came from a very large nursery, and were found only fit for the rubbish fire, as they were stunted, nearly covered with fruit-buds, and almost devoid of vigorous wood-buds.

VARIETIES OF TREES AND BUSHES.

The Apple trees in course of being planted are chiefly dessert kinds and late cookers, mid-season varieties of cooking Apples being avoided because of the glut in the markets common at mid-season. Similarly with Plums, for which a piece of land, in extension of an old plantation, has been prepared, a very late variety, President, has been chosen. There is no kind like the Victoria for cropping, excepting the common Fenshore Egg Plum; but the prices when these two varieties are in the market are barely remunerative in a good season even for great yields. The earliest and the latest of all fruits, as a rule, pay best. The Black Currants are all of the variety Boskoop Giant, raised at home. *A Southern Grower.*

MODERN HEATING APPLIANCES FOR GREENHOUSES.

THE purpose of most recent improvements in the heating appliances used in greenhouses is to reduce the amount of attention they require. So serious are the results of inattention that a small increase both in first cost and in running cost is more than compensated by the better cultural results.

Heating by hot water still holds its own for greenhouse work, though there are signs that, in special circumstances, hot air, gas radiators may gradually be introduced, and, where the running cost is not of importance, electrical heating appliances are very suitable. For many purposes, electric radiators are almost the ideal sources of heat for greenhouses, and, in particular, the luminous electrical radiator, which, in addition to heating, furnishes light, may take an important position in greenhouse work in the future. But the great difficulty in connection with the development of heating by electricity for every purpose is the very heavy cost of the current. Electrical engineers claim that their apparatus is very efficient, that something like 95 per cent. of the energy furnished by the current appears as heat. This is correct; but, unfortunately, the cost of the current required to furnish a given quantity of heat is at least ten times that of gas and considerably more than ten times that of coal or coke. Electric radiators are of two forms: the luminous pattern, in which energy is furnished by large electric incandescent lamps, specially constructed for the purpose, and the non-luminous, in which the heat is furnished by a substance offering a high resistance to the passage of the current, and embedded in material which protects it from oxidation, the whole being enclosed in some ornamental casing. Both of these forms have been employed for heating what may be termed lounge greenhouses or conservatories, and those which form annexes to the living rooms of large houses. But the heating has been primarily for the comfort of those who used the conservatory as a lounge.

Practically the whole of the work of heating greenhouses commercially, using the term in its widest sense, is done either by stoves burning anthracite coal or coke, or by gas-heated appliances. The coal and coke-using appliances have been developed on two lines, both so designed as to render attention to them during the night unnecessary. In one form the boiler furnace itself is made of sufficient capacity to hold fuel lasting for 12 hours. In the other form the idea of the well-known, self-feeding, anthracite stove, so much liked in France, and so much used for domestic heating in America, has been developed. In this form of stove the supply of fuel is again sufficient to last for 12 hours, but the arrangement is different from that in the sectional boiler. In the sectional boiler, the quantity of fuel is made sufficient to last through the night, burning in the ordinary way. In the other forms of stove, the fuel is fed automatically to the furnace as it is consumed. There is usually a cylinder above the furnace, into which the fuel is put at night, and a small quantity of the fuel is fed downwards on to the grate bars of the furnace, as that which was there previously is consumed. The sectional boiler has also been developed with respect to cheap construction in two directions. It often happens that after a boiler has been put in the owner of the greenhouse makes extensions, or finds that he would like a higher temperature. Now, previous to the development of the sectional boiler, it was necessary to scrap the old apparatus and fix a new one. As its name implies, the sectional boiler is made in sections, exactly alike, and it is always possible, so long

as the original stove is in good order, to insert additional sections and so to increase the furnace and water capacities: each section, with the exception of the front and back sections, being complete in itself. A section contains the space for the water, its portion of the fire-bars, and of the bed-plate upon which the whole rests. To extend the boiler either front or back, or both, may be removed, an additional section or two, or more, put in, connected up, and bolted together again. Thus boiler and fixtures can be turned out much more cheaply, as so many parts are alike, and machines can be employed on them.

In the various sectional boilers the same principle is followed, viz., the space containing the water to be heated surrounds, or is surrounded by, the space in which the hot gases generated by the combustion of the fuel pass on their way to the chimney, and the difference in the construction of the different boilers is merely the difference between the methods adopted by different inventors and manufacturers to accomplish the same object, viz., to expose the largest surface possible of the water space to the action of the hot gases.

In gas-heated boilers the same principle holds good. The heating is performed by one of the usual ring burners, which work upon the Bunsen principle, and burn with a blue flame. It will be remembered that the Bunsen burner, with its blue flame, furnishes a very much larger amount of heat than the white or yellow flames which issue from the ordinary burner. In the case of both coal-heated boilers and gas-heated boilers, it is the hot gases which are formed by the combustion of the fuel which heat the water. When the carbon in coal or coke burns, and when the gases in ordinary illuminating gas burn, carbonic acid gas and water vapour are formed. The gases remaining after combustion are heated to a very high temperature, and made to pass, by somewhat tortuous paths, over the surfaces behind which the water that is to be heated is lying. In their passage they give up much of their heat to the water, the remainder being carried up the chimney. The design of all boilers is arranged to check the passage of the hot gases to the chimney, so far as it can be done without checking the combustion unduly, so that the gases may be made to part with the maximum amount of their heat. The forms of gas-heated boilers vary; but in all cases there are pipes and spaces carrying the water, and the hot gases circulate in the spaces surrounding the pipes, the whole being enclosed inside an iron case. The iron case carries a chimney, just as a coal fire boiler does, and there are the usual inlet and outlet connections to the water space. The pipes are arranged either in the form of a coil or are fixed across the body of the enclosing case, or the two methods are combined.

The hot air, gas-heated radiator mentioned above is intended to be placed in the greenhouse itself. On behalf of the gas-heated hot-water radiator it is claimed that complete combustion of the gas is obtained within the apparatus. The arrangements for combustion in the different forms vary, in one form ordinary white flame burners are employed, and in another a Bunsen burner is used. In both cases the products of combustion are made to take a somewhat tortuous path on their way out into the space to be heated, and are subject to the action of bodies of hot metal, heated, in the first place, by the burning gases themselves. It is stated that the hot air which issues from the stove into the surrounding space contains only air and a small percentage of carbonic acid. The great danger in connection with the use of stoves of that kind is, of course, the possibility of unburnt gas passing into the greenhouse. As usual, it is a question of care. The writer believes that so far these stoves have not been used to a large extent, but it is possible that as they are better understood they will come into more general use. *Sydney F. Walker.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT GLEBELANDS.

THE collection of J. Gurney Fowler, Esq., at South Woodford (gr. Mr. J. Davis), gives a very instructive example of successful Orchid cultivation in the neighbourhood of London. From the first year that the present Chairman of the Orchid Committee of the Royal Horticultural Society seriously commenced to form a collection of Orchids, not only have the extent and value of the collection increased, but also the condition of the plants, until at the present time the collection is a model one. Many useful ideas may be gained at Glebelands in respect to the internal fittings of the Orchid houses, and in the culture of some reputedly difficult plants, notably *Eulophiella Elisabethæ* and *E. Peetersiana*, which thrive admirably in the warm-house. *E. Peetersiana* is in baskets suspended from the roof, a position which, in some degree, may contribute to the success, for those who fail to grow the plant successfully usually have it in pots placed on the staging.

The absence of damaged pseudo-bulbs and leaves, so noticeable throughout the whole collection, allows the stout pseudo-bulbs and bright green leaves to appear to the best advantage. This is due to removing all old pseudo-bulbs which are detrimental to the general health of the plants, and is a practice which might be carried out in many other collections with advantage. It is done periodically, but especially at repotting time.

Osmunda fibre is considered of great value as a potting material for epiphytic Orchids, but a small proportion of leaves and of Sphagnum-moss is added for many kinds. In the large intermediate houses is a very fine selection of handsome hybrids and rare varieties. Among those recently in bloom were the original *Brasso-Lælia Digbyano-purpurata* King Edward VII., with very beautiful, white flowers, the fringed lip being brightly coloured with rosy-mauve; and a richly-coloured variety of another pretty Veitchian hybrid, *Lælio-Cattleya Ilione*, with brighter flowers of better shape than any of its class in bloom at the time. *L.-C. Haroldiana* had bronzy-orange sepals and petals, and ruby-crimson lip. *Phaio-Cymbidium* Chardwarensis, *Scuticaria Steehi*, with its pendulous rush-like leaves and large yellow and red-brown flowers; *Brasso-Cattleya* Mme. Chas. Maron, with large white and rose flowers, were all in bloom, and a good number of fine hybrids were in bud.

In the *Cypripedium* houses a great number of handsome varieties were in bloom, and an equally large number in bud, among the latter being the remarkable *C. Leeanum* J. Gurney Fowler, which promises to show itself at its best; *C. Ernest Read*, whose flowers are of the largest and best in form; and *C. Thalia* Mrs. Francis Wellesley, which has developed from a very small plant into a strong specimen. Among the best of those in flower were *C. Ville de Paris*, a shining yellow flower with a spotted dorsal sepal; *C. Memoria Jerninghamie*, also a large and darkly-coloured flower with a glossy surface, and a clear white upper half to the dorsal sepal; *C. Tityus superba*, *C. triumphans*, and *C. Milo Cobb's* variety; *C. Actæus* Fowler's variety, a very charming flower; varieties of *C. Prospero*, *C. Fowlerianum*, of fine shape and rich colour; *C. Troilus*, *C. optima*, with a fine white dorsal sepal spotted with rose; *C. Aeson giganteum*, raised and flowered by Messrs. Veitch some years ago, but still the best of its class; varieties of *C. aureum*, *C. Enryades*, *C. Leeanum*, *C. nitens* Glebelands variety, a large and finely-marked flower; *C. F. K. Sander*, in great vigour, and a large number of other rare varieties.

In the cool *Cypripedium* house one side was thickly studded with the blooms of all the best forms of *C. insigne*, including a good batch of that best of all yellow varieties *C. i. Sanderæ*;

and the largest, C. i. Harefield Hall. C. isaque Fowlerianum had a fine dorsal sepal with dark blotching on the lower half, and rose spotting on the white upper part. On a shelf in the same house were seedling Odontoglossums, and in a warmer house a very fine lot of seedling Lælio-Cattleyas, Cattleyas and other Orchids, including a few *Acrides* and *Vanda* crosses.

In the *Odontoglossum* house there are more rare varieties than ever, especially of the blotched forms of *O. crispum*, including the varieties *Fowlerianum*, Mrs. J. McBean, and some of the rare hybrids, many of which were in bud, but only a few in bloom. At the end of the house a batch of *Masdevallia tovarensis* was covered with their snow-white blooms, which contrasted effectively with the varieties of *M. coccinea*, *M. Schlimii*, *Oncidium Forbesii*, *Sophranitis grandiflora*, &c., in flower beside them.

Each of the other houses contained healthy specimens, some of them being in bloom. In one house many tall spikes of *Zygopetalum Mackayi* were observed, and in the same house, in a shady situation, some very strong plants of *Miltonia Warszewiczii* were developing stout spikes. In another little group were the orange-coloured *Lælio-Cattleyas* *Cappeli* with the scarlet *Sophranitis Doris* and the rosy-mauve *S.-C. eximia*. In a warm-house the hybrid *Calanthes*, principally *C. Veitchii superba*, were commencing to make a good show. In another house *Lycaste Skinneri*, the graceful *Cymbidium erythrostylum* and others were in bloom. The varieties of *Lælia anceps*, suspended from the roof of a lean-to house, the back wall of which is covered with *Epidendrum O'Brienianum*, *E. Boundii* and *E. radicans*, were developing flower-spikes.

Plants of *Miltonia Roezlii*, potted in *Osmunda* fibre and *Sphagnum*-moss, with a sprinkling of leaves, and kept moist in a sheltered corner of the house, have become very strong and will flower well. Formerly they did not succeed.

THE DREI ZINNEN RIDGE.

I KEPT my greatest expedition for my last day at Misurina. The Drei Zinnen do not look very far away from the end of the lake, but there is seen to intervene, on second glance, a suspicious gulf between the woods and those three great naked peaks. Fortunately, however, that valley does not really isolate the Drei Zinnen, but forms a cul de sac at the back of the *Cadinenspitze*, where a long ridge connects the two mountains.

Level and luxuriant at first goes the way, until you lose it. It runs through woodland, among *Atragenes* and trifoliate *Anemones*. Then mounting higher, it comes into more open places, sunny and marshy, where for the first time this year I came on *Gentiana bavarica*, shining among wide stretches of *Primula farinosa*. Here the path ends in bog, or, at least, I lost sight of it. It was only after weariful wanderings up and down that I at last struck it again, mounting stilly over a shoulder called the *Tre Croci di Rimbianco*. As a matter of fact, there are now only two crosses—and poor specimens at that.

Here, however, the ground becomes more promising to the collector. For now we are in the high valley between the Drei Zinnen and the *Cadinenspitze*—wandering along the stone slope. At the ghastly, ruinous back of the latter mountain *Rhodothamnus* abounds, *Papaver rheticum* in great glory, *Iberidella* in sheets of harmonious pink among the coarsest white detritus, and the *Saxifrages casia* and *squarrosa* in their usual promiscuity.

Thus one reaches the end of the valley, where it is closed by the tiered ranges of the ridge that connects the Drei Zinnen with the *Cadinenspitze*. One crosses a little meadow all a rosy fire of *Silene acaulis*, growing in mats among the grass; and so, over stony banks bestarred with *Dryas*, one mounts arduously towards the highest shingles at the foot of the Drei Zinnen. In successive flights the ground rises—stony slope and grassy dell, stony slope and grassy dell. And the grassy dells are carpeted with *Gentiana acaulis* in magnificent abundance—millions of sapphire trumpets, far finer in colour than the dingy types of *acaulis*, that too often disappoint the Alpinist. And so one continues climbing.

And, in the last level below the ultimate ridge, I had my first excitement of that day. This was

Primula longiflora, growing in its thousands—the first time in my life that I had ever so seen it. In cultivation, perhaps, the plant may tend to become cabbagey and coarse, but here, among the fine, short grass, waving three or four great flowers at the most, above a rosette no larger than a good *farinosa*'s, *longiflora* is a delicate beauty indeed. But, alas! it was in vain that among all these blossoming myriads, I looked for an albino.

So one comes out on the ridge itself and suddenly sees—far away down on the other side—the huge stone slopes of the Drei Zinnen, and the tiny threads of great rivers flowing amid the indistinguishable darkness of the Pine forests below. The ridge is all of loose rubble and fine Dolomite shingle, lashed by the wind into curious, permanent ripples such as are left on sea sand by the lapping of the outgoing tide. It is matted and held together by sheets and yard-wide carpets of *Potentilla nitida*, on whose prostrate groundwork of silver foliage there now lie crowded a glory of great rose-pink flowers. And few pink tones in the garden have quite as warm a purity as these of this *Potentilla*, to say nothing of the enhancing argent of its leaves. If only it more readily displayed its flowers in cultivation. Here, on the ridge, it grows in the shingle, but lower down, and typically, it is a plant of rock crevices. And it is by such squeezing in hot that it can be best induced to flower under cultivation; the same treatment will probably answer also with the rarer *P. Valderia* of similar habit; both are being so grown now in chinks of my cliff-garden. But the albino *nitida* is a freer grower and flowerer in ordinary conditions than the type.

What else is there on the Drei Zinnen ridge? *Gentiana Clusii*, *G. verna*, and *G. verna Chionodoxa* in abundance. This last, the pure albino of *verna*, I had not sighted for some years. Then, of course, all over the levels, *Edelweiss* grows by the million, like any Daisy; you trample tufts of it at every step. Higher up, on the huge stark-red precipice of the mountain, there is nothing, but round the near corner, where the grassy ridge falls away in shelves of bare shingle, *Anemone baldensis* abounds, with *Ranunculus Thora* and *R. Seguieri*. This last seems a Dolomitic form of *glacialis*—very lovely in a tuft, with big white flowers over fine ferny foliage. But, bright and clean as it is, it has nothing like the monumental solid magnificence of *glacialis*, as you see it under the Schwarzhorn or the Pir Ot. (I have never found it in the Dolomites—but always *Seguieri* taking its place.) These, with *Saussurea alpina* and various golden *Potentillas* are the staple of that slope. I round the corner and come down on a broad, white shelf of rubble, clayey from a little spring. At first glance there is no vegetation here.

At the second, I stand still. I gasp in amazement. I yodel, strangle-throatedly, for my companion, higher up under the cliff, to hurry down and share my joy. All over this wet tract is growing the most astounding *Buttercup* I have ever seen. Huge, *Honorine-Joubert*-like blossoms, snow-white, marble-solid, expand over broad, heart-shaped leaves of a very dark, glossy green. I have already collected *Ranunculus parnassifolius* in dry earth pans on *Pir Padella*—a rare, rather insignificant tuft. It takes me quite a time now to surmount my incredulity, and realise that here is *R. parnassifolius* again, raised to a higher power, raised to a place at the head of all Alpine *Buttercups*. Away into the background sink *crenatus* and *glacialis* and *alpestris*. And here *parnassifolius* is growing in a sodden grey clay, perpetually wet, which clogs fingers and trowel alike, and weighs such tons that it all has to be washed away from the bunched white roots, waxy and fat (with their curious root-stock like a bitten bulb), before the plant can be packed for export. Of which wet clay the moral probably is that *R. parnassifolius* will best thrive here (though I won't so try it) in a sun-baked ashpit, on the principal of *Primivatarrestii*—which, difficult plant of sun-flogged premises, is now proving sound and vigorous in shade, in heavily manured soil, in the damper reaches of the bog-slope.

Ranunculus Seguieri is growing with *parnassifolius*, too; in all its bright prettiness it clean disappears by the side of that other tremendous refugence. It takes one about five minutes to realise that it is there at all, and it seems almost a bathos to collect it after the other. *Reginald Farrer*.

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM AMABILE.

REFERRING to the exhaustive note under *Callista amabilis* Lour., by Dr. F. Kränzlin, in the *Gardeners' Chronicle*, November 27, 1909, p. 354, I may say that all interested in Orchids will be grateful to Dr. Kränzlin for the very plain manner in which he has stated the case.

After careful examination of the now famous specimen in the Herbarium of the Botanical Department of the Museum of Natural History at South Kensington, I have no doubt about its being a *Dendrobium*. The name *D. amabile* will be the best name for this species, which I hope will soon be better represented in gardens, for when in bloom it must be a rather pretty plant. When one considers the very wide range in size, form, habit, and colour of the members of the great genus *Dendrobium*, the species in question cannot be excluded.

Fortunately, in this case the Vienna Conference has saved us from the necessity of referring the genus *Dendrobium* to *Callista*, a change which could not well be adopted in gardens where the name *Dendrobium* is so common. In the rules of nomenclature passed by the Vienna Conference in 1905, under Section 15 it is stated:—

"Each natural group of plants can bear in science only one valid designation, namely the oldest, provided that it is in conformity with the rules of Nomenclature and the conditions laid down in Articles 19 and 20 of Section 2."

Article 20 provides:—

"However, to avoid disadvantageous changes in the nomenclature of genera by the strict application of the rules of Nomenclature, and especially of the principle of priority in starting from 1753, the rules provide a list of names which must be retained in all cases. These names are by preference those which have come into general use in the fifty years following their publication, or which have been used in monographs and important floristic (horistiques) works up to the year 1890. The list of these names forms an appendix to the rules of Nomenclature."

In the Appendix (p. 239) we find under:—

Nomina conservanda.
Dendrobium Swartz in *Nova Acta Upsal.* vi. (1799) et in *Vet. akad. Nya Handl.* xxi. (1800) 224.
Nomina rejicienda.
Callista Lour. *Fl. Cochinch.* 1790. 519.
Ceraia Lour. *ibid.* 518."

It is therefore plain that the time-honoured name *Dendrobium* need not be superseded. *James O'Brien*.

FOREIGN CORRESPONDENCE.

HYBRID NEPENTHES.

I AM sending you three pitchers of *Nepenthes* hybrids which have received certificates of merit from the French National Horticultural Society.

The three hybrids, but particularly *N. × remillyensis* and *N. × sanglant* have a reddish colouring which comes from the male plant. They were raised at Remilly three years ago from a cross between *Nepenthes Curtisii superba*, fertilised by the pollen of *Nepenthes Northiana pulchra*, a beautiful variety of *N. Northiana*. The point of interest is that most of the seedlings have greenish pitchers, whilst few are reddish.

The brown spotted, greenish pitchers are generally of a clearer shade than *N. Curtisii superba* or *N. Northiana*. A series of seedlings raised about the same time and obtained from *N. sanguinea* fertilised by *N. Northiana pulchra* are still quite small, and the pitchers are far from attaining their maximum dimensions. The slowness with which the seedlings grow is very remarkable. In one year the seedlings of *N. Curtisii superba* and *N. Northiana pulchra* grew to a larger size than the seedlings of *N. sanguinea* and *N. Northiana pulchra* are even now. It must therefore be admitted that the female plant has a very considerable influence in the vigour and the rapidity of growth of the hybrids. It is curious to add that for the other seedlings it has been shown that the male plant had a good influence on the vigour of the seeds. Seedlings derived from a cross between *N. Curtisii superba*, and *N. Sir Thoselton Dyer* have never been raised until the present. Germination of seeds from this cross is very difficult, and the growth afterwards is slow. *R. Jarry Desloge, Paris, France, 80, Boul. Haussmann.*

NOTICES OF BOOKS.

* A HISTORIC VOLUME.

We have pleasure in welcoming a work which, for its historic associations, as well as for its intrinsic worth, is of no ordinary interest. In 1751 Jean Bergeret, a distinguished botanist, commenced the publication of the *Flore des Basses-Pyrénées*. Nearly 50 years after, his son, who, like Jean, was both doctor and botanist, published a revised and extended flora. Now, in 1909, Gaston Bergeret, a direct descendant of the original author, has carried out a long-cherished idea by publishing the whole of the original *Flore* which Jean did not live to see issue from the press. Though the author of this latest edition disclaims modestly the title of botanist, it is evident that he has inherited the scientific gifts of his ancestors, and that he has real knowledge of the plants of the Pyrenean region.

Gaston Bergeret has chosen, and rightly, in our opinion, to leave intact the old Linnean system which Jean used in the first edition. Thus, for this reason, and because of the many notes on the medicinal value of the plants, the work has a unique and old-world character which gives it a peculiar charm.

The preface, which deals with things in general, with ideas on the nature of existence of man as well as plants, stands, by its leisurely tone, in pleasing contrast with the business-like directness of the modern text-book. It shows, moreover, a glimpse of the modes of thought of a bygone race of men who were, it must be confessed, by no means inferior in scholarship and knowledge to men of modern times.

Though the volume is far too large for the traveller, and though, maybe, it offers more information of a discursive kind than the busy man of the present day cares to receive, yet those with a sense for history and for whom the past is sacred and living, will find in the study of this volume much enjoyment and profit. The labour which Gaston Bergeret has expended in the preparation of the work is labour well spent, for he has preserved a monument to the memory of a distinguished man, and has proved, by the devotedness with which he has discharged his filial task, that the race of philosophers for which the 18th century is so justly famous has not become extinct, despite the hustle and hurry of a later, commercial age.

* FRUIT-CULTURE IN JAPAN.

The astounding appearance of Japan in the front rank of nations and her strenuous efforts to encourage industrial activity are amongst the most interesting features of modern history.

That horticultural interests are not being neglected is proved by a recent work by Mr. Ikeda, which sums up the present position of Japanese fruit-culture in a succinct and interesting manner. The introductory chapter deals with the status of the industry in ancient times, and shows how small a part fresh fruit has played in Japanese diet. Thus, even at the present day, fruit is regarded more as a sweetmeat than a necessity. Several chapters are devoted to a consideration of the geology and meteorology of the country, and the reader is reminded very forcibly of the immense variation in temperature and rainfall within the kingdom. The author lays special stress on the moisture of the atmosphere over the greater part of the country, and the consequent rapid growth of all fungal pests.

It is curious to note that the Japanese Quince, *Cydonia japonica*, is called Marumero, and that this name is said to be derived from the same Portuguese word, the fruit having been introduced by the Portuguese sailors from Cambodia in 1634. The Kalkis, or Date Plums, are treated

in some detail, about 800 varieties being said to exist at the present day. Peaches and Nectarines, both local forms and introduced varieties, are largely cultivated in all parts of Japan. Plums are produced in large quantities, one village marketing 690 tons, which sold for £4,000.

Specially interesting are the particular methods of culture which are detailed, many of them being of great antiquity. The system of growing fruits on a kind of pergola is largely practised, for the accessibility of the fruit and protection from sudden storms render this method very suitable for growing the choicer Pears, &c. An example of this system, called Tamazukuri, upwards of a hundred years old, is said to exist near Tokyo.

An interesting cultural practice is that of watering Plums with saline water as a preventive of fruit-casting. Packets of salt are often buried near the trees, and the author suggests that it may be that the salt acts osmotically, and thus creates a condition of dryness in the roots, which is known to prevent premature dropping of the fruit. Oblique cuts are also made on the bark to check a superabundant flow of sap when fruit is ripening.

There are many similar points which are extremely suggestive, but we must refer the reader to the work itself, which is well worthy of study by all who are interested in fruit-culture.

* THE PRINCIPLES OF AGRICULTURE.

This work opens with the following sentences: "Agriculture deserves to be definitely outlined. What is agriculture? We answer the question with a view to show what constitutes agriculture. It is not a science, for this statement is misleading. A science is an exact knowledge, like mathematics or botany. Agriculture does not belong either to the fixed or mixed sciences. It is a pursuit, an occupation. It does not centre round mysterious processes, but round the profitability of it."

Soil "is a loose, round material usually present on or under all parts of the surface of the earth."

It must be confessed that this somewhat confused language did not inspire us with confidence in the ability of the author to act as agricultural guide to the schoolmaster, young farmer, or student. What is in many respects a worthy attempt at the production of a text-book on the "Principles of Agriculture" is very materially reduced in value for educational purposes by the obscure language used and the lack of order in presenting the facts and subject-matter with which the volume deals.

The first five chapters are concerned with the nature and origin of the soil, its cultivation and drainage. A satisfactory account is given of the weathering processes at work on the soil, the external indications of its fertility, and its chief chemical and physical properties. The various implements used in cultivating the soil are also well illustrated, and a useful resumé is given of the principles and practice of drainage.

Three chapters follow upon the nature and use of fertilisers, and these are succeeded by three upon "Plant Life" and the crops of the farm, which are too concise to be of much value. The latter criticism also applies to the three final chapters, which refer to the feeding of live stock and the dairy industry.

The book contains a large amount of undigested information, most of which is accurate enough, but the author has attempted to crowd too much into too small a space.

The usual want of balance in treatises on the "Principles of Agriculture" is conspicuous here; the soil gets too much consideration, the plant and animal being correspondingly neglected.

* A text-book for Lecturers on Agriculture, &c., by James McCutchen, F.C.S. (Edinburgh: E. & S. Livingstone.) 1909. Price 3s. 6d. net.

Possibly, in a subsequent edition, improvement may be made in the work. The statement on p. 27 that good soil contains 15 per cent. of phosphoric acid, and the extraordinary chemical equation on p. 92 should be corrected, as well as the statement on p. 76 that "the composition of bones is put chemically in the formula $Ca_5P_2O_8$."

It might also be advisable to alter the English of such a sentence as this: "Famyard manure owes its value to a large number of considerations" (p. 68).

FLORISTS' FLOWERS.

NEW DECORATIVE CHRYSANTHEMUMS.

HAVING visited several of the leading Chrysanthemum shows in various parts of the country I have made a note on the best of the newer varieties that have come under my observation.

The term "decorative" is capable of a wide definition, and, although all varieties may strictly be brought under that heading, I refer more particularly to those that are specially adapted for this purpose by reason of their colour, form, freedom of flowering and dwarfness of growth. They include several of the Japanese type, which, though new, are not large enough to rank among the ordinary, exhibition varieties.

Keith Luxford is crimson amaranth in colour, with rather short, narrow florets, yet a bold-looking flower with a dwarf habit of growth. David Ingamells is a typical, decorative, market variety, producing six to eight blooms on each shoot. The height does not exceed 2 feet 6 inches. The colour of the flowers is a deep, rich yellow. The variety named after Sir Frank Crisp has short florets of a dull, yet deep, red colour. Leslie Morrison, although not actually new, has not been seen much until the present season. Although this is a good exhibition variety, it is equally good for decorative purposes. The colour is rich, rosy crimson, and the florets are stiff and broad. Phosphorescence is a variety of terra-cotta red shade, the florets, not too closely set, make an elegant bloom. It is especially good grown as sprays. The variety Mrs. R. Luxford grows from 3 to 4 feet high, with good foliage. The flowers have drooping florets that twist at the point. The flowers of Mrs. Wagstaff Smith are produced in clusters. The colour is chrome-yellow. Felton's Favourite is not quite new, but deserves to be better known. It is one of the best of the newer, white-flowered varieties, having a stiff habit of growth.

The above varieties belong to the Japanese section; those named below are single flowered.

Leo has narrow, drooping florets, coloured a rich, dark red, with a golden ring next to the disc. It is a very effective blossom. J. H. Greswold Williams is in colour a rich yellow. The blooms are large. Mensa is a pure white variety of good form. Pictor, a pale blush-pink variety, is good either grown disbudded or in sprays. Arcturus is a velvety-crimson flower and very circular in form; the plant is of dwarf habit of growth. Leo is a shade of bright chestnut with a golden centre. Hilda Lawrence is a pretty variety of rose-pink shade. Sylvia Slade, amaranth, has a white ring around the disc. This is one of the most effective of the section. Nellie Riding is a rather short-petalled variety of a rich, terra-cotta red. Robert Thorp is a large white flower, with a deep yellow disc and Narisus, a small, rich yellow flower. Miss Mary Pope, a pale pink variety, is especially good when the flowers are produced in clusters. Mrs. R. C. Pulling has rose-pink, narrow florets which widen at the tip; the disc is deep yellow. Canary Bird is a very pleasing yellow variety.

HARDY PLANT BORDER.

THE VERATRUMS.

THE Veratrum, known popularly as the "False Hellebores," have an extremely wide range, extending through Europe, North and Eastern Asia, and North America. Some 15 species have been recognised, but so many of them are similar in habit and appearance that it is doubtful whether there are half a dozen sufficiently distinct to warrant specific rank. They are all herbaceous perennials; several of them have a stately habit and handsome foliage. The larger-habited species form admirable subjects for the

having been grown since 1548. There are several forms which differ slightly from the type, and are spread over Europe, Northern Asia and North America. One known under the varietal name of *Lobellianum* has almost green flowers, and narrower segments to the perianth than the type.

V. CALIFORNICUM.—This species (see fig. 174) is the best garden plant in the genus. Under favourable conditions, it grows to a height of 8 feet or more, and bears large panicles of ivory-white flowers in July. Its habitat is North-western America, and one district where it is found is the Sequoia region. Plants of this species were first received at Kew in 1896 from

V. NIGRUM.—This species has been in cultivation nearly as long as *V. album*. The plant grows from 3 to 4 feet high, and develops leaves 1 foot long and 8 inches broad. The flowers, like those of *V. Maackii*, are of a blackish-purple colour, and are borne in dense panicles, the flowering period being June. It is a native of Central Europe.

V. VIVIDE.—A North American plant which has been grown in gardens since 1742. It produces greenish flowers, and is considered by many to be a form of *V. album*. The popular name is "Indian Poke."

Although the Veratrum do not seed freely, they are all easily increased by division of the roots in autumn or spring. W. L.

(Photograph by W. Irving.)

FIG. 174.—*VERATRUM CALIFORNICUM* FLOWERING AT KEW.

wild garden, or for planting in groups in open woods. They grow best in rich, heavy soil that has been deeply cultivated, and they prefer a somewhat damp, sheltered, and partially-shaded position. Although they can be transplanted, Veratrum are best left alone when well established. The following are the best of those in cultivation:—

V. ALBUM.—This is known as the "White Hellebore." The plant grows from 4 to 5 feet high, and is extremely variable in habit. The colour of its flowers varies from pure white to almost green. It is the oldest cultivated species,

Herr Max Leichtlin, of Baden-Baden, and they have since flowered annually. The plant ripened its seeds at Kew for the first time last year, but only a few seeds germinated, although they were sown as soon as ripe. *V. californicum* is closely allied to *V. album*, but is much larger in all its parts.

V. MAACKII.—This Siberian species has slender stems about 2 feet high, and long, narrow leaves. The flowers are dark purple in colour, and are borne in loose panicles in summer. The species was introduced to this country in 1883.

PODOCARPUS TOTARA OR P. TOTARRA ?

IN the latest monograph of the Taxaceæ (Engler's *Das Pflanzenreich*, vol. iv., 5, p. 84), Dr. R. Pilger substitutes the specific name *totarra* for the universally-accepted *totara*, citing Allan Cunningham as the author in the *Annals of Natural History*, vol. i., 1838, p. 212. He explains this change in the following words: "Description speciei primum dedit A. Cunn. l.c. —(Cl. Don ne nomen quidem scientificum speciei dedit, sed in editone ultima operis Lambert, Genus Pinus, epitole cl. Bennett publicata sunt in quibus species verbis sequentibus designatur": it is an unpublished species of *Podocarpus*, called by the natives *totara*. Had Dr. Pilger but cast an eye over the next page of the book from which he quotes it would have lighted upon D. Don's definition of *Podocarpus totara*, which runs: "Follii undique versis lineari-lanceolatis mucronatis subtus glaucis." Don erroneously cites *Dacrydium taxifolium* Solander, Mspt., as a synonym, which made it appear that Banks was the discoverer and first collector of this notable tree in 1769.

Under "*Podocarpus totarra*," in A. Cunningham's *Flora Insularum Novæ Zealandiæ Pæcesor*, in the *Annals of Natural History*, as cited above, D. Don's brief Latin diagnosis is repeated, and the source indicated. It is true that Cunningham spells the name with two "r's," but that was probably a slip, for almost all other writers on the flora of New Zealand consulted employ only one "r."

In Hooker's *London Journal of Botany*, vol. i., 1842, p. 572, t. 19, the name is *Totara* in the letterpress and *Totarra* on the plate, which, by the way, is an excellent one.

In the foregoing note the initial letter of the specific name has been repeated as it stands in the various works quoted; but, according to the now generally adopted Vienna rules, it should be written *totara*.

There is yet one other point in this connection which ought to be definitely settled, and that is the authorship of the combination *Podocarpus totara*. It is unnecessary to enter into particulars here. Suffice it to say that some subsequent writers attribute it to A. Cunningham, whilst others give it to D. Don, and in the *Index Kewensis* it stands as *Podocarpus Totara*, G. Benn., ex D. Don. As to the first, Cunningham himself cites Don as the author. As to the second, some explanation is necessary. G. Bennett contributed to the last edition of Lambert's *Genus Pinus* some "Observations on the Coniferous Trees of New Zealand." Following these observations, at the end of which Bennett's signature appears, but cut off by a cross line, are brief Latin diagnoses of some of the trees in question. Now, D. Don was the general editor and author of the descriptions throughout the work, and all the evidence seems in favour of retaining the combination as *Podocarpus totara*, D. Don. W. Botting Headley.

NOTES ON LILIES.

In a recent issue reference was made by a correspondent to the lax habit exhibited by *L. Henryi* in cultivation, and Dr. Henry was quoted as having observed the peculiarity in the wild plant, which he first found growing near Ichang. He has put it on record that he never saw this Lily in a wild state more than 3 to 4 feet high, and with four or five flowers, and as it is not at all uncommon to see it in gardens 8 to 9 feet high, and bearing 14 or 15 blooms, it might reasonably be supposed that, in the extraordinary vigour induced by high cultivation, the "lazy" habit would be modified, if, indeed, it did not entirely disappear.

The contrary, however, appears to be the case, for, paradoxical though it may seem, it is in the stronger-growing specimens that the peculiarity under notice is the more pronounced.

In casting about for some explanation of the almost prostrate habit of this Lily, a peculiarity which is not shared to anything like the same degree by other members of the genus, one is almost driven to conclude that it is an inherited tendency, probably due to the fact, as recorded by Dr. Henry, that the wild Lily grows on the walls and slopes of precipitous places where, presumably, there is very little in the way of support for the stems.

In many Eastern Lilies, the result of high cultivation is often to produce an exaggerated head of flowers, which the stem is unable to carry, therefore the stem collapses unless supported in some way. Not so, however, with *L. Henryi*, the long, tapering stem of which is so supple that, no matter how heavily-laden it may be with flowers, nor how strongly winds may blow, it does not seem to break. Unsupported plants may be seen in which the stems, measuring 8 feet long, hang over to such a degree that the blooms are within a foot or two of the ground. Whether these tall-growing specimens should be supported or allowed to fall about over shrubs as they please is a matter of taste into which it is not necessary to enter.

It, in point of fact, the prostrate habit is inherited, it will be interesting to see if the plant adapts itself to altered circumstances and throws off the laxness in cultivation; no doubt the process, if it takes place at all, will be so slow as to be hardly noticeable.

An unusual point about the Lily in cultivation is the precocity of the offsets, which are produced in such numbers, and bulblets removed from the parent bulb in the autumn of one year will quite commonly produce a flower or two the following year, by which time the bulbs, when suitably grown, will be found to be as large as a hen's egg. In congenial surroundings, the size rapidly increases, till, in the fifth year, one finds an enormous bulb, as much as 5 inches across, and in shape not unlike a huge Globe Artichoke. Those who have only handled the bulbs in a dry or dirty condition can have but a faint idea what a beautiful thing a well-grown bulb of *L. Henryi* is when freshly lifted and washed clean; symmetrical in shape, the large scales, like those of *L. sulphureum*, are a fine, deep, plum colour at the tips, the ruddy hue gradually shading off till, at the base of the bulb, it gives place to a warm, flesh colour, thickly spotted, and like nothing so much as the belly of a mountain trout.

The very large bulbs are not infrequently included in dealers' catalogues, but are hardly worth buying, as they cannot conveniently be lifted without breaking the mass of long, fleshy roots, with the result that, if moved, the Lily usually "sulks" for a season (as do old bulbs *L. Szovitsianum* and other sorts under similar circumstances), and, as a rule, will be caught up in growth by a younger bulb.

The cultivation of this very robust Lily does not seem to present any particular difficulty. In common with all the later-flowering species,

the plant appears to appreciate as much sun as it can get in the ordinary way, and, though doing well in divers soils and under varying conditions, thrives best, as far as one can judge, when planted about a foot down in a deep, cool, loose, leafy soil, having in it a large proportion of coarse grit. The absence or presence of lime in moderate quantities in the ground does not, apparently, make any difference to the plant, which, however, may often be observed to fail in light, sandy soils.

There is little doubt that, like many sorts, this Lily takes kindly to heavy feeding, and that is probably the reason why it grows so well in rich, open, leafy soil, with manure some way under the roots, which, in the older bulbs, often travel as much as 3 feet in search, no doubt, of food and moisture.

L. Henryi seldom seems to ripen seed when grown in the open in this country; but as the flowering season is so late in the year, there is nothing remarkable in this, and, in any case, the point is not of importance as far as reproduction is concerned, since bulbs and offsets are produced in wholesale fashion by healthy bulbs, and propagation by scales is easily managed.

Notwithstanding the vigorous growth of the plant, the foliage falls an easy prey to that curse of the Lily grower, *Botrytis cinerea*, though, unlike those of *L. candidum*, *L. testaceum*, and *L. croceum*, the bulb appears to remain unaffected. A curious point about the disease in connection with this Lily is that the upper leaves seem invariably to be attacked first, so that the mischief travels down the stem and not up as in the case of so many other kinds. Taken in time, the progress of the disease can be arrested; but, if left too late, the stem should be cut down and every bit burnt.

Naturally rather late in making an appearance, once out of the ground in the spring, growth is extraordinarily rapid, and will often average 6 inches a week for the first month or so. When the ruddy "points" first push through the earth, the stem is sheathed in the most beautifully symmetrical way by the narrow leaves, which fall back as soon as the plant is a few inches out of the ground, and when their protecting covering is no longer needed by the young shoot. A.

The Week's Work.

FRUITS UNDER GLASS.

By E. HARRIS, Fruit Foreman, Royal Gardens, Frogmore.

Early pot vines.—The buds on vines started at the beginning of last month are now on the move, and it will be advisable to increase the atmospheric temperature of the house 5°. As soon as it can be seen that all the buds are breaking freely and evenly, the rods must be taken from their present horizontal position and secured more or less upright to the trellis, where they will remain for the season. Extreme care is still necessary in applying water to the roots, for any excessive watering would be very injurious. Each time a plant is watered it is a good plan to fill the pot with water twice, so that the cultivator may be sure that the roots are thoroughly moistened. The water should be first heated to the temperature of the house. If the heat of the plunging material falls below 70°, mix a little fresh litter with it, but use only litter that has been prepared by frequent turnings. Continue to syringe the vines until the shoots are about an inch long, but not afterwards. The atmosphere must be maintained moist afterwards by frequently damping all the available surfaces in the house.

Early Figs in pots.—Trees which were started last month may now be plunged in a moderately warm hot-bed. The atmospheric temperature may be raised to 55° at night, allowing it to rise to 60° or 65° during the day. Great care in watering, fringing, and ventilation must be practised, especially until the trees are actively growing.

Early Fig trees in borders.—The earliest permanent Fig trees may now be pruned and cleaned and thus made ready for starting. The time of closing the house will be determined by the date at which it is desired to have ripe fruits. Generally speaking, about five months is necessary for this purpose. If the trees were given proper attention during the growing season in the matter of stopping and regulating the shoots, there will be little pruning to be done now. Look carefully over the trees and cut out as many as can be spared of the old branches which are bearing but little fruiting wood. Their removal will make room for newer and more fruitful wood, which will improve the appearance and productiveness of the trees. It is best to remove all suckers unless some are necessary for furnishing the base of old trees which would otherwise be bare of any young growths. Mealy bug and red spider are special enemies of the Fig, and unless care is taken every season to cleanse the trees whilst dormant, they will occasion considerable trouble during the growing season. Wash the roof of the house and trellis thoroughly, then cleanse every portion of the trees with a strong solution of soft soap and sulphur. If the trees were very dirty last season, it will be advisable to repeat this operation later. Take away two or three inches of the surface soil, and in its place supply a good top-dressing of fresh loam with a mixture of old mortar rubble. If the trees appear to be in need of manure, some crushed bones may also be included in this top-dressing.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. Ford, Pencarrow, Cornwall.

Nepenthes.—Although these plants must have a reduced supply of water during the winter months, at no time must the roots be allowed to become quite dry. On fine days, the baskets in which the plants are growing should be syringed to maintain the roots in a moderately-moist condition, but, in addition, it is necessary to immerse the receptacles occasionally in warm water to prevent the soil in the centre becoming excessively dry. At this season an atmospheric temperature of 65° will be ample, and a little air, admitted on fine days, will assist in keeping the plants dormant.

Lily of the Valley.—For some time to come fresh crowns will take the place of the retarded roots for forcing purposes. As soon as they are obtained, the crowns should be potted, and the pots plunged to their rims out-of-doors; a layer of fresh moss placed over the crowns will serve to keep them fresh. Introduce batches into the forcing house as frequently as necessary, affording them a bottom heat of about 85°. The surface moss must be kept moist. Under these conditions flowers may be expected in about six weeks.

Chrysanthemums.—To obtain large flowers, it is necessary to insert cuttings of many of the exhibition varieties soon, but those plants to yield useful flowers for decorative purposes may well be left for fully another month. Where large-flowered plants are required in considerable numbers, a shallow frame should be placed on the staging of a house in which the atmospheric temperature is about 50°. A smaller number of plants may easily be raised under a handlight or in a box covered with a sheet of glass. Whichever method is adopted, the pots should be stood on a layer of clean ashes to ensure perfect drainage. After the cuttings are inserted apply a watering and allow the pots to drain before placing them in the frame. The glass covering should be removed for fully an hour each morning to dispel superfluous moisture, which is a common cause of "damping off." If the glass has not dried during this time, wipe off the condensed moisture before replacing it. If they are properly prepared and carefully inserted, the occasional flagging of the cuttings need cause no alarm. In any case, do not coddle them or spray the foliage frequently, for this would force the cuttings into premature growth and result in hollow stems, and, if cuttings so treated do eventually produce roots, they will fail to make satisfactory plants. Now that good single-flowered Chrysanthemums can be raised from seed sown each spring, it is to be hoped that many of the mop-headed varieties, which have no real beauty or decorative value, will disappear from cultivation. But whilst they are in demand, gardeners must grow them.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Balford, Surrey.

Zygopetalum.—Most Zygopetalums are now growing freely, and will require copious waterings at the roots as each plant becomes dry. Z. Mackayi produces its strong flower-spikes at this season and will need extra water until the flowers are open. When the flowering is passed, the plant may be repotted. It is a free-rooting species and requires plenty of pot room and a good depth of compost. The pots should, therefore, be filled only to about a quarter of their depth with drainage. A suitable potting compost is one consisting of good turfy loam, Osmunda fibre and Sphagnum-moss, with plenty of small crocks mixed with these. This plant, and also such species as Z. crinitum, Z. Lindenii, Z. velatum, Z. leucophilum, Z. Clayi, Z. Murrayanum, Z. Protherocianum, Z. Gottianum, grows well in a warm, shady corner of the intermediate house. The rare Z. Ballii, now in flower, requires a course of treatment identical with that recommended for Z. Mackayi, Z. maxillare and its variety Gautieri, which always thrives best on its imported piece of tree Fern. Z. Gautieri is now at rest, and should be suspended from the roof in the same house and be kept moderately moist at the root at all times. The intermediate house is also the best place for such bigeneric hybrids as Zigo-colas Veitchii, Z.-c. Wiganianum, Z.-c. Amesianum, Z.-c. leopardinum, and Z.-c. Charlesworthii. Zygopetalum rostratum and Z. Roeblingianum should be grown in the warm, moist plant stove, while Z. Burkei, which comes from a very high altitude, requires cool-house treatment. Zygopetalum (Promeneae) citrinum, Z. Rollisonii, Z. micropterum, and Z. stapelioides also thrive well when suspended from the roof of the cool house.

Sobralia.—The Sobralias that were repotted some time ago will have become re-established in the fresh compost. It is advisable to remove all the old flowering breaks, cutting them down to the roots. Afterwards tie out the young growth clear of each other so that light and air may pass freely between them. Sobralias require plenty of water at all times. Give the plants every encouragement to make strong healthy growth.

Dendrobiums.—Plants of D. Wardianum, D. crassinode, and their hybrids, that are now showing their flower-buds, should be kept in the cool resting house for the present; but when the buds become more prominent, the plants may be removed to the Cattleya or Mexican house. Water must be afforded carefully, and at long intervals, or the young shoots that develop at the base of the pseudo-bulbs will grow too quickly, and thus weaken the flowers.

Vanda.—Such plants as Vanda teres, V. Hookeriana, and the hybrid Miss Joaquim have now made sufficient growth for the season, and should be removed to a cooler and drier atmosphere, such as is maintained in the Mexican house during the winter, the temperature ranging between 50° and 60°. These terete-leaved plants, while at rest, should be kept less moist at the root than in summer, but not so dry as to cause the stems to shrivel, or many of the lower leaves will fall. Afford them an occasional spraying overhead on warm sunny days. All deciduous and semi-deciduous Orchids now resting, including the Vandas, should be exposed to full sunlight in winter.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir Edmund G. Loder, Bart., Leonardlee, Sussex.

Effects of grouping. Many plants are suitable for grouping which produce a poor effect when planted in a formal manner. In some cases where it is desirable to group plants of one kind in beds or borders for the purpose of getting rich and broad effects, their appearance may be much improved by interspersing amongst them a few taller-growing species or specimens trained as standards; these will break the level which might otherwise be monotonous. One of the commonest mistakes in grouping of trees or shrubs is that of planting them too close to one another. Certain plants possessing uncommon interest, either on account of their rarity or beauty, are suitable for cultivation as isolated specimens on the lawn, where they will be seen to the best advantage. The beautiful tints of

many such plants form a splendid contrast in winter to the sombre tones of tall Cedars and Cupressus. Notice should be taken of the beautiful hark some trees have in winter. As illustrations, among many others may be mentioned species of Cornus, Rubus leucodermis, R. biflorus, Acer pennsylvanicum, A. Davidii, Salix alba vitellina, Stephanandra Tanakae, and Betula papyrifera. Another beautiful tree, either in groups or isolated, is Cryptomeria elegans. The golden forms of Cupressus are especially attractive during winter.

Bulbs and roots.—Examine the bulbs, tubers and other roots that have been taken indoors for the winter, in order to remove any that show signs of decay, which is more likely to be present this season, owing to the wet weather in autumn.

Plants in unheated frames.—Admit plenty of air on favourable occasions, and remove decaying leaves and growing weeds. Cover the frames during severe weather with mats, and with tarpaulin. The tarpaulin will keep the mats dry, and the mats being dry will the better exclude frost. Examine the stocks of bedding plants, and, whilst refraining from stimulating them into growth, see that they are taking no harm.

Tender Roses and shrubs.—Should the weather prove severe, it will be necessary to cover tender varieties of Roses with dry Bracken or Heather, and a light, dry mulch of ashes or fine peat should be placed over the roots of such tender shrubs as Solanum jasminoides, Hydrangea, Crinodendron, Carpenteria, Buddleia, and Callistemon.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. King, Esq., Eastwell Park, Kent.

Fruit trees as cordons.—The cordon method of training is convenient in cases where a large number of varieties are desired in a limited space. The system was formerly employed mainly for Pears, Apples and Cherries, but it is now extensively used for other kinds of fruit, notably Gooseberries, Plums, and Red Currants. Not only do cordons possess a special value where the wall space is limited, but they enable the cultivator to plant a few choice kinds in various aspects. This has the effect of prolonging the season of dessert fruit. No other system of training affords equal results from the same amount of space.

Cordon Gooseberries.—These are advantageous in several ways: first, they usually produce better fruits than any other form of tree or bush, and, for dessert purposes, quality in Gooseberries is the first consideration. It is desirable to plant a number of cordons representing early, mid-season and late-fruited varieties for succession. Then, too, Gooseberries trained as cordons are very convenient to work amongst, the stopping and thinning of the shoots, training, affording protection from birds; all these details can be carried out easily. If the borders at the sides of the main paths are utilised for larger kinds of fruit, the borders flanking the smaller side paths may well be used for the Gooseberries. For providing supports, upright posts should be placed about 2 or 3 feet from the edge of the path, and from these posts wires should be strained at distances of 1 foot apart to a height of 5 or 6 feet from the ground, according to circumstances. Cross-pieces of wood about 18 inches long should be nailed to the uprights, and these will serve to keep the nets, employed to protect the fruit from birds, well away from the fruit itself. The present time is the most suitable for planting, and this should be carried out in ground which has been trenched well and manured liberally. Gooseberries never succeed to their best unless they are provided liberally with plant food.

Red and White Currants.—These are grown as cordons principally on walls of cooler aspects for the purpose of continuing the supply after the bushes in the open quarters have fruited. Red Currants, for instance, will hang on a north wall, and keep in good condition until very late in autumn.

Apples.—Apples may be cultivated as cordons on walls in order to obtain early and highly-finished fruits, whether for exhibition or home use. In some of the colder localities many of the best dessert Apples never succeed to their best except in the open garden. In regard to

newly-planted fruit walls, the cultivator may often obtain crops of fruits from these before the permanent trees come into bearing, by planting a few cordons between these trees.

Pears.—Pears are probably more commonly grown as cordons than any other fruit, for by this means a good supply is obtained of first-class fruits. There are various styles of cordon-training, such as the single, double and triple, and each of these may be upright or horizontal. The horizontal cordons are recommended for planting in front of bush or pyramid trees fairly close to the edge of the path. For the purpose of training these dwarf horizontal cordons a single wire fastened to small posts at about 1 foot from the ground is sufficient.

Plums and Cherries.—These fruits likewise yield excellent results as cordons.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, Hertfordshire.

French Beans.—If means exist for the cultivation of French Beans in winter, every effort should be made to maintain a continual supply, for they are generally appreciated. Winter Beans, however, are a crop that, in the shortest days of winter, necessitate an immense amount of care. Too much or too little fire-heat are equally injurious, just as is too little or too much moisture in the atmosphere. The atmospheric temperature should never exceed 60°, nor be less than 55°. A little too much heat and a slight deficiency of moisture are quite sufficient to cause an attack of red spider, and the spread of the pest will be very quick unless the conditions are altered. Whenever the weather is bright, the under part of the foliage should be syringed with soft, tepid water, at the same temperature as the atmosphere of the house. Whilst the plants must not be over-watered at the roots, at the same time they would suffer much damage if exposed to drought, even for a short time. The plants should be grown as near to the glass as possible. Those in bearing should be supplied with diluted manure water at every alternative watering. Successional plants should be thoroughly top-dressed with a moderately light mixture of fibrous loam, manure from an old Mushroom bed, and leaf-mould in equal portions, adding sufficient coarse sand to keep the soil in a porous condition. The plants should be neatly supported with brushy twigs. Successional sowings should be made in pots every 10 days or a fortnight, and care should be taken to see that the soil is provided with ample means of drainage. Canadian Wonder and Ne Plus Ultra are both excellent varieties for sowing in winter and spring. Though these varieties are longer in coming into bearing than some others they have a vigorous constitution, which enables them to succeed in winter.

Carrots.—Provision should now be made for making a liberal sowing of Carrots under glass, either on a mild hot-bed of leaves, or, better still, at this season, in brick pits, just sufficiently heated to exclude frosts. The soil used for this purpose should be finely sifted, light in texture, and, above all, free from wireworm. There is no better material than old potting soil, but some well-decayed leaf-mould, after it has been passed through a fine sieve, or some road or river sand may be added to it, also a small quantity of fresh soot and bonemeal. It will be necessary to mix all these materials thoroughly together. When the compost is in a moderately dry condition, it should be placed firmly on the prepared beds. There are many capital stump-rooted varieties suitable for cultivation at this season, the variety Inimitable being one of the best. Sow the seeds in drills 10 inches apart. The space between these rows may be utilised for growing Radishes, forcing Cauliflowers, Cabbages, and Lettuces, without causing damage to the Carrots.

Crops in portable frames.—Admit plenty of air to these crops whenever the weather is favourable, remove the lights entirely during mild weather, but on frosty nights take means to cover the lights sufficiently to exclude the frost. Examine the plants, and remove any rubbish or decayed leaves there may be about them. Stir the surface soil frequently to keep it fresh and sweet. Parsley should be given dressings of soot from time to time.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens or plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, DECEMBER 13—

United Hort. Ben. & Prov. Soc. Com. meet. Nat. Chrys. Soc. Executive and Floral Coms. meet at Essex Hall, Strand.

WEDNESDAY, DECEMBER 15—

Roy. Meteorological Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—40.5°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, December 8 (6 P.M.): Max. 42°.

Min. 32°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, December 9 (10 A.M.): Bar. 30.4; Temp. 38°; Weather—Dull.

PROVINCES.—Wednesday, December 8. Max. 41° Lancaster and N.W. Ireland; Min. 35° Carlisle.

SALES FOR THE ENSUING WEEK.

MONDAY AND FRIDAY—

Dutch Bulbs, Perennials and Border Plants, at 12; Roses, at 1.30, by Protheroe & Morris, at 67 & 68, Cheapside, E.C.

MONDAY—

Trimmed specimen Yews, Hollies, &c., and other Nursery Stock, at Lee's Nursery, Hounslow Road, Feltham, by Protheroe & Morris, at 11.

WEDNESDAY—

Dutch Bulbs, Herbaceous and Border Plants, Lilliums, &c., at 12; Roses, at 1.20; Palms, Azaleas, &c., at 5, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

THURSDAY—

Thousands of miscellaneous Bulbs and Roots, at 12; 1,700 cases of Japanese Lilliums, at 2.30; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

Mr. James Britten.

After a period of service extending over 38 years, Mr. James Britten has retired from the Department of Botany at the British Museum. Before entering the museum in 1871, when Mr. Carruthers had just succeeded Mr. J. J. Bennett as Keeper of Botany, Mr. Britten had the advantage of two years' training as an assistant in the Kew Herbarium under Dr. (now Sir) J. D. Hooker and Professor Daniel Oliver. He was already known to British botanists as a keen student of our native flora, and had worked specially on the plants of South Buckinghamshire; in 1867 he had published a catalogue of Buckingham plants, which at the time was regarded as a *Prodromus* of a complete flora of the county. It is to be regretted that Mr. Britten has hitherto been unable to find time for the more important work which is still a desideratum. Another careful piece of work was a *Contribution to a Flora of Berkshire*, a record of plants known from the county up to the date of publication (1871) arranged in tabular form, showing their distribution in the botanical divisions which were suggested for the county. An acknowledgment of the value of Mr. Britten's work is made by Mr. G. C. Druce in his *Flora of Berkshire*, published 26 years later (1897). Though Mr. Britten's name cannot be associated with the production of a

complete flora of either of the counties in the plants of which, as a young man, he was so keenly interested. British botanists none the less owe him a debt of gratitude. For 30 years he has edited the *Journal of Botany*, which, though not restricted to British botany, has been the recognised organ of students of the British flora, and contains, besides innumerable notes and records, useful lists and valuable critical papers by the best workers in this field. Special reference may be made to some of the larger contributions, several of which have been issued as supplements to the monthly parts and subsequently as independent publications. Such are Mr. Hemsley's *Outline of the Flora of Sussex*, Mr. J. E. Bagnall's *Flora of Staffordshire*, Mr. E. A. L. Batters' *Catalogue of British Marine Algae*, Mr. W. A. Clarke's *First Records of British Flowering Plants*, Mr. F. N. Garry's *Notes on the Drawings for English Botany*, and others. Mr. Britten undertook the editorship of the journal in 1880, when Dr. Trimen left London to take charge of the Ceylon Botanic Gardens, and in 1882 assumed financial as well as editorial responsibility. Since that time the journal has maintained its position as a medium for the publication of papers, mainly of systematic interest; it has also served a useful purpose as the unofficial organ of the Department of Botany of the British Museum. We may express the hope that in his retirement Mr. Britten will find time to prepare the much-needed general index.

Mr. Britten's name is especially associated with the literary and bibliographic side of botany. The general index to the journal will reveal a number of communications of this nature from the Editor's pen, and in this connection mention should be made of the classic *Dictionary of English Plant-names*, which Mr. Britten prepared, in conjunction with Robert Holland, under the auspices of the English Dialect Society (1878-1886). Another useful reference work, the *Biographical Index of British and Irish Botanists*, was published, in conjunction with Mr. G. S. Boulger, first in the pages of the journal, then as a separate work (1893); two supplements have since appeared, and the time is ripe for a new edition which will bring the whole up to date in one volume. The subject of botanical nomenclature has found, in Mr. Britten, an able exponent. A strong advocate of law as opposed to slipshod methods of so-called convenience, he was an early supporter of Dr. Otto Kuntze; the principle of strict priority seemed to afford the surest method of ensuring uniformity of nomenclature. Moreover, the literary work involved in the careful study of early, post-Linnean authors, a task which many botanists regarded with impatience, was to a man of his bent a labour of love. Mr. Britten was never happier than when successfully resuscitating one of Miller's names from the often overlooked *Dictionary of Gardening*, and was proud of having introduced John Hill to the notice of modern botanists. It was a great disappointment that official duties prevented him from attending the International Botanic Congress at Vienna in 1905 and from taking part there in the revision of the De Candollean rules of nomenclature. In the preparation of the *List of British Seed-plants and Ferns* recently issued by the Trustees of the British Museum, in which Mr. Britten shared, his knowledge of the British flora and

of systematic literature were invaluable factors. This list, which was issued shortly after the Vienna Conference and according to the principles of the new code of rules, served as an object-lesson in the working of these rules as applied to a well-known flora.

Mr. Britten also did important service in bringing forward the work of the collectors and botanists of the eighteenth and early nineteenth centuries, whose plants are included in the collections of Sir Hans Sloane or of Sir Joseph Banks, which formed the nuclei respectively of the British Museum itself and the Department of Botany. No one appreciated this more than American botanists, who always found Mr. Britten willing to help in unravelling problems in which the plants or types of the early American collectors such as Catesby, Bartram, Walter, and others were concerned. Many valuable notes on these collectors and their plants are to be found in the numbers of the *Journal of Botany*. Mr. Britten was also responsible for the preparation of the large volume in which are reproduced the illustrations of Australian plants collected in 1770, during Captain Cook's voyage round the world in H.M.S. "Endeavour," by Sir Joseph Banks and Dr. Solander. These illustrations were made under Banks's directions, but unfortunately the work on the voyage which they were to illustrate was never published.

Previous to his retirement Mr. Britten had been engaged in the preparation of a catalogue of the Sloane Herbarium, which will shortly be issued by the Trustees as a British Museum publication. This work, for which Mr. Britten is peculiarly fitted, will form a valuable contribution towards the history of pre-Linnean botany, and will be useful in making more widely known the extent and value of the Sloane Herbarium.

LINNEAN SOCIETY.—The next meeting will take place on Thursday, the 16th inst., at 8 p.m., when the following papers will be read:—Rev. T. R. R. STEEBING, F.R.S., "Report on the Crustacea collected by Mr. C. Crossland in the Sudanese Red Sea;" Prof. J. H. CARPENTER, "Pycnogonidia from the Red Sea and Indian Ocean, collected by Mr. C. Crossland;" Mr. R. SHELFOED, "On a Collection of Blattide preserved in Amber, from Prussia;" Rev. T. R. R. STEEBING, F.R.S., "Isopoda from the Indian Ocean and British East Africa;" Mr. A. W. WATERS, "The Bryozoa, from collections made by Mr. C. Crossland, Part II."

BIRMINGHAM CHRYSANTHEMUM SHOW, 1910.

—We are informed that the next annual show of the Birmingham and Midland Counties Chrysanthemum Fruit and Floricultural Society will be held on November 8, 9, 10, at Bingley Hall, Birmingham.

THE EXPORT OF FLOWERS FROM THE RIVIERA.

—We learn from the *Petite Revue Agricole et Horticole du Litoral* that no fewer than 879,115 parcels of flowers were despatched by parcels post from various parts of the Riviera during the winter months of 1908-9. Of this number, more than a quarter of a million of parcels were sent from Nice, and nearly a quarter of a million from Cannes, the other chief centres of distribution being Hyères, Antibes and Golf Juan-Vallauris. The numbers compare very favourably with those of the corresponding period of the previous season, and show an increase of as many as 145,765 parcels.

Spaldhurst

W. H. H. 35

MEMORIAL TO PETER BARR.—We are glad to learn that definite steps are being taken to promote a permanent memorial of the late PETER BARR. On Tuesday last a joint committee was elected from the Narcissus and Floral Committees of the Royal Horticultural Society to consider what form the memorial should take. It will be remembered that suggestions have already been made that a sum of money should be raised to maintain a pensioner on the Royal Gardeners' Orphan Fund, the annual cost being £15 a year. It appears likely that this excellent scheme will be adopted. The scheme may also include a "Barr Memorial" Medal to be awarded for Narcissi. The joint committee elected on Tuesday is composed as follows:—HENRY B. MAY,

was prepared last year, but for the present is stopped by frost. The area of the nursery at Ford has been extended, and at the present time occupies about five acres. The following seedlings for the nursery were purchased in the United Kingdom in February last:—45,000 Scots Pine, 40,000 Larch, 180,000 Spruce, 15,000 Douglas Spruce, and 5,000 Sitka Spruce; and at the same time 100,000 Spruce, which were purchased in Germany. The following plants have been ordered in the United Kingdom for direct planting on the hillside (no plants having been ordered abroad for this purpose):—150,000 Larch, 80,000 Scots Pine, 35,000 Douglas Spruce, 45,000 Silver Fir, 240,000 Spruce, and 40,000 Sitka Spruce.

well-known fact that German agriculture has been benefited greatly by the establishment of the Raiffeisen credit banks and like institutions, it is a matter of astonishment that no method of supplying the farmer with similar facilities has been adopted in this country. Nor, as would appear from an able article published in the *Times* on October 9, is the need for greater and easier banking facilities felt only by the agriculturist. The writer of the article points out that, with the merging of the private banks into the great London banks, commercial men generally find that the means open to them of procuring loans easily and cheaply have been in no small measure curtailed. It is time that this matter received serious legislative consideration. If the credit-

(See p. 389.)

WILLIAM MARSHALL, J. T. BENNETT POE, CHAS. E. SHEA, REV. J. JACOBS, R. HOOPER PEARSON, W. POUPART, W. T. WARE, W. CUTHBERTSON, and C. H. CURTIS (secretary).

AFFORESTATION.—In the House of Commons, recently, Sir S. SCOTT asked the Secretary to the Treasury what progress had been made with the Government afforestation scheme in Scotland; what number of the necessary trees had been ordered in the United Kingdom, and what number in Germany or elsewhere abroad, specifying the species of tree ordered. Mr. HOBHOUSE replied that the fencing of the area to be planted during the next two years had been put up. Planting, which will extend this season to about 150 acres, has been begun upon the ground which

PRESENTATION TO MR. J. C. GOULD.—In commemoration of 60 years' connection with the firm of Messrs. CHAS. SHARP & Co., Sleaford, Mr. J. C. GOULD was on Thursday, 2nd inst., presented with a silver Rose bowl. The gift was subscribed by the employes of the nursery, the presentation being made by Mr. A. J. JESSOP.

INDUSTRIAL BANKS.—The need for assisting agriculture and kindred industries by the formation of industrial banks has been again and again urged upon those responsible for legislation in this country. Recently, and in connection with the Development Bill, attempts to bring about the foundation of these much needed institutions have been made, though not, as it would appear, with any measure of success. Inasmuch as it is a

banks have proved a boon to German agriculture, it cannot be doubted but that they would prove of benefit to British agriculture. The Board of Agriculture would be doing a valuable service to the community if it were to circulate information on the mode of working of credit banks in various European countries, and if, also, it would ascertain through its correspondents and its *Journal* the extent of the need for such institutions in this country.

ON CAUSES DETERMINING THE FORMATION OF RESTING-SPORES IN FUNGI.—The conditions under which various fungi produce their characteristic spores have been the subject of much investigation, which has led to interesting and unexpected results. The latest research of this

kind, conducted by Dr. HEALD and published in the 22nd annual report of the Agricultural Experiment Station of Nebraska, U.S.A., shows that the formation of perithecia, the receptacles containing the resting-spores, is determined in the case of *Melanospora pampeana*, a fungus concerned in the production of "mouldy corn," by a chemical stimulus. Grown in pure cultures the fungus fails to produce its long-necked, flask-like perithecia; but when grown in company with other fungi, e.g., species of *Fusarium*, it produces perithecia in abundance. Inasmuch as perithecia are also produced if, to the culture medium in which the mycelium of *Melanospora* is growing, there be added the remains of a *Fusarium* culture, which has been sterilised by heating to 100° C., it follows that the stimulus to perithecia-formation is not dependent on the presence of living *Fusarium*; but to some chemical substance formed by the latter fungus in the course of its growth. Every year shows more convincingly how close are the inter-relations between living things, and shows, moreover, how important it is, both in the interests of science and practice, to clear up the obscurities of these relations. It is not at all improbable that the virulence of a given fungus disease in one year as compared with another may be due to some such causes as those discovered by Dr. HEALD to be at work in the production of perithecia in *Melanospora*.

NATIONAL VEGETABLE SOCIETY.—The Secretary informs us that the work of preparing the schedule of competitive classes at the forthcoming exhibition of vegetables of this new Society is proceeding. A meeting of a specially-appointed sub-committee will be held on Monday next to arrange the details. The value of the sums offered for prizes amounts at present to £140. Every section of vegetable growers will have opportunities to compete, and practically every kind of vegetable will be represented. There is yet reason to hope that a special class for the newly-created small-holders will be provided. The Duke of PORTLAND, as president, has offered a prize of 10 guineas, which will be given in an open class for 12 dishes of distinct kinds of vegetable.

FRUIT CONGRESS AT HEXHAM, 1910.—At a meeting of representatives of gardeners' societies, and others interested in horticulture, held at the Abbey Hotel, Hexham, on November 27, it was decided that a congress and show should be held on Thursday, Friday and Saturday, October 20 to 22. Hexham was agreed upon as the most central and convenient place for the event, owing to the presence of the French gardens, suitable hall accommodation and railway facilities. The trade classes will be open, but in all other classes exhibitors must be residents in the four northern counties.

WINDOW LEAVES.—The versatility of adjustment of plants is endless, and provides a constant theme to the botanist. The most recent discovery of remarkable adaptation is provided by Drs. SCHÖNLAND and MAZLETH. The former observer describes the remarkable window-leaves which occur in South African species of *Haworthia*; the latter, the similar structures which are possessed by various South African succulents, such as species of *Bulbine*. The leaves of *Haworthia* are mainly underground, the parts exposed resembling small pebbles, so that, for those who seek among plants for analogies with animals, these *Haworthias* may be regarded as instances of mimicry. The significance of the absence of chlorophyll from the exposed part of the leaf is fairly clear. In intense sunlight, chlorophyll is destroyed; plants, therefore, exposed to intense light may be expected to show evidence of protecting their chlorophyll—assimi-

lating apparatus from this fate. Even our own ordinary plants form no green chlorophyll in the epidermis of their leaves, though the epidermal cells contain colourless rudiments of chlorophyll grains. Shade plants such as Ferns and submerged aquatics on the other hand, running no risk of damage from intense sunlight, bring their chlorophyll grains up to the light by developing them in their surface cells. In *Haworthia* and in *Bulbine* the truncated apices of the leaves form windows through which the light filters. Mitigated in intensity, it passes to the deeper green layers, which are thereby enabled, without risk of damage by too intense light, to carry on the work of carbon-assimilation. Whilst in this land of but too little sun, our broad-leaved trees spread out their chlorophyll grains in flat plates, in the leaves, in countries of intense sunlight, like South Africa, the chlorophyll is protected in an almost endless variety of ways, the most remarkable of which is that exhibited by the window-leaves of the *Haworthias* and *Bulbines*. In these plants it is protected from the glare of the mid-day sun by window-like layers of colourless tissue.

* **"TREES AND SHRUBS."**—This work is now issued in two volumes. It deals with the trees and shrubs of the British Isles, including native and acclimatised species. There are 16 full-page coloured plates, most of them good representations of the different subjects, and 70 full-page black and white plates, all of them from drawings. We have already referred to the letter-press, when reviewing the different parts. The work is not exactly a book to read, but, by reason of the facts it contains, it is a reference book for those interested in tree life, but who need accurate knowledge of the habits and structural characteristics of the species.

PUBLICATIONS RECEIVED.—*The Book of Flowers*, by Katherine Tynan and Frances Maitland (London: Smith, Elder & Co.) Price 6s. net.—*A Preliminary Report on the Valusia Soils: Their Problems and Management*, by Earl Carr; *Fertilisers for Cotton Soils*, by Milton Whitney; *Hibernation of the Mexican Cotton Boll Weevil*, by W. IMPORTANCE OF FOWL DUNG.

ALTHOUGH the excretions from domestic fowls are only gathered in relatively small quantities, they are not without value, for they constitute a manure rich in soluble constituents, corresponding somewhat to the guano of the second grades.

In former times, when fowl rearing was more common than at present, the value of their dung was better appreciated. The ancient Romans particularly praised their pigeon dung; they gathered it in large quantities and utilised it, especially for fruit trees.

As is the case in respect to other domestic animals, the richness of poultry manure as a plant stimulant depends largely upon the character of the food the fowls consume. When they consume many insects and worms or are fed with bonemeal and meat-refuse, their voidings are much richer than if fed on grain or vegetable matter exclusively. Likewise, if pigeons are fed largely with Peas, Lentils, or Vetches, their manure will be correspondingly rich in nitrogenous plant-food.

Dr. Groff, who has experimented with domestic fowls, advises feeding them with all the fresh-ground bone they will eat. The result will be that their droppings will not only be richer for manurial purposes, but the value and number of eggs will be greatly increased. Dr. Groff gives the following analysis of fowl manure. In the case of No. 1 the hens were bone-fed, while in those of No. 2 the analysis consists of an average of four samples of dung, air-dried, from fowls fed in the ordinary way.

	Phosphoric		
	Acid.	Potash.	Nitrogen.
	Per Cent.	Per Cent.	Per Cent.
No. 1. Bone fed ...	4.36	1.64	6.01
No. 2. Ordinary fed ...	1.60	1.85	1.03

These figures show that the dung from the bone-fed fowls was about three times richer in phosphoric acid and six times richer in nitrogen than the dung from the ordinary-fed fowls.

The following table gives the amount of selected chemical constituents in one ton of poultry manure in a fresh condition:—

	Phosphoric			
	Nitrogen.	Potash.	Acid.	Lime.
	Lbs.	Lbs.	Lbs.	Lbs.
Hen ...	43	19	39	58
Pigeon ...	47	25	41	44
Duck ...	27	13	31	23
Goose ...	15	21	12	13

Poultry manure is thus shown to be an exceedingly valuable fertiliser. The richest manure is from hens and pigeons. Geese eat grass, and both ducks and geese drink large quantities of water.

We have sometimes heard the remark that poultry manure poisons plants to which it has been applied. This is simply because it is used in excess. It should be applied in moderate quantities only at a time, and for preference used in the spring, and not dug too deeply into the soil. It must be remembered that young and delicate plants are more often injured in the spring months by too much stimulating manure than by too little. Small doses frequently repeated should be the rule for early crops. This also prevents waste of plant food.

Plants growing in pots are frequently starved to death for want of sufficient food, owing to their limited soil area, and to the frequent waterings rendered necessary, hence the value of an occasional sprinkling on the surface of the soil of dried and pulverised fowl manure. The dung may also be usefully employed in making soil composts for potting purposes. *J. J. Willis, Harpenden.*

A BOTANICAL JOURNEY IN SOUTH-WEST AFRICA.

(Continued from page 370.)

GREAT NAMAQUALAND AND DAMARALAND.

GREAT NAMAQUALAND forms the southern half of German South-west Africa. It is separated from Cape Colony by the Orange River; its northern limit is a little north of the Tropic of Capricorn, coinciding approximately with a line drawn due east from the northern limit of Wal-fish Bay. It includes a great stretch of practically unexplored desert running parallel with the coast and merging, at higher elevations to the east, into the less arid region of the high plateau beyond which, and at a somewhat lower eleva-

ledge of the lower-lying desert belt along the coast has been but little advanced.

While in the desert region the rainfall is very small, and frequently wanting entirely for years together, on the plateau and among the mountains which intervene between it and the coastal belt, it is at times copious, but always local, in-constant and unreliable. In the late winter and early summer of 1909 unusually heavy rains fell in many districts, and were followed by a period of extraordinary vegetative activity; areas commonly arid and barren were suddenly converted into fields of green grass and bright flowers. In such a season the water holes are much frequented by farmers from the north, attracted by a greater supply of food for their flocks than is obtainable in their own districts. But these periods of plenty are so rare that permanent settlers are few and widely scattered. Warm-

scenery (fig. 176). Its branches are frequently laden with the enormous grass nests of the social weaver bird (*Philetærus socius*), a small creature hardly larger than a chaffinch. The lower surface of the nest is perforated in many places by passages leading into the interior of the structure, which contains "from 20 to more than 300 separate habitations." It "is added to, year by year, until either the tree in which it is built gives way, or its branches can afford room for no more material."† As in Bushmanland, the deep sand makes travelling slow and heavy, and the water holes are far apart. Such as it is, the water is, on the whole, more carefully guarded than in Bushmanland; but that attention to detail for which German administration is justly famous is more clearly seen in the condition of the transport roads, along which directions and distances are indicated by legends painted on solidly-constructed cairns.

In the latitude of Lüderitzbucht (see map in the first article), the high plateau merges into the desert about 60 miles from the coast at an elevation of 2,700 feet. The vicinity of the arid coast belt is clearly indicated by changes in the vegetation among which the following are conspicuous:—grasses become fewer; all the trees disappear save the Camelthorn and the tree *Alôë* (*A. dichotoma*); other constituents of the vegetation of the plateau—especially *Mesembryanthema* and some other succulents—consequently play a more important part in the flora; *Euphorbias* (fig. 177), similar in habit, but of more than one species, become very numerous and form by far the most dominant feature in the vegetation. The desert itself commences very abruptly. A journey of no more than 5 kilometres brings us from a plain fairly rich in species to a lower elevation at which rain rarely falls, and where the bare spaces separating each plant from its nearest neighbours are measured in scores or hundreds of yards. The water famine which prevails in the upper layers of sand is aggravated in its effects by the remarkably clear atmosphere in which distances of 50 miles, when judged by English standards, appear to be no more than 10; the sun's rays beat upon the exposed surfaces of sand and rock and heat them to such an extent that to touch them is painful. The temperature falls rapidly after sunset, and a cold mist forms before midnight: this lasts through the night, but is soon dissipated when the sun rises, except upon the hilltops, which it conceals frequently for some hours longer. This fact probably affords a partial explanation of the presence of a richer flora on the upper slopes and summits than at lower levels. Conspicuous among the few species which have been able to adapt themselves to the high degree of insolation which prevails are the *Euphorbias* already mentioned, and two *Sarcocaulons* (*Geraniaceæ*), whose thick cuticle affords a most efficient protection against evaporation. This covering, which completely envelops the stem, is rich in hydrocarbons, and burns energetically with a yellow, smoky flame; it is commonly known as the "Bushman's Candle."

The desert belt extends southwards to the Orange River, and probably beyond it, in the neighbourhood of the mouth. Apart from the German settlement at Lüderitzbucht, and a few stations on the recently-completed railway—whose water supply is mainly obtained by the condensation of sea-water—there are no permanent inhabitants save a few nomadic bushmen and Hottentots on the banks of the Orange River. Their existence is largely dependent upon that remarkable Cucurbitaceous plant the "Naras"—*Acanthosicyos horrida*—which flourishes in a wild state upon the sand dunes of Wal-fish Bay. It is believed that it does not naturally occur so far south as the Orange River, but has been introduced there by the natives, to whom its fruits and seeds are essential

FIG. 176.—SOUTH-WEST AFRICA.

A scene on the high plateau of Great Namaqualand. The specimen of the "Camelthorn" (*Acacia giraffæ*) in the foreground bears a large nest of the Social Weaver-bird (*Philetærus socius*). In the middle distance, along a dry river bed, are bushes of *Tamarix articulata*.

tion, lies the southern end of the desert and semi-desert region of the great Kalahari. The first white man to traverse the whole length of this trackless wilderness was Sir J. E. Alexander, who left Cape Town in September, 1836, and, in the face of enormous difficulties, due mainly to the lack of water, at length arrived on the coast at Wal-fish Bay in April, 1837. The account of his journey, published in 1838,* constitutes one of the most interesting chapters in the history of the exploration of South-west Africa. Since these early days the high plateau has been crossed many times by missionaries, traders and other travellers; but our know-

bad (formerly called Nisbet's Bath), an old settlement on the banks of the periodical stream Houm, a tributary of the Orange River, and the headquarters of the Bondelzwart Hottentot tribes, has assumed some importance in recent years as a military station. It is well known for its natural springs of warm water impregnated with sulphuretted hydrogen.

The flora is closely related to that of Bushmanland, except at elevations above 3,500 feet, when Bushmanland grasses, succulents, and shrubs are associated with the Camelthorn (*Acacia giraffæ*) and other *Acacias*, which are either absent or rarely met with at lower elevations south of the Orange River. On flat, sandy ground the Camelthorn is so abundantly represented that it gives a distinct character to the

articles of food. The recently-discovered diamond field lies along the coast south of Lüderitzbucht: its exploitation is very seriously hampered by the difficulty of providing an adequate

are small, frequently minute. They possess, further, strongly-developed root systems which penetrate to considerable depths, and reach subterranean water supplies derived from the

PLANT NOTES.

MONSTERA DELICIOSA.

To grow this tropical aroid in all the magnificence of its wonderful foliage, a hothouse after the style of the lofty Kew Palm house would be required. The height to which the stems of this plant would ascend is limited only by the pillars, or, in its natural state, the trees, around which it tightly wraps its supporting, flexible roots. The amount of growth a plant makes each year in tropical heat is astonishing. The leaves, when they first appear, although destined to be strong and leathery, 2 to 3 feet long, and as much broad, are very tender and soft and of a pleasing shade of pea-green. As soon as they uncurl, these leaves are almost of full size, and the blade of the leaf hangs straight downwards—thus they are less exposed to injury from heavy tropical rains. The leaf soon matures and hardens, then it assumes a horizontal position through a stiffening of the hinge-like arrangement at the junction with the leaf-stalk, which continues stiff, and at the same angle throughout. Equally interesting is the shape of the leaf: the margins are boldly cut, and the central portions perforated with irregularly-shaped holes which admit the light to the leaves growing on a lower plane. While many of its roots closely entwine their support, others hang straight down to a considerable length; they are stout, flexible and very tough. In the native habitat in Mexico, these roots are used as a rough cordage for tying bales of merchandise. Most of the fruits of Aroideæ, if not actually poisonous, are very bitter, but *Monstera deliciosa* is a remarkable exception. In this species the fruits are deliciously fragrant and luscious, so luscious that few people could eat them in great quantity, whilst with some persons they leave a somewhat unpleasant tickling sensation in the throat. The boat-shaped spathe is nearly white, and it does not fully open. It quickly discolours and falls, leaving the stout, club-like spadix slowly mature. The fruits often take 15 or more months to ripen. The flavour of the fruits is improved if they are cut when nearly ripe and placed in a warm

Aloe dichotoma and *Euphorbias* on a barren ridge at the eastern edge of the littoral desert of Great Namaqualand (about 2,500 feet above the sea).

water supply. To the north the desert stretches continuously, but with considerable differences of breadth, through Damaraland and beyond the Cunene River, whence it is continued as a less arid belt almost to the mouth of the Congo. In Damaraland, about 200 miles north of Lüderitzbucht, and some 40 miles from the coast, *Welwitschia mirabilis* occurs in considerable numbers, in that part of the desert usually known by the Hottentot name "Namib." Here the flora is somewhat richer than farther south in Namaqualand, though the rainfall is almost a negligible quantity. With the *Welwitschia* is usually found a plant in many respects hardly less remarkable: this is *Commiphora saxicola* (Burseraceæ) a specimen of which is shown in fig. 178. The tissues of its short and coriaceous stem and branches contain great quantities of water. Its leaves are very small, and probably, in some years, none at all are produced: its flowering certainly depends to some extent upon atmospheric moisture, for in very dry years some plants do not flower at all.

Broadly speaking, the vegetation of this waste may be subdivided into two classes. There are species in which the whole life of the individual is crowded into the space of a few weeks. The majority of these only appear in favourable seasons when a little more rain than usual has fallen. Their existence therefore depends primarily upon the power which the seeds possess of remaining dormant on the periodically-heated surface for periods of years of intense drought. They are further endowed with the faculty of responding promptly to a slight increase of atmospheric humidity and precipitation and of germinating with great rapidity. The bulk of the vegetation, on the other hand, is composed of woody or more or less succulent species which persist for several years. These all possess water-storing tissue to a greater or less extent, and, without exception, their leaves

drainage of the Eastern highlands, and absorbed by the thirsty ground on its way to the sea. The ephemeral parts of the plant—leaves and flowers—normally develop with great rapidity, the latter usually very profusely, and their production is to some extent dependent upon local rainfall. H. H. W. Pearson

(To be continued.)

FIG. 178.—SOUTH-WEST AFRICA.

Commiphora saxicola, a stout-stemmed bush occurring commonly among rocks with *Welwitschia mirabilis* in the Damaraland littoral desert.

cupboard. *Monstera deliciosa*, when growing in tropical conditions, quickly assume enormous proportions, but in a glasshouse having an intermediate temperature, its growth, although equally healthy, is not nearly so rapid, and the plants fruit much more freely. At Pencarrow we fruit it regularly in such a house, and the plants, which grow against an Elm post at the end of an aquatic tank, are cut down when they have become 7 or 8 feet high. The tops of the plants, with a foot or more of stem, are inserted around the Elm post, where they quickly root. *Monstera*s growing in pots make useful subjects for use in sub-tropical groups where such are arranged in warm, sunny places. *A. C. Bartlett, Pencarrow Gardens, Cornwall.* [Our correspondent forwarded a spadix of ripe fruits with his notes.—Eds.]

FRUIT REGISTER.

THE STRAWBERRY-RASPBERRY.

This plant was introduced from Japan somewhere about the year 1895, and ever since then has been cultivated in gardens in this country under a variety of names already applied to other species, so that Strawberry-Raspberry, although a misnomer, was the only name by which one could be certain of what was meant. At least three erroneous names have been given it—*R. rosaeifolius*, *R. palmatus*, and *R. sorbifolius*. The first-named is a tall, woody species, with downy leaves and stems and a branching inflorescence. The leaves of *R. palmatus* are palmately five or six-lobed, and therefore quite distinct from those of the Strawberry-Raspberry. *R. sorbifolius* has tall stems, densely covered with bristly prickles, like those of the common Raspberry, only more numerous and of a different colour. The plant under notice was described by the celebrated German botanist, Dr. W. O. Focke, in 1899, under the name of *Rubus illecebrosus*, referring to the enticing appearance of the fruit. Its distinctive characters are the glabrous, pinnate, and prickly leaves, and the annual, glabrous, prickly stems, 1 foot to 3 feet high, and bearing solitary, fragrant, white flowers of large size from the apex and from the axils of one or two of the upper leaves. The root-stock is perennial and creeps extensively. The fruit is useful for preserving and for cooking with Apples for immediate use. *J. F.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

A NEW SPINACH.—On p. 380 it is stated that *Chenopodium amaranticolor*, or the new Spinach, may not thrive in this country because it is a warmth-loving plant. However, we are already well off for leaf plants of the Spinach type. This *Chenopodium* is presumably of the same type as Good King Henry (*Chenopodium Bonus Henricus*), one of the oldest of garden vegetables. Of this leaf plant it is said in *The Vegetable Garden*, by MM. Vilmorin & Andrieux, that it is "an excellent vegetable, and deserving to be more generally planted." But old as it is and good as it may be, we never see it constituting a general crop in gardens, although a few plants may be seen. Why has so useful a vegetable been thus superseded? Is it due to the fine, true Spinaches we have and which are so easily grown? It is said that the new *Chenopodium* will grow well in hot, dry seasons, when common Spinaches will not. But if seed of such a fine variety, for instance, as Longstander, be sown thinly, in succession, in shady positions, especially on the north side of walls, or between rows of tall Peas and Beans, an ample supply of leaves can be had all through the summer. Then the quality and flavour of the leaves are well known. But apart from common Spinaches, there is the free-growing, spreading New Zealand Spinach, which is rapidly becoming so popular in the market:

and single plants of which on good soil will cover a square yard of ground, and give several abundant leaf-pickings. That is specially a kind suited to tide over hot summers. Besides that kind there is the perpetual or mountain Spinach, which does well in any cool place in the garden and gives a large leaf supply over a long season; and, still farther, there is the Seakale or Beet Spinach, which is an excellent substitute for common Spinach. But with all this abundant leaf production, none of these plants can well be classed among high-class or popular vegetables. Of these latter we have a wealth of kinds and varieties. I trust, when the exhibition of the National Vegetable Society is seen at Westminster next September, it will be amply evidenced that we have the finest vegetables in the world. *A. D.*

EUCALYPTUS CORDATA.—Doubtless many readers of the *Gardeners' Chronicle* are acquainted with the beauty and elegance of *Eucalyptus cordata* as a decorative plant for summer bedding. In my opinion it is gracefulness itself. My friend, Mr. A. Campbell, gardener to Lady Ardilaun, St. Ann's, Clontarf, Co. Dublin, informed me a week or two ago that he planted a plant 9 inches high, in August, 1904, in a permanent position out-of-doors. It was only slightly protected during the first winter, but it has now attained a height of 20 feet, and has beautiful, drooping branches, which sweep the ground. The specimen is now well set with flower-buds, which are white, and, when developed, are about 1 inch in diameter, resembling the flower of *Hypericum*. It is interesting to mention that seed was saved from a tree in the spring of 1904 and sown at once, and it was one of these seedlings which Mr. Campbell planted. I enclose herewith a small spray containing a number of undeveloped flower-buds. I am not aware that this *Eucalyptus* has previously flowered out-of-doors, in the United Kingdom. I think I may claim to have been the first to introduce *E. cordata* as a bedding plant some years ago. Since that time I have had many enquiries respecting the plant from all parts of the kingdom. *J. Melville, Superintendent, Finsbury Park, London.* [An illustration of the foliage of this species was given in these pages, June 30, 1888, p. 802.—Eds.]

THE JERUSALEM ARTICHOKE (see p. 374).—May I point out that *Asa Gray*, and all those who commonly give the same etymology, are undoubtedly wrong in connecting the epithet "Jerusalem" with the Italian "girasole"? This is merely an unfounded but plausible guess without either historical or philological foundation. As a matter of history the vegetable gained its name in England long before it was cultivated or known in Italy. Other plants, which neither in name nor in origin are connected with Italy, bear this same epithet "Jerusalem," e.g., *Phlomis frutescens*, Jerusalem Sage; *Pulmonaria officinalis*, Jerusalem Cowslips. The meaning is simply "foreign," "outlandish," and dates from as far back as the time of the Crusades, when Jerusalem was the typically foreign place to the English mind. "Saracen" was used in the same sense, and still survives in its corruption "Sarsen." The great boulders which lie on the Marlborough Downs (most of Stonehenge was built from them) are to this day called the Sarsen, or foreign and unexplained stones. A very old Hampshire villager, once employed in my garden, always called French Beans Jerusalem Beans, the meaning being Beans introduced from abroad later than the old English Broad Bean. *G. H. Engleheart.*

—The interesting notes on Jerusalem Artichokes in last week's issue refer to the use of "Heliantis" as fodder, and the question is asked whether the common Jerusalem Artichoke stems have ever been "fed to cattle in this country." On two occasions in my experience I have had to clear large quarters devoted to these Artichokes before the roots were sufficiently developed to be utilised as a crop, and the tops were given to horses, cattle, and pigs with various results. In the first case, the stems were not more than 2 feet high, and were therefore in quite an early stage of growth, fresh and succulent. These were readily eaten by cattle and pigs, but horses would not touch them, though the same horses would greedily devour such apparently untempting fodder as Cow Thistles. In

the second example, the Artichoke stems were more advanced, about two-thirds of the average height, but still fresh and comparatively tender, though the stems were hardening somewhat. Neither horses nor cattle would touch these tops, and pigs would only eat the younger leaves. As to the actual food value I cannot speak, but it is obvious this would not count for much if animals would not take to such fodder. However, I give my experience for what it is worth, and should like to know more of the qualities claimed for *Heliantis* as fodder. *R. Lewis Castle.*

LILIUM GIGANTEUM SEED.—Early in October I notified that I would send seed of this Lily to any reader of the *Gardeners' Chronicle* who wished for some. At that time there was promise of a most abundant supply, but I regret to say that the heavy wet of October, followed by severe frost early in November, has destroyed the crop. The capsules are full of seed membranes, but the seeds are totally devoid of albumen, owing, I suppose, to the cold and wet weather prevailing since June 25. I am compelled, therefore, most reluctantly to confess myself unable this year to fulfil the request of between 30 and 40 persons who asked for seeds. I have kept their addresses, and next year, if the season is more favourable, I hope to fulfil my undertaking to them. *Herbert Maxwell, Monreith, December 6.*

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 7.—Although much smaller than usual, the exhibition at the fortnightly meeting in the Society's Hall, Westminster, on this date, was very varied. Some of the exhibits had remained from the recent Colonial Show, and there were others which were intended for the Carnation Show on the following day. Groups of Carnations, Cyclamen, and Begonias formed the principal subjects brought to the notice of the FLORAL COMMITTEE. Novelties in this section were fewer than usual, and only two Awards of Merit were granted by the committee, both being to new Chrysanthemums. There were, for the time of year, many good exhibits of Orchids, and two novelties were granted Awards by the ORCHID COMMITTEE.

The FRUIT AND VEGETABLE COMMITTEE made no award to a novelty. An exhibit of BRASSICAS, shown by Messrs. SUTTON & SONS, was of more than usual interest.

Floral Committee.

Present: H. B. May, Esq., and Messrs. Geo. Paul, W. P. Thomson, Chas. E. Pearson, Chas. Dixon, W. Bain, H. J. Jones, Chas. E. Shea, Walter T. Ware, A. Kingsmill, J. T. Bennett-Poe, W. Howe, Jno. Jennings, Jas. Douglas, G. Reuthe, R. C. Notcutt, John R. C. Boscawen, E. T. Cook, James Hudson, R. Hooper Pearson, E. H. Jenkins, and W. Cuthbertson.

Carnations were shown splendidly by Mr. H. BURNETT, Guernsey, who had all the best of the standard varieties and many new kinds displayed in an attractive manner. The bright colour of the flowers impressed visitors, their high tints being indicative of the favoured climate of the island. Amongst the newer varieties we noticed *May Day*, which was given an Award of Merit at a recent meeting; *Defiance*, a notable addition to the scarlet varieties; *Apple Blossom*, showing a faint blush at the base of the white petals; *Mrs. W. B. Clode*, deep salmon; *Comtesse of March*, a seedling from the popular *Enchantress*, the salmon coloured petals being fragrant; *Bridesmaid*, salmon-pink; *Alvina*, a flower of medium size, coloured a pleasing shade of cerise; and a seedling raised from *Mrs. H. Burnett's Enchantress*, the large bloom being bluish pink. (Silver-gilt Banksian Medal.)

Mr. W. H. PAGE, Nurseryman, Hampton, Middlesex, displayed one of his beautiful exhibits of Carnations and Lilies which always find high favour at these meetings. The fine quality of the flowers and the attractive method of displaying them cannot be too highly praised. The Lilies were shown in big clusters and included *L. longiflorum* and *L. speciosum rubrum*. The new *Pelargonium Mrs. Marjesty*, certified at the last meeting, and another of rose pink colour named

Fiscal Reformer were grouped at either end of the exhibit. (Silver-gilt Banksian Medal.)

Messrs. CUTBUSH & SON, Highgate, who have exhibited Carnations at these meetings for a very considerable period, again contributed a fine display. They showed a new tree variety named Rosine, the blooms being sweet-smelling and of rose-pink colour. Mme. Barreto is also fragrant; the colour is the shade known as puce. A seedling labelled A4 has exceptionally strong stems; the colour is after Mrs. Burnett but darker. White Enchantress, The President, Winsor and other standard kinds were represented by exceptionally choice blooms. In another part of the building Messrs. CUTBUSH showed a bright group of berried shrubs, including Hollies, Pernettyas, Skimmias, Cotoneaster angustifolia and Hippophae rhamnoides, set off with Bamboos and Palms. (Silver Flora Medal.)

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, arranged, in the central transept, a kiosk decorated with Carnations. It was a very pretty feature, the columns being terminated by hanging baskets of flowers, the whole forming a gay bower of these attractive blooms. Some notable varieties were O. P. Bassett (scarlet), May Day (salmon-pink), Mrs. Crook (pale crimson, flaked with maroon), Roseate Dawn, Floriana (pale pink), and Lady Allington (deep salmon). (Silver Banksian Medal.)

An attractive group of flowering plants arranged with Ferns and Palms was shown by E. H. BROWN, Esq., Roehampton (gr. Mr. R. Bradford). In the centre was a large bank of Euphorbia (Poinsettia) with finely-developed bracts; on either side were six large pyramid-trained plants of Begonia Gloire de Lorraine and between these were arranged small pot plants of Paper White Narcissus and Lily of the Valley, with a background of Dracenas and Palms. There were also large pans of Cyripedium insigne, the plants being well bloomed. Numerous foliage plants were interspersed amongst the flowers for relief. (Silver Flora Medal.)

A considerable exhibit of Cyclamens was displayed by Rev. E. H. BUCKSTOKE, Etwell, Derby. They were grouped in batches of crimson, red, pink, and white-flowered varieties, all the plants being freely flowered and with healthy foliage. (Silver Flora Medal.)

Another but smaller group of these flowers was exhibited by W. ASTOR, Esq., Taplow (gr. Mr. W. Camm). They were all of salmon colour, and made a very attractive group, the culture being excellent. (Silver Banksian Medal.)

Messrs. JAMES VEITCH & SONS, King's Road, Chelsea, again showed their beautiful hybrid Begonias, the method of staging being different on this occasion, but showing them to the very best advantage. Mingled in the group were handsome specimens of *Nucifera gratissima*, a useful, winter-blooming, tender shrub; and late-flowering Chrysanthemums. (Silver-gilt Banksian Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Upper Edmonton, showed an assortment of greenhouse Ferns, well-flowered plants of *Erica melanthera*, a fine strain of *Primula obconica*, *Plumbago rosea*, and *Begonias Gloire de Lorraine* and Turford Hall. The whole made a very fine display, all the plants showing the perfection of culture. (Silver Flora Medal.)

Mr. FRANK BRAZIER, nurseryman, Caterham, Surrey, showed a floor group of Chrysanthemums, principally of decorative and single varieties, interspersed with sprays of ornamental-leaved shrubs. The new variety Mrs. W. Parker (see Awards) was represented by many attractive specimens.

Messrs. W. WELLS & Co., LTD., Merstham, Surrey, showed Chrysanthemums, principally of single and Japanese varieties. Miss Muriel Smith is a pretty flower of pale-pink colour shaded with terra-cotta. Captain Julian (yellow), Merstham Jewel (a yellowish bronze single), R. F. Felton (rich yellow), Mrs. David Syme (white), Wells's Pink, and Bessie Evans (an incurved Japanese bloom of blush shade) were the more notable varieties.

Messrs. H. CANNELL & SONS, Swanley, Kent, showed a pretty exhibit of single and decorative Chrysanthemums and varieties of Zonal Pelargoniums. Amongst the Chrysanthemums, those labelled Miss Gweneth Wood, with Chestnut-red florets and a pretty yellow centre; Souvenir de A. Scalarandis, a fine yellow decorative variety; Mrs. Amy Collett, salmon-pink, set off by a large yellow disc; Camell's Crimson, Camell's White, and Mrs. Chas. Willis (single) were the

more noticeable. The Zonal Pelargoniums were shown in massive trusses of big blooms; Berlin (scarlet), Venus (white), Ascot (salmon), and Cymric Crimson (magenta) are notable varieties of their respective colours. (Silver Banksian Medal.)

Vases of single Chrysanthemums were shown by F. W. WILLIAMS, Esq., Bromyard. A good Incurved Chrysanthemum, of richest yellow colour and with hair-like eruptions on the florets, was shown by Messrs. J. & F. CHATFIELD, Southwick, Sussex.

Messrs. JOHN PEED & SON, nurserymen, West Norwood, again showed Alpine and succulent plants in pans and small pots, as at the last meeting.

Mr. L. R. RUSSELL, Richmond, Surrey, showed a group of berried shrubs, Ivies, Hollies, *Erya latifolia*, and other ornamental-leaved plants.

Mr. JAMES DOUGLAS, Great Bookham, Surrey, showed large blooms of Carnation Hercules from autumn-layered plants. The colour is crimson maroon. As a winter-blooming variety, the plant is an acquisition.

AWARDS OF MERIT.

Chrysanthemum Mrs. W. Parker.—A single variety of faint blush colour, the large conical disc being an additional attraction. Shown by Mr. F. BRAZIER.

Chrysanthemum Kathleen May.—Naturally grown and disbudded sprays were shown. Those that were disbudded showed large blooms with reflexed petals and a prominent yellow "Ane-mone" centre. In the other sprays, the disc was scarcely observed, and the florets were erect and stiff. The large blooms were $\frac{1}{2}$ inches across, with several rows of petals. The colour is crimson. Shown by Mr. H. J. JONES.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. sec.), W. Bolton, W. Cobb, R. G. Thwaites, W. Boxall, F. J. Hanbury, Stuart Low, J. F. Alecock, A. A. McBean, C. H. Curtis, J. Charlesworth, J. Cypher, A. Dye, W. H. Hatcher, H. Ballantine, H. G. Alexander, Gurney Wilson, J. Wilson Potter and de B. Crawshaw.

Lt.-Col. G. L. HOLFORD, C.I.E., C.V.O., West-norbert (gr. Mr. H. G. Alexander), showed several fine hybrid Cyripediums, including *C. Arctusa*, which had previously secured an award; *C. Draco* (*Euryades* × *insigne magnificum*), the fine white upper sepal spotted with purple; *C. Dawn*, a well-formed flower with white dorsal sepal having a purplish central band, and pale-greenish petals and lip; and *C. Euryades leopardinum*, a very beautiful flower.

H. S. GOOSEMAN, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), was awarded a Silver Flora Medal for an excellent group, principally Cyripediums, among which were a fine lot of *C. insigne Sanderae* and other varieties of *insigne*; *C. Mimos*, *C. triumphans*, *C. Mme. Jules Hye*, *C. Maudie*, &c. In the centre was a fine crimson form of *Odontioda Bohnhoffiae*, and at the back some good *Laelio-Cattleyas* and hybrid *Odontoglossums*.

Messrs. SANPER & SONS, St. Albans, were awarded a Silver Flora Medal for an effective group, in which were several very remarkable plants, the finest of which was *Cyripedium Alcibiades illustre* (*Lecanum giganteum* × *Mons. de Curte*). As the flower bore a resemblance to that of the very fine *C. Alcibiades magnificum* for which Lt.-Col. G. L. Holford received a First-class Certificate on January 9, 1906, no award was given. In effect it resembles the remarkable *C. Lecanum J. Gurney Fowler*; in size and substance it is perfect, and the large white dorsal sepal, which is broader than long, is prettily marked with dotted purple lines from a small green base. Other fine *Cyripediums* were *C. Lion* (see Awards), *C. Clousoniam*, of unknown parentage, but bearing evidence of a fine *C. Lecanum* on one side. The flower is of good size, well balanced, the white dorsal sepal having distinct dotted lines of purple. The petals and lip are honey-yellow tinged with mahogany red. Fifteen varieties of *C. insigne* were included; several showy hybrid *Odontoglossums*, and some interesting species.

Messrs. CHARLESWORTH & Co., Haywards Heath, were awarded a Silver Flora Medal for

a varied group of good things, principally hybrids. In the centre were a group of *Calanthes*, and on one side a large batch of that richly-coloured winter flower *Laelio-Cattleya Charlesworthii*, with its bright heads of orange-red flowers, with crimson lips. A magnificent variety of *Cattleya Octave Doin* had broad, pearly-white sepals and petals and gold-veined mauve-purple lip. Several fine blotched *O. crispum* raised from seeds; a superbly-coloured new form of *O. ardentissimum*, obtained from *O. Pescatorei Charlesworthii* × *O. crispum Graireanum*; an evenly-spotted *O. Fascinator*, and various other hybrid *Odontoglossums*; some fine *Cyripediums*, including the handsome *C. Eboracum*; also some showy *Sophranitis* crosses.

Messrs. MANSELL & HATCHER, LTD., Rawdon, Leeds, secured a Silver Banksian Medal for a neat group, in which *Cyripediums* were well represented. Among these were *C. Sidney-anum*, a very attractive flower, with the white dorsal sepal effectively spotted; *C. insigne Bohnhoffianum*, with the colouring in the dorsal sepal not displayed in blotches, the upper part being very clear white; *C. triumphans*, *C. Mme. Jules Hye*, *C. Marjorie*, of fine shape; *C. Lecanum magnificum*, and other forms of *C. Lecanum*; *C. gigas superbum*, &c. Also in the group were *Brasso-Laelia Jessopii*, with pale-green sepals and petals and white fringed lip; and the pretty *Maxillaria elegantula* and *M. grandiflora*.

Messrs. JAS. CYPHER & SONS, Cheltenham, were awarded a Silver Banksian Medal for an extensive group of good *Cyripediums*. Among the varieties of *C. insigne*, one named *C. i. Ethel Cypher* was a very attractive light form; *C. Mr. F. Sander* a remarkable flower of good shape and dark colouring, and with some appearance of *C. mitens*. Other good things included *Cyripedium G. F. Moore*, a very handsome flower; varieties of *C. Euryades*, *C. Mimos Veitchii*, *C. Charlesianum* (Cypher's variety, a bold flower, good dark forms of *C. Fairrieanum* and the deep-red *Masdevallia Bocking Hybrid*).

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed a selection of beautiful hybrid *Cyripediums*, splendidly grown, and including *C. Memoria Mostynii* (*Acteas Langleyense* × *aureum Surprise*). The delicately-tinted flowers were of good shape, and showed well the light yellow and white of *C. aureum Surprise*. The white dorsal sepal had some very small dark spots near the base, which was tinged with emerald green. *C. Etienne*, a large flower, somewhat resembling *C. Eson giganteum*; *C. The Emperor* (*Beckmannii* × *Sallieri*), shaped like *C. Beckmannii*, and nicely spotted; *C. Thalia The Baron*, with more white in the dorsal sepal than other forms; the fine *C. Elatior splendens* (*Lecanum giganteum* × *Baron Schröder*); and *C. P. G. Henriquez*, a cream-coloured flower, marked with light claret colour.

Messrs. J. & A. A. McBEAN, Cooksbridge, showed *Cattleya Trianae alba Kathleen*, a charming, white-petalled flower, with magenta-crimson blotch on the lip, and resembling *C. labiata Gilmeriae*; also the dark-coloured *Cyripedium Euryades New Hall Hey variety*, and cut flowers of *Laelia anceps Schröderae*.

The Duke of MARLBOROUGH, Blenheim Palace (gr. Mr. Hunter), showed *Cyripedium Lord Ivor Leonidas* × *Mrs. Wm. Mostyn*, a very darkly-coloured flower of the *C. Euryades* class.

E. ROGERSON, Esq., Oakdene, West Didsbury, Manchester (gr. Mr. W. C. Prive), sent *Cyripedium insigne albidum*. This has a good, round dorsal sepal, with much white in the upper half.

C. L. N. INGRAM, Esq., Elstead House, Godalming (gr. Mr. T. W. Bond), sent *Laelio-Cattleya Susiana* (*maxima* × *Dayana*), and *L.-C. Simonette* (*elegans Turneri* × *Ingramii*).

Sir JEREMIAH COLMAN, Bart, V.M.H., Gatten Park, sent two very pretty plants of *Laelio-Cattleya Epicasta Colmaniae*, each with a spike of three large rose and purplish-crimson flowers.

Mr. H. A. TRACY, Twickenham, sent *Cyripedium Floryanum* (*Charlesianum* × *Lecanum giganteum*).

Messrs. STUART LOW & Co., Bush Hill Park, staged a group which included some good *Cyripediums*, *Cirrhopetalum Medusae*, with three spikes; a very beautiful *Cattleya Maggie Raphael alba*, with white sepals and petals, and carnine-rose lip with gold veining, and the handsome *Cyripedium Beryl*.

Mons. MERTENS, Mont St. Amand, Ghent showed several hybrid *Odontoglossums*.

Mr. E. V. Low, Haywards Heath, staged a small group of good *Cypripediums*, *Cymbidium erythrostylum*, *Dendrobium Dearei*, a fine plant of *Oncidium ornithorhynchum album*, &c.

AWARDS.

AWARD OF MERIT.

Cypripedium Lion (*Boadicea* × *Sallieri Hyacinthum*), from Messrs. SANDER & SONS, St. Albans. This is a grand flower, in which the fine, dorsal sepal has the middle area of a soft rose tint, the upper part being pure white, and a broad, rose-purple band extending up the middle. The petals are broad of pale greenish-primrose tinged with purple, the large lip being tinged in like manner. The subdued tone of the colouring is very effective.

BOTANICAL CERTIFICATE.

Monomeria barbata Lindl., from the ROYAL BOTANIC GARDENS, Glasnevin, Dublin. A very remarkable species, which should delight all lovers of curious flowers. It is the species on which Lindley founded the genus, though afterwards named *M. Crabro*, Parish and Reich. f. It may be said to have the growth of *Bulbophyllum*, the roundish, one-leaved pseudo-bulbs being distantly placed on stoutish rhizomes. The inflorescence, at first sight, appears like that of one of the slender *Gongoras*. The stout scape is about 1 foot long, green, spotted with purple, and bearing on the upper part singular flowers, each about one inch and a quarter long, greenish, marked with red-brown. The upper sepal is ovate acuminate, and rests on the column; the lower sepals are longer and broader, and curiously folded over each other at the tips, which are greenish-white; the surface is hairy. The petals are small and fringed. The lip is poised on the upturned end of the column, to which it is so delicately hinged that it moves up and down as the position of the flower is changed, the extended, horned side lobes acting as a counterpoise to the thickened front lobe, which is viscid. It is well figured in the *Orchids of the Sikkim Himalaya*, t. 208.

Fruit and Vegetable Committee.

Present: W. Pompart, Esq. (in the Chair), and Messrs. W. Bates, A. Dean, H. Parr, H. Markham, A. R. Allan, J. Vert, J. Jaques, J. Davis, P. D. Tuckett, G. Wythes, O. Thomas, G. Hobday, C. Foster, A. Beckett, and G. Reynolds.

An Apple submitted under the name of Kentish Red Quarrenden was considered identical with Winter Quarrenden. It was held over for comparison at the next meeting.

Mr. H. LANGSTON, of Marston, sent a round red Apple named Red Wonder.

Mr. W. ALLAN, Guntton Park Gardens, Norwich, showed examples of Apples Bramley's Seedling and another, which he claimed was that variety. Fruits similar to these latter he had exhibited for competition at a previous meeting and they were disqualified, as the variety was then considered to be Beauty of Kent. The general opinion was now that the variety is Kentish Fillbasket.

MESSRS JARMAN & Co., Chard, sent maiden Apple trees to show the damage done by vermin in eating the roots, the whole of which were destroyed. It was assumed that the injury might have been done by water rats or voles.

A singularly interesting collection of Brassicas was staged by Messrs. SUTTON & SONS, Reading. In the centre a table 30 feet long contained at the back, elevated pyramids of Sutton's Protecting Broccoli, Dwarf Blood Red Cabbages, and Perfection and Dwarf Green Curled Savoys. There were also Winningstadt and Pomeranian Cabbages, and, on the level, Savoys, Best of All, Sugar Loaf, New Year, and Reliance. There were also green and purple dwarf Arctic Kales, heads of the wild Cabbage from the sea cliffs, resembling small Thousand Head, stems of Exhibition and Dwarf Gem Brussel Sprouts. On dishes were Hearting Conve Tronchuda, Christmas Drumhead, Hybrid Brussel Sprouts, with cabbage-like heads, and trays of handsome "bulbs" of the Early White Kohl Rabi. On either side of this table were large collections of Kales, such as the Russian, Cottagers, Lark's Tongue (a very curious form), the tall Palm Tree, Dwarf Curled Scotch, Ragged Jack, and the tall Chou de la Porthe with huge leafage. At the other end were the giant purple Flanders

Kale, huge Drumhead Savoys, Thousandhead and other Kales. (Silver-gilt Knightian Medal.)

The Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), set up numerous tall pyramids of Kales or Broccoli. These pyramids were from 4 to 5 feet in height, and proportionately broad. The varieties included Tall and Dwarf Green Curled, Scotch Kales, the Russian, Labrador, Cottagers, Sutton's A1, red and white variegated, with mounds of Sutton's Hybrid Hearting Kale at either end. The greens were of the usual high quality from Aldenham. (Silver Knightian Medal.)

MESSRS. SHEARN & SON, Tottenham Court Road, had 26 broad baskets of Nuts of many kinds. The Giant Coconut was included; also numerous specimens of imported Jamaica Pine-apples, home-grown Grapes and other fruits. (Silver Knightian Medal.)

Mrs. MILLER, Moylen, Marlow, Bucks., showed a collection of bottled fruits and chutny sauces. (Silver Banksian Medal.)

MISS MARTIN, New York, United States, had an extensive collection of bottled fruits, Tomato soups, chutnies, and pickled Peaches. The Peas and Peaches were tasted by the Committee. They had been bottled in brandy, so that the flavour was almost wholly of this spirit. (Silver Knightian Medal.)

COMPETITIVE CLASSES.

VEGETABLES.—Mr. BECKETT was the only exhibitor in the classes for two varieties of Celery, both coloured and white kinds. He staged first-class samples of Superb Pink and Standard Bearer, and (white) Solid White and Giant White.

There was no competition in the other classes for Celery.

Mr. BECKETT was also placed 1st in the class for three varieties of Beet, having Cheltenham Green-top, Delicacy, and the Sutton Black; 2nd, The Countess COWPER, Panshanger (gr. Mr. R. Staward), with Blood Red, Sutton's Crimson, and Satisfaction.

No trade collections of herbs were staged.

The best three dishes of Carrots, distinct, were shown by Mr. BECKETT, who staged Scarlet Intermediate, New Intermediate, and Favourite. There was no other entry in this class.

In the class for two varieties of Brussel Sprouts on stems, E. J. PRESTON, Esq., Kelsey Park, Beckenham (gr. Mr. M. Webster), was awarded the 1st prize for capital samples of Dwarf Gem and Exhibition; 2nd, Mr. BECKETT, with shorter, well-sprouted stems of the same varieties.

For two dishes of Brussel Sprouts there were five entries, Mr. BECKETT being placed 1st with first-rate Exhibition and Dwarf Gem varieties. Mr. WEBSTER was awarded the 2nd prize, his Sprouts being larger and of the same varieties as Mr. BECKETT'S. We preferred for 2nd place the small green and perfectly-shaped Sprouts staged from Cliveden, by Mr. CAMM.

Mr. BECKETT was the only exhibitor of two varieties of blanched Endives, having Broad Leaved and Exquisite Curled, and this exhibitor was also 1st for three varieties of Savoy Cabbages, two heads of each variety. His varieties were Reliance, Green Curled, and Best of All. Mr. STAWARD was 2nd with larger but almost white heads.

EDINBURGH SEED TRADE ASSISTANTS.

ANNUAL DINNER.

DECEMBER 2.—The annual social function of the Edinburgh Seed Trade Assistants was held in the Carlton Hotel, Edinburgh, on the evening of the above date. More than 100 members and friends were present. Mr. Wm. Newton, the well-known flower and fruit salesman, occupied the chair. After dinner was served, the Chairman proposed the loyal toasts, and then, in a short, humorous speech, proposed the toast of the Edinburgh Seed Trade Assistants. He said he had been a seed trade assistant for a considerable period, and knew well both the pleasures and discomforts of an assistant's career. He strongly advocated young men to work hard, as all, or nearly all, the hard workers were successful men. But hard mechanical work must be associated with intellectual study. The toast was accepted with much enthusiasm. Mr. Forbes replied on behalf of the assistants. The toast of the Nursery and Seed Trades was pro-

posed by Mr. J. Anderson in an appropriate speech, and replied to in a characteristically humorous speech by Mr. James Grievie, the well-known nurseryman. In addition to other toasts, the programme included music and recitations. A collection was made on behalf of the Royal Gardeners' Orphan Fund, and a sum exceeding £5 was thus obtained.

DUBLIN SEED AND NURSERY EMPLOYÉS.

DECEMBER 4.—The seventh annual dinner of the above association was held on this date in the Gresham Hotel, Dublin. About 150 members and friends were present. The president, Mr. George Watson, discharged the duties of chairman. The room was decorated with choice flowers, and, from the spectacular and social aspects, the gathering was undoubtedly one of the most notable and successful yet held under the auspices of the association.

After the usual loyal toast, Mr. MacDonough, the hon. secretary, read a number of letters of regret from persons who were unable to be present.

The toast of the Dublin Seed and Nursery Employes' Association was proposed by Mr. George Ryce, B.A., who said the association had a career of remarkable success, and its record of useful work might be envied by other organisations enjoying the benefit of much more influential patronage.

Mr. George Watson (president) replied, and commented on the great advantages enjoyed by the Dublin seed trade assistants of the present day. During the period of his apprenticeship, scarcely five per cent. of the apprentices knew anything of the sciences bearing on their business, and had no facilities for acquiring knowledge outside their daily shop routine. The association had remedied that within the past six or seven years, and, besides the intellectual benefits that had accrued from the association, there had also sprung from it a feeling of kindly fellowship among the members of the different establishments, that was in itself highly to be valued, and which he hoped would long continue.

Mr. J. S. Cuthbertson proposed the toast of "The Seed and Nursery Trade" and bore testimony to the cordial relationship existing between the employers and their employes. Mr. J. J. Egan, J.P., replied.

Mr. J. A. Rochford gave the toast of "The Guests," and thanked those who had invited the association to visit their gardens and nurseries. He also thanked those who had delivered lectures.

Mr. E. Knowlton returned thanks on behalf of the guests, and urged the desirability of fostering the bond of friendship that existed between the different houses, especially in these days of keen competition.

SMITHFIELD CLUB.

DECEMBER 6-10.—The usual exhibition of fat cattle, sheep, pigs, and poultry, together with the thousand and one articles of use to the farmer and gardener was opened on Monday last at the Agricultural Hall, Islington. The prize beasts, as usual, represented what may be termed the finished product, to which the many side shows of roots, grains, patent cattle foods, medicines, root cutters, cake mills, hay presses, food pulpers, &c., all contribute. There were many labour-saving machines, including Potato plauters and diggers, Corn elevators, manure distributors, and spraying machines.

Among the cattle the greatest interest centred around an Aberdeen Angus steer, shown by Sir RICHARD COOPER, Bart., of Shenstone Court, Lichfield. Not only did this beast win the 1st prize in its section, but it also secured the piece of plate valued at 100 guineas, offered for the best beast in the show, in addition to a silver cup valued at £50. H.M. the KING, as usual, won many prizes; his beasts surpassed all others in the three classes for Devon breed, and he showed the best Hereford steer aged more than two but not exceeding three years, whilst his Highland steer, a magnificent beast, was adjudged the best in its class.

A useful implement was shown by Messrs. BERNARD & SONS, Bishopgate, Wigan, for

whitewashing walls, &c. It is somewhat similar to a portable spraying machine, the lime-wash being applied as a fine spray forced through a nozzle. [A portable machine for spraying with whitewash was figured in *Gardeners' Chronicle*, January 2, 1904, p. 15.] A very cheap and serviceable fencing made of Chestnut staves was shown by the FERNDEN FENCING Co., Surrey. The pales are held in position by twisted strands of wire, which is sold by the yard very cheaply. A handy telescopic ladder was shown by the PATENT SAFETY LADDER Co., Peterboro'; the height of the ladder is easily adjusted. The NORTH BRITISH RUBBER Co., Edinburgh, displayed high-class garden hose, rubber gloves for spraying operations, and many other articles in this useful material. Insecticides of all kinds were shown by Messrs. STRAWSON & Co., 79, Queen Victoria Street. Cheap fencing and gates were shown from the Marquis of EXETER'S Burghley estate. Engines for haulage, pumping, threshing, ploughing, &c., were extensively exhibited. Those driven by gas power, shown by Messrs. CROSSLEY BROS., Manchester, were excellent. Messrs. RANSOME, SIMS & JEFFERIES, Ipswich, also had a selection of engines showing all the latest improvements.

In the gallery, which the King visited this year for the first time since his accession, many of the leading seed firms showed produce from their various strains of farm seeds. Messrs. JAS. CARTER & Co., High Holborn, had one of the largest stands. In the front they piled up huge roots of Mangels, Swedes, and Turnips, with a selection of Potatoes, Onions, Beet, and Carrots at the foot, with sacks of pedigree cereals. Their Black Cluster Oat is a remarkably fine variety. Some of their Mammoth Loud Red Mangel were 2 feet in length. Messrs. STETTON & SON, Reading, had also an important exhibit of roots and cereals. Mangels, which are of such importance to the stockbreeder, being shown in perfection. The centre of the stand was piled with a large group of Prize-winner Mangel, a prolific cropping variety. Golden Tankard, Golden Globe, Intermediate and Mammoth Long Red are other ponderous rooted kinds. Not the least interesting on this stand were the varieties of Grasses for pasturage. Messrs. STETTON also showed tubers of some choice varieties of Potato; Tomato Winter Beauty, Onions, Kohl Rabi, Mushrooms, and Carrots formed other items on this interesting stand. Messrs. TOOGOOD, Southampton, also showed produce from their farm seeds and a Vegetable Marrow having a weight of 116 lbs. This received much notice in the daily Press, but our "record" book gives 242½ lbs., with a girth of 10 feet 4 inches, as the record pumpkin (see *Gardeners' Chronicle*, October 12, 1841); Giant Yellow intermediate Mangel, Red Marvel Wheat and Broad Clover were some specialities in this exhibit. Messrs. CANNELL & SONS, London, Norwich, showed a selection of roots, including Dreadnought Green Top Swede, a hardy Turnip useful for feeding purposes in winter, as the tops are unharmed by frost. Messrs. J. K. KING & SONS, Coggeshall, Essex, displayed Mangels, Swedes and Turnips of the usual gargantuan proportions. Golden Tankard Mangel has the appearance of a very solid root. Defiance Short Top Kohl Rabi also favourably impressed us. This firm also showed Onions, Potatoes, Tomatos, Peas, Beet, and Grass seeds. A similar display was made by the other Coggeshall firm of this name—Messrs. E. W. KING & Co. Messrs. HARRISON & SONS, Leicester, had a prominent display of Turnips, Mangels, Swedes, Onions, Potatoes, Peas, Beet, and Grasses. Messrs. WELB & SONS, Stourbridge, were also exhibitors of produce from farm seeds. A considerable number of "seed" Potato growers showed their wares, whilst fruit was shown by Messrs. W. & J. BROWN, Peterborough; Messrs. DICKSONS, Chester; Messrs. W. HORNE & SONS, Cliffe, Rochester, Kent; and Messrs. W. SEABROOK & Co., Chelmsford.

PERPETUAL-FLOWERING CARNATION.

DECEMBER 8.—This Society held a show at the Royal Horticultural Hall, Westminster, on the above date. The exhibits were about equal in numbers to those contributed at former shows, but the quality exhibited much improvement. Several new, or, at the least, improved colours

were remarked, and one new variety received an Award of Merit.

In a class (open to members of the Society) for a group of cut Carnations, not fewer than 12 varieties, with which decorative foliage plants or cut foliage was used for effect, the 1st prize was awarded to Mr. C. F. WATERS, Deaulands, Balcombe, for a good display of choice varieties. We noted beside old favourites, Ruby, Mrs. Chas. Knopf (a pretty bluish flower), Mrs. N. A. Patten, Rose Doré, Mikado, &c. 2nd, Mr. S. MORTIMER, Rowledge, Farnham, Surrey, with a collection consisting of, on the whole, smaller blooms. The finer ones were Beacon, Nelson Fisher, White Perfection, Jessica, Rose Doré, Enchantress, and Neptune (a pale yellow flower).

There was a class for three vases of 12 blooms each of American novelties distributed since January 1, 1907. The 1st prize, a challenge cup presented by the American Carnation Society, was awarded to Messrs. BELL & SHELDON, Castel Nursery, Guernsey, for, among others, May Day, Winona, and Pink Delight—the first-named variety being a very beautiful pink flower of a soft shade.

COLOUR CLASSES.

In a class for 25 blooms of any white variety, the 1st prize was awarded to Mr. W. H. LANCASHIRE, Victoria Nurseries, Guernsey, for extra fine blooms of White Perfection in choice condition; 2nd, Mr. D. M. COLLINS, Heathfield Nursery, Swanley, for White Perfection; and 3rd, Messrs. BELL & SHELDON, for the same variety, which was shown by all the exhibitors.

In the corresponding class for 25 blooms of a Flush or light pink variety, the 1st prize was won by Messrs. BELL & SHELDON, with Winona; 2nd, Mr. W. H. LANCASHIRE, with Enchantress; 3rd, Mr. D. M. COLLINS, with the same variety.

For 25 blooms of a rose or salmon variety, Mr. W. H. LANCASHIRE was placed 1st with fine examples of Rose Doré; 2nd, Mr. A. F. DUTTON, Iver, Bucks., with May Day.

For 25 blooms of a deep pink or cerise variety, Messrs. BELL & SHELDON secured the 1st prize with Afterglow (very vivid in tint); 2nd, Mr. W. H. LANCASHIRE, with Mrs. T. W. LAWSON; 3rd, Mr. C. ENGELMANN, Saffron Walden, with Afterglow.

For 25 blooms of a crimson Carnation, Mr. W. H. LANCASHIRE was 1st, with President, and Mr. C. ENGELMANN 2nd, with Carola (a very large flower of much substance and smooth-edged petals); 3rd, Mr. A. SMITH, Enfield Highway.

In a similar class for a scarlet variety, the 1st prize fell to Messrs. BELL & SHELDON for Britannia. The blooms were adjudged the best shown in the colour classes, and thus received a Silver-gilt Medal offered as a special prize in this section. 2nd, Mr. LANCASHIRE, with R. Craig; 3rd, Mr. C. ENGELMANN, with Britannia.

For 25 blooms of any other colour or any fancy variety: 1st, Mr. W. H. LANCASHIRE, with Emperor (a scarlet flake fancy, with pleasing markings, the petals being smooth edged and of moderate size); 2nd, Mr. C. ENGELMANN, with Vinca (a compact flower, moderate in size, and rich purple in colour).

The 1st prize for 12 blooms of any variety not in commerce was won by Mr. C. ENGELMANN, who showed a bloom of reddish-crimson, with a dentate edge to the petals and rather more than moderate size; 2nd, Mr. A. SMITH, Enfield Highway, with Empire Day (a soft shade of pink, with petals having a dentate edge). A special prize for the best vase of Carnations exhibited in classes 3-10 inclusive, and the Society's Silver-gilt Medal, were awarded with the 1st prize.

A special prize, given by Messrs. Felton & Sons, Hanover Square, was offered for the best vase of 36 blooms (either one or any number of varieties), arranged for effect. Any kind of foliage was allowed, and any or all the blooms could be wired, if artificial support was necessary. The prize was won by Messrs. BELL & SHELDON.

The best basket of Carnations arranged for effect with any kind of foliage was shown by Mrs. ALEX. ROBINSON, Nonhyrst, Park Hill, Carshalton. The exhibit was composed of small pink Carnations, Asparagus, and Golden Privet; 2nd, Mr. H. J. DUDNEY, South Road Nurseries, Erith.

Messrs. BELL & SHELDON showed the best bouquet of Carnations.

Three ladies' sprays of Carnations were best shown by Sir RANDOLF BAKER, Bart., Ranston, Blandford; 2nd, Messrs. R. FELTON & SONS, Hanover Square.

In the class for a dinner table decorated with perpetual-flowering Carnations, the best exhibit was shown by Messrs. R. F. FELTON & SONS, but they were disqualified, as the exhibit was not in accordance with the schedule. The 1st prize was awarded to Mrs. ALEXANDER ROBINSON, Park Hill, Carshalton; 2nd, Sir RANDOLF BAKER, Bart.

For a group of perpetual-flowering Carnations, arranged in a semi-circle and occupying 25 square feet. The 1st prize, with which went Lord Howard de Walden's Silver Challenge Vase, was awarded to C. F. RAPHAEL, Esq., Shenley (gr. Mr. A. Grubb), and he was also awarded the President's Challenge Cup and a Silver-gilt Medal. The blooms were large and of good quality. We noted Dabim, Rose Doré, Britannia, Enchantress, and John Peed (a rich, purple flower).

Sir R. BAKER, Bart. (gr. Mr. Usher), showed the best collection of Carnations as cut blooms. Among the flowers we noted Winsor, Britannia, Mrs. T. W. LAWSON, Ranston Gem (of orange-scarlet), Sarah Hill, White Perfection, and C. P. Bassett; 2nd, Sir DANIEL GOUGH, Bart., Highland, Chelmsford (gr. Mr. P. Wilkinson); 3rd, FRANK MAY, Esq., Radlett, Herts.

A special prize presented by Mr. W. H. Page, Hampton for the best six Carnation plants (six varieties, in bloom), was won by Sir RANDOLF BAKER, Bart.; 2nd, Lord HOWARD DE WALDEN, Audley End, with good blooms, but too few of them.

Sir RANDOLF BAKER, Bart., won the 1st prize offered for three Carnation plants in as many varieties.

AWARD OF MERIT.

Carnation Mary Vilden, a seedling shown by Messrs. BLACKMORE & LANGDON, Twerton Hill, Bath.

ANNUAL MEETING.

The annual meeting and dinner was held on the same evening as the show, in the Hotel Winsor, about 40 being present. The chair was occupied by Mr. J. S. Brunton. Several toasts were proposed, and afterwards the Annual Report and Balance-sheet were submitted. The Report showed a steady increase in the membership, which at the end of October was 250, 64 new members having joined in 10 months. The balance-sheet showed a surplus of £28 11s. 5d. The officers for the new year were elected, Lord Howard de Walden being appointed president, Mr. Hayward Mathias hon. secretary, and Mr. E. F. HAWES hon. superintendent.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

DECEMBER 2.—*Committee present:* Messrs. Ashworth, Arthur, Ashton, Cowan, Cypher, Holmes, Keeling, Parker, Shill, Sander, Thorp, Ward, Warburton, and Weathers, hon. sec.

A large number of groups were exhibited, and the following awards were made for these.

Messrs. CYPHER & SONS, Cheltenham, Silver Medal for *Cypripediums*; G. S. BALL, Esq., Burton, Westmoreland (gr. Mr. Herdman), Silver Medal for a miscellaneous display; CLIVE COOKSON, Esq., Wylam-on-Tyne (gr. Mr. Chapman), Silver Medal for a display including Hybrid *Calanthes*, *Odontoglossums*, &c.; J. T. CLIFTON, Esq., Lytham (gr. Mr. Float), a Silver Medal for *Cattleyas* and *Laelias*, and a similar award for a display which included a fine specimen of *Angræcum sesquipedale*, to which a Cultural Certificate was awarded; C. PARKER, Esq., Ashton-on-Ribble, a Silver Medal for a group of *Cypripediums*; N. GALLOWAY, Esq., Great Horton, Bradford, Silver Medal for *Cypripediums*; H. J. BROMILOW, Esq., Rainhill (gr. Mr. Morgan), a Silver Medal for *Cypripediums*; J. McCARTNEY, Esq., Bolton (gr. Mr. Holmes), Silver Medal for *Cattleyas* and *Laelias*; Mrs. S. WOOD, Glossop (gr. Mr. Gould), a Silver-gilt Medal for a general display; J. H. CRAVEN, Esq. (gr. Mr. Corney), a Silver Medal for the beautiful albino hybrid *Cypripedium* × *Boltonii*, the parentage of which

MARKETS.

COVENT GARDEN, December 8.

[We cannot accept any responsibility for the unquoted reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—E.S.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Acacia longifolia, Azalea, Bouvardia, Carnations, Eucharis grandiflora, Gardenias, Gladiolus, Hyacinths, Lilac, Liliun auratum, Mimosa, Pelargoniums, and Roses.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and plants, including Adiantum, Asparagus plumosus, Berberis, Croton, Cycas, Galaxias, Grasses, and Hardy foliage like Ivy and Myrtle.

Plants in Pots, &c. Average Wholesale Prices.

Table listing various potted plants and their prices, including Ampelopsis, Araha Sieboldii, Arcaea, Aspidistras, Asparagus plumosus, Cyclamen, Cyperus, and various ferns and succulents.

Plants in Pots, &c.: Average Wholesale Prices (Cont'd.).

Table listing various potted plants and their prices, including Liliun lancifolium, Lily of the Valley, Marguerites, Pelargoniums, and Zonals.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples (Nova Scotia), Grapes (Canon Hall), Lemons, Nuts, Peaches, Pomegranates, and various berries.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Asparagus, Beans, Beetroot, Cabbages, Carrots, Cauliflowers, Celery, Cucumbers, Endive, and Mushrooms.

REMARKS.—Apples from Nova Scotia and California continue to sell well and realise good prices. The demand for Oranges remains about the same. Doyenne du Comice Pears from California are realising high prices. There is a slight improvement in the Grape trade. English forced Rhubarb may be had, but there is scarcely any demand before Christmas. English Tomatoes are practically finished, and the last shipment of Tenerife produce arrived, with few exceptions, in a bad condition. E. H. K., Covent Garden, Wednesday, December 8, 1909.

Potatoes.

Table listing various potato varieties and their prices, including Bedfords, British Queen, Epicure, Blacklands, Dunbars, and Lincolns.

REMARKS.—Prices remain about the same. The stocks of tubers in London are still heavy. —Edward J. Newbourn, Covent Garden and St. Pancras, December 8, 1909.

is not recorded; and Messrs. SANDER & SONS, St Albans, a Silver Medal for Cypripedium x Alcibiades var. Illustrans.

Bronze Medals were awarded to W. J. RUTHERFORD, Esq., M.P., Blackburn (gr. Mr. Lupton); Mr. H. ARTHUR BLACKBURN for Cypripedium, and Messrs. MANSELL & HATCHER, Rawdon, near Leeds.

Other exhibitors who received the thanks of the Committee were Messrs. S. GRATRIX, Whalley Grange; FRANCIS WELLESLEY, Westfield, Woking; J. ROBSON, Altrincham; Wm. BOLTON, Warrington; W. R. LEE, Heywood; A. J. KEELING, STUART LOW & Co., and J. J. HOLDEN, Southport.

FIRST-CLASS CERTIFICATES.

Cypripedium Boltonii.—A beautiful white hybrid, whose parentage is not recorded. It is probably C. insigne Sanderae and C. niveum. In style and shape it resembles the former parent, with the rich whiteness and solidity of the latter. Shown by J. H. CRAVEN, Esq., Keighley.

Cattleya x Peetersii var. J. J. Holden.—This is a cross from C. x Hardyana var. alba x C. labiata autumnalis var. alba. It is a finely-shaped flower with creamy-white sepals and petals. It shows the influence of C. Hardyana alba in the labellum. Shown by J. J. HOLDEN, Esq., Southport.

BRITISH GARDENERS' ASSOCIATION.

At the last meeting of the Council, Mr. R. J. Frogbrook in the chair, it was reported that 360 circular letters had been issued to candidates for the Borough Councils in reference to a minimum wage for public gardeners. Replies had been received from a considerable number (25 per cent.), nearly all being in favour of the Society's proposition. Many who replied were of opinion that a minimum wage of 30s. is too low. Thirty-two new members were elected, bringing the total membership to 1,594. J. Weathers, Secretary.

DEBATING SOCIETIES.

BANBURY AND DISTRICT GARDENERS.—The usual fortnightly meeting was held at the White Horse, Banbury, on December 3. The Mayor of Banbury presided. Mr. Childlow, gardener to Mrs. Morrell, Headington Hill Hall, Oxford, gave a paper on "The Culture of Winter-flowering Plants."

CHEAM (SURREY) LECTURE AND RECREATION.—On Thursday, November 25, Mr. P. Aquinas, of Tiptree, Essex, gave a lecture on "Intensive Gardening on the French System." The lecturer having traced the history of intensive gardening and having described how a French intensive garden is managed, related the work done in a French garden month by month.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

- List of gardening appointments including Mr. W. H. Johns, Mr. H. B. Currey, Mr. James Sinfield, Mr. G. W. Goodsell, Mr. A. Edwards, Mr. A. Turner, Mr. W. Spicer, Mr. H. B. Currey, Mr. James Sinfield, Mr. G. W. Goodsell, Mr. A. Edwards, Mr. A. Turner, Mr. W. Spicer.

CATALOGUES RECEIVED.

Mawson Bros., Windermere—Trees, Shrubs, and Roses. James Stredwick & Son, Silverhill Park, St. Leonards-on-Sea—New Cactus Dahlias and Japanese Chrysanthemums for 1910.

COVENT GARDEN FLOWER MARKET.

Growers are holding back their stocks for the Christmas trade, but there are still large supplies of Chrysanthemums. There are large supplies of Paper White and Snow-d or Narcissi, also Roman Hyacinths. Lily of the Valley is plentiful, but there is a great falling off in supplies of Lilium longiflorum (Callas (Kochia africana) have been making fair prices. Violets are now at their best but their prices are low. Camellias were a little dearer this morning (Wednesday). Good blooms of Roses are making slightly advanced prices, but it is difficult to state their actual value, as one or two days of bright sunshine makes a great difference in the supply; the demand also varies. Carnations have developed so slowly that many growers were unable to exhibit at the exhibition on Wednesday last, yet supplies in the market are equal to all demands.

POT PLANTS.

Some fairly good Poinsettias are seen but the cold weather has affected the trade for them. Azaleas, both white and pink varieties, are fairly well flowered. Carnations are good, but they are soon affected by the cold. Chrysanthemums are still plentiful and generally of very good quality. Erica hyemalis, E. gracilis, and E. gracilis nivalis are well flowered. Although marketed in pots the florists cut the sprays extensively for decorative purposes. Cyclamen are fairly good, also Begonia Gloire de Lorraine and its several varieties. Plants of Lilium longiflorum in pots have been more plentiful than the cut blooms. In foliage plants Aralia Moseri is very good, and it appears to be taking the place of A. Sieboldii. Asparagus plumosus nanus, A. Sprengeri, and A. tenuissimus are all good. Supplies of Ferns are abundant. I recently saw in a nursery 20,000 plants of Pteris tremula ready for immediate sale and large quantities coming on for succession. Other market sorts were equally abundant. Christmas trees, Holly, Mistletoe, and other Evergreens are already seen in large quantities. A. H., *Covent Garden, December 8, 1909.*

THE WEATHER.

THE FOLLOWING SUMMARY RECORD OF THE weather throughout the British Islands, for the week ending December 4, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather.—During nearly the whole of this period the conditions were rough and unsettled, rain falling daily over a large portion of the kingdom, while towards the end of the week many localities experienced hail, sleet, and snow. Thunder and lightning occurred in several parts of the country generally, either early or late in the week.

The temperature was below the average in Scotland, the north-east of England, and the north of Ireland, the deficit being as much as 3.1° in Scotland N.; elsewhere it was above it, the greatest departure being 2.7° and 2.5° respectively in England E. and S.E. The highest of the maxima were generally recorded on November 28 or 29, and ranged from 56° or 55° in many parts of the kingdom to 51° in Scotland N. and W. The lowest of the minima, which were registered on December 4, varied from 20° in Scotland N., 22° in Scotland E., and 24° in Scotland W. and England N.W. to 34° in England S.E., and to 30° in the English Channel. The lowest grass readings reported were 17° at West Linton, 18° at Crathes and Glasgow, and 20° at Aspatria and Buxton. At several other stations the readings were below 25°.

The mean temperature of the sea.—At all stations except Aberdeen and Seafield the water was colder than during the corresponding week of last year, the greatest difference being nearly 5° at Kirkwall. The means for the week ranged from 49.8° at Seafield, and about 49° on the south-west coast of England and at Port Erin to below 42° at most places on the north-east coasts of Great Britain.

The rainfall was largely in excess of the normal. In several districts the fall was more than twice as much as the average, and in the English Channel more than three times as much. Falls of an inch or more in one day were experienced over a wide area, generally either on Sunday, Monday, or Thursday. In some Scottish localities there was more than an inch both on Sunday and Monday, the largest fall in any one day being 2.68 inches at Fort William on Sunday. The highest total for the week was 4.25 inches at Fort William and Llangamarch Wells; at Buxton the total was 4.21 inches, and at Bettws-y-Coed 4.19 inches.

The bright sunshine just equalled the normal in Scotland E. and W., and also in England S.E., and slightly exceeded it in Scotland N. and Ireland S., but elsewhere it was deficient. The percentage of the possible duration was 24 in Ireland S. and 20 in England S.E., but only 10 in the Midland Counties and the English Channel, and 9 in England N.W.

THE WEATHER IN WEST HERTS.

Week ending December 8.

A very wet week.—The mild weather mentioned in the last report only lasted six days, after which a return to lower temperatures took place. On the first two days of the past week the highest reading in the thermometer screen was 52°, whereas four days later it was only 35°. On the coldest night the exposed thermometer registered 11° of frost. The ground temperatures are now 2° colder at 2 feet deep, and 4° colder at 1 foot deep, than is reasonable. Rain or snow has fallen on each day as yet this month, and to the aggregate depth of 1 1/2 inch, or nearly half the average fall for the whole month. During the week 53 gallons of rainwater has come through the bare soil percolation gauge, and 54 gallons through that on which short grass is growing. The sun shone on an average for 1 1/2 hours a day, or for 20 minutes a day longer than is usual in the early part of December. The wind was very high during the first three days of the week, but since then light airs have, as a rule, prevailed. In the windiest hour, during the early morning of the 3rd inst., the mean velocity amounted to 26 miles—direction W.S.W. This is the highest wind recorded here since December 14, 1907. The average amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 5 per cent. At 5 a.m. on the 3rd inst. the corrected reading of the barometer was 28.48 inches—the lowest reading registered here since December 21, 1899, or for 10 years. E. M., *Berkhamsted, December 8, 1909.*

NEW INVENTION.

Mr. C. E. WEST, horticultural sundriesman, Higham Hill sends samples of a new zinc wall fastener for trees. It consists of a piece of metal about the shape and size of an ordinary nailing shred with slots at either end, so that when bent around the shoot the nail can be driven through. The bottom part of the holes are large enough to permit of the head of the nail passing through at such times, as it is necessary to unloop the fastener. It is claimed that by their use shoots can be detached from a wall for pruning or cleansing, and almost instantly be put back again without nailing.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

APPLE GOLDEN NOBLE: L. L. This variety is always classed as a culinary Apple, and we have never seen it shown as a dessert variety at exhibitions. In the list of culinary and dessert Apples, published in the R.H.S. *Rules for Judging*, it is clearly defined as a cooking Apple. Dr. Hogg also, in his *Fruit Manual*, states that it is a culinary variety and makes no mention of it ever being used for dessert purposes.

BEGONIA GLOIRE DE LORRAINE: P. H. No disease is present. The injured condition of the leaves has been caused by some error in culture, probably excess of moisture in the plant-house.

BUDDELEIA VARIABILIS: L. T. P. Defer the transplanting of this plant until the spring-time. The Pine tree can be shifted at once, selecting a time when the weather is fairly mild, and the ground damp, but not too wet. Cuttings of Buddleia should be inserted in late summer, placing them under hand-lights in a cool, frost-proof pit. They will root slowly during the winter, and, when they are potted off in spring-time, they should be plunged in a bottom heat of 60° to 65°.

CARNATION RUST: R. D. It is best to cut off all the affected leaves and burn them. Although this will spoil the appearance of the plants for a time, it is the most effectual remedy. Spraying with potassium sulphide will serve to check the spread of the disease.

CHRYSANTHEMUM: G. C. Decay in the centre of the flower arises from a variety of causes, including an excess of manurial stimulant, too much moisture at the roots and in the atmosphere, and from injury to the bud. You will, no doubt, know which of these causes is responsible for the failure of your blooms.

CHRYSANTHEMUMS SPORT: A. E. C. The bronze variety has arisen as a sport, and you should perpetuate it by inserting cuttings. Next season submit flowers at one of the National Chrysanthemum Society's meetings for the consideration of the Floral Committee. The Cyclamen seedlings are attacked by the damping-off fungus (Pythium De Baryanum). Damping off usually arises through overcrowding in the seed pans and a too moist and stagnant atmosphere. Pick out those that have the disease and burn them; sprinkle some dry sand over the surface of the pot, at the same time placing it in a dry situation.

CYCLAMEN LIBANOTICUM: B. L. The Lebaum Cyclamen, although not hardy under all circumstances, would succeed in such a warm situation as you describe. The soil will need to be specially prepared, and if it be of a clayey nature, with a very moist subsoil, you should mix with it liberal quantities of sandstone, brick rubble, old plaster or mortar rubbish. The plants succeed best in the dry positions within the rooting area of trees or shrubs. Not only do they receive protection from cold in such places, but the soil suits them better than the richer staple in more highly cultivated ground. The corms should be inserted about 3 inches deep.

FORCING VEGETABLES: A. T. The forcing of Potatos, Seakale, Asparagus, Rhubarb or Mushrooms on a hot-bed of manure requires the most careful judgment. Hot-beds should consist mainly of tree leaves, the rest being stable manure. Potatos will hardly give satisfactory results under such conditions. Those forced under very mild circumstances should be fit for lifting in from 10 to 15 weeks, according to the variety. Seakale and Rhubarb forced under proper conditions, will take from three to eight weeks, according to the season of the year; Asparagus from three to five weeks, and Mushrooms from 8 to 12 weeks. Seakale, Rhubarb and Mushrooms are all best brought forward in a dark shed specially set apart for the purpose. Experience and observation must decide when to replenish the fermenting material between the frames.

FRENCH AND GERMAN DIRECTORY OF GARDENS: J. S. & Co. Thalacker's *Adressbuch für den deutschen Gartenbau und Kalender* (Bernard Thalacker, Leipzig-Gohlis. Price, not including postage, 2.50 marks). We know of no Directory of gardeners and nurserymen published in France.

GUN LICENCE: Gun. No licence is required by the occupier of any land using fire-arms for the purpose of scaring birds or killing vermin.

NAMES OF FRUITS: A. Fisher. The fruits were badly packed. 1. Very much bruised, it cannot be identified; 2. Cheshunt Pippin; 3 and 6. King of the Pippins; 4, bruised, but looks like Lane's Prince Albert; 5. Blenheim Pippin; 7. Court of Wick.—E. G. Horner. Knight's Monarch.—E. E. R. 1. Bellissime d'Ilver; 2. Prince Consort; 3. Bergamotte Esperen; 4. Beurré Diel; 5. Catillac; 6. Glou Morcean; 7, decayed; 8. Duchesse de Bordeaux; 9. Josephine de Malines.—G. White. 1. Sussex Nanny; 2. D'Arcy Spice; 3. Small's Admirable; 4. Castle Major; 5. Dumelow's Seedling; 6. Dutch Codlin; 7, not recognised, probably a local variety; Pear Beurré Clairgeau.

NAMES OF PLANTS: C. R. Nerine undulata.—P. H. 1. Maranta Makoyana; 2. Acalypha marginata; 3. A. Macleaniana; 4. A. tricolor; 5. Eranthemum variegatum.—P. W. J. 1. Eupatorium Weimannianum; 2. Eupatorium petiolare (illustrated in the *Gardeners' Chronicle*, March 12, 1904, p. 163); 3. Adiantum cuneatum elegans; 4. Carex riparia variegata.—O. R. 1. Masdevallia triaristella; 2. Rodriguezia secunda; 3. Oncidium flexuosum; 4. Epidendrum dichromum.—A. B. H. Lycaeste costata.—W. B. All varieties of Sonerila and almost identical with the Sonerila Hendersonii raised many years ago between S. margaritacea, and a species which appeared with an Orchid said to have been imported from Borneo.—W. D. Abelia rupestris.

PRESERVING FRUIT NETS: G. M. Fishermen preserve their nets by either boiling them in tan water or dipping them in linseed oil. Procure some tan from a tannery, place it in a caldron with water, and when the liquid is boiling dip the nets several times into it. The linseed oil should also be boiled, and after the nets are steeped in it they should be spread out to dry. You might adopt either of these methods.

VIOLETS: T. M. The leaves are badly affected with disease (Ascochyta violae). As your plants have failed for two seasons your best plan is to start with a new stock, destroying your old plants by burning them. Remove all the old soil from the frames and bury it in a distant part of the garden; thoroughly cleanse the woodwork and all parts of the frame with warm water, with a little carbolic acid and plenty of soft soap added. If you can select fresh frames for their culture you will be less likely to be troubled again with the disease. You will find particulars respecting the best soil for Violets and details of their culture in the issue for April 11, 1908, p. 234.

THE EFFECT OF GRASS ON TREES.

THE effect of grass on trees is probably intimately connected with that fundamental question in agriculture to which no comprehensive answer has yet been obtained, namely, the fertility of the soil. The casual observer may dismiss the subject by stating that it is simply due to the grass robbing the tree of its nourishment or its moisture, but such a statement can only be based on ignorance of the facts, and of all the work which has been done in the matter. The subject has been under investigation at the Woburn Experimental Fruit Farm for the last 15 years: one report (the third) dealing with it was published in 1903, and it is hoped that another will be issued before very long.

Although no final solution of the problem has yet been obtained, considerable progress has been made in the matter, and various possible explanations have been definitely negated. Foremost amongst these is the theory that the action is due to the grass absorbing all the food and water from the soil. The original experiments are, perhaps, the most striking, though not the most precise, on this point. A large number of Apple trees were planted in rows, 11 feet apart, in 1904: the ground in one row was kept tilled, and that in the other row laid down to grass; the grass, when cut, is left to rot on the ground,

and the same amount of manure is given to both rows of trees. Those in the tilled soil are now such large trees that half of them have had to be removed, their spread being some 15 to 16 feet; those in grass did not grow at all for several years, and only began to make growth when their roots extended beyond the grassed area; they are still miserable specimens of trees, about one-sixth the size of the others, and the crops borne by them have only been about one-tenth of that of their neighbours. Yet the grassed soil is actually richer than the tilled soil. In the 15 years it has had removed from it only one crop of grass (that actually growing at any given moment), and the small amount of material required for the stunted growth of the trees; whereas, from the tilled soil there has been removed material for an annual crop of fruit, and also for the vigorous growth of the trees. Analysis also shows that the grassed soil is the richer of the two, and it also shows that, in this particular case, there is practically no difference between the water contents of the grassed and open plots.

Of the many other experiments on these points, the most conclusive are, perhaps, those made with Apple trees grown in pots. In some of these the grass roots were separated from the tree roots by very fine wire gauze, through which the former could not penetrate; the pots were weighed and watered every two days, so as to keep the water contents the same, and such water and food as was added, was introduced from below, so that the tree should have the first pull at it. Yet the trees still suffered badly from the grass, although the soil was actually moister and richer than in the case of similar trees without grass. Corresponding experiments have been made with trees planted in the open. Though increase of moisture up to a certain point, and increase of food in certain cases, may benefit the trees the benefit is much too small to do more than very slightly diminish the deleterious effect of the grass.

The behaviour of a tree in grass is clearly a case of starvation in a land of plenty, and this cannot be explained by supposing (intenable as such a supposition is for other reasons) that the grass roots suck up whatever nourishing solution there is in the soil, leaving none for the tree roots. The pot experiments, just quoted, effectively negative this. Nor can we explain the matter by supposing that the tree was only temporarily affected by the grass, but, being in a weak state after transplanting, this check resulted in its becoming permanently stunted; for a precisely similar, and even more marked effect has been proved to be produced by grassing over trees which have been established, in one case for four years, and in another case for 12 years; the effect, indeed, was so great that, in the first instance, many of the trees have been killed, and, in the second instance, a similar result appears imminent.

Other explanations which suggested themselves have been investigated, and found equally unacceptable: these were differences in soil temperature, differences in aeration or proportion of carbon dioxide, and difference in the physical condition of the soil. The only other explanation which appears to be possible is that the growth of the grass results in the formation of some substance which is poisonous to the tree. This may be an active poison—a toxin—or the poisonous

action may result from an alteration in the proportion of various substances present in the soil. An active poison may be produced in various ways, such as by the decomposition of the debris of the grass, actual excretion from the grass roots, or as a product of the bacteria present in the soil. As to the origin of the toxin, no definite evidence has yet been obtained, but it has been found that toxins may be formed in soils by heat, and other means, producing effects which are analogous in many respects with those produced by grass on trees. Thus, on heating soil, substances are produced which are toxic towards the germination of seeds, and these have been found to be toxic towards plant growth also. That established plants grow better in heated than in unheated soil, is due to the fact that heating causes a considerable increase in the soluble nitrogen present in the soil, and also in the composition of the bacterial flora of the soil. Moreover, the toxin formed as the result of heating the soil soon becomes oxidised and destroyed, allowing the favourable conditions to assert themselves. If, however, the toxin is present in sufficient quantity, it is not all destroyed before the plant grows, and its deleterious effect becomes apparent. It is noticeable that this effect varies greatly in different cases, and is very much less in the case of grasses than in that of the other plants which have been examined. Earth from grassed ground behaves in the same way as earth which has been slightly heated and which contains only a limited amount of toxic matter, for trees planted in it (the grass being removed) do better than in soil taken from tilled ground, such toxic matter as there was present in it having evidently become destroyed before the tree started into growth; whether its presence originally in soil can be established by its effect on germinating seeds, still remains to be seen.

If the formation of a toxic substance is the explanation of the grass effect, we might naturally expect great variations in this effect in different soils; and this is certainly the case. At Ridgmont the effect is, perhaps, greater than in any other instance which has come under the writer's observation, but cases of very nearly the same intensity have been found in various parts of the kingdom, whilst only one instance has been noticed where the grass, apparently, had no effect. This variation in intensity with the nature of the soil is, probably, the chief reason why the action is not more widely recognised; but two other causes contribute to an under-estimation of the grass effect, the one that it is very rare for a plantation to be partly grassed in such a way as to give satisfactory evidence as to the bad effect of this grassing; the other, that the grassing is generally effected gradually, extending throughout several seasons, and in that case, it has been found, the effects are far less marked than they otherwise are, the trees, apparently, becoming gradually adapted to the altered conditions.

No definite connection has yet been found between the nature of the soil and the intensity of the action, but it does not appear to be governed by the richness of the soil. The case, alluded to above, in which the action has been nil, cannot be explained by any greater depth of soil into which the tree roots penetrate, thus getting away from the grass roots, for many of the trees have been killed, and all have been found to have their roots near the surface. *Spencer Polking.*

NOTES ON IRISES.

POLLEN GRAINS AS A MEANS OF CLASSIFICATION.

HITHERTO, as far as I have been able to discover, very little attention has been paid to pollen grains as a means of classification or as a help to the determination of the relationship between the various species of a genus. The reason probably, is that systematic botanists are usually content to know dried herbarium specimens without having recourse to living plants; and herbarium specimens seldom offer facilities for the examination of the pollen.

During the past year I have examined microscopically the pollen grains of about two-thirds of the known species of *Iris*, which number in all about 270. Among them I have observed at least four distinct types, which agree to a large extent, but not in all respects, with the usual grouping of the species. So far, I have not obtained much help from this examination towards

the use for, the spines on the surface of the grains. I can make no suggestion, and it would indeed be interesting to find any explanation of the phenomenon or to hear from workers on other genera whether they have observed similar anomalies. *W. R. Dykes, Charterhouse, Godalming.*

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM INSIGNE AT DELAMERE HOUSE GARDENS.

SOME remarkably fine blooms of *Cypripedium insigne* were recently sent us by Mr. John Thompson, Delamere House Gardens, Norwich. Accompanying the flowers were photographs showing the plants in flower, and these were so well flowered that we asked Mr. Thompson to describe their treatment, which is as follows:—They are grown in a mixture of three parts fibrous loam

grown principally for supplying cut flowers. Of *Cypripedium*, *C. callosum* is the species chiefly grown. Besides this species, *C. Curtisii*, *C. Lathamianum* and *C. insigne* are grown. *Cattleya Schroderae*, *C. Trianaei* and *C. labiata* are also grown in great numbers. It is seldom that one observes such large quantities of Orchids growing with so great a degree of vigour and health as is the case at this establishment. There is a magnificent lot of *Phalenopsis Schilleriana* and *P. amabilis*. *Dendrobium*, it is strange to state, are but little cultivated. Mr. Welzel's customers, in many instances, objecting to the too great variegation and spottiness of the blossoms, and to their loss of vigour, owing to much cutting, so that every two years the plants must be renewed. The cultivation of *Vanda cœrulea* and *Oncidium varicosum Rogersii* has been increased, and that of *Lycaste Skinneri* lessened, its blooms, which at one time sold better, being now less popular

FIG. 179.—THUNBERGIA FRAGRANS VAR. LEVIS: FLOWERS PURE WHITE.

[Photograph by C. F. Raffill.]

the arrangement of the species within each group, but a few curious facts have come to light.

In only one case—in that of the well-defined group of the Juno Irises—are the grains spherical. In all other species, as far as I have been able to examine them, the outline is a more or less pointed oval. In the case of these spherical grains, the surface is covered with a number of hexagonal bosses, which, in their turn, are covered with a network of irregular markings and separated from each other by comparatively deep, smooth channels. The number of bosses on each grain seems to decrease with the size and vigour of the plant. Thus *persica* and *cassanica* have each about 20 bosses to the grain, while *bucharica* and *Warleyensis* have only from seven to ten or twelve.

There is, however, one remarkable fact about the Juno group, and that is that there are two species whose pollen can be at once recognised as unlike that of all the others. In these two cases the grains are still spherical in outline, but closely set all over with small spines. I think that on some grains I have been able to trace very faint and shallow hexagonal markings, but on this point I do not feel very certain, for I usually fail entirely to see any sign of them. The species in question are the two Mediterranean representatives of the group that flower long before any of their Asiatic relatives, namely, *alata* and *palaestina*. As to what may be the cause of, or

and one part peat, with a few small crocks intermixed to keep the compost porous. They are examined at the roots each year and repotted as required; the pots range from 3½ inches up to 10 inches in diameter. The total number of flowers on the various plants is 590. After flowering, the plants are wintered in a temperature of 40° to 45°. They are transferred to cold frames about the second week of May until the latter end of September. During the summer the lights are only used in the daytime for the purpose of placing shading over the plants, and they are removed altogether when the sun is on the wane, remaining off until early noon the next day. They are exposed to rains and dews. During the growing season the plants are given light doses of manurial stimulants. The plants were exposed to 6° of frost during the month of February, 1908.

HOUSE BERGLINDEN.

THOSE who visit the old-world town of Naumburg, near Weimar, and have the time to pay visits to the nurseries, should climb to Spechsart, to the House Berglinden, and direct their steps to the handsome Herrenhaus, and let Mr. Obergartner Welzel, many years manager of the nursery and garden, show them the plant treasures and cultures. The chief plants cultivated are the autumn, winter, and spring-flowering Orchids, the stock numbering about 7,000 plants. They are

than *Cattleyas*. Besides Orchids, *Begonias* of the *Gloire de Lorraine* type, English *Pelargoniums* and *Cyclamen* are largely cultivated. *P.*

THUNBERGIA FRAGRANS VAR. LEVIS.

THE twining *Thunbergia* is a very free-flowering plant, and in a stove or warm greenhouse it will blossom practically through the whole year. The growths, being slender and twining, are suitable for training round the smaller pillars in a warm greenhouse, or they may be trained to small wire balloons or even to a tripod formed of three stakes. In the *Begonia* house at Kew, where the spray of blooms shown in fig. 179 was photographed, several plants are arranged on the front of the stage and trained up wires to the roof. The pure white flowers are 2 inches across; they are freely produced from the leaf-axils. Unlike the species, the variety *levis* is not fragrant. Plants are readily propagated from seeds, which are freely produced, and also from cuttings inserted in spring. For potting the plants a compost of fibrous loam, leaf-mould, and coarse sand is suitable. *Thunbergia fragrans* is a native of the East Indies, where it grows in hedges and bushes on the banks of streams. It is especially plentiful on bushes along the water courses in districts of the Coromandel coast. *A. O.*

MADRESFIELD COURT.

(Concluded from page 390.)

THE bowling green is sheltered on three sides by splendid Yew hedges. On one side recesses are formed, in which are placed marble busts of the Cæsars, forming an interesting out-of-door sculpture gallery.

Thence I entered the pleasure ground or arboretum. It may, I think, rightly be claimed that Earl Beauchamp possesses some of the finest Conifers in the Kingdom. They were planted by the late earl some 40 or 50 years ago. As the hardy flowers are the charm of these grounds in spring, summer and autumn, so are the handsome and stately trees their glory in winter. On emerging from the bowling green I stood in front of an avenue of *Cedrus atlantica glauca* a quarter of a mile in length, the trees being from 40 feet to 50 feet in height and well clothed down to the grass. Need I describe the effect of these two huge banks of silvery foliage, hursting at once on the view, or the expression of delight it evoked? For all who love trees

it has enabled the present owner to convert the larger spaces between the trees into a rare garden of hardy ornamental-flowering and foliage trees and shrubs, and of bulbous plants. It is safe to say that there is no hardy tree, shrub, bulb, or herbaceous plant of merit introduced of late years which has not found a home in these gardens. It is his lordship's desire that his out-of-door garden shall never be found without flowers throughout the year. In late winter, spring, and early summer, it is aglow with bulbs, commencing with the Aconite, Snowdrop, *Chionodoxa*, Crocus, early and late Narcissi, Dog's Tooth Violets, Anemones, bulbous Saxifragas, and later with Tulips. In the autumn hardy Cyclamen and autumn Crocuses, not in tiny patches, but in broad masses of thousands, wherever there is a point of vantage in the grass in which they could be placed, provide masses of colour. This colour effect is continued throughout the summer with Irises and Lilies, with flowering and foliage shrubs and trees, and, later in the autumn, with brightly-coloured, bold-habited and hardy herbaceous plants.

The practice of grouping in masses of one

another extremely bright garden of annuals. It is named Lady Mary's garden, and is formed in the shape of the Greek M, with grass paths. Leaving this, and proceeding through the Lavender garden and by the Eglantine walk, I came to the maze and to the skating pond and island water garden, where all the popular forms of *Iris germanica*, *I. pallida*, and *I. Kæmpferi* are grown.

THE KITCHEN GARDEN.

This includes a walled-in portion of three to four acres, and another part outside the walls of about the same area. The soil is nearly a pure clay. Land of this character has its advantages as well as its disadvantages, for, when subjected to deep and thorough cultivation, it can support crops of fruit or vegetables, without exhaustion in trying summers, so that there are seldom any failures. Evidence of this was reflected in the splendid crops of fruit, vegetables, and salads seen in these gardens.

The collections of Apples, Pears, Peaches, Plums, Apricots, and Cherries are so extensive, and the varieties so numerous, that it is impossible, from considerations of space, for me to do more than briefly refer to them. The quality of the fruit was of the highest throughout, as those who have seen the exhibits of fruit from Madresfield at the shows in London and elsewhere would expect. The lower part of the south wall is mostly devoted to Peaches and Nectarines, which were bearing good crops at the time of my visit. Apricots occupied part of the top south wall.

But Apples form the most important crop. They are grown on trees trained in many ways. Dessert varieties are largely grown as cordons, not against walls, but out in the open border, better flavour and colour being obtained in this way than in any other. Cordon trees of Cox's Orange Pippin were splendid. The Paradise stock is only used for cordon trees in these gardens, but bushes and standards are worked on the crab or free stock—which, however, is treated in an original and, I believe, excellent way. The tap, or perpendicular root instead of being cut off in the usual way is carefully bent until it is got into a horizontal line, and then planted firmly in this position. The result is that large quantities of fibrous, surface-roots are formed of better quality than those from the Paradise stock, and there is but little danger of the roots getting into the subsoil. As it is now planting time, it may be useful to enumerate a selection of Apples and Pears grown so well by Mr. Crump. To take first dessert Apples on bush or cordon trees:—James Grieve, American Mother, Christmas Pearmain, Rival, Claygate Pearmain, Cox's Orange Pippin, and The Houbon are all excellent. To these must be added the fine new variety "William Crump." It is a cross between Worcester Pearmain and Cox's Orange Pippin, partaking of the handsome colour of the former parent, with the yellow flesh and delicious flavour of Cox's Orange Pippin. It was raised by Messrs. Rowe, nurserymen, of Worcester, and has received an Award of Merit from the Royal Horticultural Society. Of culinary Apples, Mr. Crump recommends the following varieties:—Eckinville Seedling, Stirling Castle, Lane's Prince Albert, Cox's Pomona, King of Tompkins County, Gascoyne's Scarlet Seedling, Bismarck, Dunchow's Seedling, and King Edward VII. a recently certificated Apple of great merit, also raised by Messrs. Rowe.

For standard orchard trees, the following dessert varieties are recommended by Mr. Crump. Worcester Pearmain, Duchess of Oldenburgh, Tyler's Kernel, King of the Pippins, Gascoyne's Scarlet Seedling, and Blenheim Pippin; and for culinary purposes, Lord Grosvenor, Lord Derby, Warner's King, Bramley's Seedling, Newton Wonder, and King Edward VII.

Photograph by H. J. King.

FIG. 180.—GARDEN OF ANNUALS AT MADRESFIELD COURT.

description is surely unnecessary! At the far end of this avenue, and looking to the left, another avenue opens out to view; the two together forming two sides of a triangle, one the Cedar avenue, extending south, and the other, which is planted with *Abies nobilis glauca*, running westward. The third side is composed of Lombardy Poplars. Thus the avenues form on those sides the boundary of the pleasure grounds. The *Abies* avenue is of the same length, age, and height as the Cedar avenue, and, as all the trees are grafted, every specimen is of the true bright, silvery-coloured variety. Among the specimen Conifers in the gardens, I may instance the following species: *Abies grandis*, 110 feet high; *A. Douglasii*, 80 feet; *A. orientalis*, 50 feet (perhaps the finest specimen in the United Kingdom); *A. lasiocarpa*, 50 feet; *A. Pinsapo*, 50 feet, and *A. Nordmanniana*, from 50 to 60 feet.

The pleasure ground covers an area of 70 to 80 acres. The trees have been planted wide apart (excepting in the avenues); thus they have ample scope for the full development of their form and beauty. It is fortunate for another reason, for

colour is a great feature throughout these gardens, no confused mixing of colours being tolerated.

I next inspected a construction of "Pulham" rock, where Bamboos and rock plants thrive. A short distance away is Lady Susan's garden, enclosed between hedges of clipped Yews, and not far off is the flowering shrub border, where all the best of the new varieties find homes. The evergreen varieties have a section to themselves. I noticed some large groups of the new Japanese Maples, whilst in front of a Holly plantation were masses of *Prunus Bissardii* and Golden Elder. The most surprising thing to me was that in this vast area of planting scarcely a case of repetition is to be seen! A little farther on I came to the herbaceous garden proper. Two long borders are planted between two Holly hedges, the path being grass, with red tiles in the centre, laid on cinders, to form a dry footing. These borders are planted with a choice collection in bold groups, each variety being used but once. In the centre is a sundial, opposite to which is an opening which brought me to

Pears.—No one can visit Madresfield without being impressed by the pergolas furnished with cordon Pear trees which span many of the walks of the kitchen garden. These are delightful when covered with blossoms or laden with fruit. They are formed by selecting one strong, young shoot at the top of each tree on either side of the walk, and training it in cordon fashion over the paths. Very choice fruits are obtained from these plants. Pears are largely grown also on walls of various aspects, and in warm summers magnificent fruits are obtained, the heavy soil suiting the Pear. The following is a selection of the Pears grown on pyramid trees:—*Souvenir du Congrès*, *Marie Louise*, *Beurré Hardy*, *Doyenné du Comice*, *Thompson's*, and *Beurré Superfine*. An orchard of cider Apples has been recently planted. Mr. Crump thinks highly of the *Loganberry*. It is as easy to grow as a Bramble bush, and the fruits make delicious jelly for flavouring ices.

Amongst Strawberries, *Royal Sovereign* still

summer for furnishing blooms early in spring. The remainder of the houses in this block are used for forcing Strawberries in spring, and afterwards for the growing of Melons, Tomatos, Cucumbers, and winter decorative plants.

Strawberries are forced in large numbers, and for later supplies they are planted out in cold pits, where excellent fruits are obtained with very little trouble or expense. The pits are freshly planted each season as early as strong runners can be obtained. Of Melons the grand old variety *Blenheim Orange*, raised by Mr. Crump more than 50 years ago, when he was gardener at *Blenheim*, is still a favourite.

Several plant houses are devoted to Figs, the trees being grown on the extension system; they seldom, if ever, fail to produce two crops in a year. Ripe Peaches are available from the first week in May to late in October.

The vineries contain most of the popular varieties of Grapes. It was a treat to me to

CAMPANULA CARPATICA.

THE Carpathian Harebell is a valuable subject for the border or rock-garden, and one of the easiest of the family to cultivate. It produces its pretty blue flowers in profusion during the summer months. A row of plants in flower forms a pleasing band of colour to the front of a flower-bed or border. At fig. 181 is shown a flower-border margined with this *Campanula* in the garden of Mr. Platt, at Highgate. The photograph was sent us by the gardener, Mr. C. Turner, who states that the plants are moved every three years, as the flowers grow larger and much finer if the plants are afforded fresh soil occasionally. The flowers shown in our illustration were all of the blue-flowered variety, but there are several other kinds, one of the best being the variety *alba*, which is very suitable for mingling with the type.

TREES AND SHRUBS.

AMERICAN CRATEGUS IN THE SPECIES PLANTARUM OF LINNÆUS.*

SINCE the publication last year in *Rhodora* (x. May, 1908) of Mr. Eggleston's notes on the species of *Crategus* described by Linnaeus I have had the opportunity to examine again the specimens of *Crategus* in the Plukenet Herbarium at the British Museum and the specimens of this genus preserved in Linnaeus's own herbarium.

Three of the four species of *Crategus* described by Linnaeus in the first edition of the *Species Plantarum* are what may be called book species, that is, there is no evidence that Linnaeus had ever seen a specimen of these plants when his descriptions were published in 1753, these having evidently been based on the descriptions and figures of earlier authors. Of the fourth species, *Crategus viridis*, there is a specimen in the Linnaean Herbarium collected by Clayton in Virginia which Linnaeus may have seen before his description was written. Several years ago I made out that this specimen represented the plant described later by Elliott as *Crategus arborescens*, although at that time this species had not been rediscovered in Virginia. It is interesting to report, therefore, that *Crategus viridis*, Linnaeus (*C. arborescens*, Elliott) was found by Mr. Rehder last summer on the bank of the Blackwater River near Zuni, in South-eastern Virginia.

Crategus Crus-galli was described by Linnaeus from Plukenet's figure and description. The specimen which appears to have served in part, at least, as the subject for Plukenet's figure (*Ann. Bot.*, 149, t. 46, f. 1) is preserved in his herbarium. It is a young shoot without flowers and fruit, and, although I suspect that it is not the plant which is now usually considered to be *Crategus Crus-galli*, it is impossible to say what it is except that it is from one of the *Crus-galli* group of species. The specimen labelled *Crategus Crus-galli* in Linnaeus's Herbarium is also only a barren shoot. It was collected by Kalm and no locality is given. It is certainly one of the *Crus-galli* group, and probably represents a different species from the specimen in the Plukenet Herbarium. In spite of the doubt which these specimens raise on the identity of *Crategus Crus-galli* of Linnaeus, it does not seem desirable or necessary to abandon his name, as no confusion is likely to occur by retaining it.

It is not possible to guess even at the plant described by Linnaeus as *Crategus tomentosus*. His species was based on the specimen collected by Clayton in Virginia, and, unfortunately, this is one of the few of Clayton's specimens which is not preserved in the British Museum. On the sheet labelled *Crategus tomentosa* in Linnaeus's Herbarium there are two specimens collected by Kalm without locality. One is evidently wher-

FIG. 181.—*CAMPANULA CARPATICA* FLOWERING IN A LONDON GARDEN.

holds the first place for forcing and cropping out-of-doors. The old *La Grosse Sucrée* is still employed as a forcing variety.

Out-of-doors, the following Strawberries are grown:—*Trafalgar*, *Gunton Park*, *Burghley President* (true strain), still unsurpassed taking it all in all, and *Oxonian* for a late crop.

THE GLASS HOUSES.

The glass department includes two ranges in the kitchen garden, the one against the south wall consisting chiefly of vineries and Peach houses. The other range extends parallel with it, and is devoted to Figs, Melons, and Peaches.

On the north side of this wall, and facing the offices, are the potting sheds, fruit rooms, and other garden buildings; also the recently-enlarged and conveniently-equipped bothy, close to which is another block of glasshouses and forcing pits, the whole covering upwards of one acre. Winter-flowering Carnations and Begonias are extensively grown. *Saint Bridget Anemones* are planted in cold frames at the end of

see one house is devoted to *Lady Dawne's*, and better bunches of this fine variety I have seldom seen.

In conclusion I will say a few words about the original *Madresfield Court* vine. It was raised upwards of 40 years ago by Mr. William Cox, the gardener at that time. It is the result of crossing *Black Morocco* with *Muscat of Alexandria*. It obtained the certificate of the R.H.S. in 1863. The variety is unsurpassed for all-round excellence. About 30 years ago, when Mr. Crump first took charge of these gardens, the vine was planted with several others, but now it nearly fills the vinery itself. I have seen the old vine on many occasions, but never before have I seen it carrying such splendid bunches as this year, many of them weighing from 3½ lbs. to 4 lbs. each.

These delightful gardens have been laid out and planted to express in every feature the love of the owner for hardy plants and general out-of-door gardening. *Owen Thomas*.

is now generally called *Crataegus tomentosa* and the other is one of the thick-leaved, tomentose species. It is of interest, perhaps, that there is a thorn on the first of those specimens, as *Crataegus tomentosa* is usually thornless, although "ramis spinosis" appears in Linnaeus's description of his *Crataegus tomentosa*. As no confusion is likely to arise from retaining the name of *Crataegus tomentosa* for the plant now generally considered to be that species, there appears to be no good reason for abandoning the name.

Crataegus coccinea was established by Linnaeus on Plukenet's figure (*Ann. Bot.*, t. 46, f. 4). The figure well represents one of the three specimens so numbered preserved in Plukenet's Herbarium. The numbers published by Plukenet have been written below the specimens of his herbarium by some one now unknown and, perhaps, after the collection had become the property of the British Museum. Under the specimen which is the type of Linnaeus's *Crataegus coccinea* there is a note by Robert Brown confirming the determination. Mr. Eggleston's statement that the type of *Crataegus coccinea* was an unnumbered specimen found by Mr. Britten is not clear. All the specimens in Plukenet's Herbarium are numbered, and Mr. Britten assures me that he has no recollection of having made such a statement. It is probable, however, that the fruit that he sent to Mr. Eggleston is from the specimen represented on plate 45, f. 4, as one of the seven fruits figured by Plukenet is missing. The leaves of this specimen are only slightly villose on the upper surface; the fruit is glabrous and the pedicels are slightly hairy; and it cannot, as Mr. Eggleston has suggested, represent *Crataegus modesta*. The specimen is thornless, and the detached thorn in the Plukenet figure may have been taken from one of the two other specimens in the Plukenet Herbarium, which the same unknown person has referred to the plant figured on t. 46, f. 4. The thorns on one of these specimens are slightly thicker and on the other they are more recurved than that figured by Plukenet. These three specimens in the Plukenet Herbarium referred to t. 46, f. 3, certainly all represent different species, either in the Molles or Lobulate Groups, and I am unable to identify any of them. The matter is further confused by the fact that Linnaeus also referred to his *Crataegus coccinea* the plant figured in the *Hort. Angl.*, t. 15, f. 1, which is *Crataegus cordata*. The specimen labelled *Crataegus coccinea* in the Linnaean Herbarium was from a plant cultivated in the Upsala Garden, and, being unable to determine any of Plukenet's specimens, it was this specimen that I formerly considered the type of *Crataegus coccinea* and referred to it a common species of the New England coast and the St. Lawrence Valley (see *Bot. Gazette*, xxxi, 11). Aiton's specimen of *Crataegus coccinea* in the British Museum is a barren shoot of some Molles species.

Under Rule 51 of the Vienna code it is provided in Section 4 that every one should refuse to adopt a name "when the group which it designates embraces elements altogether incoherent or when it becomes a permanent source of confusion and error." This is the case of *Crataegus coccinea*. Certainly the type of *Crataegus coccinea* cannot be determined, and a large number of different species have at different times been called *Crataegus coccinea*. It appears therefore desirable to abandon the name entirely and to find a new name for the plant figured as *Crataegus coccinea* in the *Silva of North America* (1) in the *Manual of North American Trees*. A glabrous form of this which I have called *Crataegus coccinea rotundifolia* was first described in 1785 by Moench (*Baume Weiss*, 29, t. 1) as *Crataegus rotundifolia*, which would therefore be the name of the species if the hairy and glabrous forms are considered to belong to one species; and the hairy plant which I have described as *Crataegus coccinea* may then become *Crataegus rotundifolia* var. *pubera*.

NOTICES OF BOOKS.

* THE GARDENER'S COMPANION.

THIS little work on flower gardening out of doors is written by a lady "who has lived and worked in a garden all her life, under a father who made one of the most charming gardens in Kent." Those who wish to make a garden but do not know how to begin may, with this book in their hands, be at no loss to know how to lay it out.

Hints and suggestions abound as to what should be done in making walks, flower borders, sunny nooks, and warm corners in which to sit and enjoy the warm days of autumn, and delightful spots of cool shade for shelter from summer heat. We are told how the garden, if it be small, may be laid out and planted so as to mask its boundary and, as it were, cheat the vision; how to make use of adjacent grass land, and throw into view distant fine trees and handsome buildings; where a hedge may be more desirable than a fence of any kind; or if a fence must be erected, then how to conceal it. Hints are given on what to plant in the way of trees, half trees, and shrubs, and explanations of the more important features in garden planning, planting for shelter, and for securing a certain degree of privacy in the garden. An abundance of material is mentioned for filling beds and borders, the plants being chiefly perennial species, the rest biennials. Roses receive special notice.

There are some sensible remarks on the making of pergolas and rockeries. A useful list of the better class of herbaceous perennial-flowering plants, with both the popular and botanical names, will be much appreciated by many amateurs, accompanied as it is by cultural directions. A list of the finer annuals will be found valuable. Sweet-scented foliage has not escaped the authoress's notice, although but few species with this property are mentioned. Evergreen and deciduous trees and shrubs are referred to, but mention is made of only a few of the finer varieties of modern introduction. In a short chapter on the rooting of cuttings of hardy plants, the reader is told that clay and sand make the best medium—surely a mistake. This is a chapter that should be extended in a future edition, when numerous errors in the spelling of plant names should also receive attention.

LISSELAN.

LISSELAN, the property of Mr. Reginald Bence-Jones, is a lovely spot, a few miles from the sea, nestling between wooded hills near Clonakilty. The clear river Arrigadeen runs through the garden, and from the lawn many a fine salmon has been caught. From the house stretches a long and wide terrace-lawn, margined on one side by a large border bright with well-grown Phloxes, double *Lychnis chalcedonica*, and other herbaceous plants. The terrace is bounded by a stone balustrade over which one looks down on the garden 30 feet below. Beyond the lower lawn the river forms a lake, but since the rush of water is often too great for Water Lilies they are grown in a secluded lakelet in another part of the grounds. Upon the lake is an island where Bamboos, Rhododendrons, and fine foliaged plants luxuriate, whilst, at its edge, *Astilbe Davidii* flourishes to perfection with self-sown seedlings springing up around it in hundreds. Majestic Gunneras spread their giant leaves, *Saxifraga peltata* grows in masses at the margin, and *Zizania aquatica* shoots up from the water. From the terrace to the lower level a rock-garden slopes, the interstices between the rough stone steps being filled with flowering Sedums, Aubrietias, Sea Pinks, dwarf Campanulas, *Hellianthemum*, and *Oxalis*, which make a very pretty picture. In this garden are

* *The Gardener's Companion*, by Selma Randolph. (London: Mills & Boon, Ltd.) Price 2s. net. 400 pp. 8vo., pp. 1-6.

Androsaces in variety, *Linaria alpina* spreading over the rocks, *Lithospermum rosmariniflorum*, *L. graminifolium*, and *L. prostratum* in blue sheets, *Sedum kamtschaticum variegatum*, *Zauschneria californica*, *Senecio pulcher*, *Linum narbonense*, dwarf Phloxes, *Stokesia cyanea*, *Sphaeralcea Munroii*, *Dryas octopetala*, *Cerastostigma plumbaginoides*, and *Glaucium Fisheri*, all in the best of health. The dwarfier plants are relieved by taller-growing subjects, such as Palms, *Yuccas*, *Cordylines*, *Kniphofia Northii*, and *Dasylirotr quadrangulatum*. At the back of the riverside lawn is a pergola 70 yards in length covered with flowering Roses and terminated by a thatched summer-house smothered with *Solanum jasminoides* in full bloom. Beyond, and at the side of the lake, is the Rose garden. This is filled with bushes and standards and climbing varieties trained to tall poles, while the sloping bank at the back is veiled with Roses. On the other side of the lake the rising ground is planted with flowering Brooms and other shrubs, that have a bright effect in spring. At the time of my visit in July in the newly-constructed bog-garden was the pretty *Thalictrum Delavayi* bearing its large, lilac-coloured flowers, and *T. dipterocephalum* was in bud. *Helonias asphodeloides*, with pale yellow blossoms, was attractive. *Podophyllum Emodii*, bearing its great crimson pods, was a very handsome object, and *P. peltatum* was growing hard by. *Pinguicula grandiflora*, from the damp mountains near Bantry, was evidently at home, and *Ranunculus lingua*, *Butomus umbellatus*, varieties of *Trollius*, *Mimulus* *Crimson Queen*, *Galax aphylla*, *Iris longipetala*, *Diphylleia cymosa*, *Redgersia podophylla*, and *Astilbe grandis* obviously appreciated their environment. The *Primulas* evidenced the most robust health, and there were fine colonies of *P. rosea*, *P. silkimensis*, *P. involucrata*, *P. pulverulenta*, *P. japonica*, *P. cashmeriana*, *P. capitata*, and *P. farinosa*, while hundreds of self-sown seedlings were growing vigorously around on the higher and drier ground.

Probably Lisselan is the only place in the British Isles where the grand *Dahlia imperialis* has flowered in the open. On the Riviera it blooms magnificently; but as it does not perfect its blossoms until November, they are, even in Cornwall, generally spoilt before they expand. However, last autumn was a marvellously warm and open season, and the plants of *Dahlia imperialis* at Lisselan produced a number of exquisite blooms. This summer also the plants were looking well. There is a fine collection of rare and tender shrubs in these gardens. Against the walls are growing *Solanum Wendlandii*, which, since it is generally killed in the open in Cornwall, will probably not survive the winter here. *Hidalgoa Wercklei*, *Cantua dependens*, *Oleander*, *Pomegranate*, *Plumbago capensis*, *Pentstemon cordifolius*, *Mandevilla sauveolens*, *Calceolaria Burbielae*, *Acacia leprosa*, *A. Drummondii*, *Viburnum hydrangeoides*, and the blue-flowered *Pueraria Thunbergiana* from Khasia.

Of *Buddleias* there are *B. Colvilei*, *B. variegata*, *B. variegata* and *B. magnifica* and the new variety *superba*. A fine shrub of *B. asiatica*, 8 feet through, and unharmed by the 15° of frost to which it had been subjected, scents the November air with the perfume of its white blossoms. Other good shrubs are *Eucryphia pinnatifida*, *Eubothrium coccineum* (such a glorious sight in Cornwall in the month of May), *Tricuspidaria lanceolata*, better known as *Crimodendron Hookeri*, *Plagianthus lyallii*, which had flowered profusely, *Nandina domestica*, a good plant of *Davidia involuta*, *Prunus Winteri*, *Edgewoodii* (*Sophora*) *microphylla*, the rare New Zealand *Hibertia populnea*, *Crocea latifolia* from New South Wales, *Correa cardinalis*, *Callistemon salignus*, *Rhapitannus cyanocarpus* bearing blue berries, *Osteomeles anthyllifolia*, *Foaja Sellowiana*, *Anemone canescens*, the Japanese *Ilexa polycarpa*, *Lomatia ferruginea* a very handsome foliage shrub, the New Zealand pink *Prunus*

(*Notospartium Carmichaeliae*), *Carpenteria californica*, the rare *Nevusmia alabamensis*, *Caragana frutescens*, a fine specimen of *Dimorphanthus mandschuricus variegatus*, *Cornus aurea elegantissima*, very good in colour, and the new *Hydrangea arborescens grandiflora*, an extremely handsome plant introduced by M. Lemoine, bearing trusses of flowers 18 inches across. Beyond the garden proper is a long walk at the foot of a steep bank, which, in the old days, was covered with weeds and Bramble. These have been cleared away, and it is now planted with *Spiraea*, *Olearia*, *Lilac*, *Hypericum*, *Escallonia*, *Berberis*, *Diervilla*, *Philadelphus*, *Cotoneaster*, *Cistus* and *Veronica* in variety. They are planted in large groups and produce an exceedingly pretty effect. In one spot the bank is covered with a large colony of *Libertia formosa*, which spreads for a distance of fully 40 feet. Beyond is an orchard sloping down to the path, and below the Apple trees a trellis has been erected with arches, over which *Rose Dorothy Perkins* is trained. In July this was a beautiful sight, for the Roses were in full bloom, and for 100 yards they formed a sheet of delicate pink.

Leaving the orchard one enters the kitchen garden, through which a broad walk extends, margined on both sides by wide, herbaceous borders full of handsome perennials. Here *Artemisia lactiflora* grows with astonishing vigour, being well over 6 feet in height, and shares its quarters with the *Dropmore* variety of *Anchusa italica*, *Delphiniums*, *Phloxes* excellently grown, *Lycchnis chalcidonica* (single and double), *Michaelmas Daisies*, and other plants. *Tropaeolum speciosum* grows like a weed at Lissaban. It rambles up tree-trunks, wreathes pergolas and arches, and clammers amongst flowering shrubs, spreading its veil of brilliant scarlet on all sides. *Wynndham Fitzherbert*.

NOTES FROM A "FRENCH" GARDEN.

We are now preparing hot-beds, which will be cropped immediately after Christmas. A portion of the beds first made will be utilised for the growing of Turnips to succeed the Lettuces late in February; other beds will be employed for pricking out Tomatos at that date.

The manure of the beds will be 12 inches thick when trodden down; it will consist of dry manure collected in September and fresh manure in equal proportions.

For forcing Lettuces, Radishes, and Carrots from January 10, the manure need not be more than 10 or 11 inches deep. There is no advantage in making the beds too thick, as young Lettuces do better in winter in a mild temperature, say, about 40° or 45°. During frosty weather the requisite temperatures may easily be maintained by lining the frames with good straw manure as necessity demands.

We are placing the cold frames in position on ground dug for the purpose early in October. Three barrow-loads of decayed manure are placed in each frame, and they are next covered with the lights. By this method the soil is in a good condition in January when the Passion or Little Black Gott Lettuce is planted.

The frames and lights used for this purpose are available for the first batch of Melons and also for planting early Tomatos in April.

Cabbages and Cos Lettuces under the cloches have not grown much during the present month owing to the damp and cold weather, but they are very clean and free from mildew. We have been obliged, owing to damping, to prick out earlier than was intended, the Lettuces sown late in November on a mild hot-bed.

The Cauliflowers are doing well in their winter quarters, though they are not very forward. In more favourable seasons we have transplanted them twice during December to check their growth and to give them increased room. *P. Aquatias*.

A BOTANICAL JOURNEY IN SOUTH-WEST AFRICA.

(Concluded from page 402.)

ANGOLA.

THE desert strip which lies between the sea and the hinterland of Namaqualand and Damaraland crosses the Cunene River and stretches northwards into the Portuguese territory of Angola. To the north of Mossamedes it merges into a thinly-populated dry belt, fairly rich in vegetation but with a meagre supply of surface water, which extends northwards almost to the mouth of the Congo. North of Benguela this belt is a grass-covered plain, dotted with Baobabs (*Adansonia digitata*) and a few other trees.

Beyond this dry belt, in the latitude of St. Paul de Loanda (8° S.), is a mountainous forest region rising to about 4,000 feet. Our knowledge of the flora of this region is mainly due to Dr. F. Welwitsch, who spent two years at Golungo Alto, and obtained a remarkably rich collection of new plants. The forest is high and frequently very dense, with a woody under-

growth, Ceara, Castilloa, Funtumia, and others—which, if allowed to proceed, will certainly yield results of the highest economic value. Many fibre and food plants are also established, and the station has already become an important centre for their distribution and for the dissemination of information concerning the best methods for their cultivation. It is feared, however, that the Portuguese Government is inclined to view this important work with a considerable measure of indifference, and to regard the results as insufficient to warrant the expenditure involved. To abandon it or to allow it to languish for want of funds would be an extremely short-sighted policy. Except for the Coffee industry, the increasingly difficult exploitation of wild rubber and the manufacture of rum from home-grown sugar, but little attempt has yet been made to utilise native products or the cultural possibilities of this rich region, and, with the certainty that the rum industry will decline, it becomes increasingly necessary to find new economic plants whose suitability for cultivation has been thoroughly tested.

Farther south, in the latitude of Mossamedes, a stony, low-lying plateau borders the sea. It

FIG. 182.—SOUTH-WEST AFRICA.

A group of *Sesamum* sp. among granite blocks at an altitude of about 1,500 feet on the Mossamedes Railway.

growth of which a wild coffee, *Coffea arabica* var., is a common constituent. This plant is the source of nearly all the Coffee obtained in Angola. In general it is left in its natural surroundings, except that other constituents of the undergrowth are more or less completely cleared away from it. Little attempt has yet been made to improve the plant or its yield, or to introduce more profitable varieties. Among the many woody climbers found in the same forests, rubber-yielding species of *Landolphia* (*L. florida*, &c.) are abundant, and that little-known member of the family Gnetaceae, *Gnetum africanum*, is found here and there. One of the most interesting features of the forest region, where it merges into the savannahs of the central plateau, in the vicinity of Golungo Alto, is the experimental station established in 1907 under the direction of Mr. J. Gossweiler and, in spite of many difficulties and much discouragement, administered by him to the present time with conspicuous success. The primary object of the station has been the experimental treatment of various rubber plants—Para, Mani-

usually presents all the familiar features of a desert, though it is to some extent less arid than is its southern continuation in Damaraland. A short rainy season sometimes occurs in the summer and is followed by a growth of grasses so luxuriant as to provide, for a few weeks, an abundant supply of food for various herbivorous animals. One admirable regulation in force in the vicinity of Mossamedes enacts that no grass may be cut for fodder until the seeds have fallen. On these plains *Welwitschia* is found in considerable abundance; indeed, the classical locality in which Dr. Welwitsch's memorable discovery was made is only a few miles distant from Mossamedes and lies between that town and the Cape Negro. Here the plants are large—larger than any to be seen in Damaraland—and not only do they set seed abundantly, but young seedling plants are very frequently met with. This energetic reproduction is probably not of annual occurrence, but it certainly happens with far greater frequency than in more southerly localities. Here, at least, as long as the present climatic conditions persist, there is

no probability that this remarkable species will die out through failure of the natural means of reproduction.

The lower 10 miles of the broad bed of the

covered plains offered them grazing for their oxen and one of the finest climates in Tropical Africa, while in the surrounding country they found elephants, lions, the rhinoceros, the

From the Huilla plateau the land slopes, at first abruptly, afterwards more gradually, to the Cunene River on the east and to the sea on the west. Down to the Cunene on the one side, and to within 50 miles of the coast on the other, the country is for the most part covered with a light, open forest, in which the undergrowth during the summer rainy season consists mainly of grasses affording rich pasturage. On the upper slopes Proteaceous trees prevail. At lower elevations two types of forest are curiously intermixed; the one is dominated by the leguminous tree *Copaifera Mopane*, and includes numerous rather small Baobabs, while the other consists mainly of a few large, more or less shrubby species of *Acacia*, with two Palms, one acaulescent, both apparently species of *Hyphane*. An Orchid, a species of *Amsellia*, is rather common as an epiphyte on the rough trunks of the *Copaifera*, and, while the presence of woody climbers is not a marked feature of these forests, a few lianas of the families *Asclepiadaceae* and *Menispermaceae* are rather frequently met with. In the wide, open spaces, which are of frequent occurrence, numerous grasses—many of them remarkably handsome—white and blue-flowered *Acanthaceae* bushes, tall, purple-flowered species of *Sesamum* (fig. 182) and many other striking plants are found. Below 4,500 feet this forest region is for the most part unhealthy and sparsely populated. Native cultivation is concerned mainly with a few varieties of Millet, and, to a less extent, with Mealies (*Zea Mays*). An Anglo-French company has, within the last three years, commenced the experimental cultivation of Cotton on a large scale on the low-lying lands (3,500 to 4,000 feet) west of the Cunene, and the variety known as the "American King" has yielded very encouraging results. The cultivation of Cotton, if successful, probably offers the greatest promise for the economic development of this region. The experimental introduction of Agaves and other dry-climate fibre-plants would also seem to be indicated. A native species of *Sansevieria* flourishes in the more open parts of the forest, but nothing is known as to the quality or yield of its fibre, and the natives appear to make no use of it. No indications of the presence of valuable minerals in workable quantities are yet disclosed. H. H. W. Pearson.

FIG. 183.—SOUTH-WEST AFRICA.

A view on the Huilla plateau near Humpata (6,000 feet), showing *Aloe Baumii* and Proteaceous bushes.

River Bero presents a remarkable contrast to the barren country through which it flows. This river rises in the western flanks of the Huilla plateau, but it is only in years of exceptional rainfall that the drainage of this part of the plateau reaches the sea as a surface stream. Normally it is absorbed by the thirsty ground of the desert belt, and consequently, although the lower course of the river may be waterless, there is a sufficient water store not far beneath the surface. This makes cultivation possible and, in fact, near the sea the river bed is a scene of considerable agricultural industry. The principal crop is Sugar Cane, the final product being mainly rum, though some sugar is exported. Figs, Bananas, Dates, Pineapples, Oranges, Pears, and other tropical and sub-tropical fruits are grown, and also many common European vegetables. The neighbouring town of Mossamedes is supplied and there is a small export trade with the coast settlements to the north. If a better market were available, no doubt, the production of fruit and vegetables would be capable of further development.

The new railway running at first across the Bero, and for some distance up the bed of the Giroual River, crosses the desert and at present ends less than 20 miles from the foot of the steep ascent of the Chella range, on the top of which is situated the great Huilla plateau whose remarkable flora was first investigated by Dr. Welwitsch. On this plateau—an undulating plain, 6,000 to 6,500 feet above the sea—is a remarkable development of Proteaceae and of other forms well known at the Cape in association with other members of this ancient family. In April the neighbourhood of the Boer settlement of Humpata (6,000 feet) was gay with flowers—*Aloe Baumii* (fig. 183), various Proteaceous bushes, everlastings, leguminous bushes and annuals, *Melastomaceae*, *Scrophulariaceae* and many others scattered among the rich growth of grasses. This plateau is the headquarters of a small Boer colony numbering about 1,000 souls. They or their fathers arrived here in 1881 after a six years "trek" from the Transvaal across the Kalahari and Ngamiland. These grass-

giraffe and smaller game in abundance. Their energies have been mainly directed to hunting, transport riding and cattle-breeding, while agriculture, except in a few instances, has received little attention. Now, however, various causes, among which must be reckoned the attraction offered by the new régime in South Africa, have induced many of them to return to the Transvaal, and it is probable that the number of Boers remaining on the plateau will, in a short time, be very considerably reduced.

FIG. 184.—SOUTH-WEST AFRICA.

The Caenlovar River near Humpata, a few miles above its junction with the Cunene. The trees are mostly *Acacias*.

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to SIR TREVOR LAWRENCE, Bart., Burford, Surrey.

Cattleya.—Among *Cattleyas* that bloom late in spring may be mentioned *C. Warneri*. Plants of this species are now showing signs of activity, both new growths and roots are pushing freely; they should, therefore, be well elevated on stands or flower-pots so as to bring them as near to the light as possible. From the time until the flowering season is past the compost should be kept in a fairly moist condition. There are other plants in the *Cattleya* house which are in various stages of growth, such as *Lælia crispa*, *L. porpurata*, also many *Cattleya* and *Lælio-Cattleya* hybrids which must be watered with much discretion. Of the long-bulbed section, *Lælia harpophylla* is growing fast in the *Cattleya* house, and will require plentiful supplies of water. When growth is completed and the flowers are past, the plants should be removed to a warm corner of the cool house.

Polycynis muscifera.—This very interesting species thrives well in a structure having an intermediate temperature. The species requires plenty of water during the growing season, but after flowering is over it should be kept cool and allowed a decided rest.

Sophranitis.—There are nearly 50 beautiful and remarkable hybrids, which have been obtained by crossing and inter-crossing *Sophranitis grandiflora* with species of *Cattleya*, *Lælia* and *Epidendrum*. They flower at different seasons, and a collection of these plants provides one or more in bloom nearly the whole year round. Those in flower at the present time are *Sophranitis Cattleya Marcus*, S.C. Chamberlainiana, S.C. Denis, S.C. Saxa, *Sophranitis Lælia Leda*, S.L. Gratrixie, S.L. Marriottiana, and *Sophranitis Cattleya Marcus* others which have recently bloomed, and are commencing to grow, may, if they require it, be repotted. All these hybrids thrive well in a mixture of *Osmunda* and *Polypodium* fibres with plenty of material for drainage; a light, warm corner of the intermediate house is the most suitable place for them. Great care is necessary in affording water at the roots, as the young growths are apt to decay if the plants are watered indiscriminately, whilst the old leaves and pseudo-bulbs will quickly turn black from the same cause. The inflorescences of such varieties as S.C. eximia and S.L. Gratrixie develop peculiarly; when the flowers are nearly ready to open, they have not escaped from the partially-developed growths, and appear to be deformed, but later they grow fast and open out perfectly. While the flowers are developing inside the sheath, no water, either from syringe or sprayer, should be allowed to settle on them, or they will rapidly decay. The safest plan is to suspend the plants so that no water from the syringe can reach them, but moisture at the roots must be given when necessary. *Epiphranitis Veitchii* is one of the finest of these hybrids. We have at Burford half-a-dozen plants, and during the past six or eight months one or more have been in bloom. They grow very freely, and in a suitable temperature will produce young plants from the old growths and flower-stems. These, as soon as they begin to push forth roots, may be removed with a portion of the old stem attached and potted. Ten or a dozen of these pieces put in a 6-inch teak-wood basket will form a good compact specimen. Place a few large crocks over the bottom of the receptacle, and fix the plants firmly in chopped *Sphagnum*-moss freely mixed with small crocks. Suspend the plants at one end of the *Cattleya* house, where they can be shaded from strong sunshine at all times, and afford them plenty of water throughout the whole year.

Trichosma suavis.—This is a neat, compact-growing plant, and a moderately-sized specimen, when covered with its creamy-white, scented flowers, is a very pretty object. Its flowering season is now past, and any repotting that is necessary should be done at once. The plant is a strong grower, and when potted in the new Orchid compost increases in size very rapidly. It requires a cool, shady position in the intermediate house, and plenty of water at the roots at all seasons of the year.

Trichopilia.—*Trichopilia fragrans* is one of the best sweet-scented, white-flowering Orchids

which blooms at this time of the year. The variety *nobilis*, sometimes known as *Pilunna nobilis*, has larger flowers than the type, and they are of purer whiteness. The plant requires a trifle more warmth than *Odontoglossums*, therefore a cool position in the intermediate house is the best place for it. *T. crispa*, *T. laxa*, *T. rostrata*, *T. tortilis*, *T. coccinea* and *T. galactiana* all require a similar temperature. The majority of these plants have now made their growths, and must not be watered often or their leaves and pseudo-bulbs will quickly decay. Those which are showing bloom should be placed in the *Cattleya* or Mexican house, where their flowers will open better than in a cooler temperature. None of these *Trichopilia*s need strong light, and direct sunshine often turns their leaves from deep green to yellow. The best time to repot *Trichopilia*s is soon after they commence to grow. They root freely in a compost of *Osmunda* and *Polypodium* fibres and *Sphagnum*-moss. Use well-drained pots and keep the plant a trifle elevated, so that it can be easily watered without moisture lodging in or around the base of the young growths.

General work.—Cleanse the houses both inside and out, washing the glass so that the plants may receive all the light. At the same time, the plants should be thoroughly cleansed of dirt and insects, and the pots and stages well washed. The borders under the latter may be forked up and replanted with various dwarf-growing foliage plants, so as to give the house a smart appearance.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Herefordshire.

Salads.—These vegetables are usually in great demand during the Christmas season; where proper provisions were made during the past summer and autumn, there should be little difficulty in furnishing a good supply of most kinds. With regard to Lettuce, the Cabbage varieties are the best to cultivate at this season. These will have been transplanted into frames during the past autumn, and will now be sufficiently matured for the table. Any plants which do not show signs of hearting may be tied up in much the same manner as are the *Cos* varieties. All the Year Round and Hardy Hammersmith are two desirable varieties for the purpose. In gardens where there is likely to be a scarcity of Lettuce during the winter months, seeds of varieties suitable for forcing should be sown at once, and the plants raised in moderate warmth. Before the second leaf appears, the seedlings should be pricked off into boxes and grown on in a temperature of about 55°. These forcing varieties are very suitable for use in salads; the leaves grow quickly and are therefore very tender. They may be cut off when quite small in much the same manner as Mustard and Cress.

Endive.—Maintain a plentiful supply of both the plain and curled-leaved kinds in a well-blanching condition. This salad will also have been planted in cold frames or orchard houses.

Chicory.—Where a sufficient supply of roots have been grown there will be little difficulty in having *Chicory* in good condition for salad till May. It is also much appreciated, if properly blanched, as a cooked vegetable. Once a week, a few fresh roots should be placed in the darkest part of the Mushroom house, or some other suitable warm place from which light is entirely excluded. Should severe frosts appear imminent, a sufficient number of roots for use should be lifted from the open and stored in a frost-proof place.

Mustard and Cress should be sown weekly in boxes and raised in gentle warmth.

Tarragon.—A flavouring of this herb is often appreciated in salads. A supply can be easily obtained by lifting a few roots, planting them in boxes, and placing them in gentle heat.

Onions.—Sow, each fortnight, a small quantity of seed of the silver-skinned variety and raise the plants in a temperature of about 50°, keeping the seedlings near to the glass.

Tomatos.—Fresh, ripe Tomatos should always be included in a well-assorted salad. When nicely sliced they are not only appetising, but add greatly to the appearance of the dish.

Betroot.—This, too, should be included, small roots being kept in readiness for the purpose.

Skabale should be introduced into heat in large quantities, as it is sure to be in great demand. Each week from now it will start into growth more and more readily.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

The forcing house.—Considerable forethought and management is necessary in the management of this structure. In the matter of forcing plants and shrubs, every garden must be a law unto itself. The gardener, knowing the particular requirements of the establishment under his care, should introduce fresh subjects into the forcing house at the proper times and in sufficient numbers to meet the demand. If his judgment is faulty, his show house will become either insufficiently furnished or overcrowded. The careful manager commences to force the various plants some few days, or even a couple of weeks, according to the nature of the plant, in advance of the latest date, well knowing that, should the weather prove very unfavourable, the extra time will be needed, whilst in the absence of unfavourable weather, he can easily retard the progress of the plants on the approach of the flowering stage, by decreasing the temperature of the house, or by removing the plants to a cooler structure. The plants to be forced should not be introduced at once into great heat, but gradually accustomed to warmer surroundings. Well-rooted bulbous plants will put up with more in this direction than most species, but even in the case of bulbous plants the forcing should be comparatively gradual until a maximum heat of about 65° is reached; with some few exceptions, which have previously been remarked upon, it is not wise to attempt to force shrubs into flower in a greater artificial heat than 60°. Water at the root must be applied with extreme care. It often happens that the water used in syringing the growths of shrubs keeps the surface soil sufficiently moist to give the impression that no water is needed, whilst the remainder of the soil may be too dry. No attempt should be made to subject *Liliums* to a high temperature until the flower-buds have attained to a good size.

Solanum.—Before the fruits shrivel and fall, a few of the largest berries should be gathered, and the seeds removed ready for sowing in the spring. As these plants are now kept somewhat dry at the root, frequent fumigations will be necessary to destroy insect pests.

Gardenia.—If *Gardenia* flowers are required during the winter months, it is essential to devote a house entirely to their culture. A high temperature (75° to 80°) with abundant atmospheric moisture is necessary, and the plants must receive every possible ray of light. The culture of *Gardenias* becomes much easier when flowers are not required until the spring. The plants for this purpose should, for the present, be kept in an atmospheric temperature of 57° to 60°, and they should receive but little water at the root. The plants should be inspected frequently, and if mealy bug is detected, they must be at once cleansed.

Epiphyllum truncatum.—Plants coming into flower should be placed in a house having a moist atmosphere and a temperature at night varying from 55° to 60°. The scarlet-flowered *E. Gaertneri*, which flowers in the spring, should be resting at the present time.

FRUITS UNDER GLASS.

By E. HARRIS, Fruit Foreman, Royal Gardens, Frogmore.

Early Peaches.—The earliest house should be kept slightly warmer from this date; the night temperature ranging between 50° and 55°, in accordance with the atmospheric conditions outside. If this degree of warmth can be maintained without the aid of the hot-water pipes at the front of the house nearest to the trees, so much the better, as then there will be less danger of red spider appearing. Admit a little fresh air through the top ventilators on fine mornings, but close the apertures before the sun has lost its power, after slightly spraying the trees with luke-warm rain-water. Damp down the paths and bare surfaces of the borders as often as is

necessary to maintain a moderately humid atmosphere, as dry air is favourable to both red spider and aphids. It is a good plan to fumigate the house with some vaporising compound just before the trees open their flowers. When the young growths are about an inch long disbanding may be commenced. It is better to remove at least one-third of the buds at this stage rather than to wait till the shoots are 2 or 3 inches long, as the removal of a number of shoots at one time is a great check to the plants. This work should be done on at least three occasions. Commence at the upper part of the trees, rubbing off the buds on the lower side of the shoots first. Before the flowers expand carefully examine the borders to ascertain if they require moisture; if they are dry give them a copious soaking with clear water, which should not be colder than the atmosphere of the house. More than ordinary care is necessary at this time of the year to ensure the fruits setting, therefore strict attention must be paid to the smallest cultural details whilst the trees are in flower. Excessive use of fire-heat or sudden fluctuations of temperature are two of the chief causes of failure in this matter. Damping and syringing must be discontinued till the flowering stage is over. Encourage a free circulation of air during favourable weather, but never allow cold draughts to reach the flowers. Pollinate the blooms at noon by carefully passing a rabbit's tail over them, and especially see that all the flowers at the top-side of the branches are dusted with pollen.

Second early Peaches.—The beginning of the New Year will be sufficiently early to start the trees in another house for a succession to the earliest crop. If the buds on the trees are already swelling, it will be advisable to close the front ventilators when cold winds prevail, as cold draughts are responsible for much injury to Peach buds when they are bursting.

Late Grapes.—All Grapes should now be cut, provided a suitable room is available for keeping them, as the vines need to be watered, pruned and cleansed. The roots and borders should also receive any necessary attention.

Young vines.—Vines intended to be planted in the spring should be cut down to three or four eyes. Paint the cut surfaces with styptic and place the vines in a cold house. Young vines which were planted last year may now be pruned. Cut back the main rod to about 2 or 3 feet, according to the strength of the plant. Proper treatment when they are young is essential to secure strong, healthy vines, and there is nothing so detrimental to their future welfare as over-cropping them when in that stage.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonardslee, Sussex.

Trenching and digging.—Any flower-beds that are not planted with bulbs or spring bedding, or bare parts of the borders and shrubberies, should be dug or trenched. If the soil needs enriching, afford it a good dressing of manure, leaf-soil, or ashes from the garden fire. Let the surface of the ground lie as roughly as possible, so as to expose it to the beneficial influences of frost and air.

Grass verges.—Any worn patches in the grass edging, by the side of paths or carriage drives, may now be renovated. Remove the turf, and place sufficient fresh soil to raise the verge to its proper level. If the grass is badly worn, it is better to employ fresh sods, but in some cases all that will be necessary is to reverse it, placing the worn part inside, and levelling it by adding some fine soil. When doing this, see that all drains and gullies are in a proper working condition.

Garden paths.—It is a suitable time to mend or make garden paths. If new ones are being prepared, excavate the soil to a sufficient depth, and place at the bottom a quantity of hard core, or large stones; then some smaller pieces of the same material, finishing with a good layer of fine gravel. Where there is a considerable amount of traffic, the material forming the path should be at least 1 foot deep. Older paths should be forked over lightly and surfaced afresh with new gravel, and afterwards thoroughly rolled. It is necessary to do this every few years in order to maintain them in good condition.

Potting materials.—Get ready the various loams, leaf-mould, manure, soot, lime, and other materials which will be required for potting purposes. Mix up the soils for the several purposes for which they are intended, and then place some material such as boards or corrugated iron over them to keep them dry.

Berried shrubs.—The birds will now be busy amongst these, and measures should be taken to protect the fruit. Birds are very fond of Mistletoe berries, which must be protected by nets or some other means. Black cotton or thread entwined amongst the branches is a simple and useful measure for keeping away birds, which will even devour the berries of small shrubs in pots intended for decorative purposes indoors.

Climbing Roses.—Where there are large quantities of Roses of the Rambler type, their thinning and pruning may be undertaken as opportunity presents. The branches will need to be unfastened, so that the useless shoots may be cut out easily. All the old shoots should be cut down to the ground level, and the young ones trained in position. Do not bunch the branches together, but arrange them so that they will cover all sides of the support, and allow the smaller side branches to hang free, as this will give a more natural effect. It is not necessary to do this every year, but it should be undertaken every second or third season. After the pruning and training is finished place a good mulching of manure about the roots.

Brier stocks.—Where these can be obtained in the neighbourhood, they should be dug up, and planted in rows for budding later. Those with long, straight stems are very useful for standards.

The Alpine garden.—Small shrubs may be planted on the rock-garden whenever the weather permits.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

Strawberries.—The beds should be lightly forked over, during favourable weather, and generally made tidy. Established plants should be given a liberal mulching of well-rotted manure. The manurial substances contained in the mulching will be washed into the soil by the rains and when the roots become active again in the spring they will find a reserve of food which will enable them to grow vigorously and produce good crops of fruit. The Strawberry is a gross feeder, and is much benefited by these heavy manurial dressings in winter. When making the beds tidy, see that each variety is properly labelled. In the case of beds which were planted last autumn, this heavy mulching of manure will not be required, provided the ground was suitably prepared and enriched at the time. The present is a suitable time for preparing land intended for Strawberry planting next year. Trench the soil and work in plenty of manure as the digging proceeds, also apply a good dressing of lime. Leave the surface of the soil in a rough condition, so that it may be exposed to the beneficial actions of frost and air. The ground need not necessarily remain fallow until the Strawberries are planted; a suitable crop to precede Strawberries is early Potatoes, which will be harvested early in the summer. After the Potatoes are dug, the ground should be made level and tidy, and nothing more will be required to prepare it for the Strawberries. Trenching land in the winter has many advantages; not only is the soil exposed to the weather all through the winter, but it settles down, so that by spring-time it is in a proper condition for planting, and the manure is well rotted. In addition, labour for the work can be better spared in winter than at any other season.

Planting and root pruning.—The wet weather has delayed this work, but it is nevertheless desirable to wait rather than plant when the ground is in an unfavourable condition. Pruning and training can be attended to in the case of wall trees, or in places where planks can be employed for the operator to walk upon. Trees arriving from the nursery while the ground is in the present condition should be "heeled in" for the time being, but plenty of soil should be placed about the roots, because the trees may remain un-

planted for some considerable time, and it will not be wise to risk injury from frost. Even the tops of the trees should be protected during very severe frost, and some light material such as Bracken Fern should be at hand ready for the purpose. If the trees are delivered during very cold weather it will be better not to unpack them, but to place them just as they are in a shed or cellar. When the weather becomes milder they can be heeled in as advised. Stakes for securing fruit-trees should be prepared, and any necessary staking carried out, also any other work that will forward matters when the ground is in a suitable condition for planting, lifting, or root-pruning. When tying the stems of the tree, use a piece of sacking or other soft material round the part where the string is tied; fasten them securely, so that there will be no danger from the bark being rubbed during windy weather. Coarse, tarred twine is the best material to use.

PUBLIC PARKS AND GARDENS.

By W. W. PETTIGREW, Superintendent of City Parks, Cardiff.

Special grounds for professional sports.—In these days, when so many more sources of income exist than was formerly the case, in connection with public parks, there is a danger of judging a park's success according to the greatness or smallness of its financial returns. Park officials are naturally always very pleased when they are in a position to report to their committee and through it to the general public, at the end of each season, that the takings from the playing of games, the hiring out of chairs or the letting of boats, are on the increase. For the same reason, when recommending any new departure in park management, they are always glad to be able to point out that it will result in a financial return, even before indicating its public advantage. This danger of losing sight of the real function parks play in urban life was forcibly brought to my notice last summer when visiting a large park one evening after a band performance had taken place. The superintendent, meeting one of his assistants, casually asked how everything had gone off. The reply was prompt and to the point. "Very poor, sir. The crowd was the largest we have had all season, and yet the chairs were hardly patronised." Prior to the introduction of chairs (for the use of which a charge is made at this park) the answer would have been very different, for then, apart from the quality of the music, the standard of success would have been the number of visitors present and not the number of pennies collected.

Financial considerations sometimes necessary.—While it is to be hoped that parks will never descend to such a low plane as to be regarded as commercial concerns, there are circumstances under which money-making is not merely justifiable but actually essential, namely, where certain forms of amusement are desired by the public. Such sports as foot and cycle racing, pedestrianism, and professional football matches, &c., can only be provided at great cost, and persons desiring to see these must be prepared to pay for the privilege. In many towns private companies provide grounds for these games, and in such cases there is no need for the parks department to deal with the question. There are, however, many places where no facilities exist for private enterprise taking up such sports, and it is then to the advantage of the public authority to make the necessary provision.

Methods of management.—After being laid out and fitted up, sports grounds may be dealt with in one of two ways. They may either be leased to a company for a number of years or retained by the Parks Department, and let out from time to time to clubs and societies requiring their use. The latter, from the public standpoint, is the better course, as they are then always at the disposal of the parks authorities, and when not in use for one thing are available for another. Even when this is the method adopted, there are two different ways of charging for the use of the ground. In some cases a fixed charge is made per day, whereas in others payment is made by handing over a given percentage of the gross takings. When payment is made on this latter basis it is necessary to have registering turnstiles fixed at the entrances to the grounds as well as at the entrances to each different class of seats on the grand stand.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for names, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Editors and Publisher.—Our Correspondents would oblige by delay in obtaining answers to their communications, and save us much time and trouble, if they can conveniently observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, DECEMBER 21—

Roy. Hort. Soc. Com. meet.

SAFFORD, DECEMBER 25—

Christmas Day. Quarter Day.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last fifty years at Greenwich—38.6°.

ACTUAL TEMPERATURES:—

LONDON.—If Wednesday, December 15 (6 P.M.): Max. 41°.

Min. 35°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden London.—Thursday, December 16 (10 A.M.): Bar. 30.1; Temp. 33°; Weather—Slight rain and sleet.

PROVINCES.—If Wednesday, December 15: Max. 42° Cornwall and S. Ireland; Min. 35° Cambridge.

SALES FOR THE ENSUING WEEK.

WEDNESDAY—

Dutch Bulbs, Herbaceous and Border Plants, at 12; Roses and Fruit Trees, at 1.30; Palms and Plants, at 5; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

The
French
Government
and
Horticulture.

A few weeks ago we recorded the formation of a Sub-Department for Horticulture by the Belgian Government. We have now to announce the creation, by the French Minister of Agriculture, of a permanent, Technical Commission of Horticulture.

The step taken by the French Government is so wise and so important that we propose to set forth in some detail the considerations which have led the Minister of Agriculture, M. Ruan, to decide upon the formation of this standing Committee of Horticulture and the programme of the work which the Committee will undertake.

In an admirably lucid report which prefaces the official decree establishing the Committee, M. Ruan draws attention to the enormous progress of French horticulture during the past 20 years. This progress, which consists in increase of production, in improvement of varieties and in means of transport, may be gauged by the fact that, whereas the total value of French horticultural produce was 295,904,000 francs in 1892, it has now reached 400 million francs. That is to say, the annual value of French horticultural produce has increased in 17 years by 36 per cent. and is now 16 million pounds sterling. Notwithstanding this marked development in the industry, the Minister states roundly that

French horticulture cannot rest content with its position. Competition in the open markets of Europe, and even in France itself, is becoming keener year by year. To maintain their position, M. Ruan is convinced that French horticulturists must redouble their efforts and "must receive every assistance from all departments of the State." These efforts and this assistance must take the form of improvement in the methods of production, the introduction of co-operation among the producers and vendors, improvement in methods and in speed of transport and in revision of the charges for the carriage of horticultural goods. The supreme function of the commission will be to co-ordinate the efforts now being made in these and in other directions "in order to increase the prosperity of France." Among the first practical tasks of the Committee will be the investigation of carriage rates and the establishment, under conditions which have the approval of horticulturists themselves, of an agricultural parcels-post for produce sent in parcels up to 40 kilog. (90 lbs.) in weight. The Minister recognises that, before establishing this new parcels-post, he requires to have the advice of the growers and merchants whom the new post is intended to benefit.

Another duty, which the Committee will be required to undertake, is that of organising a national bureau for the granting of certificates of export. M. Ruan points out that, owing to the stringency and uncertainty of the new laws concerning the importation of nursery stock and other horticultural produce into the United States and also other countries, French horticulturists run, at present, the risk of heavy losses. He proposes to form a body of inspectors who shall, when required, examine goods intended for export and give certificates which will be accepted by the Customs authority of the country to which the goods in question are consigned. The Minister points to the enterprise shown by Belgium in founding a State Research Station for the investigation of insect and fungal pests which attack cultivated plants and foreshadows the establishment of a similar institute in France.

Nor is the Committee to neglect the gardener in its attempt to ameliorate horticulture; amongst other things, it will be called upon to consider the conditions under which gardeners incurring accidents in the course of their work shall have legal claims for compensation.

The constitution of the Committee augurs well for the success of its work. Besides some 16 members who are appointed by virtue of their several offices—the Director-General of Customs, the Director of Agriculture, the President of the National Society of Horticulture, the Director of the School of Horticulture at Versailles, the chief of the Agricultural Enquiry Bureau, and representatives of the chief railway companies—there are also 30 members nominated by the Minister. In making his first nominations, M. Ruan has taken care that all the chief horticultural interests are represented. The list includes seedsmen, florists, nurserymen, market-gardeners, fruit-growers, salesmen and head gardeners chosen from the various regions of the country. Among the names of members of the Committee we note those of Messrs. René Adnet, of Antibes; Antoine Rivière, of Lyons; Victor Lemoine, of Nancy;

Albert Truffaut, of Versailles, Amédée Lecointe, of Louvecienne; Philippe de Vilmorin, of Paris; and Jules Vacherot, head gardener to the town of Paris.

We not only wish all success to the Standing Committee, but hope earnestly that the formation of this important body will not escape the notice of our own administrators. They "order these things better in France," but there is no reason why we should not imitate where we cannot originate. We do not want to see a doctrinaire committee of well-meaning amateurs and procrastinating officials, but we should welcome gratefully a standing committee constituted on the lines of the French "Commission Technique de l'Horticulture," and like it leavened with the leaven of the leading representatives of horticulture.

ROYAL HORTICULTURAL SOCIETY.—The Rev. W. WILKS reminds us that there will not be an exhibition on December 21, as the date is found to be too near to Christmas. The Floral, Orchid, and Fruit Committees will sit upstairs, and plants, &c., for Certificate will be received, but nothing else. It will be remembered that a show for December 21 was announced in the R.H.S. publications and in our own Almanac.

ROYAL INSTITUTION.—Amongst the series of Friday evening lectures to be delivered before Easter, 1910, is one on "The Heredity of Sex," by Prof. W. BATLSON, M.A., F.R.S., on February 4.

ROYAL GARDENERS' ORPHAN FUND.—We are glad to hear that this charity has received a sum of £10, the proceeds of a whist drive arranged by Mr. F. TOPHAM, Northwick Hall Farm, and held at Worcester on the 9th inst. Mr. TOPHAM may be congratulated on the results of his efforts.

KEW.—In the *Bulletin*, No. 9, 1909, just published, it is announced that Miss J. J. CLARK, B.Sc., has been appointed to the vacancy on the Herbarium staff as the result of a competitive examination. Another appointment announced is that of Major HENRY ALFRED CUMMINS, C.M.G., as Professor of Botany, University College, Cork. The *Bulletin* records the death of Mr. C. W. SMYTHE, Agricultural Superintendent, Sierra Leone, on October 15. Mr. SMYTHE left Kew in 1904 to take up the duties of Curator of the botanic station in Sierra Leone.

YORK CHRYSANTHEMUM SHOW, 1910.—The next show of the York Chrysanthemum Society will be held on Tuesday, Wednesday, and Thursday, November 15, 16 and 17, 1910.

PUBLIC PARK FOR BANGOR, CO. DOWN.—The corporation of this town recently offered a premium for the best design for laying out a public park. We are now informed that a large number of designs were submitted, and that of Messrs. J. CHEAL & SONS, Crawley and London, has been awarded the first prize.

RAILWAY COMBINATIONS.—The following resolution was passed at a recent meeting of Hull fruit traders: "That this public meeting of fruit traders of Hull and district declares that it is absolutely necessary for the welfare and growth of their trade that there should be healthy competition and freedom for all railways in this large port, and we are therefore absolutely opposed to the proposed agreement of the North Eastern and the Hull and Barnsley Railway Companies, which means practically amalgamation and monopoly, and we pledge ourselves to oppose this agreement by all legitimate means."

"THE BOTANICAL MAGAZINE."—The issue of this journal for December contains figures and descriptions of the following plants:—

PARTHENOCISSUS TRICUSPIDATA (AMPELOPSIS VEITCHII), tab. 8237.—Gardeners will scarcely recognise, under this somewhat lengthy name, the familiar plant known to most of them as *Ampelopsis Veitchii*. Indeed, they have never used the name *Vitis inconstans*, which was until recently considered the correct nomenclature. The conception of the genus *Vitis* in the *Genera Plantarum* is made to include all the Ampelidaceæ except the species of *Pterisanthes* and of *Leea*. Planchon, however, subdivides the *Vitis* of the *Genera Plantarum* into nine distinct genera. It is in following Planchon that Mr. SPRUCE now adopts the name *Parthenocissus tricuspidata*.

ASPARAGUS TETRAGONUS, tab. 8238.—This species is a native of South Africa. It was first collected by MEYER and MAIRE in Cape Colony. In general characteristics, the species most resembles *A. racemosus*. The specimens from which the figure was prepared were obtained from a plant which has been growing for many years past in the succulent house at Kew. It is cultivated in a shallow border, and its stems attain to a height of over 10 feet. The plant flowers very freely, the blooms being fragrant; they are succeeded by red, globose, one-seeded berries. This species has a root system remarkable for the large, whitish, watery, ovate tubers, which are formed along the principal roots, and are calculated to enable the plant to endure long seasons of drought.

PRUNUS MARITIMA, tab. 8239.—This species is described as a low, spreading bush 4 feet to 5 feet high, and considerably more in width. It flowers in May, and not only produces its blossoms in great profusion, but keeps them in perfection longer than is the case with most Plums. It appears to possess a robust constitution, and is one of the most accommodating of American Plums in regard to soil. It is surmised that it will prove useful for planting in fairly-exposed places near the sea. The fruits are red, and, as a rule, freely produced.

OPUNTIA IMBRICATA, tab. 8290.—This is a very old plant in gardens, having been introduced to cultivation early in the 19th century. The plate is prepared from a plant which flowered early in August, 1908, in Sir EDMUND G. LOBER's collection at Leonardlee, a plant which Sir EDMUND LOBER himself collected in Colorado in 1878. The rose-pink flowers are very beautiful, but, apparently, the plant seldom flowers in this country.

EURYOLES VIRGINEUS, tab. 8291.—This species belongs to the Natural Order Compositæ. It is tender in most gardens in this country, but it can be successfully grown in sheltered situations in the south-western counties. It thrives luxuriantly in the gardens of Mr. T. A. JORDAN SMITH at Trecco Abbey, Isles of Scilly, who furnished the materials from which the plate was prepared.

THE SHREWSBURY SHOW.—Several important alterations have been decided upon in respect to the next show of the Shropshire Horticultural Society. The groups of ornamental foliage plants which for some years past have been more or less similar to the other groups of flowering and foliage plants, will be discontinued. In the place of these there will be a class for displays of indoor and hardy plants and cut flowers, each exhibit to be arranged on a space of 250 square feet. The prizes offered in this class are of a very liberal character, the desire being to encourage exhibitors to show groups of plants and flowers of a type entirely new to these shows. The 1st prize will consist of £20 and a large gold medal, the 2nd prize £15 and a small gold medal, the 3rd prize £12 10s., and the 4th prize £10. The selection of plants and flowers is left to the exhibitors, and they will be allowed to arrange them in any method they choose, using mecha-

nical aids of any description. The Society has decided not to accept any trade prizes for Sweet Peas, it being considered that sufficient classes are already provided for these flowers. The hardy flowers in class 52 will in future be arranged on the ground level, where they will be much more effective than if staged on tables as heretofore. Each exhibit will occupy a floor space of 20 feet by 6 feet. It will be remembered that some correspondence took place in these columns last season in respect to class 72, for a decorated fruit table. It was felt that the practice which formerly obtained of displaying the points awarded to each exhibit was of considerable interest to the general public, and the discontinuance of this practice was regretted. We are glad to be able to state that the Society has decided that in future the points will be shown on cards placed to each exhibit. The points for decoration have been altered as follows: six for beauty of flower, &c., and an equal number for general arrangement; a total of 12, instead of 24. No prizes from trade growers will be accepted for single dishes of vegetables; such prizes must be offered for collections of six or more dishes. The non-competitive exhibits are to be treated more liberally than last year. The judges will be empowered to award the Society's medals in gold, silver-gilt, silver, or bronze to such exhibits as may be worthy of such distinction. In order to prevent inferior exhibits obtaining medals, the judges will be empowered to pass, without award, exhibits of insufficient merit.

FLOWERS IN SEASON.—MESSRS. GEORGE WILLIAMS & SONS, Manor House Nurseries, send blooms of their new single *Chrysanthemum Caledonia*. The blooms are from 7 to 8 inches across, the colour of the florets being a bright rose-pink.

INTERNATIONAL EXHIBITION AT BUENOS AYRES, 1910.—According to information from the Commissioner-general for Europe (Argentine Embassy, Berlin, W.), December 31, 1909, will be the last day for receiving applications from exhibitors for the International Agricultural Exhibition of live stock, agricultural products, implements, &c., as well as the recently added section for provisions, to be held next year in Buenos Ayres from June 3 to July 31, under the auspices of the Argentine Government in connection with the celebration of the first centenary of the independence of the Argentine Republic. Applications may be sent direct to the secretary of the Exhibition, 316, Florida, Buenos Ayres, Argentine Republic. Further information may be obtained from the Argentine Consulate or from the Commissioner-general for Europe, the Hon. Consul GUSTAV NIEDERLEIN, Berlin, Argentine Embassy.

CHEMICAL ANALYSIS OF THE "WONDER-BERRY."—Our readers will remember that we published in a recent issue the results of an analysis by Dr. GRESHOFF of the fruits of the Wonderberry; and that this authority found more poisonous alkaloids in this fruit than in the fruits of the Nightshade and Huckleberry (see *Gardeners' Chronicle*, October 30, p. 291). We have received a letter from Mr. J. LYON WHITTLE, Town Clerk of Warrington, enclosing a report from the official analyst for the County Borough of Warrington, Mr. FREDERICK G. RUDDOCK, F.I.C., on the results of the chemical analysis of fruits of the Wonderberry grown in this country from seed obtained from New York. Mr. Ruddock states that he has "analysed both the leaves and fruit of this sample of Wonderberry, making a special search for the alkaloids atropine and solanine," and that he is "of opinion that neither solanine, atropine, or other poisonous alkaloid is present in either the leaves or fruit of this sample." Attention has more than once (see *Gardeners' Chronicle*, March 27, 1909, p. 204) been drawn to the fact that the alkaloids responsible for the poisonous effects of the Nightshade (*Solanum nigrum*) are erratic in their occurrence. It

would be worth the while of some botanist to enquire more closely into the phenomenon of the occurrence and distribution of these toxic substances in species of *Solanum*, with the object of determining whether these alkaloids are produced under definite climatic conditions or whether their presence is confined to certain kinds only of the plant in question.

OUR ALMANAC.—According to our usual practice, we shall shortly issue a *Gardeners' Chronicle Almanac* for the year 1910. In order to make it as useful as possible for reference, we shall be obliged if *Secretaries of Horticultural, Botanical and Allied Societies, or any of our correspondents, will send us IMMEDIATE INTIMATION of all fixtures for the coming year.*

CYPRIPEDIUM TIBETICUM AND C. MARGARITACEUM.

(See Supplementary Illustration.)

OF the many terrestrial *Cypripediums* found in Western China, *C. tibeticum* and *C. margaritaceum* are amongst the most important.

Much has been written regarding *C. tibeticum*, but the illustration now published is probably the first showing the species *in situ*. Though it is now in cultivation (see fig. 185), I may say that the plant is only seen at its best in the wild state. It is comparatively common on most of the ranges of West and North-west Yunnan, extending as far south as latitude 25° N., but it also grows in abundance on the eastern slopes of the Mekong-Salween divide, about 28° N., where, in the spring and early summer, scarcely an Alpine pasture can be traversed which is not starred with its dark, nodding blooms.

In common with many of the earlier Alpine plants, it appears almost immediately on the melting of the snows, and favours the more open and exposed pastures, generally on dry, well-drained soil, at an altitude of 9,000 to 11,000 feet. The plants are from 9 to 12 inches high, the flowers being so large in comparison as to give the impression of top-heaviness. The normal colouring of the perianth is a pinkish-yellow ground shade, heavily veined and streaked with deep purplish-rose; the much-inflated label-lum, measuring 1 to 1½ inch in length by about the same breadth, is very much darker, and it is not uncommon to find specimens with all parts of the flower of a uniform deep, almost black, maroon.

C. MARGARITACEUM.—This species also is a hardy Alpine, but it is much rarer than *C. tibeticum*, being extremely local in its distribution. It has only been found in one or two districts in the basin of the Mekong river.

The plants are generally about 3 inches and never exceed 6 inches in height. The solitary flower arises from the centre of the foliage, which consists of a pair of large, broadly-ovate, sheathing leaves. These measure 3 to 5 by 2½ to 4 inches, and are deeply ridged along their full length, of a dark green colour marked with large purplish-maroon blotches. The upper surface is glabrous, the under sparingly coated with livid purplish hairs.

The flowers are large, the segments of the perianth extremely fleshy and brittle, of a yellowish shade, streaked and spotted with purplish-maroon, so much so in many specimens that little or none of the ground colour shows. The label-lum is very large, 2 inches by 1 inch, exceptionally thick, and of such a brittle nature that it was only by exercising great care that perfect specimens could be preserved for herbarium material. The ground colour is a pale shade of yellow, broken with numerous reddish-purple spots, all parts of the surface being covered with purplish shining hairs.

The illustration now published shows one of a group found growing, on almost pure limestone in open Pine forest, on the eastern flank of the Liching Range at an altitude of 10,500 feet. *G. Forrest.*

BATTERSEA PARK.*

BATTERSEA PARK is 199½ acres in extent. The land was purchased by Government in 1846 at a cost of £150,000, or £750 per acre. The park was laid out by the late Mr. Gibson and was opened to the public in 1858. The cost of laying out the park, including the embankment along the River Thames, was about £80,000, and the average cost of annual maintenance is £12,000. Being a comparatively new park, it is laid out in the picturesque garden style, and it is a pleasant contrast to such formal parks as Hyde Park and Kensington Gardens. Less than 60

thrive in more favoured localities. The park is approached by four principal entrances. Being oblong in shape, an entrance has been formed at each corner. These are guarded by ornamental gates attached to pillars of masonry; smaller gateways have been formed between these to make convenient junctures with the main thoroughfares.

THE CARRIAGE DRIVE

is two miles in length and of sufficient width to give dignity to the park. The course of the drive follows the whole boundary of the park, but it does not allow of the extreme outskirts

have been formed at carefully-chosen points; therefore, upon looking through these openings, some beautiful landscape views can be seen. At some points one can look across the whole of the playing fields over vast tracts of restful greenward to the distance beyond, where the skyline is irregularly broken by the towering peaks of many graceful trees.

For the safety and convenience of pedestrians, footpaths have been made upon each side of the carriage drive, and raised 6 inches above it; the edges are built up with kerb stones 4 feet by 1 foot by 1 foot, let 6 inches into the ground. The paths slope towards these edges, so that the

FIG. 185.—*CYPRIPEDIUM TIBETICUM*.
(See p. 419 and Supplementary Illustration.)

years ago the site of Battersea Park was a desolate swamp, a resort of gamblers and prize-fighters!

The situation of the park is not an ideal one from the cultivator's point of view. It is bounded on the north side by the River Thames, and upon all other sides by a forest of chimneys; the smoke from these, combined with the mist from the river, renders the atmosphere unfavourable for the growth of many plants which

of the park being seen, as these are screened by avenues of trees and carefully-arranged shrubberies. Herbaceous borders have been formed in front of the shrubberies, and from March to November these borders afford the visitor an ever-changing series of floral pictures.

At various points the belts of trees and shrubs have been broken up to form glades and vistas. The glades were formed by excavating the soil and throwing it up to form mounds and hollows; these make charming spots for naturalising spring bulbs, such as Snowdrops, Aconites, Crocuses, Bluebells and Daffodils. The vistas

surface water can drain off easily into the gullies. The drive is drained by a row of 9-inch pipes extending down one side; the gully traps upon the opposite side are connected by pipes which cross the drive at these points. The gully traps are placed at intervals of 25 yards, and are so arranged that they can easily pass off the surface water, whilst all sediment falls to the bottom, where it can be collected as often as circumstances may require.

THE ELM AVENUE AND FOOTPATHS

Branching off from the drive are numbers of

* A paper given before the London branch of the British Gardeners' Association, by Mr. V. Cockram.

gravel walks and footpaths leading to the principal portions of the grounds. Some of the playing fields have been cut up in a regrettable manner by an unnecessary number of paths which have been formed to make short cuts for people going to their businesses. Not only has this taken up much valuable space, but the number of consequent fences has marred the scene.

The Elm avenue, in the centre of the park, is also a doubtful acquisition. In the first place it cuts the park in halves, thereby lessening its apparent size, and also provides half a mile of straight line which seems out of harmony with the rest of the park. Open spaces are of the utmost value in parks, nothing being more restful to the eyes of the town dweller accustomed to narrow streets, than a wide expanse of unbroken sward.

The Elm trees are planted on both sides of a broad walk, which is intercepted in the centre by the band stand. Here the walk diverges and forms a circle, which is used as a promenade during the band performances. The trees afford a grateful shade during summer, whilst in spring and autumn the varying tints in the leaves give some pretty effects. It is unfortunate that just as the trees have reached their prime they have to be condemned. The trees are attacked by the parasitic fungus, *Polyporus Ulmaria*. This parasite has found a lodgment in the bark of the trees, and the mycelium has worked its way through the fibres of the branches and so weakened them that they are apt to fall without any warning, being therefore a source of danger to the public. The trees have already been lopped to minimise the danger of accidents, and in time they will be entirely displaced by the young Plane trees (*Platanus acerifolia*) which have been planted alternately with the Elms with this object in view.

It would seem a matter for regret that the choice has fallen upon the Plane, as there are already several avenues of this tree in the park, as well as many isolated specimens. There is beauty in variety, and variety stimulates interest.

An avenue of *Ailanthus glandulosa* would have been very distinct; this graceful tree flourishes in almost any soil and position. The long, graceful pinnate leaves retain their spring-like freshness long after many other trees have become scarred and brown by the effects of dust and drought. *Catalpa bignonioides* also deserves mention as an avenue tree. This tree has handsome, dark green, cordate leaves, and produces its flowers in great profusion; it also retains its freshness until autumn. All the varieties of *Fraxinus* do well, especially *simplicifolia*; this makes a handsome park tree.

The Beech trees present a picture of health; the damp locality suits them so well that there is not a dead twig to be found in their spreading branches. (To be continued.)

FRUIT REGISTER.

CROPS OF PLUMS AND PEARS ON A SOUTH WALL.

The following tables give the crops of Plums and Pears obtained over a period of 10 years from trees planted against a south wall in a Lincoln garden. The wall is 390 feet long and 8 feet high. It is built of cement and wired from end to end. The trees were obtained from Messrs. J. R. Pearson & Sons. Each had four tiers of horizontal branches (two on either side of the stem), and they were six years old when they were planted in the autumn of 1898. They were not allowed to fruit until 1900. During the flowering period, the trees were protected by a removable wooden coping, 12½ inches wide, and Frigi Domo curtains, which, when tied together, covered the whole length of the wall.

The Pear trees were worked on the Pear stock, but as the wall was only 8 feet high, I think the Quince stock would have been better. Those varieties marked with an asterisk were root pruned in 1906. The two trees of Pitmaston Duchess Pear are precisely alike in all respects and are growing side by side. Whilst one tree gave 225 fruits the other produced only 15 in the 10 years. Reine Claude Bavay Plum was

somewhat shaded by a Rose tree, but I should never again plant that variety. Early Transparent Gage was over-cropped in 1906, and therefore was not allowed to fruit in 1909. Doyenné du Comice may be the finest quality Pear, but I prefer 961 fruits of Conference to 92 of Doyenné du Comice. Twenty vertical cordons of Cox's Orange Pippin Apple did not give 20 fruits in the 10 years. They bloomed, and the fruits set, but they dropped, not from lack of water, but from too much heat.

The tables may be of service in guarding against two common mistakes: (1) the planting of fruit trees of too high a quality for the particular locality, and (2) the planting of all kinds of trees in the wrong situations. C. C. Ellison, *Bracebridge, Lincoln.*

CYANANTHUS INCANUS.

THERE appears to be only two species of *Cyananthus* in cultivation, viz., *C. incanus* and *C. lobatus*. The latter has purplish-blue flowers, and is a native of the Himalayas; it is a fairly well-known rock-garden plant. *Cyananthus incanus* (see fig. 186) comes from Alpine Sikkim, and is extremely rare in cultivation. The erect flowers are of a beautiful soft blue colour, and at a distance somewhat resembles those of *Gentiana verna*, but the petals are longer; when fully opened the flower measures 1½ inch across, the corolla tube being 1 inch long. A tuft of soft, white hairs closes the corolla tube at first, but the hairs turn back as the flower ages, and a white five-rayed stigma is revealed. The plant has a neat, trailing habit, and is clothed with small oval leaves. The stem and calyx are covered with white hairs, and the leaves on their under surface, but the upper surface is glabrous.

Cyananthus lobatus is often planted in too dry a situation to succeed. At Glasnevin it grows in a fairly moist but well-drained peat bed, where it flourishes and flowers abundantly, but the plants have to be guarded from slugs. It grows to perfection in Mr. Walpole's garden at Mount Usher, where it is planted in a group close by a stream. *Cyananthus incanus* flowers usually about August or September at Glasnevin, but this year it flowered in October.

Both the species of *Cyananthus* can be increased from cuttings or seeds. The flowers are distinctly protandrous, and for this reason seeds are very sparingly produced. The stigma is at first capitate and hairy, and sweeps away the pollen from the anthers as it grows upwards; later the stigma becomes receptive, opening into five rays. C. F. Ball, *Glasnevin.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

LILY OF THE VALLEY DESTROYED BY CATERPILLARS.—When lifting a large pot of Lily of the Valley for forcing, a few weeks since, I was much surprised to find a large proportion of the crowns destroyed by caterpillars. They had eaten into them some distance below the surface of the ground, and worked upwards, consuming the central portion. Some were found inside, and many were distributed about among the roots; they were rather more than an inch long, whitish in colour, with brown heads, and have been identified as belonging to the garden swift moth (*Heptadus lupulinus*). We have not noticed the moths flying about, neither have we found the caterpillars in any numbers elsewhere. I have not heard of Lily of the Valley suffering in this way before, but, as the damage is done underground, the above instance may account for failures in other places where the cause is still mysterious. W. H. Davis, *Belvoir Castle Gardens, Grantham.*

APPLE GOLDEN NOBLE (see p. 408).—Many of the recognised dessert Apples are not nearly so good as Golden Noble. It might be used for both purposes, culinary and dessert, just as Gascoyne's Scarlet Seedling. I have reason to believe that another variety is often substituted for Golden Noble. In Barron's list of synonyms in *British Apples*, Golden Noble is given as a synonym of Waltham Abbey Seedling, although no one knew better than the late Mr. Barron that these two varieties are quite distinct. T. W. Turner, *The Gardens, Royal Hospital, Chelsea.*

MR. W. BOTTING HEMSLEY (see p. 381).—Writing with unavoidable haste, I blundered rather badly in some of my dates. Although I knew better, I put the date of the paper on *Jubianaceae* as 1897 instead of 1907, and I mistook 1896, that of Mr. Hemsley's election as a Fellow of the Linnean, for 1899, when he was elected a Fellow of the Royal Society. I find also that he entered the Herbarium at Kew in 1861, not in 1863, as I imply. W. T. Thiselton-Dyer.

JUGLANS AILANTIFOLIA (see p. 384).—Ripe fruits of this species are possibly of rare occurrence in this country, but the fruiting is not confined to Belgrove. In a sheltered, warm, and naturally well-drained position facing west, in the gardens at Aston Rowant, Oxfordshire, there is a tree of considerable height, which I believe to be *J. ailantifolia*. This has matured fruits on three or four occasions during the last 10 years. As an isolated tree, it has an attractive appearance. Although the fruits are edible, the kernel adheres so firmly to the shell that there is some little difficulty in removing it. W. H. Clarke.

FROST FIGHTING.—Last week I witnessed a demonstration given by a representative of the Colorado Orchard Heater Co., in a fruit garden, in the midst of the Strawberry industry, at Botley. The demonstration was to show how fruit crops may be saved from a sudden frost when the trees or plants are in blossom, or even in the bud stage, for, in the case of Strawberries, more damage is often done to the plants in the bud stage than when the blossoms are fully expanded. The idea is to warm the atmosphere within the area where the fruit trees or Strawberry plants are in bloom. In the case of Strawberries, the early fruit is of the greatest importance to the grower, and it is this which is frequently damaged by frost. Although frost does much injury to the Apple crop, it is not the only cause of failure. A low temperature, with easterly winds, not necessarily frost, accompanied by an absence of sun for several days at a time at the critical stage of fertilisation, or during the first swelling of the fruit afterwards, is often most injurious. At the demonstration, the attendant first showed how, at any period of the night, the owner may be apprised in his bedroom of a sudden frost by the aid of an electric bell connected by a cable with a thermometer out-of-doors, by setting the alarm at a point a few degrees above freezing-point. Fifty heaters to an acre are necessary for Strawberries; but for such fruits as Apples, Plums, and bush fruit, forty would suffice. The heaters were arranged over the acre of ground to be experimented upon. They were round, pan-like in appearance, about 18 inches in diameter, and made of sheet iron, standing on wire legs, the pan being a few inches above the soil to allow a draught through the punctured base. In charging the heaters, a small piece of cotton waste was placed at the bottom, on this a few pieces of split wood about 6 inches long, and then 14 lbs. of common nut coal, arranged around a central, temporary funnel, 3 inches in diameter. When the funnel was drawn out, a ventilating shaft was left so to speak, which accelerated the draught and induced a quicker burning of the fire. This amount of coal will maintain a sufficient heat for four hours. Unfortunately for the demonstration, a south-west gale was blowing, yet, in spite of this, the temperature within the given area was increased 4° in 2½ hours. The 50 heaters were lighted in the space of three minutes by the aid of a small torch made of cotton waste soaked in paraffin, some of which was previously poured on the wood and coal. The fires burnt fiercely, owing to the strong wind, and they filled the atmosphere with dense volumes of smoke. I was anxious to know if harm would accrue to the Apple or Plum blossom, for example, from the smoke passing through the trees in such density and for so long a time, and the attendant assured me no harm would be done. Probably in the near future there will be similar experiments during the actual setting period. *E. Molyneux.*

LIME-LOVING PLANTS.—I am obliged to Mr. Arnott and Sir Herbert Maxwell for their notes in reply to mine (see page 346). Mr. Arnott desires fuller particulars as to *Coronilla iberica*. In the case where the plant was growing in loamy soil taken from chalk land, the rock-garden was built up above the surroundings, hence, it was exposed to wind, and the plants may have suffered in consequence. In the more successful instance, the rockwork arrangement was on a gentle slope, with granite rocks employed on the out-crop system, the plants being bedded in heavy brick earth below the ground level. In my opinion, the success in the latter instance was due to the heavier soil, and its uniformly cool condition. I do not agree with Mr. Arnott when he states that as a rule those plants which like lime in their native homes "prefer it with us." The opposite, I think, is abundantly evidenced in the Pasque Windflower, *Anemone pulsatilla*, which is still found on the chalk downs of this country, though usually dwarfed and not always flowering well. The plant, however, according to my experience, attains its highest excellence when planted in rich, deep, clayey loams that are always moist. This is no isolated example, as witness the many plants from the Dolomites and other limestone ranges, which appear quite indifferent. With

reference to lime, I think failure may often be attributable to either excess or deficiency of this element or to the lime being in a form not readily assimilated by the plant. That a large number of choice Alpines do inhabit limestone rocks almost exclusively is well known. I am inclined, however, to regard their presence there as circumstantial, and not preferential, and, being there, the plants do their best to perpetuate their kind in the most natural manner, i.e., by seeds. It might appear that, after a plant's association for centuries with one particular rock formation, the soil constituents of that rock would be well-nigh indispensable to its well-being, were it not that there is abundant testimony to the contrary. After all, a high mountain range is the home of a host of Alpines, because plants of taller growth cannot exist there. The limestone range thousands of feet high I regard as no more essential to the successful cultivation of most Alpine plants than is Table Mountain to the "Flower of the Gods" or the Giant tree of the tropical forest to epiphytic Orchids. Plants can be safely transported from their habitats to other climes and lower altitudes, where their increased vigour of growth or freedom of flowering demonstrates that the conditions of their natural homes were not indispensable. I fully agree with Sir Herbert Maxwell that certain plants appear to require lime to bring out all

third year. Unfortunately, the sudden and severe frost of December of last year, following such an unusually mild November and early December, caught the Eucalypti in full growth, unchecked by slight frosts, and the bark of several species was split open and the trees cut to the ground level. *E. cordata* shot out from the base this spring, but the sunless, damp summer prevented healthy growth, and I think all the specimens are now dead. They were planted in 1901, and in 1905 I exhibited flowers before the Scientific Committee of the Royal Horticultural Society (vide *Journal* of R.H.S., vol. xxxi, December, 1936, p. xci), and, for purposes of comparison, flowers of *E. pulverulenta*, also grown in the open. It is now hard to procure seed of *E. cordata*, and I should be pleased to hear from anyone who could supply it, as although one must expect to get the specimens killed every 10 years or so, its beauty is so great it is worthy of a place even though it is subject to periodical disappearance. It is one of the few fairly hardy species that retain broad and brilliantly blue leaves when grown to flowering size. I saw a fine specimen of it at Heligan this autumn. *E. Augustus Bowles, Myddelton House, Waltham Cross.*

—For several years young trees of *E. cordata*, which I planted in 1930, flowered regularly, but 25° of frost at last killed them.

FIG. 185.—*CYANANTHUS INCANUS*: FLOWERS BLUE.

(See page 421.)

that is best in their nature. The encrusted Saxifragas are instances, though even in their case we must not ignore the vast importance of the moisture-absorbing rock with which the plants delight to be surrounded, or the benefits accruing from the sun-warmed bank or slope that affords such a perfectly drained soil. Extreme instances of a puzzling nature such as are seen in the stemless Gentian and Lithospermum, the latter reputedly both a "lime-hater" and a "success in limestone," opens the door. I think, for experiments in other directions than lime. My experience has been identical with that of Sir Herbert Maxwell with this plant. I have repeatedly attributed its lack of success to a soil known to be deficient in lime, and to extreme root dryness. *E. H. Jenkins.*

EUCALYPTUS CORDATA (see p. 403)—This fine and comparatively hardy species of Eucalyptus, as Mr. Melville points out in his note in your last issue, is one of the most decorative for English gardens. But only in its young state for summer bedding, for in most gardens there must be a fairly sheltered corner, where, protected from the north and east, the species would safely pass through ordinary winters. I had several fine specimens of it here that flowered regularly every November, and one of which ripened seeds, from which I have a young plant now in its

Besides having also flowered in the Cornish Riviera, a tree for years regularly flowered in my father's front garden, within the city boundaries, at Exeter. On various occasions I have advocated in your columns the use of this species for summer bedding, for which purpose *E. coccifera* and *E. coriacea*, to mention species the seed of which may usually be purchased and are similar in appearance when young, are almost equally valuable. The most beautiful of the silvery-foliaged Eucalypti is *E. Stuartiana*, of which the late Mr. Rashleigh grew a fine example at Menabilly. For some years it has been difficult to obtain seeds of *E. cordata*, but it appears that a good quantity of seeds of *E. pulverulenta*, a closely-allied species, was imported last year. Whilst in the juvenile stage of growth this species only differs from *E. cordata* in the size of its leaf; it is equally effective in the flower-garden. A month ago, in the *Times*, Mr. F. G. Heath, of Silverton Grange, Devon, stated that *E. amygdalina* was, in his experience, one of the hardest of the Eucalypti, of which he had planted a large collection. I have tried many different sorts at Penarrow, and cannot support his statement; North Cornwall is much colder than South Devon. The only species which has successfully withstood our winters here (with a minimum of 25° of frost) are

E. Gumii, *E. urtigera*, and *E. coccifera*. The flowers of the *Eucalypti* are often very fragrant, and they remain open for a considerable time. May not a species of *Eucalyptus* be sometimes described as the Australian Myrtle? (See p. 388) *A. C. Bartlett*.

I was pleased to see Mr. Melville's note on this plant, for I have long admired the species, both for bedding and as a hardy tree. When living in Sussex, a few years ago, I experimented with most of the *Eucalypti* commonly seen in gardens, and it seemed as if *E. cordata* was the most beautiful species. Plants raised from seeds in 1897 were used for bedding and other purposes until the spring of 1901, when I planted them out in permanent positions. One plant in particular flowered profusely three seasons in succession up to 1905, when I left the place, the plants being then 18 feet in height. I cannot say if it still survives, but when I last saw it, in addition to being strikingly graceful, it provided one of the most effective bits of colouring to be seen in the garden. In point of hardness I believe *E. cordata* ranks second to *E. Gumii*. *F. J. Bray, Greenhurst Park Gardens, Capel*.

PELECYPHORA ASELLIFORMIS.—This curious plant has recently produced an extraordinary number of off-sets. I have one with 36 and another with more than 100 to the plant. Some are produced at the top of the plant. Some plants have neither a flower nor off-set, but both combined and showing colour. I have known plants produce off-sets after receiving damage to the crown, as they frequently do in their native habitat, but never unless such injury has taken place. Can any reader enlighten me as to the cause of the plants acting in this manner? *J. C. Blewbury, Didcot*.

SOCIETIES.

ROYAL HORTICULTURAL

Scientific Committee.

DECEMBER 7.—*Present:* J. T. Bennett-Poë, Esq., M.A. (in the Chair); and Messrs. A. Worsley, J. Fraser, L. Crawshaw, J. Douglas, W. Cuthbertson, R. Hooper Pearson, W. E. Ledger, and F. J. Chittenden (hon. sec.).

Lobelia thapsoides.—Mr. WORSLEY showed flowers of this species, a tall-growing plant, reaching 7 feet in height, seeds of which he had collected at the summit of the Organ Mountains, in Mexico.

Saxifraga tridactylites.—Mr. J. FRASER showed specimens of this plant growing vigorously in a pot, reaching a size considerably greater than that attained in its usual habitat, such as the tops of walls and similar places in the British Isles. The seed had been collected at Weybridge, and the plants were now commencing to flower. He remarked that the plant had a wide distribution through the north temperate zone, and that, although in this country it was confined to such situations as the tops of walls, on the Continent it grew among pasture plants and appeared able to compete with them.

Psychotria jasmminiflora (see *Gard. Chron.*, August 16, 1879, figs. 33 and 34).—Foliage cut from a seedling of this plant, raised by Mr. GEORGE LEE, of Clevedon, was sent, illustrating the difference between the juvenile and adult forms of leaves, the latter being much broader in proportion to their length than the former, and also considerably larger. The seed had been produced eight years ago by a plant at Clevedon, and it appears rare to find it fruiting in this country, though the plant is again cultivated under the name of *Gloneria jasmminiflora*.

Trees attacked by colts.—Examples of maiden Apple trees with their bark bitten off below the ground level all round the stem, and the roots eaten, were received from Chard, Somersetshire. The committee was of opinion that the damage was the work of field voles. It was pointed out that the best way of checking the spread of these pests was by encouraging owls and kestrels. They may sometimes be trapped by digging pits wider at the bottom than the top, and they may be driven away by injecting carbon-bisulphide into the soil at the rate of about $\frac{1}{2}$ ounce to the square yard, or by the use of paraffin poured in

small quantities around the trees, taking care not to touch the trees with the liquid.

Malformed Cyclamen.—From Mr. RICKARDS, of Usk Priory, Monmouth, came a malformed Cyclamen, having the sepals developed into foliage leaves.

THE ROYAL BOTANIC AND ROYAL HORTICULTURAL.

I AM directed to send to the *Gardeners' Chronicle* copies of the correspondence which has passed between representative committees of the Royal Botanic and Royal Horticultural Societies with reference to the meeting held on November 24 to consider and discuss proposals affecting the welfare of the two societies.

By order,

J. BRYANT SOWERBY, Secretary,
Royal Botanic Society.

No. 1.—From the Royal Horticultural Society,
November 26, 1909.

MEMORANDUM

consisting of a skeleton outline of a suggested working arrangement between the

ROYAL HORTICULTURAL and the ROYAL BOTANIC SOCIETIES.

POSITION OF AFFAIRS.

A circular issued by the Royal Botanic Society's Council on November 6, 1909, describes the position thus: "The R.B.S. will come to an end . . . within four weeks' time unless . . . a sum of £2,000 . . . is immediately paid."

In a previous official statement sent out by the R.B.S., the expenditure for the year 1908 is shown to have been £6,290, and the receipts £4,503, that is to say, there was a loss of £1,787, or of £1,053 even if the £734, the interest paid on debentures, be deducted; and looking back on the previous balance-sheets, the R.B.S. appears to have been working for some time at an annual loss. The Council of the R.B.S. is therefore amply justified in their "apprehended close of the gardens," and the consequent loss of all the Fellows' rights and privileges and enjoyment therein.

OBJECTS AIMED AT.

1.—To safeguard and secure in perpetuity all existing rights and privileges of the Fellows of the Royal Botanic Society in the Regent's Park Gardens.

2.—To secure the continued use of the gardens for the service of horticultural and botanical science.

3.—The constitution and establishment of one great united Horticultural and Botanical Society for the Metropolis and Kingdom.

SCHEME.

(a)—A new society of similar or joint name to be formed under the auspices of the R.H.S., each of the contributing societies nominating members of council in proportion to the number of existing Fellows.

(b)—The R.B.S., with the assent of the Department of Woods and Forests, to sublet or assign their lease to the new society for the full term of such lease (less one month), the Department of Woods and Forests agreeing to accept payment of rent from the new society and giving it their receipt in discharge.

(c)—A covenant to be inserted in the assignment that the joint society is to give up the gardens and buildings at the close of the lease in as good a state of repair as when assigned.

(d)—The Fellows and Associates of the R.H.S. to rank as Fellows and Associates of the new society, on the same terms and conditions, and with the same privileges as attach to them as Fellows and Associates of the R.H.S.

(e)—The Fellows and debenture holders of the R.B.S. to rank as Fellows of the new society on the following conditions:—

1.—Subscribing Fellows to pay to the new society the same rate of subscription they at present pay to the R.B.S., and to retain all their existing privileges at Regent's Park, and have added thereto all the privileges of the R.H.S. as well.

2.—Life Fellows and debenture holders to retain all their existing privileges at Regent's

Park, and have added thereto the rank and privileges of Life Fellows of the R.H.S. as well.

(f)—At the termination of the lease all Life Fellows and debenture holders of R.B.S. to cease to rank as Fellows of the R.H.S. unless the lease be renewed.

FINANCIAL ASSISTANCE.

1.—The question of the possibility of the R.H.S. affording immediate financial assistance to the R.B.S. does not rightly come under a scheme suggested for the purpose of maintaining the rights and privileges of the Fellows of the R.B.S. in perpetuity, and securing the upkeep and present uses of the Regent's Park Gardens.

2.—The president of the Royal Horticultural Society nevertheless would bring before the Council and Fellows of his Society the apparent necessity that some financial assistance should be given, but he wishes it to be distinctly understood that he has no power whatever to pledge the Society to agree to this proposal.

NOTE.—The suggestions embodied above are in no sense offered as an ultimatum, but as forming a convenient basis for further friendly negotiation, and in the hope that the Fellows of the R.B.S. would prefer such a scheme rather than that their society should perish and they themselves lose all their rights and privileges therein.

No. 2.—From the Royal Botanic Society,
December 8, 1909.

Suggested working agreement between the Royal Botanic Society and the Royal Horticultural Society.

The special committee of the Royal Botanic Society appointed to confer with the special committee of the Royal Horticultural Society, wish, at the outset, to acknowledge their very frank and courteous reception on the occasion when they met by invitation at the Royal Horticultural Society's Hall in Vincent Square. And the special committee, as desired, accept as a basis for further friendly discussion between the two societies the memorandum received by them on the 27th ult.

As regards the memorandum itself, they cannot help saying that its shape leaves something to be desired. As regards, for instance, the circular of November 6, to which prominence is given in the memorandum, it was explained at the interview that circumstances had altered considerably since that circular was written.

The actual position of affairs would seem to be as follows:—

The Botanic Society is emerging from a critical financial position, but is gathering its forces together. And with the support and self-sacrifice of its Fellows, and the considerate action of the debenture holders, is now in a better position relatively than for some years past. Prompt financial assistance would, of course, further improve matters. The Royal Botanic Society has possession of admittedly the finest garden in London, which, if lost, could never be replaced, and the prospects of the society for next season are good.

The Royal Horticultural Society is in a strong financial position, and has a hall in Vincent Square, where flower shows are held fortnightly, supported by a brisk trade element.

On the other hand, the Royal Horticultural Society has no garden of its own in London, and depends for its more important gatherings on the friendly aid of the owners of the Temple Gardens, or of Holland House, or on the hire of grounds such as those of Chelsea Hospital, &c.

Turning to the memorandum itself, it is not clear whether there are intended to be three societies—"in perpetuity," namely, the Royal Botanic Society, the Royal Horticultural Society, and "The Great United Society," or only one Society. And, if only one, what is to be done of the rights, properties, and incidents of the two other societies?

As to the mutual extension of the privileges of each society over the territories of the other, it is necessary to remember how this would operate in practice. One society has, say, for the purpose of argument, 1,100 Fellows, and the other has, say, 11,000 Fellows, and the smaller society has a garden, whilst the larger society has none.

Again, the effect of vesting the ownership or management of the gardens in the larger society, whether by sub-lease, transfer, or other way,

unless the matter was very carefully arranged beforehand, would be that the smaller society would be submerged and swamped in the larger body, and it would cease to have practically the same enjoyment of what are now its own gardens.

Under the heading of "financial assistance," it is to be gathered that the Royal Horticultural Society do not think this rightly comes within the scheme at all. The president generously expresses his willingness to lay the matter before the Council and Fellows of the Royal Horticultural Society, "but has no power whatever to pledge the society to agree to this proposal."

If, therefore, the negotiation is to proceed, with hope of useful results, the special committee invite the Royal Horticultural Society to make their proposals more clear and definite, especially as to finance.

Without interfering with the constitution or independence of either society, it would, of course, be possible to arrange for the Royal Horticultural Society to enjoy similar facilities at Regent's Park to those which they have had in previous years at the Temple Gardens or Holland House or Chelsea Hospital. And the special committee of the Royal Botanic Society would cordially consider any proposition in that respect for the ensuing season of 1910.

LINNEAN SOCIETY.

DECEMBER 2.—On behalf of Dr. H. Drinkwater, F.R.S.E., there were exhibited 25 drawings in body-colour on dark backgrounds, of wild flowers, chiefly of Wrexham.

Mr. Clement Reid, F.R.S., exhibited photographs on the screen of fruits and seeds of some of the plants introduced by the Romans into Britain. The remains have been collected principally from disused Roman wells, employed subsequently as rubbish pits, and often sealed up under Roman pavements of later date. The principal sources have been Roman Silchester, Caerwent, London, and Pevensey, and to a large extent the collections have been made by Mr. A. H. Lyell, who has been most careful to reject any deposit of doubtful or later date.

The fruits and seeds exhibited belong to Pea, Bean, Fig, Grape, Mulberry, Medlar (a very small variety), Apple, Cherries (probably both black and red), Sloe, Bullace (wild and cultivated), Damson, a larger Plum like the "black Plum" of Cornwall, Portugal Laurel, black and white Mustard, Turnip, Fennel, Dill, Coriander, Alexanders, *Cherophyllum aureum* (a casual, perhaps introduced with packing-case rubbish from France, and not grown in Britain), Belladonna, Henbane, field Poppies (*Papaver Rhoeas*, *P. Argemone*), the Opium Poppy (seeds of this were probably used, as in Rome, scattered on loaves of bread), greater Celandine, Corn-Cockle, White Campion, Bladder Campion, Penny Cress, Sow-Thistle, Ox-eye Daisy, *Chenopodium urticum* and *C. murale*, and leaves of Box. Box leaves have been found in three different rubbish-pits in Roman Silchester; the branches may have been used for wreaths, as the nearest native substitute for the Italian Myrtle.

The plants thus far found do not suggest any direct shipping trade with the Mediterranean. The Peach, Apricot, Almond, and other fruits that will only ripen south of Britain are missing. The fruits and spices found are only such as can be grown commercially in Britain at the present day, and this makes it probable that the abundant Fig and Grape seeds belong to fruit grown in this country and not imported in a dried state. Mulberries do not travel well and are scarcely ever dried; they must have been grown at Silchester.

Mr. Lyell (visitor), Lieut. Col. Prain, Mr. G. C. Druce, Mr. L. A. Boodle, the Rev. J. Gerard, Mr. E. M. Holmes, Mr. E. G. Baker, and the president took part in the discussion which followed, and Mr. Reid briefly replied.

Mr. G. Claridge Druce, F.L.S., exhibited specimens of (a) *Zamichellia gibberosa*, Reichb., new to Britain, from Eye Green, Northants, and (b) *Orchis maculata* var. *O'Kellyi*, Druce, from Ballyvaughan, Co. Clare, recently described in *The Irish Naturalist*.

Mr. Clement Reid exhibited in connection with this, three photographs of *Zamichellia* fruits obtained by him from the Cromer Forest Bed (pre-glacial), and also contributed some remarks; Mr. Holmes brought specimens of another variety of *Orchis maculata* and commented on the same.

SCOTTISH HORTICULTURAL.

DECEMBER 7.—The monthly meeting of this association was held at 5, St. Andrew Square, Edinburgh, on this date. Mr. Whytock, the president, occupied the chair, the audience numbering more than 150. A debate took place as to whether "Frost is Beneficial to the Soil," the affirmative being held by Mr. G. P. Berry, lecturer in horticulture at the Edinburgh and East of Scotland College of Agriculture, Edinburgh, and the negative by Mr. David Storrie, Glencarse Nurseries, Perthshire. Mr. Berry contended that frost was the most powerful mechanical disintegrator or soil former in Nature, and without this force there would be no fertile soil in many parts of the country. Frost was also useful in bringing about proper aeration of the soil, thus enabling plants to take full advantage of the latent feeding material in the soil. When land is properly drained the benefits of frost are seen in heavier crops. Again, the soil bacteria were rendered inactive (but not destroyed) at temperatures below 32° Fahr., and, therefore, in the resting season of plant life the accumulation of food materials formed by these organisms at a time when they would be washed away and wasted was prevented by frost. Frost was also beneficial when it came early enough in autumn or late enough in spring to destroy insect pests before they had been provided with proper protection for the winter, or just as they are emerging from this condition in spring. Frost was of great use in destroying spores of disease-producing fungi.

Mr. Storrie's contention was that air and moisture, without which frost is of no avail, were the essentials in rock weathering. These dissolved out certain parts of the rock which the rain washed away probably long before any frost put in an appearance. When a rock was frozen, all the fungi, algae and bacteria, which were active above 32°, were arrested in their work and kept waiting for the thaw, therefore frost was not an accelerator but a retarder of rock weathering; the claim that there is a liberation of plant food in rock shattering by frost is not true. Mr. Storrie also said that the idea that frost pulverised the soil and produced a fine tilth was also wrong, and that in dry, open winters a much better tilth was got than by the aid of frost. With regard to the cultivation of the soil, Mr. Storrie stated that the more a light or medium soil was cultivated in autumn the better, but a dense, clay soil, in a clean, healthy condition, ought not to be dug in autumn. The arrest of the work of the soil bacteria by frost was not beneficial, and Mr. Storrie cited the well-known fact that crops are always stronger on ground which has been protected by a hay or corn rick in winter, underneath which the frost does not penetrate.

So much time was taken up by the debaters themselves that none was left for discussion by the members, and, so far as the meeting was concerned, there was no expression of opinion upon the matters dealt with by the disputants.

A report on the Chrysanthemum show held in November was presented to the meeting, and it was decided to hold a four days' show in 1910, from November 16 to 19.

The office bearers for 1910 were nominated, and the election of these will take place on January 18, 1910, the date of the annual business meeting.

NATIONAL ROSE.

ANNUAL MEETING.

DECEMBER 9.—The annual general meeting was held on this date at the Westminster Palace Hotel. The Rev. F. Page-Roberts, President of the Society, occupied the chair. After the minutes of the previous meeting were read and confirmed, the ballot for the election of officers for the ensuing year was opened, Messrs. Strange and A. Turner being appointed scrutineers.

The annual report was read by the secretary, and the financial statement by the treasurer, Mr. G. W. Cook, who gave details of the larger items grouped under the various heads of both receipts and expenditure.

REPORT OF EXECUTIVE COMMITTEE.

The following are extracts from the report:—
"The Metropolitan Exhibition again took place in the gardens of the Royal Botanic Society, Regent's Park.

Owing to the backwardness of the season the display of Roses was not quite as extensive as usual, and the general quality of the blooms was below the average standard. In other respects this must be regarded as having been a most successful show, the attendance of visitors being the largest, the tents the cleanest and best, and the refreshment arrangements more complete and satisfactory than at any previous exhibition.

The Provincial Show was held at Luton, in conjunction with the Luton and District Sweet Pea and Rose Society. This was, with one exception, the largest exhibition the Society has yet held in the provinces.

The sixth Autumn Show of the Society took place in the Royal Horticultural Hall, Vincent Square, Westminster. It was of about average extent, and was noteworthy for the keenness of the competition in the leading class for nurserymen.

During the year new and carefully revised editions of the *Handbook on Pruning Roses* and the *Official Catalogue of Roses* were issued to the members, in addition to the *Rose Annual for 1900*.

Six new Rose and other horticultural societies have become affiliated during the past year, bringing up the total number of societies in affiliation to the National Rose Society to 55.

The committee record with regret the death of Mr. T. B. Hall, of Rock Ferry, in Cheshire. Mr. Hall was for a long time a member of the committee, and for many years a leading exhibitor at the Society's exhibitions, and in 1887 and 1888 carried off the Society's Jubilee Challenge Trophy.

The amount received in gate-money from the general public at the exhibition in the Royal Botanic Gardens exceeded that at any previous exhibition held by the Society. The receipts from all sources during the past year, including a balance from the previous year of £427 8s. 2d., amounted to £3,151 6s. 4d., and the expenditure to £2,714 15s. 10d., leaving a balance at the bankers' and in the treasurer's hands of £436 10s. 6d. after £300 had been placed to the reserve fund. The reserve fund now stands at £750.

During the past 12 months exactly 900 new members joined the Society, or 115 more than in the previous year. Allowing for the losses by death and resignation, the total number of members is now 3,797. Taking the year as a whole, between two and three members a day have, on an average, been added to the list of membership.

INCREASE IN MEMBERSHIP SINCE 1904.

	1904.	1905.	1906.	1907.	1908.	1909.
Number of members	1,308	1,637	2,034	2,484	3,150	3,797
Net increase since previous year ..	301	329	397	450	666	647

The Metropolitan Exhibition will again be held in the Royal Botanic Gardens, Regent's Park, the date fixed for the exhibition being Friday, July 8. (The holding of a provincial show is still under consideration.)

The Autumn Show in the Royal Horticultural Hall, Vincent Square, Westminster, will be held on Thursday, September 15."

The President, in moving that "the Report and financial statement be adopted," spoke of the excellent progress the Society had made during the past year. The work had grown so large that, instead of one general committee, a series of sub-committees had been elected to deal with general purposes, finance, exhibitions, and publications.

Mr. E. J. Holland seconded the adoption of the report, and the motion was carried unanimously.

Mr. C. E. Shea proposed that a grant of £100 be awarded to the hon. secretary, Mr. Edward Mawley, as an honorarium for the great services he has rendered to the Society. This was adopted.

Mr. Mawley, in returning thanks, gave a brief survey of the secretary's work.

ALTERATION OF BY-LAWS.

Dr. A. H. Williams moved the alteration of several rules and by-laws, which were dealt with individually. The principal objects of these alterations were to confine to the "treasurer and secretary" alone, power to give receipts;

changing the name from "General Committee" to "Council of the Society"; and making the "sub-committees" previously referred to "standing committees," which shall report direct to the Council; and a general rearrangement of rules into individual groups.

It was proposed also that by-law 8 be added the following words:—"In all boxes for single blooms the tubes must be 5 inches apart each way from centre to centre of the tubes."

"The thanks of the Society to its officers and committee for their services during the past year" was proposed by Mr. Robbins and seconded by Dr. Lamplough. This was received with acclamation. Mr. E. Mawley, who replied for all the officers in rotation, stated that the President had attended eight out of nine general committee meetings, and 21 out of 28 sub-committees, and that nearly every member had attended the 11 meetings of the Publication Committee.

The next business was the presentation of the Dean Hole Memorial Medal to the Rev. J. H. Pemberton. The Chairman, on presenting the medal, said: "I know you will value this more than any of the other prizes or medals you have so deservedly won." The Rev. J. H. Pemberton expressed his thanks, and paid a tribute to his sister, Miss Pemberton, who acts as his head gardener, assisting both in growing and showing his Roses.

A vote of thanks to the Chairman concluded the business.

THE CONVERSAZIONE.

A conversazione took place in the afternoon instead of the usual dinner. It was held at the Westminster Palace Hotel from half-past four to six o'clock. The decorations of Rosés with pretty foliage by Messrs. R. F. Felton & Son, florists, Hanover Square, were greatly admired. Refreshments were provided, and vocal and instrumental music was rendered at intervals. About one hundred members and friends were present at this social meeting.

NATIONAL SWEET PEAS

DECEMBER 10.—The annual general meeting of the National Sweet Pea Society was held on the above date at the Hotel Windsor, Westminster. The chairman of the General Committee, Mr. Horace J. Wright, presided in the absence of the president, Sir Randolph Baker. There was a very good attendance of members, and much enthusiasm was shown in the proceedings.

EXTRACTS FROM THE REPORT.

We extract the following paragraphs from the Report of the committee for 1909:—

"At the end of the year 1908, the Society had 779 members on its books and 51 societies in affiliation. During the year just ended no fewer than 280 new members have joined the Society, a few of these having entered for the coming year. There have been several losses from death and removal, and again a number of members have failed to respond to the several requests for payment of subscription. After deleting the latter, the membership stands at 938, while the number of affiliated societies is 101.

"The committee is glad to find itself able to record a very satisfactory financial position. The generous manner in which the members are treated quite naturally entails a large expenditure in printing, postage, stationery and prizes, but it would appear that this policy is now producing its proper effect, for no society has become so strong in so short a period. The balance at the bank is the largest yet carried forward, and it would have been still larger had all those who received the *Annual* in January last promptly paid the subscription then due.

"In conjunction with the Salsaire Rose and Horticultural Society, the Provincial Sweet Pea Show was held in Salsaire Park, Salsaire, on July 13, but the somewhat early date coupled with the lateness of the season resulted in a comparatively poor display. The growers in the Lake District and others from Surrey and Hampshire showed well, and the Provincial Cup was again won by Mr. T. Stevenson.

"Held on Thursday, July 23, at the Royal Horticultural Hall, Westminster, the Society's London Show was a great success. The fine hall was again taxed to the utmost, and a building halt as large again would not have been too big for the beautiful and fragrant display. There were nearly 200 exhibitors, and in the small growers' section the competition was very keen.

"The Society's trials were not so entirely successful this year as they have been in previous seasons, owing to the vagaries of the weather, and the consequent difficulty experienced in inspecting the trials under the best conditions. The thanks of every member are due to the Council of the University College, Reading, for permission to hold the trials in their gardens; to Mr. Charles Foster for his able conduct of the trials and, under difficult conditions; and to Mr. Drew, who had the trials under his care for a considerable portion of the year. There were 350 varieties or stocks of Sweet Peas on

trial at Reading, and an abridged report of these has been sent to every member of the Society.

"The work of the Floral Committee has been unusually heavy and difficult this season. The members paid two visits to Reading and held one meeting in London. They made awards sparingly, drew up a list of too-much-alike varieties, and made a selection of the best varieties (in commerce) of each colour for the guidance of members. They also selected a number of varieties for further trial and drew up a statement concerning the fixity and purity of the stocks tested.

"The following awards were made at Reading:—First-class Certificate to Clara Curtis (Trial No. 156), from Mr. W. J. Unwin, Histon, Cambs.; Award of Merit to Charles Foster (Trial No. 7), from Mr. Robert Bolton, Warton, Carnforth; Award of Merit to Edrom Beauty (Trial No. 250), from Mr. A. Malcolm, Duns; Award of Merit to Mrs. W. J. Unwin (Trial No. 289), from Mr. W. J. Unwin; Award of Merit to Dazzler (Trial No. 334), from Mr. C. W. Breamore, 130, High Street, Winchester; Award of Merit to Sunproof Crimson (Trial No. 338), from Messrs. Lobbin & Co., Rothsay; Commendation as a Market Variety to Mercia (Trial No. 136), from Messrs. G. Stark & Sons, Great Ryburgh; Commendation as a Garden Variety to Colleen (Trial No. 305), from Mr. Wm. Deal, Brooklands, Kelvedon.

"When the Society proposed to issue a medal of its own, the committee was fortunate in securing the services of Miss Williamson for the preparation of the now well-known design, and during the past year Miss Williamson has again placed the Society under a debt of gratitude by designing the new certificate. This certificate will be issued to affiliated societies, and will serve as an award either in conjunction with the Society's medal or distinct therefrom. As a slight acknowledgment of her valuable assistance the committee has presented Miss Williamson with a suitably engraved silver-gilt copy of the medal she designed.

"In the United States of America the year has been marked by the formation of a National Sweet Pea Society, formed on similar lines to our own, and with similar objects in view. The American Society will hold Sweet Pea trials in the gardens of the Cornell University, and our own raisers are invited to send their varieties across the water for trial. The hon. sec. of the American Society is Mr. Harry Bunyard, and the conduct of the trials is in the hands of Mr. Alvin C. Beal.

"The committee has been fortunate enough to secure the Royal Horticultural Hall for the purpose of a two days' show in 1910, and the dates already fixed for the London exhibition are Tuesday and Wednesday, July 12 and 13. No provincial show will be held next year, but the Society's Provincial Cup will be offered for competition at the exhibition of an affiliated society. The trials will be continued, and arrangements are being made for a more extensive and conclusive test of varieties than has been possible hitherto. Mr. Charles Foster will again superintend the trials, which will be conducted at the Times' Experimental Station, Sutton Green, near Guildford."

The Chairman, in moving the adoption of the Report, stated in a few words that the Society was in a very satisfactory condition. He thought the Report now presented was the most favourable in the Society's history. Mr. A. Dean seconded the resolution, and suggested that, should the Society find itself with more funds than were needed, it might consider further the interests of those members living in the Midland and Northern counties, by establishing trials in those districts such as have already been conducted at Reading. The Report was adopted unanimously without further discussion.

Votes of thanks were next passed to the retiring officers, and the meeting then proceeded to the election of officers and committee for 1910. Mr. N. N. Sherwood was elected president; Mr. Edward Sherwood, treasurer; Commander Humphery, R.N., chairman of General Committee; Mr. Richard Guyas, auditor; and Mr. C. H. Curtis, secretary.

On the meeting proceeding to the election of the General Committee it was pointed out by Mr. Brunton and others that the names of many appeared on the list of the General Committee who never attended the meetings of that committee. Eventually a resolution proposed by Mr. Brunton was adopted. This resolution has the effect of disqualifying for future election any member of the General Committee who fails to attend two meetings of the Society's committees during the year. A vote of thanks to the chairman terminated the proceedings.

The General Committee held a meeting immediately afterwards for the purpose of electing the Executive Committee, the general meeting having no voice in the election of this latter committee. There were nearly 30 names submitted, and 15 members were elected by ballot. These were as follow: Messrs. Horace J. Wright, Chas. Foster, T. Stevenson, H. Smith, E. F. Hawes, W. J. Unwin, W. Cuthbertson, R. Hooper Pearson, G. F. Drayson, S. B. Dicks, C. W. Breamore, W. Deal, E. King, G. W. Leek, and W. Lumley.

DINNER AND CONFERENCE.

Some of the members afterwards attended a dinner at the same hotel, at which Commander

Humphery, R.N., presided. Immediately following the dinner a meeting was held under the presidency of Mr. H. J. Wright, and papers were read by Mr. Wm. Cuthbertson, J.P., and Mr. W. J. Unwin. Below we give extracts from these papers.

SWEET PEA NAMES.

A paper on this subject was read by Mr. W. J. Unwin. We make the following extracts:—

"I do not propose to deal particularly with the naming of Sweet Peas, but rather to outline a scheme by which I believe growers may be safeguarded in making their selections of distinct varieties. Our Society is already doing good work, but more must be done if we are to know, with certainty, which new varieties are worth growing.

"The Society cannot prevent unfixed stocks being sent out, but it can debar unfixed new varieties from being stage I in competitive classes at its shows. I suggest that all new varieties in future shall be sent to the trials, and only those that prove to be fixed shall be eligible for entry in any of the Society's competitive classes. If the Society is firm in this matter, members will soon know which varieties to grow and who to look to for more reliable information than we have at present.

"I next suggest that a more detailed account be given by the Society of all fixed stocks, as to their type and colour, and whether they are distinct, or how they compare with varieties already in commerce. Unless any of the unfixed stocks are of special merit, they should not be mentioned. It is useless to waste time over varieties that are badly mixed and of no particular merit. If the Society allows only fixed varieties to be staged in the competitive classes, and publishes a fully-detailed report of the trials from the Floral Committee, growers will be safeguarded to a great extent, and I believe this would eventually prove a benefit to the trade.

"I assume that the Society will deal with those unfixed varieties already in commerce. At the present time the list of too-much-alike varieties is of little value, but with the detailed report on fixed stocks it would enable us to know which varieties are identical, and what differences there may be between others.

"There is a marked difference in the colour of Sweet Peas growing in a row, as compared with the same variety when bunched. To arrive at a more accurate description of its colours, I make a further suggestion, namely, that a bunch of 12 sprays from every fixed stock (new and old) be brought from the trials to the London show and staged under numbers, in their different colour sections, and judged by points for colour effect and size. A few ladies would be useful as judges in this class. After the judging each bunch shall be named or numbered as sent to the trials. This would be a real benefit to hundreds of members who cannot visit the trials.

"Mr. Unwin then added a few words as to the unfair way raisers of novelties are being treated by some seedsmen."

A discussion followed, in which Messrs. Foster, Cuthbertson, Breamore, and others took part.

THE IMPERFECT SEEDING OF WAVED SWEET PEAS.

The following extracts are taken from a paper, read by Mr. Wm. Cuthbertson, J.P., on the imperfect seeding of Sweet Peas:

"In the present paper I shall endeavour to show as clearly as I can by means of photographs and some flowers which have been kindly sent me by the Rev. Macduff Simpson, of Eldrom, the essential differences between the old and the new 'Spencer' type of Sweet Peas, and, in conclusion, state why, in my opinion, the waved or Spencer type seeds so imperfectly.

"Last season was altogether an abnormal one, and I am not therefore disposed to argue from experience gained in it, but if we look at an average season I think you will agree with me if I put it that, on an average, the old type seeds ten times better than the Spencer type. Having said that I have not said all, because a number of the finest Spencers are far below the average, and are nearer being 20 times worse seeders. Think of Edna Dyke and Dorothy Eckford—Clara Curtis and Mrs. Collier or James Grieve—The King and King Edward VII.—Mrs. Chas. Foster and Lady Grisell Hamilton—Earl Spencer and Henry Eckford—Mrs. Harcastle Sykes and Prina Donna."

"In the old type of Sweet Pea the pollen escaped and could not help coming immediately in contact with the stigmatic point, as they were all squeezed up together, owing to the constricted or clamped keels in the old and Unwin types. In many of the Spencer or waved forms the stigma from the very earliest stage has grown out beyond the anthers. It is apparent therefore that the chances of fertilisation are much reduced when this condition of things exists. The old type and the Unwin type cannot help being prolific. They are abundantly self-fertilised before they expand.

"In the Spencer type the stigma protrudes beyond the anthers. In some flowers it seems to do this right away from the beginning, slightly protruding in the earliest bud stage. My theory regarding this is as follows:—We all know that the anthers dehisce, that is, shed their pollen in the very early bud stage of the flower. Unless, therefore, the point of the stigma, by pushing its way to the outside position just referred to, gets coated or partly coated with pollen, the flower runs an exceedingly poor chance of producing seed. If the stigma has not been pollinated before it protrudes, what chance has it of being pollinated afterwards? Very little indeed. It is not in the nature of pollen to rise above its own level. It is subject to the same law of gravitation as other things, and, consequently, will drop down into the keel and lie there without having an opportunity to fulfil the function for which it was made.

"Some people argue that Sweet Peas are pollinated by wind-borne or insect-borne pollen, and that accounts for the variations we get in so many stocks of Spencer Sweet Peas. I have never been able to accept this theory, because I think I have had as large an experience as most, and have not observed it happen in practice. The plan we adopt at Mark's Tey is to grow the different varieties in lines of 100 feet long. There may be four lines of 'The Marquis,' followed closely by four lines of 'Comtesse Spencer,' then four lines of 'Helen Lewis,' and so on. If the wind or insect theory of cross-fertilisation held good we should not get pure seed, but as a matter of fact we do get pure seed. Then again, it is suggested that in America there must be insects, unknown in this country, at work there to give us the fine variations we so frequently get! I should like to have Mr. Burpee's or Mr. Morse's opinion on this point. Fifty years ago so extremely careful an observer as Charles Darwin wrote: 'Whatever the cause may be, we may conclude, that in England the varieties of Sweet Peas never or very rarely intercross. But it does not follow from this that they would not be crossed by the aid of other and larger insects in their native country.'

"Then there is the liability of the pods to rot off. Last season this was particularly noticeable. Close to the footstalk the pods became brown, as if attacked by a fungus. When this happened the pods fell away in a few days. After the petals dropped on some varieties—notably on Earl Spencer and Edrom Beauty—the young pod appeared all right, but on the slightest touch it dropped. I remember one evening Mr. William Deal and I were examining some rows at Mark's Tey, and he remarked, 'You have a good promise here.' I took out a pencil and walked along the row, merely touching the young pods with it, and quite 50 per cent. of them dropped. I think the abnormally cold weather had much to do with this.

"To sum up, I must put as the first and foremost cause of imperfect seeding in Spencer varieties—the open keel in conjunction with the protruding stigma, otherwise imperfect fertilisation. Then the extreme sensitiveness of the type to adverse weather conditions. Its very shape, the large waved standard, make it much more sensitive than the old type. How often have we noticed in bad weather the standard almost rotting and falling down and clasping the keel and pod! Sunshine supervening after such conditions made the standard adhere to the keel and pod as if they had been glued round them, and they could only be removed by being pulled sharply.

"To all but the seed-grower this non-seeding is an advantage. It means a longer continued period of bloom, and this must enhance the value of the Sweet Pea as a decorative plant. The consolation I would offer the seed-grower is this.

The choicest things in the world—the things most worth having—are the things most difficult to get. Nature seems to decide for us that the more perfect we make her productions from our point of view, the more difficulty we shall encounter in reproducing them. This law holds good right through the floral world."

A discussion followed, in which the following members took part: Messrs. Foster, Deal, Sydenham, Fraser, Stevenson, Harvey, Ireland, Hawes and Dicks.

ROYAL SCOTTISH ARBORICULTURAL.

DECEMBER 11.—The annual meeting of the Aberdeen branch of this Society was held in the Music Hall Buildings, Aberdeen, on this date. Mr. Gammell, of Drumtochty, president of the branch, occupied the chair. There was a large attendance, including many visitors, who were admitted after the general business had been transacted to hear a paper on "When afforestation Comes," by Sir John Fleming, of Dalminzie, Aberdeenshire, a leading timber merchant.

Sir John Fleming said that afforestation, by which he meant afforestation aided by the State, was bound to come. It was the result of, first, the high price to which timber had risen; second, the extraordinary demand for timber for paper-making; and third, the desire to create some new industry to keep the people on the land. The timber trees best suited for cultivation in Scotland were the Larch and Fir, and the wood from these would be principally used, as at present, in the making of staves and sleepers, pit-wood and box-wood, with the addition, as time proceeded, of roofing and joisting in dimensions from 4 inches by 2 inches up to 7 inches by 2½ inches. The Scottish white wood, Spruce, was, so far as his experience went, only inferior to the Silver Fir. Larch had not its equal amongst soft woods for its lasting qualities, for boat-building, for millwright and cartwright purposes, for making railway sleepers and pit-wood, and for all manner of house-building timber. Referring to railway rates, Sir John Fleming stated that timber could be brought from Russia, 1,500 miles away, to Aberdeen at 7s. to 7s. 6d. per ton; from Ballater to Aberdeen, a distance of 44 miles, the rate was practically the same.

The annual report showed that much good work was done by the Society during the past year. The office-bearers for the ensuing year were elected as follows:—President, Mr. Sydney J. Gammell, of Drumtochty and Comitesswells; vice presidents, Dr. Trail, professor of botany Aberdeen University; Mr. John Michie, M.V.O., factor to the King at Balmoral; Mr. A. Forbes Irvine, Drum; and Mr. C. S. France, F.B.S., Aberdeen. A number of proprietors, factors, and foresters were added to the committee and Mr. Massie was unanimously re-elected secretary and treasurer.

NATIONAL VEGETABLE.

DECEMBER 15.—The sub-committee appointed to arrange the schedule of classes and prizes for the exhibition of vegetables, to be held at the Royal Horticultural Hall, Westminster, on September 23, 1910, met on the above date. It is hoped the completed schedule will be ready for issue early in the new year. The schedule will include the President's prize of 10 guineas for a collection of 12 dishes. Other prizes are promised from the proprietors of *Country Life* and *The Gardener*, and other gentlemen, for a collection of eight dishes of uncommon vegetables: S. Mouro, Esq., for six dishes of Tomatos (distinct); chairman of committee, for a collection of six kinds of vegetables, open only to cottage garden societies in the county of Surrey; Mr. R. Sydenham, for collections of 12 kinds and six kinds of vegetables; Messrs. Dobbie & Co., for six classes for single dishes and one class for two dishes of Potatos; Messrs. Wool & Sons, Wood Green, for a miscellaneous collection of vegetables to occupy a table space of 45 feet, and also for six dishes of vegetables; Messrs. Dickson & Robinson, for 12 single-dish classes, and one for two dishes of Tomatos; Messrs. Barr & Sons, for a collection of seven dishes out of eight specified kinds; Messrs. J. Cheal & Sons, for a collection of six dishes of vegetables; Messrs. H. Cannell & Sons, for a

collection of six dishes (distinct) grown on virgin or unmanured soil; Messrs. Clibrans, for a single dish of Celery; Messrs. S. Massey & Sons, for three single dishes of Potatos; and Messrs. Clay & Sons, for classes not yet specified.

There will probably be offered prizes for bottled vegetables. So far the cash prizes amount to about £150.

Several of the leading trade firms have given subscriptions, but, we are informed, the list is not yet complete.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

DECEMBER 13.—At the monthly committee meeting held at the Royal Horticultural Hall on this date, four new members were elected and one nominated. The sum standing to the credit of the late Mr. J. C. Tallack in the society's books, viz., £39 ls. 6d., was paid to his widow. Three members over 60 years of age were granted their interest, as per Rule 18. Two distressed members were relieved from the Benevolent Fund. The sick pay distributed since the last meeting has amounted to £44 7s.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending December 11, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather.—The general condition was changeable, frequent and in some cases heavy falls of rain being interspersed with considerable intervals of fine bright weather. Snow showers occurred in several northern and eastern localities early in the week. Thunderstorms were experienced in various parts of Great Britain between Sunday and Tuesday. At Brighton a thunderstorm at 3.45 a.m. on Tuesday was accompanied by snow.

The temperature was below the average, the greatest deficit being 47° in Scotland W., and the least 17° in the Midland Counties. The highest of the maxima were registered during the latter half of the week, and ranged from 56° in Ireland, England N.W. and Scotland E. to 50° in England S.E. The lowest of the minima were recorded at most places on Tuesday or Wednesday. In Scotland E. the thermometer fell to zero at Balmoral on Tuesday, and to 6° at West Linton on Thursday, and in Scotland W. to 12°, while elsewhere the values ranged from 15° in England N.W. to 24° in England E. and S.W. and to 34° in the English Channel. The lowest glass readings reported were zero at Balmoral, 4° at West Linton, 5° at Newton Ring, 9° at Buxton, and 10° at Burnley. In several other localities the readings were below 20°.

The mean temperature of the sea.—At almost all stations the water was colder than during the corresponding week of last year, the difference being about 5° in several localities. The means for the week ranged from 49° at Seafield, and 48° at Plymouth and Port Erin to about 40° on the north-east coast of England.

The rainfall was much above the average in most parts of Great Britain, and slightly in excess in Ireland S., but in Ireland N. there was a deficit. Some heavy continuous falls occurred in the west of Scotland on Thursday, and in the east on Saturday, the largest measurements being 2.46 inches at Fort William, 2.94 inches at Lamdale, 2.69 inches at Stonehaven, and 1.48 inch at Aberdeen. On Friday, more than an inch fell in the north of England, the heaviest amount being 1.92 inch at Lancaster, and on Saturday 1.66 inch fell at Aslington.

The bright sunshine exceeded the normal in all parts of Great Britain except Scotland W., England S.W., and the English Channel district. The highest percentages of the possible duration being 31 in England S.E., and 30 in Scotland F. In Ireland the week was much more cloudy, the percentage of the possible amount in Ireland N. being only 10.

THE WEATHER IN WEST HERTS.

Week ending December 15.

Five sunless days in succession.—Except on two days the weather remained cold during the daytime, but there was only one cold night when the exposed thermometer registered 12° of frost. The ground is at the present time 1° colder, both at 1 and 2 feet deep, than is seasonable. Rain fell on four days, but to the total depth of only about a quarter of an inch. The percolation through the soil gages has gradually slackened during the week, but there are still small quantities of moisture coming each day through both of them. The sun shone on an average for 52 minutes a day, which is 23 minutes a day short of the average for the month. On the last five days of the week no sunshine at all was recorded. Light winds have, as a rule, prevailed, and for the last three days they have come from some point of the compass between north and east. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 7 per cent. E. M., Berkhamsted, December 15, 1909.

PUBLICATIONS RECEIVED.—*The Estate Magazine*, December, 1909. Price 6d.—*Bulletin of Miscellaneous Information (Royal Gardens, Kew)*, No. 9., 1910. Price 2d.

DEBATING SOCIETIES.

WARGRAVE AND DISTRICT GARDENERS'. - At the last meeting of this association a paper on "Rock-work" was read by Mr. A. Mackenzie, gardener to Mrs. Groves, Wargrave Lodge. The lecturer gave full directions for building and planting a rockery, and the best plants for the purpose.

The previous meeting was devoted to competitions in vase decoration for table centres, and some good work resulted. In the journeyers' class the winners were (1st) Mr. Arthur Keep, Sealeys Gardens, and (2nd) Mr. P. Allen, Sealeys Gardens. In the head gardener's and Foreman's class the prize-winners were (1st) Mr. E. Collier, Oldfield Gardens, Maidenhead; (2nd) Mr. J. Shipley, Old Vicarage Gardens, Shiplake; (3rd) Mr. A. Mackenzie, Wargrave Lodge Gardens. The flowers were next day forwarded to the Royal Berkshire Hospital.

READING GARDENERS'. - The fortnightly meeting held in the Abbey Hall on Monday the 6th inst. was not well attended. The President occupied the chair. The hon. secretary presented the balance-sheet of the recent exhibition, which showed a profit of £18 15s. 6d. A friend, not a member of the association, has since contributed £14 5s. 6d. to make the amount £20, which will be devoted to the two gardening charities. With the object of encouraging impromptu speaking, questions had been prepared, each bearing a number. The chairman drew tickets bearing corresponding figures, and the holder of the number called was asked to speak on the subject named on his question paper. Mr. A. F. Bailey presided during the latter half of the evening.

BRITISH GARDENERS' ASSOCIATION (LONDON BRANCH). - The monthly meeting was held at Carr's Restaurant, Strand, on December 9. Mr. E. F. Hawes presided. The concert held on November 27, showed a profit of £2 18s., which will be used to carry on the work of the branch. The concert having proved so successful, it was proposed that a Bohemian concert be held in March next, at the Essex Hall. The proposal was favourably received, and the matter will be considered by the committee. It was announced that as a result of Mr. Hawes' lecture on "State Recognition of Horticulture," a sub-committee has been formed by the executive council to consider the subject. The secretary, Mr. Cockram, gave an address upon Battersea Park.

BRISTOL AND DISTRICT GARDENERS'. - A meeting of this society was held on December 9 at St. John's Parish Rooms, Mr. E. T. Parker presiding. A special feature at the meeting was a collection of Zonal Pelargoniums, staged by Messrs. Garaway. The lecturer for the evening was Mr. Gostling, gardener to A. G. Groves, Esq., Horfield Lodge, the subject being "Manure as the Gardener's Friend." The lecturer recommended nitrate of soda for Onions and Cabbages, and superphosphate for Potatoes; he caused astonishment among his audience by stating that leaves of Pine trees were beneficial to Potatoes.

CHESTER PAXTON. - The annual general meeting was held in the Grosvenor Museum on Saturday, December 11, when the hon. secretary (Mr. G. P. Miln) presented a report of the transactions for the past year. The report was very satisfactory, and showed that the recent exhibition of fruits and Chrysanthemums, as well as the course of winter lectures, had been successful. Mr. T. Gibbons Frost, C.C., was unanimously re-elected president, Mr. A. W. Armstrong chairman of the committee, and Mr. G. P. Miln hon. sec. and treasurer. The new committee was appointed.

SALISBURY AND DISTRICT GARDENERS'. - A meeting of this society took place on the 8th inst. Mr. T. Challis occupied the chair. Mr. Tucker, Longford Castle gardens, read a paper on "Perpetual-flowering Carnations," Mr. Tucker described fully the methods of cultivating these plants, and gave a list of the best varieties.

CARDIFF GARDENERS'. - The members of the association paid their annual visit to the Central Free Library on the 7th inst., with the permission of the Libraries Committee of the City Council, to inspect the collection of books dealing with horticulture and kindred subjects. The works were arranged in sections, each dealing with a particular subject. Mr. Farr, the chief librarian, welcomed the association and pointed out additions which have been made to the library since the last visit.

EGHAM AND DISTRICT GARDENERS'. - At the last meeting a large number of members were present to hear Mr. Giles, of Messrs. Sutton & Sons, Reading, deliver a lecture on "Improvement in Vegetables," illustrated by lantern slides. Mr. Giles gave the history of the common vegetables since the sixteenth century.

CATALOGUES RECEIVED.

MARKETS.

COVENT GARDEN, December 15.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Cut Flowers, &c.: Average Wholesale Prices.

Table with columns for flower types (e.g., Acacia longifolia, Azalea, Bouvardia) and prices in s.d. s.d. format.

Cut Foliage, &c.: Average Wholesale Prices.

Table with columns for foliage types (e.g., Adiantum cuneatum, Asparagus plumosus) and prices in s.d. s.d. format.

Plants in Pots, &c.: Average Wholesale Prices.

Table with columns for plant types (e.g., Anemone, Arabis, Aspidistra) and prices in s.d. s.d. format.

Plants in Pots, &c.: Average Wholesale Prices (Contd.).

Table with columns for plant types (e.g., Lilium lancifolium, Lily of the Valley) and prices in s.d. s.d. format.

Fruit: Average Wholesale Prices.

Table with columns for fruit types (e.g., Apples, Grapes, Avocado Pears) and prices in s.d. s.d. format.

Vegetables: Average Wholesale Prices.

Table with columns for vegetable types (e.g., Artichokes, Asparagus, Beans) and prices in s.d. s.d. format.

REMARKS.—Large consignments of Onions have been received and they are selling freely. Oranges are plentiful and cheap. Mandarins from Florida are arriving in very fine condition. Lemons are a short supply. Large quantities of Pines are realising satisfactory prices. Tomatoes from the Canaries are very poor in quality. The Grape trade is quiet. The market is well supplied with Christmas stock. Vegetables are, generally, a little dearer. Trade is fair. E. H. R., Covent Garden, Wednesday, December 15, 1909.

Potatoes.

Table with columns for potato varieties (e.g., Bedfords, British Queen) and prices in s.d. s.d. format.

REMARKS.—Trade and prices are about the same as last week. Edw. J. Newborn, Covent Garden and St. Pancras, Dec. 15, 1909.

COVENT GARDEN FLOWER MARKET.

It is difficult to estimate what the Christmas trade may be, but it seems likely that there will be a plentiful supply of all subjects. Liliums will be sure to advance in value. Callas (Richardias) are already dearer, but this may be in consequence of growers holding them back until next week. Christmas Day falling on Saturday the market will be closed from Friday until the following Tuesday or Wednesday. As growers will be forced to clear their stocks on Friday, it is probable that prices will be low at the close of the market. A large quantity of cut blooms is ordered in advance at Christmas. The salesmen endeavour to serve their regular customers at ordinary rates, but casual buyers are made to pay advanced prices as soon as the supply appears short. Some of the growers are ready to take advantage of the regular buyer when there is a short supply, but when I was a salesman I found that old customers were ready to pay a fair price when there was an abundance, expecting to receive favoured treatment when things were scarcer.

POT PLANTS.

Chrysanthemums will be available over a longer period than usual this season. Comparing their prices with ERICAS they must be the most profitable to cultivate. Chrysanthemums in 48 size pots are worth from 8s. to 12s. per dozen, whilst ERICAS, which require two years before they are marketed, do not far exceed these prices. Euphorbias (Poinsettias), are very good this season. Those propagated late from strong cuttings make the best plants and retain their foliage best. ERICAS (Heaths) have been selling rather better. Tulips are very good, also Roman Hyacinths, Azaleas, Cyclamen, and Cinerarias. Spiræas are not so plentiful. The successful market grower must be ready to supply the florist with what he wants at short notice. A large London florist once informed me that he did not deal with a certain firm because he got things cheaply, but because he could always rely on getting them promptly. The market trade is very different now to what it was when florists used to be up in the early hours of the morning to meet the growers before they reached the market. *A. H., Covent Garden, December 15, 1909.*

LAW NOTES.

GARDENER'S CLAIM FOR COMPENSATION.

At the Epsom County Court on Friday, 10th inst., Henry Robinson, gardener, claimed compensation from his employer, Mrs. Annie Cunliffe, Leatherhead, in respect of being incapacitated from work owing to injury received from a horse. Plaintiff was feeding a horse when the animal kicked him in the stomach, and he was thrown against a hayrick. On May 15 the head gardener handed him a written week's notice, which expired on May 22. On the previous day, May 21, he was given a certificate from a doctor, who certified that plaintiff was, in the doctor's opinion, now recovered from the effects of the kick. That certificate was dated May 13. On May 21 plaintiff was given £1 17s. 5d., with a document written apparently by Mrs. Cunliffe. At the bottom of the document were the words, "In lieu of all demands." That document was signed by plaintiff. Plaintiff here on counsel's statement.

His Honour found that the present condition of the applicant was the result of the accident that occurred while he was in the employ of the respondent, that at present he was wholly incapacitated from work, and that he was entitled to an award of 12s. 3d. a week, payments to commence from April 23.

ACTION RESPECTING A CYPRIPEDIUM.

In the City of London Court on Monday, December 13, before Judge Lumley Smith, a case was tried in which Mr. J. Forster Alcock, of Great St. Helen's and Northchurch, Berkhamsted, sued Mr. Francis Wellesley, of Westfield, Woking, to recover £100 for breach of warranty. Mr. Newbolt appeared for the plaintiff, and Mr. Crawford for the defendant. Mr. Alcock purchased at a sale of Orchids belonging to Mr. Wellesley, for 80 guineas, a plant named *Cypripedium insigne* Francis Wellesley, which was stated to be a great improvement on *C. insigne* Harefield Hall, but which on flowering, the plaintiff stated, proved to be *C. insigne* Harefield Hall. In summing up, Judge Lumley Smith, K.C., stated that all the parties concerned seemed to have acted in perfect good faith. He found for the plaintiff for £70 and costs. In another similar action judgment was also given for the plaintiff.

ENQUIRY.

CONCERTS IN PUBLIC PARKS.—Can any reader inform me upon what basis concert parties are charged for the privilege of giving performances in public parks? What do such parties usually pay the parks department? *Midland Superintendent.*

* * * *The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.*

ABIES: *W. Edworthy.* The gouty growths on the twigs of the Abies are produced by the fungus *Æcidium elatinum*. The affected branches should be removed and destroyed. *Chermes abietis* produces a similar malformation, though not to such a marked extent as the *Æcidium*.

BLACK CURRANT MITE: *H. E. H.* Your suggestion to procure a fresh stock of trees is an excellent one. The variety Boskoop Giant should be selected, as this kind is not so liable to attack by the mite. In the meantime, pick off and burn all the infested buds, and next March or April dust the bushes with a mixture of lime and sulphur, using one part of unslaked lime and two parts of flowers of sulphur, repeating the application in the middle of April and again in the first week of May.

COMMERCIAL GARDENING: *Manchester.* You state that as cemetery registrar and gardener you are able to dispose of all the bedding plants you can raise annually—about £20 worth. Assuming that you have reasonable anticipation of a market for all you could produce, you could do much with a capital of £200. You could rent 2 acres of land, as you suggest, but if you want a cottage and greenhouses, it would be wise to take the land on a lease for 7, 14, or 21 years, providing for a renewal of the lease at the end of either of those periods. With the aid of a few good greenhouses, about 12 feet wide and of any convenient length, and a few cold frames, you could raise large stocks of Zonal Pelargoniums, Lobelias, Calceolarias, Fuchsias, Petunias, and similar plants each year. You could utilise some of the houses during the summer months for growing Tomatoes and Cucumbers, while early and late-flowering Chrysanthemums might be grown in the open air during the summer months. It would be well to study local conditions and tastes before going in largely for any particular crop. For indoor plants you will find *Stove and Greenhouse Plants*, by F. Baines, and the *Gardener's Assistant*, edited by W. Watton, useful; while for outdoor plants, including fruits and vegetables, you should procure *Practical Guide to Garden Plants and School, Cottage, and Allotment Gardening*, both by John Weathers. These books can be obtained from our publishing department.

CORRECTION.—On p. 405, col. 2, "Sow" Thistles was made by a printer's error to read "Cov" Thistles.

MEALY BUG ON VINES: *B. A.* In pruning your vines (which you say are old), remove altogether as many of the old spurs as can be dispensed with, cutting back the current year's growth on the spurs retained to a prominent bud or "eye." Young growths that have pushed from the main stems this year should be pruned to within one "eye" of their origin. This will enable you next year to cut clean away an equal number of old unsightly spurs. After the pruning has been done, remove all the loose bark from the stems, being specially careful to leave none about the old spurs, as this is where the mealy bug is likely to conceal itself. Thoroughly wash the vines with a solution of soft soap water and petroleum, using 4 ounces of soap dissolved in one gallon of hot water, and one part wine glassful of the paraffin. Keep the mixture well stirred when applying it to the vines. The woodwork and glass of the vinery should also be washed with soapy water and the brick and plaster work with hot lime-wash. See that every nook and cranny in the

wall is filled with the lime-wash, and afterwards repair any bad joints in the mortar. This done, smear the vines thoroughly with a mixture of coal-tar and clay, using one part of the former to nine parts of the latter. The clay should be dried and powdered so that it may be passed through a sieve with ½-inch mesh. It may be pulverised in a large flower-pot, having a lump of stiffish clay put into the hole in the bottom, using a 5 inch flower-pot as a measure. Pour in the tar and work the two materials well together, afterwards adding sufficient water to give the mixture the consistency of ordinary paint, apply it to the vines with a stiffish paint brush, working it into every crevice about the spurs, keeping it stirred meanwhile. Do not syringe the vines overhead with tepid water, as is usually done, to induce them to break into growth.

NAMES OF PLANTS: *H. N.* *Odontoglossum Wilckeanum*.—*A. F. D.* 1, *Cestrum* (*Habrothamnus*) *corymbosum*; 2, *Aster diffusus*; 3, *A. ericoides*; 4, *Lycycteria formosa*.—*H. R. J.* *Selenipedium* (*Cypripedium*) *Sedemii* and *Origanum Dictamnus*.—*C. S. C.* 1, *Begonia subpeltata nigro rubra*; 2, *N. Calvia angustifolia*.

ORANGE TREES: *W. W.* You may employ the fumigator you mention, but be careful to see that the house is not excessively damp, and do not make the fumigation unnecessarily severe.

PLANTS FOR DECORATIVE PURPOSES IN WINTER: *Hortus.* Besides those you mention, the following are suitable for the purpose:—*Ericas*, including *E. hiemalis*, *E. gracilis*, and its variety *nivalis*, Zonal Pelargoniums, *Cinerarias* (which should be started early to flower in December), Lily of the Valley from retarded crowns, *Astilbes* (*Spiræas*), *Liliums*, including *L. longiflorum* and *L. speciosum*, Tulips, Roman Hyacinths, *Narcissus* *Zetetta*, and Indian Azaleas (*Rhododendron indicum*).

POLYGONUM BALDSCHEVICICUM: *E. P.* We are not surprised the plants failed to flower the first season after planting. As they have made such satisfactory growth, no doubt they will bloom freely in the coming season, provided the aspect is a favourable one.

PRUNING: *A. B.* The manner in which "trees" should be pruned that were planted last year" will depend partly on how they were pruned last season, and also on what amount and kind of growth they have since made. Assuming that they were average young trees, and that they were pruned very lightly last year, they should require little or no pruning this season. This is because the check trees receive by transplantation is usually sufficient to keep them from growing much in the following season. Your second question relates to "older trees." If you mean old, neglected trees, you will find ample directions for treatment in the articles recently published in these pages under the title of "The Hardy Fruit Garden." So much depends on the class of tree and the treatment it has received that it is not possible to give you definite advice unless such information is sent us. As a general rule, intelligent pruning consists of cutting out all shoots which cross each other, any side-growths which are not required, and shortening the leading growths to 12 or 18 inches, according to the space to be occupied. Some kinds flower on the previous season's growth and others on the new wood, therefore an intimate knowledge of their habitats is necessary before an operator can prune with a reasonable hope of getting the best returns. If the present growth is particularly strong, the roots may need pruning rather than the tops.

RICHARDIA (CALIA) LEAVES INJURED: *W. E. C.* No disease is present in the plants. The injury is due to an excess of moisture in the air.

SOLANUM LEAVES DECAYING: *W. S.* See reply to *W. E. C.* on *Richardia*.

ALDENHAM HOUSE.

(See Supplementary Illustration.)

ALDENHAM HOUSE, the country residence of the Hon. Vicary Gibbs, is situated in West Hertfordshire, nine miles from St. Albans and five miles from Watford. Elstree, the nearest village, lies a mile away, to the south. Looking at the reposeful situation and the grand site of the mansion, it is difficult to realise that Hyde Park Corner is only 13 miles off. There is but little history to relate of Aldenham House. The mansion is a massively-built brick building in the style of Queen Anne. It was probably constructed at about the year 1550. In 1614, with Thomas Sutton's daughter and heir, it passed to her husband, Henry Coghill, in whose family it remained until 1734, when it passed to Robert Hucks, who had married a relative of another Henry Coghill, and remained in the Hucks's family until 1814. After this time the estate descended through a Miss Noyes, a relative, thence to the Gibbs family through the marriage of Antony Gibbs (grandfather of the first Lord Aldenham) with Dorothea Hucks.

Aldenham is especially noted for its extensive collection of trees and shrubs and high-

class vegetables. The Hon. Vicary Gibbs possesses a wonderful knowledge of trees and shrubs, not only a knowledge of their nomenclature, but of their requirements from a cultural point of view.

During the last 27 years many extensive alterations have been carried out in the gardens. The late Lord Aldenham, whose death occurred in 1908, was passionately attached to his home. He devoted much of his great wealth to improving the garden. The designs, prepared by his son, the present resident, were ably carried out by Mr. E. Beckett, who has been gardener at Aldenham for many years. So vast has been the increase in the garden that the pleasure grounds now occupy 200 acres, and even that apparently large area is becoming crowded, so many trees and shrubs have been added of late. A noteworthy addition is the extensive collection of Chinese plants, introduced through the agency of Mr. E. H. Wilson. The approach to the mansion is through a double avenue of Chestnuts, which extends for a mile along the carriage drive, over a handsome bridge of stone, which spans a portion of a ten-acre lake, on whose banks are huge clumps of golden Elder, golden and red-barked Willows, Astilbes, Snowberries, and Berberis, some of which are effective at every season of the year. A magnificent avenue of Elms on grass serves as an approach to the house from the northwest. A quarter of a mile west from this avenue is another of Turkey Oaks, probably 20 years old, and growing most luxuriantly. Although this avenue appears to join on to that made by the Elms, the public road from Elstree to Watford runs between, but the grounds are so arranged that even pedestrians are not seen from the Elm avenue.

The shrubberies form the most charming feature of the garden, many acres being planted with the choicest trees and shrubs. The clumps vary in size and form, but all are surrounded by grass; many of the clumps cover an acre or more. In the formation of these clumps care has been exercised to secure such graceful curves and easy slopes as are most in keeping with the immediate surroundings. The individuality of each subject has been preserved, and there is no confused planting or overcrowding.

The general scheme of planting is a mixture of evergreen and deciduous subjects. Pillar plants are effectively employed in such subjects as golden Ivies, coloured vines, Sweet Briars, Clematis, Polygonum baldschuanicum, which tend to relieve the surroundings by patches of colour—flower or foliage. A careful system of pruning is practised, and the results are shapely specimens, even if small, and those of a flowering character give their full share of blossom. As to variety, it is almost endless, including such choice plants as Symphoricarpos mollis, Sassafras officinalis, Larix lyallii, Salix lanata, Juniperus pachyphloea, Hydrangea arborescens grandiflora, Colutea persica, Esculus chinensis, and the very rare E. Bushii; Ilex pedunculosa, Magnolia hypoleuca, Cotoneaster adpressa, Ononis arragonensis, and Fagus antarctica uliginosa. Others, not quite so rare, are Shepherdia canadensis (a fine specimen), an extraordinarily fine plant of Hamamelis mollis, Saix gracilistyla, Aristotelia Macquii, Castanopsis chrysophylla, Davidia involnerata,

Ribes lobhii, Berberis Knightii, Prunus Mume, and a charming plant of Hex Aquifolium "Golden King."

Of the more common yet distinctly desirable shrubs and trees are the following:—Lespedeza cystobotrya, a new Japanese form, rosy purple; the creamy-white inflorescence of Sambucus canadensis, with red stems; Quercus nigra, with thick, leathery leaves, which are green on the upper surface and gold beneath; Disanthus cercidifolia, a tree like the Judas tree in growth, with crimson and gold colouring; Cytisus sessilifolius, with small, deep-green leaves, and a mass of bright golden blossoms, as many as 100 on each spike; Cydonia sinensis, a huge Quince, very bright in the autumn, Rhamnus alaternus variegatus and Fraxinus dimorpha var. dumosa, the small-leaved Ash, with silvery stems, most peculiar, in the opposite growths of leaves and branches; Berberis virescens, which starts into growth with a rich purple hue and dies off rich crimson; B. coccinea, a most desirable plant, producing its rich, coral-red fruit freely; B. diaphana, worthy of a place in any collection, no matter how small, for its red stems and yellow flowers; Rhus typhina; R. Osbeckii; Paraphyllum ramosissimum, with its rosy-white, early-summer Apple-blossom-like flowers; and Fuchsia coralina.

The Lavender-like purple spikelets of Perowskia atriplicifolia, with its silver leaves, are exceedingly attractive; Mallothus japonicus, with its Paulownia-like leaves, and the variegated Bramble in front, all add to the interest of the collection. A very handsome specimen is Pittosporum eugenioides, fully 11 feet high and as much as 9 feet in diameter. One of the richest of crimson-flowering trees is Amygdalus magnifica. But I could go on almost indefinitely naming rare trees and shrubs at Aldenham! For are there not upwards of 100 species and varieties of Oaks alone, including many forms of Q. Cerris? Of Berberis, in addition to those already named, there are 30 varieties, including Fendleri, Fremontii, pruniosa, nepalensis, congestiflora, and empetrifolia.

A wonderful collection of Ash, includes many of the Japanese species. Of Pyrus there are many desirable sorts, which add their quota of interest to the garden during their season of blossom or fruit. Loniceras number some 25 species. Pendulous trees are much appreciated; Tilia petiolaris is a fine specimen. Morus alba, Beeches, and Ash are a few of the more noteworthy.

Mention should be made of the many uncommon subjects treated as low wall climbers on the pillars of the handsome balustrade in terra cotta, extending parallel for some six hundred yards to a broad gravel path on the east and southern side of the mansion, and dividing the grounds from the park. Colletia cruciata, Hydrangea quercifolia, Berchemia racemosa variegata, Otherea japonica, Menispermium canadense, Escallonia macrantha Ingramii, Cotoneaster angustifolia, Olearia macrodonta, Grisebina littoralis, and Rhus Toxicodendron, with its brilliantly-coloured crimson leaves. *Edwin Molyneux.*

(To be continued.)

NOTICES OF BOOKS.

* THE FLOWERS OF MADEIRA.

THE island of Madeira, situated off the north-west coast of Africa, is about a ten days' sail from England. It is about the same size as the Isle of Wight, but, instead of being largely meadowland, Madeira is a mass of basaltic rock, rising abruptly from the Atlantic to a height of over 6,000 feet. There are valleys and ravines, through which streams and rivulets in plenty run, watering the soil as they go, and, as the climatic conditions are subtropical, the mean temperature for the year at Funchal being about 70°, the island is very fertile. When the Portuguese found it about 500 years ago, the island was covered with trees, and, to get a clearing, the first settlers set fire to the forest, which is said to have burnt for seven years. Trees, chiefly Chestnuts and Pines, are still abundant on the highlands, but a large part of the island is now cultivated. Sugar being the principal industry, Vines, Bananas, Lemons, Citrons, Cherimoya, Guava, and other fruits being also largely grown. Madeira wine is, of course, well known. The great charm of the island is the wonderful variety of introduced plants, which occur not only in the gardens, but wild in all kinds of positions. A walk along the steep roads and lanes which start from Funchal and wind up the mountain is, to anyone acquainted with plants, truly delightful. It is so at most times of the year, but the best months for flowers are March, April, and May. Even in December there is a great display of bloom; Poinsettias, Bougainvilleas, Erythras, Bignonias, Allamandas, Passifloras, Roses, to mention some of the most familiar, take the place there of Thorn and Ivy and Bramble here.

The gardens are not of the kind we make. There it is not possible to have stretches of lawn and well-kept borders. The plants make the garden, growing in semi-wild fashion, to be pushed out of the way if they intrude too much, and never failing to yield a wealth of bloom. Probably most of the plants have been introduced at some time or other by residents of British nationality in the island, which has for centuries been the resort of invalids on account of the mildness and uniformity of its climate, and the

* *The Flowers and Gardens of Madeira*, by Ellen and Florence du Cane. (London: Adam and Charles Black.) Price 7s. 6d. net.

FIG. 187.—VIEW IN THE ROYAL BOTANICAL GARDENS, PERADENIYA.

Englishman delights in flowers. The Portuguese, to whom the island belongs, are not keen gardeners. The best of the houses in Madeira are—and have been for many years—in the occupancy of Britishers.

A list of the beautiful, exotic plants now estab-

lished in Madeira, cultivated and wild, would be of astonishing dimensions. Here are a few:—Jacaranda, Duranta, Stephanotis, Poinciana, Solandra, Weigandia, Brunfelsia, Rosa gigantea, Lonicera Hildebrandtiana, Azalea indica, Romneya, Hibiscus, Palms, Strelitzia, Musa, Streptosolen, Amaryllis, Belladonna, Datura, Wista-

lished in Madeira, cultivated and wild, would be of astonishing dimensions. Here are a few:—Jacaranda, Duranta, Stephanotis, Poinciana, Solandra, Weigandia, Brunfelsia, Rosa gigantea, Lonicera Hildebrandtiana, Azalea indica, Romneya, Hibiscus, Palms, Strelitzia, Musa, Streptosolen, Amaryllis, Belladonna, Datura, Wista-

Messrs. Black were well advised to add to their series of Beautiful Books this volume by the Misses du Cane. The illustrations are charming works of art, remarkable for their beauty of composition, clever drawing, and effective coloration. Every picture is a pleasing study of plants, either as seen in a garden, by the roadside, or in a sea view. The letterpress, by Miss Florence du Cane, is as clever as are the pictures. A short chapter accompanies each picture, giving particulars sufficient to enable one to realise the whole, of which the picture shows only a part. The criticisms are honest and to the point, displaying an orthodox feeling for plants and a correct knowledge of the art of gardening.

Whilst the gardens and cultivated plants are interesting features of the island, the scenery and natural vegetation are well worth the attention of visitors. No other island of its size has such variety of scenery, and the flora is remarkable for the number of endemic species it contains, or, rather, contained; for, according to Sir Joseph Hooker, many of the plants peculiar to the island have perished through the operations of the cultivator, or have been elbowed out by vigorous aliens. *Clethra arborea* (the Lily of the Valley tree), peculiar to Madeira, forms a large tree, as also does the Portugal Laurel. The palm for flowering trees is given by Miss du Cane to *Jacaranda mimosifolia*, from Brazil. There is a beautiful picture of this species in the book, showing a tree about 40 feet high, shaped like an Oak. It loses its leaves in winter, and in May it bursts into a cloud of blue blossoms. It is common in Funchal, where it is known as the Blue Tree. Most people, however, give pride of place to the Bougainvillea, which, in Madeira, is everywhere, and when in flower really seems to paint the whole island magenta-red. W. W.

CEYLON.

ROYAL BOTANICAL GARDENS.

THE illustration, fig. 187, shows the entrance to the Orchid collection in the Royal Botanic Gardens, Peradeniya, and is typical of the vegetation in these gardens. Needless to say, the Orchids here are not grown under a glass roof and in artificial heat, as in cooler climes. Instead, however, a structure with screened sides, on which climbing plants are trained, and a roof consisting of a framework covered with coir netting, provides the requisite conditions for the plants. It is noteworthy that when suitable trees are at hand these invariably form the best "ground" for epiphytic Orchids.

bare stem and branches by short, slender stalks; dangling in the air, they readily give the impression of a chandler's shop (see fig. 189). This impression is intensified as night falls and the numerous fire-flies move among the fruits. It is not, perhaps, surprising that the inexperienced traveller should not infrequently be informed that the fireflies perform the duty of lighting up these "candles" when required by the denizens of the jungle. The fruits are fleshy and juicy, and have a peculiar Apple-like odour. They are eaten by certain tribes and also by cattle. The tree belongs to the Natural Order Bignoniacæ.

"HEN-AND-CHICKEN" PINEAPPLE.

This peculiar variety of *Annona* (see fig. 190)

grown in native gardens as a vegetable. In the illustration, fig. 183, a tall Tamil man is seen standing by the side of one of these fruits, which is nearly as long as himself. The plant grows with rapidity, and produces an abundance of peculiar fruits which reach usually a length of 4 to 5 feet. They are esteemed by the natives as a vegetable for curries, a portion of one fruit only being used for each meal. *Hugh F. Macmillan.*

NEW OR NOTEWORTHY PLANTS.

CALLISTA v. DENDROBIUM

I AM sorry that my short note about *Callista amabilis* (see p. 354) seems to be misunderstood in more than one respect. Mr. O'Brien, in support of his contention (p. 393), quotes the ruling of the recent Vienna Botanical Congress, with which I am well acquainted. I never dreamed of returning to Dr. O. Kunze's nomenclature, but as I recorded the plant after it had more than a century's oblivion I took the opportunity to mention its interesting history in botanical literature from the time of Swartz to Kunze. I

FIG. 189.—THE CANDLE TREE (*PARMENTIERA CEREIFERA*).

THE CANDLE TREE.

One of the most remarkable trees of the Tropics is undoubtedly the Candle Tree (*Parmentiera cereifera*), native of Panama. It grows 30 to 40 feet high, and produces from its stem and older branches a profusion of almost sessile campanulate flowers; these are followed by yellowish, cylindrical, smooth points, 12 to 18 inches long, which appear exactly like wax candles, as the botanical name implies. So close is this resemblance, that travellers, seeing the tree in fruit for the first time, are liable to be temporarily puzzled as to whether the candles of shops are made in factories or grown on trees! The candle-like fruits are suspended from the

has of late become common in native gardens at low elevations in Ceylon. Though grown for its fruit, the latter can only be described as of second rate quality, being rather pithy and insipid. The two striking peculiarities of the variety are that the fruit does not bear the usual characteristic crown of small leaves, but a growth resembling a cock's comb instead and its habit of producing a number (usually from seven to ten) miniature growths at its base.

THE SNAKE GOULD

The "Snake Gould" (*Trichosanthes anguina*) is so called on account of its long, snake-like fruits. It is a native of India, and is commonly

FIG. 190.—"HEN AND CHICKEN" PINEAPPLE.

have not even quoted Dr. Kunze's name in my Monograph. At the same time I believe it is necessary to convince his followers that their master was wrong in this as in many other matters. For this reason I have treated that part of the question a little more fully than it really deserved. Now this part is inseparable from the second: is Loureiro's plant in the British Museum a *Dendrobium* or is it a *Callista*? All I can say for the moment, after ten years' study of the vast genus *Dendrobium*, is that the plant is not a *Dendrobium* as defined by Dr. Lindley, the author of the genus, nor in the sense of the term as used in Bentham and Hooker's *Genera Plantarum*. Although the plant may be similar in its growth and habit to a *Dendrobium*, there are peculiarities both in the lip and side petals of the flower which separate the plant absolutely from the genus. It is impossible to go into all the details of this very intricate matter now, and I propose that further discussion be withheld until the Monograph now in the press is published. The genus is so polymorphous that without a clear definition as to what section or subgenus a plant belongs to, the declaration of its being a *Dendrobium* says practically nothing. *P. Kraenzlin, Berlin.*

THE ALPINE GARDEN.

SOME GOOD AUTUMN-FLOWERING CROCUSES.

THE Crocuses enumerated below are given in the order in which they have flowered. *Crocus speciosus* is an all-important kind among first earlies. The type is well known, but the exquisitely beautiful *C. s. Aitchisonii*, which is later in flowering, and whose petals reveal the lovely colouring of *Iris stylosa* on their inner surfaces, is less frequently seen. *C. nudiflorus* is also an early-flowering species, and its bold and handsome flowers render it a conspicuous object. Its period of flowering is not greatly removed from that of *C. speciosus*, but permanently-planted corms are usually a little later to flower. *C. zonatus* has long, pointed flower-buds, its mauve-lilac colour and finely-pencilled petals having at their bases a coloured zone of rich yellow. *C. medius* is a showy, free-flowering species. Its first flowers were spoiled during the wet and frosts of late October, but the sunny weather on two or three occasions in the first week of November favoured the secondary flowers, which afforded a rich display. One must see this glorious species in the sunlight to realise to the full the richness of its purplish-violet cups, or to get a proper glimpse of the mahogany-red colour of its plume-topped stigmata. It deserves to be extensively grown for its freeness of flowering. On a sunny ledge in the rock-garden a group of *Crocus medius* would constitute a rare feature in early November, when so few plants are in flower; grown in pots or pans in a cold house, it would also prove a great attraction. With me it is one of the very best and most reliable of the autumn-flowering kinds. *C. ochroleucus* is a dainty-looking, white-flowered kind, whose pointed petals are coloured a golden yellow at their bases. It is smaller and less vigorous generally than any of the above-named, but it is a pretty little plant, and merits more extensive cultivation. It does not compare in point of size or beauty with the lovely white-flowered *C. marathonisius* (*C. Boryi*), which is the best of the white-flowered, autumn-blooming Crocuses. Unfortunately, *C. marathonisius* has not proved satisfactory with me. *E. H. Jenkins.*

APPLES AT THE WOBURN FRUIT FARM.

FOR some years past annual exhibitions of Apples have been held at the Duke of Bedford's Experimental Fruit Farm. A fortnight ago I had the pleasure, in response to an invitation by Mr. Spencer Pickering, F.R.S., of representing the *Gardeners' Chronicle* at one of these shows. It was held in a large pavilion on the farm, the central hall of which was filled with specimen fruits representing upwards of a hundred varieties.

Before saying anything further about the Apples, I should remark that there is no attempt made to grow what may be termed show fruit, either by the aid of warmth and shelter from walls, by thinning the fruit, or by extra feeding. The Apples seen represented the produce of orchard fruit trees, grown under various conditions. The object in view is to demonstrate to the fruit farmers and gardeners of the county, by scientific and practical tests, the most economical and successful methods of Apple culture.

The experiments have been carried on for 15 years, and the results have been published in the reports issued periodically from this farm by Mr. Spencer Pickering. In these reports we are told that unpruned trees (trees which have never been treated with the knife during the 15 years of their life) are larger, healthier, and bear better crops of fruit than those which have been annually pruned for the same length of time. We are also told that trees in untruncated and unmanured land produce better fruit, and more of it, than do those on land which has been trenched and specially prepared for planting at a great cost. I make no comments on these statements. I can only bear witness to what I saw. I saw the trees and I saw the fruit, and both bear out the truth of the above report. I took the liberty to sug-

gest to Mr. Pickering that the Fruit Committee of the R.H.S. should be invited to inspect the farm next autumn. This would give him a rare opportunity of trying to convert some of those who most persistently reject the conclusions which he has reached.

The exhibition of Apples was arranged on a large centre table and on side stages by Mr. Nield, the manager, large pyramids of the most attractive fruit as to size and colour being raised in the centre, ends, and corners of the table. The body of the table was filled with raised dishes of other choice varieties. The sides were arranged in the same pleasing way, the whole showing presenting a surprisingly good exhibition of Apples of excellent quality, generally of high colour, and certainly of fair to over-average size for orchard fruit.

I noticed the following as being amongst the best samples:—Cox's Orange Pippin, Gascoyne's Scarlet Seedling, Bramley's Seedling (very high colour), Cox's Pomona, Golden Spire, Gospatrick, Newton Wonder, Egremont Russet, Beauty of Kent, Lane's Prince Albert, Northern Greening, Blenheim Pippin, Maggie Grieve, Wealthy (very fine), Lord Derby, Warner's King, Manningham Pearmain, Allen's Everlasting, Tom Putt, Hamblin's Seedling, Allensbank (a splendid cooking Apple of large size, the tree being of extraordinary erect habit of growth), Scarlet Nonpareil, Wadhurst Pippin, Baxter's Pearmain and American Mother. *A Conventional Fruit-grower.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchard Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Miltonia.—Plants of *Miltonia vexillaria* are growing fast, and, occasionally, some of the leaves clasp each other so firmly as to become wrinkled. When this is observed, the leaves should be liberated by passing a thin, smooth piece of wood between them. Only very moderate supplies of water are needed until the flower-spikes appear in the spring. The black spot which is apt to appear on the tips of the leaves is often caused by the heat of the house being deficient, especially if, at the time, the atmosphere is damp. It is also caused by too frequently damping between the pots, particularly if the plants are standing upon some moisture-holding material, such as fine coal or shingle. *M. vexillaria* is a shallow-rooting plant. Most of the roots ramble about the surface of the compost, and woodlice are very fond of them. These latter should be trapped and destroyed. *M. Roezlii* thrives better in the same house with *M. vexillaria* than in a warmer temperature, but it requires a denser shade. Should any plants of *M. Roezlii* need repotting, it may be done when new roots are seen to be pushing out at the base of the young growths. This species thrives well in the new Orchid compost. It is a compact-rooting plant, and should not be over-potted. The roots tend to collect together around the inside of the pot, in which state the plants will take plenty of water. *M. Phalenopsis*, being at rest, should be given a light position in the Mexican house; the plant will require but very little water until growth recommences. *M. Phalenopsis* is seldom seen in good health, but this is owing more often than not to the foliage being attacked by a small species of red spider. To remedy this, the leaves should be sponged with some weak insecticide or soft-soapy water at least once a month.

Polystachya.—Among small-flowering Orchids, many of the *Polystachyas* are pretty and interesting, one peculiarity being that, invariably, the flowers are inverted. At the present time the following are in bloom:—*P. grandiflora*, *P. Laurentii*, *P. luteola*, *P. Buchananiana*, *P. odorata*, and *P. pubescens*. These and other species, as *P. Oltoniana*, *P. laxiflora*, *P. zambesiaca*, *P. Haroldiana*, and *P. flexuosa*, thrive and bloom freely in the new Orchid compost; a light, moist position in the warmest house is the best place for them.

Mexican Odontoglossums.—Plants of *Odontoglossum Reichenheimii*, *O. lavei*, and *O. citros-*

mum will, by this time, have completed their growths. They require a long and decided rest. Therefore, as each pseudo-bulb becomes fully made up, gradually diminish the quantity of water at the root, and in a few weeks' time watering may be discontinued. Owing to the absence of water at the root, the bulbs will shrivel; but shrivelling does not affect the well-being of the plants, unless it is excessive, for when the growing season commences, if the plants receive a good supply of water, and are placed in a moist atmosphere, the bulbs readily plump to their normal condition. The best position for these plants while at rest is near the roof of the Mexican house. The rare *O. Londesboroughianum*, being now at rest, should be in a similar position; if kept at all moist at the root, the pseudo-bulbs will certainly decay. *O. Inseleyi splendens* grows well on a dry shelf in the cool house, and should now be sending up its flowers. It is a plant well worthy of being freely grown, as it lasts long in flower, and the blooms are very showy and attractive. After the blooms fade, keep the plant on the dry side until new growth commences.

Calanthes.—Many of the deciduous *Calanthes* of the *vestita* and *Veitchii* sections will now be passing out of bloom. As these plants require a thorough rest, they should be placed on a dry shelf, close to the roof of the warmest house, where the light will help to mature the bulbs. Water must be entirely withheld till after the repotting of the plants in the spring. Before removing them to their resting quarters, cleanse every pseudo-bulb from the white and brown scale which commonly infests them. Such late-flowering hybrids as *C. Wm. Murray* and *C. Bryan* are now at their best, and those of the *C. Regneri* section, as *C. Regneri*, *C. Sanderiana*, and *C. Stevensii*, will soon be opening their flowers, which will last well into the spring months. These varieties help greatly to prolong the *Calanthe* season. The flowers show to the best advantage when the plants are stood on the ground arranged with Ferns, &c.

FRUITS UNDER GLASS.

By E. HARRIS, Fruit Foreman, Royal Gardens, Frogmore.

Strawberries.—Some of the plants which were placed into warmth at the end of November, or early in the present month, will be developing flower-spikes. These should be removed into a warmer house and placed near to the glass. The atmospheric temperature of the house should not be lower than 60°. Spray the plants with lukewarm water twice daily, and give occasional applications of liquid manure. Other batches may be placed in warmth for succession, according to requirements. Shelves in vineries or other fruit-houses which have just been started are very suitable places for these later batches, but see that the Strawberries are not infested with insect pests, as there will be a danger of these spreading to the permanent fruit trees.

Melons.—Where there is a large demand for forced fruits, and provision is made for early forcing, preparations must now be made. Select a house or pit having a southern aspect, and have it ready for planting the Melons as early in the New Year as convenient. Place at the front of the house and quite close to the glass a hot-bed of leaves and stable manure in equal proportions. For a rooting medium use a fairly strong fibrous loam, mixed with a quantity of old mortar rubble, or wood-ashes. Press all the materials very firmly together, or the growths will be soft and liable to be affected by canker. Raise the seedlings in 2½-inch pots, using a light compost, and plunging the pots in a hot-bed. When the seedlings are well through the soil, place the pots containing them on the beds of soil, where the plants will be put out.

Cucumbers.—A fresh batch of plants should be raised to take the place of those which are now in bearing. They will need more care than Melons. Sow the seeds singly in 2½-inch pots filled with a mixture of loam and leaf-soil in equal parts, which should be warmed before the seeds are sown. If the compost is just moist at the time of sowing, no further water will be needed until the seeds have germinated. Plunge the pots in a hot-bed, and cover them with a sheet of glass. In the meantime prepare beds as advised for Melons, and when the plants are large enough plant them in small mounds of soil placed about 5 feet apart in the hot-bed.

Tomatos.—The plants which were raised in October are ready for potting in 6-inch pots. The soil for Tomatos at this period of the year should be of a lighter texture than will be used later in the season. Afford a temperature of about 60°, and place the plants close to the glass. Tomatos now fruiting should be given a top-dressing of fresh soil, whenever the roots appear through the ground. An occasional sprinkling of some artificial manure will also be useful.

THE FLOWER GARDEN.

By W. A. COOK, Gardener to Sir EDMUND G. LODER, Bart., Leonard-lee, Sussex.

Shrubs with winter berries.—A good selection of plants that produce bright berries during the winter months will assist in making the garden effective when the general surroundings are dull. All the Roses of the rugosa type are valuable, and they have the additional advantage of furnishing a good display of their pretty single blooms in the summer-time. The Cotoneasters all produce beautiful fruits, and these shrubs are amongst the easiest to cultivate. A well-fruited plant of *C. horizontalis* is always a beautiful object; other species that should be included are *C. Simonsii*, *C. microphylla*, *C. thymifolia*, *C. frigidula*, *C. Franchetii*, and *C. adpressa*. Then the *Skimmias* may be mentioned, and of these *S. Foremanii* is the best for the purpose, the berries being larger and more freely produced than on any other species. *S. japonica* also fruits freely, and is a very pretty object at this time of the year. The *Skimmias* grow well in a smoke-laden atmosphere, and for that reason they are good plants for town. The *Aucuba* is also prized for its scarlet berries in winter. Sometimes the *Aucuba* does not set its fruits. Both the *Skimmia* and the *Aucuba* bear flowers of one sex only on the individual plants, and this is also true of *Hippophae rhamnoides*, the Sea Buckthorn, which produces its berries in the greatest profusion. A few male plants should always be grown with the females. With respect to the *Aucuba*, the variety known as *Fertility* produces the brightest berries and in the greatest quantity. The species of *Berberis* must be included in our list, the best for our purpose being *B. Thunbergii*, *B. vulgaris*, and *B. atro-purpurea*. The *Crateagus* family includes many useful berry-bearing plants. Nothing is finer at this season than a tree of *C. Pyracantha* covered with its scarlet berries. Others of the family that are effective in winter are *T. tanacetifolia*, *C. orientalis*, *C. Carrièrei*, and *C. præcox*. The Strawberry tree, *Arbutus Unedo*, bears its scarlet berries in winter, and the flowers at the same time. *Eleagnus multiflora* is a prolific berry-bearing, ornamental shrub; the fruits are sometimes used as a preserve. The native Spindle tree, *Euonymus europæus*, should be extensively planted in the shrubbery. The fruits are very pretty when they have burst and exposed the seeds covered with orange-coloured arils. Hollies have an especial interest at this season, but they are beautiful all through the year. *Ilex cornuta* is little known in gardens, but it is one of the best of the Hollies to retain its berries, besides being a handsome subject at all times. *Pernettya mucronata* and its varieties are always welcome in winter. Nothing is finer than a dense mass of these plants covered with their fruits. *Pernettyas* are suitable as edgings to clumps of shrubs or in places near trees. Even the *Magnolias* furnish a fine berry-bearing plant in *Magnolia tripetala*, which produces large, purplish-red fruits. The blue-fruited vine, *Vitis heterophylla*, will succeed in light soils in warm situations; the bunches of pale blue berries will afford a pleasing change to the scarlet kinds.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Onions.—It is necessary to make a commencement early in the New Year in order to produce the finest bulbs, whether for the table or for exhibition purposes. The seeds should be sown on some date during the first fortnight in January, but the soil should be prepared beforehand, so that everything is in readiness at the date of sowing. Some gardeners prefer sowing Onions at the end of December, but I have had the best results from sowing in January. The soil for the seed-bed should consist of fibrous

loam three parts, well-rotted leaf-mould one part, and manure from a spent Mushroom-bed one part. All these materials should be passed through a fine-meshed sieve. Whilst they are being mixed together add a quantity of road or river sand for the purpose of keeping the compost open. It should be used in a moderately dry condition; the seed-bed should be made very firm. The seed may be sown in either boxes or pots, but whichever receptacles are used, adequate provision for drainage must be provided. It will be sufficient to just cover the seeds with the soil, and, after they have been pressed firmly and watered, place them in gentle warmth, an earlyinery or Peach house being a suitable structure for the boxes. There is no variety better than a good strain of *Ailsa Craig*.

Preparing Onion beds.—At the time that the seeds are being sown, the ground should be prepared for the planting of the seedlings out-of-doors in the month of April. The Onion is a very deep-rooting plant, and revels in a deep soil. It is also a gross feeder; therefore, the ground should be well enriched as well as deeply dug. The best plan is to trench the land 3 feet deep, placing a thick layer of manure at the bottom, and another layer below the top spit. If the soil is naturally deficient in lime, apply a good dressing of this, as well as plenty of wood-ashes. A little later on dust the ground pretty freely with soot.

Leeks.—These require much the same treatment as Onions, except that the seed should be sown a fortnight later. Nothing is gained by sowing the seed too early, for it often causes the plants to have a tendency to "bolt" and form bulbs.

Potatos.—Attend to the earthing-up of the earliest plants in heated frames or other warm structures. Do not unduly force the plants, but endeavour to promote a sturdy, short-jointed growth by admitting all the light possible and fresh air, whenever the weather will permit, being careful to ventilate on the opposite direction from which the wind is blowing. Make successional plantings in heated pits, and prepare further "sets" to follow these by selecting suitable tubers and laying them thinly on suitable trays; place the trays in a greenhouse, and keep them in the light.

The soil order.—The nursery firms having issued their new catalogues, it is advisable for gardeners to place their orders early. In addition to ordering old and tried varieties, there is much interest in cultivating a few of the most promising novelties for comparison.

PLANTS UNDER GLASS.

By A. C. BARTLETT, Gardener to Mrs. FORD, Pencarrow, Cornwall.

Clivia miniata.—Although this is not the usual season of flowering, some plants of this species generally develop their inflorescences in winter. Such plants should be moved into a structure having an intermediate temperature, and be given occasional applications of manure water. The increased warmth and feeding will cause the flowers to be finer, and of a brighter colour. The general stock of *Clivias* should remain in the cool house and be kept moderately dry at the roots.

Colceus thyrsoides.—In order to obtain the best results with this useful winter-flowering plant, it should be kept in a moderately-warm house, where the atmospheric temperature at night is not lower than 45°. Apply water at the roots with great care, for any excess of moisture will cause the margins of the leaves to turn brown. The use of manure water must now be discontinued.

Clerodendron fallax.—As the plants finish flowering, they should be pruned severely and placed in a warm glasshouse. The strongest plants may have the shoots shortened to five or six buds. Keep the roots somewhat dry, until the new shoots appear, and, in order to assist the growths breaking freely, syringe the plants in the morning and afternoon of fine days. As soon as the new shoots are 3 inches long, they should be taken off with a portion of the old wood, or "heel." Insert them singly in small pots, and place these in a brisk bottom heat.

Carnations.—As soon as good cuttings of the tree and winter-flowering varieties can be obtained, they should be inserted with a view to

raising plants for flowering next autumn and winter. By propagating the plants early, they will have a longer season of growth, and this will permit of extra stopping, which will be especially useful in varieties not naturally of a bushy habit. The best cuttings are obtained from basal shoots pulled from the plants, with a portion of the old wood attached, the cuttings being about 3 inches long. Those much longer than this must be trimmed in the usual manner. Insert the shoots either singly in small pots, or around the sides of 3-inch pots. Use a mixture of sifted loam three parts, and leaf-soil one part, adding plenty of sand. Make the cuttings very firm in the soil, and then plunge the pots in a frame where there is a bottom heat of 70°, and an atmospheric temperature of 60° to 65°. If the cuttings are given one good watering before they are inserted in the frame, it generally suffices until roots are formed. After about a month the pots will be well filled with roots, and then the propagating case may be opened for ventilation, and five or six days later the plants may be taken out of the case and placed on the shelf of the same house.

Hippastrum.—A small batch of bulbs should be potted up and placed in a warm house, where bottom heat can be provided. Plants for early flowering should be selected from those which were repotted last season, as these will merely require a top-dressing.

THE HARDY FRUIT GARDEN.

By J. G. WESTON, Gardener to H. J. KING, Esq., Eastwell Park, Kent.

The Loganberry and Blackberry.—Cut out all the old wood that has fruited, and trim the new growths thinly to the fence, poles or trellis-work, as the case may be. Allow plenty of space between the shoots, as the fruits will not be nearly so fine if the branches are crowded. When the training is completed, fork up the ground, and then apply a mulching of rotted manure. Fresh canes may be planted at the first opportunity when the weather and soil are favourable. In the meantime have the ground properly prepared for the plants.

Small fruits.—It is desirable to have a reserve of young bushes both of Currants and Gooseberries. These home-grown plants admit of any necessary planting being done early in the autumn, and they receive very little check in transplanting. Cuttings for propagating Currants and Gooseberries should be made of well-ripened wood. Select some of the best shoots removed when pruning, tying them in small bundles, and placing them in damp soil or sand until required. The shoots may be prepared under cover during bad weather, when out of work is impossible, and should later on be planted at the first favourable opportunity. When preparing the cuttings of Gooseberries and Red and White Currants, only about four or five buds should be left at the top of the shoot, removing all others, or suckers will cause trouble later on. The cuttings should be from 15 to 18 inches long, after removing the thin, weak end of the original shoot. No buds should be removed from Black Currant shoots, and the cuttings may be rather shorter than those of the Gooseberry. The reason for leaving all the buds is that the Black Currant always fruits better on young wood, and, leaving these buds, allows plenty of strong shoots to spring from the base of the bush. Gooseberries and Red Currants, on the contrary, are better on a clean, short stem. A cool, sheltered border is the best place for the cuttings, but after the first year they should be transplanted to an open piece of ground. The ground having been previously dug, should now be raked over, and all the larger stones removed. The cuttings should be inserted firmly in the ground, putting them about 4 to 6 inches below the surface.

General work.—A good plan is to have a fire burning always in the garden to consume the prunings, weeds and rubbish. Endeavour to keep every place tidy; there is no economy of labour in allowing heaps of rubbish to accumulate in corners or in yards; if these are burnt up, the ashes make valuable manure. See that imperishable labels are fastened to fruit trees. In view of severe weather, where experience has proved the necessity of protecting Fig trees during winter, this should be done without further delay.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens or plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will gladly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SAURDAY, DECEMBER 25—
Christmas Day. Quarter Day.
MONDAY, DECEMBER 27—Bank Holiday.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—38.5°.

ACTUAL TEMPERATURES:—

LONDON.—Tuesday, December 27 (6 P.M.). Max. 37°; Min. 25°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden London—H. ednesday, December 22 (10 A.M.): Bar. 29; Temp. 53°; 41 other—Dull.

PROVINCES.—Tuesday, December 27. Max. 40° Cornwall and S. Ireland; Min. 25° Durham.

SALES FOR THE ENSUING WEEK.

THURSDAY—

Dutch Bulbs, Herbaceous and Border Plants, at 12; Roses and Fruit Trees, at 130; Palms, Azaleas, Rhododendrons, &c., at 5; at 67 and 68, Cheapside, London, E.C., by Protheroe & Morris.

It can scarcely be claimed that the year now nearing its close has been marked by any horticultural event of outstanding importance, although it has been attended with great activity and steady progress. If there is one fact more obvious than others, it is the increased prosperity of the Royal Horticultural Society. By continuing the sound horticultural policy, happily inaugurated after the salutary lessons at South Kensington, successive councils have obtained the confidence of the public, and the Society now occupies such a position that its usefulness and influence are felt throughout the country. The fortnightly meetings in the Society's building, of which every Fellow is justly proud, are invariably interesting. Indeed, these displays have grown so much in extent that they appear to crowd the present hall, with its greatly-increased area, just as often as the resources of the old Drill Hall used to be overtaxed. The annual exhibitions in the Inner Temple Gardens and Holland Park were again eminently successful, that at Holland Park having exceeded in general interest any of its predecessors. The annual show of British-grown fruits was allowed to lapse, and in its place there has been a series of competitions at the fortnightly meetings. The idea was to encourage exhibits of fruits and vegetables at these meetings—for hitherto they have been but poorly represented—and thus distribute throughout the year some of the interest that attached to the autumn show. In some degree the objects have been realised, but it will probably be felt that the competitions have not been sup-

ported quite so liberally as was desirable. The reason, doubtless, is that most of the growers of hardy fruit reside at considerable distances from London, and, whilst they are disinclined to exhibit in competitive classes unless they are themselves able to stage their fruits, it is scarcely worth their time to come to London expressly for the purpose of showing in a single class. It may be noted here that next year the usual show will be revived, for the Council has already announced that an exhibition of British-grown fruit will take place in October. The jubilee of the Floral and Fruit Committees was celebrated by a dinner, at which Sir Trevor Lawrence presided.

SPECIAL FLORAL SOCIETIES.

The increased interest in horticulture on the part of the general public is reflected also in the flourishing condition of most of the special floral societies. Of these we may cite the National Rose Society for an example. Extracts from the annual reports, published in our last issue, show that the membership has increased during the present year by 647. The total number of members is now 3,797, as compared with 1,308 in 1904. Notwithstanding the expenses incurred by holding several exhibitions during the year, and publishing the *Handbook on Pruning Roses*, *Official Catalogue of Roses*, and the *Rose Annual*, the finances have steadily improved, and the Society has, very wisely, placed a sum of £300 to the reserve fund, which now amounts to £750. The National Sweet Pea Society has increased its membership from 779 to 938, and its activities are supported by much enthusiasm on the part of its members. The National Chrysanthemum, National Carnation and Picotee, National Auricula and Primula, the National Dahlia, and the Winter-flowering Carnation Societies, if unable to show as much progress as those already mentioned, have nevertheless given proofs, by their several excellent exhibitions, of vigour and enterprise. It is to be remarked that one more National Society has been added to the list in 1909. Opinion may be divided as to the need for further multiplying such societies, but, rightly or wrongly, it has been felt by many of those most interested in the cultivation of vegetables that these necessary products have not received sufficient recognition from the Royal Horticultural Society; therefore, a National Vegetable Society has been formed, and an exhibition will be held next October. The Society will also conduct trials, which are expected to have considerable interest for gardeners. If it is able to discharge useful work not at present being carried out, the histories of similar societies go to show that this one may hopefully expect a large measure of public support.

THE PROVINCES.

The provincial societies have generally maintained their hold upon the public. There may be some cases where the interest has decreased, but these are concerned with autumn shows, at which Chrysanthemums form the principal feature. The great summer exhibitions at Shrewsbury, Edinburgh, Wolverhampton, York and other places were as extensive and excellent as ever. Whilst, speaking of Edinburgh, we may recall the fact that during the year the Royal Caledonian Horticultural Society has celebrated its centenary. In a

review of its history in our columns, Mr. David W. Thomson recalled its long and honourable record. It is felt by many Scotsmen that the position it fills to-day is less satisfactory than it should be, and there were indications during the exhibition in September last that efforts would be made to increase its prestige and usefulness. It is to be hoped that a suggestion put forward on that occasion for the amalgamation of the two leading Scottish horticultural societies will be realised. Scotsmen should be shrewd enough to see that the support obtainable by either society is insufficient to enable them to properly serve the interests of Scottish horticulture, and if this fact is recognised, the case for amalgamation is already proved.

NEW PLANTS.

Many new plants have been exhibited, and these will form the subject of an article in our next issue. The largest proportion are hybrids raised by skilful plantmen in this country, but there is also a considerable number of new species from abroad, especially from China, where Mr. E. H. Wilson and others have recently botanised. Some of the most striking brought to notice during this year include the new *Primulas* introduced through the agency of Mr. Forrest, whose excellent photographs of Chinese plants are now appearing in this journal. It is satisfactory to know that Messrs. Jas. Veitch & Sons have a representative in Western China at the present time, and, we believe, Mr. Forrest proposes to sail next month for that district and Thibet as a representative of Messrs. Bees, Ltd. Thus we may hopefully expect to receive many more new species from that comparatively unexplored region.

WEATHER AND THE CROPS.

The season of 1909 has been a trying one for cultivators. Early in the summer there were excellent prospects of good fruit crops, but these latter failed to develop as they should have done, owing to adverse weather conditions. In this climate there is seldom excessive sunshine, but this year the summer, always a short one, was confined to a week or so in the middle of August. During this short period there were tropical skies and sunshine, but afterwards nothing but damp weather and dull days, in which gardeners had all they could do to fight the innumerable weeds that appeared amongst the crops. To some of the vegetable crops the unusual amount of moisture was beneficial, but the Apples and Pears, being ill-matured, have not shown good keeping qualities, and every variety is deficient in flavour, just as were the Strawberries, Raspberries, Plums and other soft fruits. It may very well prove to be the case that the failings of the past season may have a bad effect on the fruit crops next year, owing to the trees and buds being less well ripened than usual.

DARWIN CENTENARY.

The Darwin Centenary celebrations in June last, at Cambridge, represented the great veneration entertained over the whole world for the life and work of the great naturalist whose investigations and researches have yielded results which have benefited gardening and all pursuits that have any relationship with the natural sciences. As was pointed out at the time of the centenary,

Darwin was a frequent contributor to these pages. Thus was there a kind of mutualism established, for he has left it on record that the experiences in practical gardening related by our correspondents were not without value in helping to elucidate the many problems which he was able to solve. It is a noteworthy circumstance that one hundred years after Darwin, Professor Bateson has been appointed the first Director of the John Innes Horticultural Institution, which it is expected will be opened next spring. Whatever else may be undertaken at this Institution, it is certain that there will be systematic researches in heredity, which, although one of Darwin's chief objects of study, is nevertheless fresher and more absorbingly interesting than ever since the discovery of Mendel's law.

The two first lectures in a series instituted in memory of Dr. Masters were delivered during the present year by Professor Hugo de Vries, who selected for his first subject "Dr. Masters' work on *Vegetable Teratology*," and for his second "The Origin of Garden Varieties." In this latter lecture Professor de Vries referred to his own experiments and observations on "Mutations."

LEGISLATION.

Early in the year a Government Committee reported in favour of a large system of State afforestation, for the threefold objects of utilising waste lands, cultivating a home supply of timber, and providing work for the unemployed. The Board of Agriculture and Fisheries have used the powers entrusted to the Department for stamping out diseases of field and garden crops, particularly in the case of the American Gooseberry-mildew. The warty or black scab disease of Potatoes, which was observed some years ago and illustrated at the time in these columns, has appeared in epidemic form in some localities, and has in consequence been scheduled as a notifiable disease.

Horticultural traders have been relieved of a grievance by the new Act authorising the local justices to grant them licences for the sale of poisonous compounds, in cases where the public has not already proper and convenient means of obtaining them. The public health and interest being safeguarded by the regulations of sale, it is a matter for satisfaction that in most cases the local authorities have served the public convenience by issuing one or more licences to dealers in general horticultural requisites.

It will be seen from a note on another page that a special concession to florists granted by the Home Secretary in October, 1908, in regard to the Factory and Workshop Act, 1901, has been rescinded.

HORTICULTURE ABROAD.

With reference to foreign affairs, we have recorded important horticultural events in Belgium and France. In Belgium, effect has been given to the promise made last year of a State Department of Horticulture, and in France there has been appointed the Standing Committee on Horticulture, the functions of which were outlined in our issue for last week.

In April an international exhibition was held in Berlin, which was visited by a deputation of the Royal Horticultural Society and

others. The exhibits contained many features of interest, and the representatives from Britain will long remember the cordial reception accorded them by German horticulturists. In connection with this event it will be remembered that in September last the Royal Horticultural Society caused an announcement to be made that the Council proposed to call a public meeting to consider the question of holding a great international exhibition in London in 1911, on similar lines to the memorable one of 1866. Nothing has been heard of this since, and it may well be that the Council has found a difficulty in getting a suitable site for the exhibition if it intended to go this far before summoning the meeting. In any case, we think our more impatient correspondents may rest assured that the Council is in earnest in the matter, and that means will be found for holding the show.

THE ROYAL BOTANIC SOCIETY.

This subject naturally leads us to the question of the proposed amalgamation of the Royal Botanic Society with the Royal Horticultural Society. Our readers have seen the correspondence between the two societies which was published in our last issue, and we know that already some of them feel a certain amount of fear that the Royal Horticultural Society may get involved in some arrangement that may not be to its interest. So far as we understand the position, the only asset the R.B.S. has to offer is a site for the bigger shows, which cannot be satisfactorily accommodated in the Vincent Square Hall. Since the lease of the Chiswick Gardens was surrendered on the ground that it was worthless for trial purposes, it can hardly be contended that useful trials could be conducted at Regent's Park. Bearing this in mind, we feel confident that the R.H.S. Council will not hastily accept any arrangement which would have the effect of placing the policy of the Society partly in the care of the R.B.S. Fellows will take comfort from the words of Sir Trevor Lawrence that no arrangement will be agreed upon without the consent of the Fellows.

LITERATURE, CHARITY AND OBITUARY.

Garden literature has received many additions during the year. Amongst these works *The Orchid Stud Book*, by Messrs. C. C. Hurst and R. A. Rolfe, is a serious contribution to the question of how to provide a convenient form of nomenclature for multigeneric orchid hybrids. *Mendel's Principles of Heredity*, by Professor Bateson, summarises the present state of our knowledge on this important subject. Other noteworthy publications are:—An admirable work on insect pests of fruit trees by Mr. F. V. Theobald; *Illustrations of Conifers*, by Mr. H. Clinton Baker; *Trees and Their Life Histories*, by Dr. Percy Groom; several fresh volumes of the *Book of Nature Study*, by Dr. Bretland Farmer; the second volume of the *Vegetable Growers' Guide*, by Messrs. J. and H. J. Wright, which completes the most comprehensive book on vegetable culture in the English language; *In a Yorkshire Garden*, by Mr. Reginald Farrer; and *Harley Garden in Spring and Summer*, by Miss Willmott, V.M.H.

The gardening charities have striven, not unsuccessfully, to mitigate the suffering of

the widows and orphans, but the task is very great, and big hearts are needed to grapple with the many calls for assistance. The Gardeners' Royal Benevolent Institution particularly is unable at present to assist the many cases requiring aid.

The British Gardeners' Association continues its way, seeking to make itself a means of raising the gardener to a higher level of efficiency and status, whilst the numerous debating societies in every part of the country are disseminating the practical experiences gained by their best-informed members.

The obituary list includes many well-known names. We have to mourn the loss, amongst others, of the distinguished botanist, Sir Geo. King; the skillful and indefatigable Orchid cultivator and raiser, Norman C. Cookson; several prominent nurserymen, including George Dickson, of Chester, John Forbes, of Hawick, Peter Kay, of Finchley, and Peter Barr, who had travelled round the world after his retirement from business; and such first-class exponents of practical gardening as David Thomson, William Miller and John C. Tallack.

OUR ALMANAC.—According to our usual practice, we shall shortly issue a *Gardeners' Chronicle Almanac* for the year 1910. In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and Allied Societies, or any of our correspondents, will send us IMMEDIATE INTIMATION of all fixtures for the coming year.

PRESENTATION TO MR. JAMES GRIEVE.—A large company of horticulturists and others assembled in the Royal British Hotel, Edinburgh, on the 14th inst. to do honour to this veteran nurseryman on the completion of 50 years' work in the city of Edinburgh. Mr. GRIEVE was born 68 years ago at Peebles, and after serving his apprenticeship in the nurseries of Messrs. GENTLE & SONS, of that town, and four years in the gardens at Stobo Castle, entered, in 1859, the nurseries of Messrs. DICKSON & Co., at Pilrig, Edinburgh. When the firm removed to Liberton, Mr. GRIEVE started business in company with his two sons at the old premises at Redbraes. A gold watch and chain and a purse of sovereigns were presented to Mr. GRIEVE by Mr. D. W. THOMSON, on behalf of about 180 subscribers. Mr. GRIEVE was one of the first members of the Scottish Horticultural Association.

BEQUESTS BY A SEEDSMAN.—Mr. FARQUHAR UOQUHART, of Inverness, seedsman, who died in August last, left personal estate in the United Kingdom valued at £16,247. The testator bequeathed £300 to the Northern Infirmary, Inverness, and £200 each to the Northern Counties Institute for the Blind, Inverness, and the Highland Orphanage, Inverness; and, subject to life interest, £1,000 to the Northern Infirmary, Inverness, and £500 each to the Institute for the Blind, Inverness, and the Highland Orphanage, Inverness.

FLORISTS WORKSHOPS AND THE FACTORY ACT.—The Home Secretary, pursuant to section 3 (5) of the Rules Publication Act, 1895, made on December 15 an Order under section 59 of the Factory and Workshop Act, 1901, rescinding as from January 1 next the Order made by him on October 15, 1908, granting a special exception to florists' workshops under section 46 of the said Act and so much of the Order made by him on October 15, 1908, granting a special exception under section 45 of the said Act, as relates to florists' workshops.

PRESENTATION TO A NURSERY EMPLOYÉ.—Mr. THOMAS SWIFT, of Messrs. HURST & SON, 152, Hounslow-lane, who is retiring at the end of this year, after upwards of 40 years' service, was, on the 17th inst., presented with a silver centre-piece and two silver vases by past and present employés of the firm. On the same evening Mr. SWIFT was entertained to dinner at the London Tavern, Fenchurch Street.

THE NEW BOTANICAL LABORATORIES OF UNIVERSITY COLLEGE.—The new botanical laboratories of University College, London, were opened on Friday, December 17, by Dr. D. H. SCOTT, F.R.S. After the inaugural ceremony the guests inspected the laboratories, which occupy

company the operation; for instance, the affording of fresh soil or such ingredients as wood-ashes, lime rubble, and manure. A striking instance of this kind has just been brought to our notice by a correspondent who has the management of a large garden in Buckinghamshire. He has sent us fruits of Bramley's Seedling Apple. These are in two samples, one being from trees planted 15 years ago, and not since moved, the other from similar trees that were lifted three years ago, at which time they were root-pruned, and lime rubble and burnt earth added to the soil about them. All the manure given has consisted of a top-dressing of leaf-mould applied in summer. The fruits varied so much that we took them to be distinct

FRUIT PRESERVING IN TASMANIA.—According to the *Times*, the capital of Messrs. H. JONES & CO., LTD., fruit preservers of Old Wharf, Hobart, Tasmania, has been increased to £500,000. The company has been growing very rapidly, and now employs about 4,000 hands. The production in Tasmania of Strawberries, Raspberries, Currants, Gooseberries, and Blackberries is constantly increasing, and, in order to secure the best fruit, Messrs. JONES have allotted shares to leading fruit-growers. The original shareholders in the company now hold one-half of the shares, and the other half is held by those who sell fruit to or buy preserves from the company.

*** A BOOK WITHOUT WORDS.**—Many of our readers are familiar with the name of Miss ELLEN WILLMOTT, V.M.H., whose enthusiasm for horticulture is only equalled by her great knowledge of gardening matters. But comparatively few have had the privilege of visiting Miss WILLMOTT's garden at Great Warley, so full of treasures and so rich in interest. They will, therefore, welcome the more gladly the reproductions of Miss WILLMOTT's photographs now issued by Mr. QUARTICH. The volume contains 41 illustrations, each of which measures 9 by 11½ inches. In most cases the views represent but small portions of the garden and, therefore, the plants may be seen in considerable detail. Some are printed in black, others in a tint of brown, and all are on parchment paper. Some of the best include "Naukeen Lilies," "Border of Hardy Flowers," "Gumera by Pool," "Harebells and Mountain Pinks," "Alpine Primroses," and "Wild Crocuses." Interesting as these pictures are, we cannot but regret that the author has issued them without text. A descriptive chapter or two would have helped the reader to piece the various scenes together and get a better understanding of the garden scheme.

ARSENICAL INSECTICIDES.—The volume containing the 31st and 32nd reports, for the years 1907-8, of the Connecticut Agricultural Station, consists of no fewer than 954 pages, and contains the results of valuable investigations on a large number of subjects of interest to horticulturists. The present note, however, deals only with a short, but extremely practical article by Mr. J. P. STREET on the arsenical insecticides, lead arsenate and Paris green. Mr. STREET's conclusions and recommendations are as follows: Paris green (copper aceto-arsenite) is the oldest arsenical insecticide. Its use is, however, open to the objection that, owing to the solubility of the arsenous oxide which it contains, it is apt to damage foliage. This "burning" may be prevented by mixing with the Paris green an alkali, e.g., lime. For use as a spray the following formula is given:—Paris green 1 lb., fresh quicklime 3 lbs., water 100 gallons. If applied dry:—Paris green 1 lb., air-slaked lime 100 lbs. When used with Bordeaux mixture there is no need to add lime, that contained in the mixture being sufficient to neutralise the acid properties of the Paris green. Lead arsenate possesses several advantages over Paris green. It is more adhesive, remaining on the foliage two or three times as long. It is less soluble, and, therefore, though slower in action, is less apt to damage the leaves. By reason also of its lesser solubility, its use by inexperienced men is less dangerous. Another advantage is that lead arsenate keeps longer in suspension than Paris green. Mr. STREET is of opinion that home-made lead arsenate remains in suspension longer than the commercial article. He recommends the following mode of preparation:—Dissolve 24 ounces of lead acetate or 20 ounces of lead acetate in one gallon of cold water (using a

FIG. 191.—GIANT BAMBOOS IN JAMAICA.

(See p. 437.)

the rooms recently vacated by the Department of Physiology. Among the most interesting of the exhibits were the portraits of former members of the botanical staff, including those of JOHN LINDLEY, who was professor from 1823 to 1860, and of Dr. SCOTT, who was assistant professor from 1881 to 1885.

THE EFFECT OF ROOT-PRUNING.—Whilst root-pruning may never be necessary in certain favourable districts and soils, in others, and particularly in late districts and on cold, clayey soils, such treatment is not only beneficial but essential. At the same time, some of the improvement in crop which follows the operation of root-pruning is attributable to certain processes which ac-

varieties; the first sample consisted of large, well-developed fruits with yellowish skin, and marked with reddish stripes and patches. The average weight of each fruit was 10½ ounces and its circumference 12 inches. The Apples of the second sample were as perfectly green as a French Crab, not more than half the size, whilst their average weight was 5 ounces, and circumference 9¼ inches. Our correspondent states that in the heavy soil of his particular garden the best results can be obtained only by lifting the trees at regular intervals, and treating them in the manner described, combined with a system of pruning by which the branches are thinned out sufficiently to expose them fully to the sunlight.

* *Warley Garden in Spring and Summer*, by Ellen Willmott, F.L.S., V.M.H. (London: Bernard Quaritch.) Price 41 Is.

wooden vessel); to another wooden vessel, containing three quarts of water, add 10 ounces of sodium arsenate. Pour the two solutions into a spray tank containing from 100 to 150 gallons of water. A white precipitate of lead arsenate is formed at once, and the fluid is ready for use. For general purposes 3 lbs. of lead arsenate to 50 gallons of water is sufficient. It may be used with Bordeaux mixture, but in this case it is perhaps less effective than Paris green.

INSECT PESTS IN THE WEST INDIES.

UNDER the auspices of the Liverpool School of Tropical Medicine, Mr. Robert Newstead, F.E.S., has conducted investigations, during last summer, on the insect pests in the West Indies. Most of the work was done in the island of Jamaica, which Mr. Newstead made his headquarters. He found, however, that the various pests were fairly common on all the islands. At the recent Colonial Exhibition in the Royal Horticultural Hall, Westminster, Mr. Newstead gave an account of the results of his expedition.

Many of the pests have not been described previously. There are maggots, thrips, mealy bug, destructive ants, wood-boring beetles, weevils, slugs, butterflies, moths, scale and other insects that attack Cotton, Maize, Sugar Canes, Oranges, Mangos, Rubber and other economic plants. Mr. Newstead's mission was to discover the best remedies.

Among much that was extremely interesting in Mr. Newstead's lecture, his remarks on certain ants, which destroy the Cacao flowers, may be cited. The ants belong to a small, black, stinging species, apparently a Myrmecid, near the genus *Stenamma*. Their nests are generally constructed so that they are partly protected from the direct rays of the tropical sun, often on the outskirts of plantations, without any apparent regard to the distance from their feeding grounds. They do not devour the leaves of the Cacao trees, but are attracted by "honey dew" secreted by aphides. The ants endeavour to screen their movements, and construct galleries or covered ways, using, amongst other things, the petals of the flowers which they injure in such a way as to prevent them falling from the trees. The loss to the trees, occasioned in this way, is considerable.

A serious pest is found in the Girdler-weevil of the Orange and Cacao (*Præpodes vittatus*). The grubs occur just below the surface of the ground near the junction of stem and roots; they eat right through the bark, so that the tree dies. The remedy is a simple one, viz., to replace the soil about the collar of the tree with rock-chippings or small stones. The rubber-producing trees have many pests. Mr. Newstead found on plants of *Ilexa braziliensis* a night-feeding slug which no one had previously detected, although the damage it occasioned was considerable. A girdle of cotton wool around the stem is recommended as a simple yet effectual remedy.

The culinary vegetables of the West Indies appear to have as many foes as our own, and Mr. Newstead found caterpillars of butterflies attacking Cabbages, of moths which injure Beet, and a larva or grub destructive to the Sweet Potato.

The paper concluded with a description of the scale pests of these islands. They have spread lately with great rapidity, probably by strong winds.

The Bamboo forms remarkably fine specimens (see fig. 191) in these Colonies, but is subject to the depredations of the fringed scale (*Asterolecanium bambusa*). The two kinds of scale most destructive in Jamaica are *Aspidiotus ficus* and *Chionaspis citri*, foes of the Rubber and Orange trees respectively. The paper included descriptions and formulae for washes, some of which will destroy the mosses and lichens on the branches, as well as the insect pests. Not a few of the trees are infested with the Spanish Moss, *Tillandsia usneoides* (see fig. 192), an epiphytic member of the Natural Order Bromeliaceæ.

BATTERSEA PARK.*

(Concluded from page 421.)

THE SUBTROPICAL GARDENS.

IN close proximity to the avenue is the subtropical garden for which the park has become famous. The garden is well sheltered upon the north-east and south-west by high ground and belts of trees and shrubs, the only side at all exposed being the south. By this means the tender subjects planted in the garden are protected from cold winds and gales, and are given all the light and warmth possible.

The trees used for wind breaks are the black and white Poplars, Ash, Lime, Alders, and Planes. The south-westerly gales have had a curious effect upon the Poplars: all the branches

From March to October the garden is exceedingly attractive. The flower-beds are occupied by a great variety of flowering and foliage plants. During the summer months the large Palms and other half-hardy foliage plants are placed upon the lawns, either in groups or as isolated specimens.

Many hardy plants are also used in this garden because of their tropical appearance. The following are the most deserving of mention: *Ailanthus glandulosus*, *Gymnocladus canadensis*, *Paulownia imperialis*, *Rhus glabra* and *R. typhina* are useful shrubs. They are cut back each to one bud every year; by this means the plants are induced to produce beautiful, large leaves of Palm-like appearance, those of the *Ailanthus* reaching a length of 6 feet.

Fatsia japonica does well planted out perma-

FIG. 192.—WEST INDIAN TREE BEARING FESTOONS OF THE EPIPHYTIC FLOWERING PLANT *TILLANDSIA USNEOIDES*.

have been permanently bent over in a north-easterly direction. The subtropical garden is laid out in quite an informal manner: it is intersected by a broad, winding walk, upon either side of which are a number of flower-beds laid out upon the lawns. The beds do not form a geometrical design, but each one has been shaped to harmonise with its own particular surroundings. A well-kept lawn occupies the centre of the garden, and a number of deciduous and evergreen trees and shrubs are planted in groups around it. These help to furnish the garden in winter, and also have the effect of preventing the flower-beds from being seen all at one time.

* A paper given before the Lond. a branch of the British Gardeners' Association, by Mr. V. Corkram.

nently in moist, sheltered positions: the white corymbs of flowers produced in October and November are very striking. *Polygonum cuspidatum*, *P. sachalinense*, and *P. Sieboldii* are planted in masses in odd corners, and give a bold effect. Bamboos are also largely used. Of hardy perennials there are *Acanthus latifolius*, *Gynecomium argenteum*, *Gunnera scabra*, *Rheum palmatum*, *Heracleum giganteum*, and such species of *Yucca* as *Y. recurvifolia* and *Y. glauca*.

THE LAKES

The two lakes in the park cover an area of about 13 acres, and are situated in the lowest portion of the grounds: the larger lake is used extensively for boating during the summer

—for the charge of 6d. per hour a boat to carry one, two or four passengers may be hired. Even at this low figure the boats earn a considerable profit; on the year's takings the annual net profits average about £700. A motor launch is also employed to take visitors around the islands. The banks are irregular in shape and outline, so that bays and promontories tempt the visitors on miniature voyages of discovery. By the margins of the lakes the grassy slopes add a pleasing effect. The slopes are broken up by small belts of trees and shrubs planted upon mounds of earth made, no doubt, when the ground was being excavated. The mounds are planted with groups of Lilac, Laburnum, Hawthorn, Almond, Forsythia, and many other flowering trees and shrubs. Planted along the margins of the lakes are such ornamental foliage plants as Bamboo, Gyneryum, Mescanthus (Eulalia), Iris, Funkia, and Hieracium.

Fish and waterfowl give animation to the scene, and are a source of endless interest to the children.

On three large islands are planted Arbutus, Aucuba, Laurel, Elder and Dogwood as undergrowths, and trees of Poplar, Willow, Plane, Alder, and Birch. *Salix babylonica* is particularly striking as a waterside tree.

The two lakes are separated by a low dam which is spanned by a rustic, wooden bridge. It consists of large pieces of timber which rest at each end upon a stone wall, that also supports the banks on either side. The bridge is further supported by struts which rest upon a concrete foundation, and are fastened at the top in the angles of the cross pieces. Graceful, weeping trees, such as *Populus alba*, *Salix babylonica*, and *Alnus glutinosa*, with their branches overhanging and touching the water, give beautiful reflections of light and shade, whilst in sharp contrast with these is the characteristic, upright *Populus nigra fastigiata* in the background. The beauty of this spot, however, is somewhat marred by the number of artificial-looking brick burrs that have been used to support the dam and margins of the lakes. Some attempt should be made to hide them.

THE CASCADE.

This is a very striking feature of the park; it is formed of huge boulders arranged precipitously. The water, which is obtained from the pumping station close by, falls over the rocks in a cascade. The rocks are partly draped with such trailing plants as *Cotoneaster microphylla*, *Jasminum nudiflorum*, *Vitis purpurea*, *Berberis stenophylla*, and *Vinca major*.

THE RUSTIC WALK.

A charming feature of the park is the rustic walk situated near the West Lodge, and consisting of a winding path cut through a little wood, and bounded upon each side by a rustic fence composed of Larch poles nailed together crosswise. During the heat of summer it affords a cool retreat. The shade is too dense for the successful cultivation of any great variety of wild flowers, but in spring there is a lavish display of bloom from the bulbs that have become naturalised in the grass. Crocuses, in bold, irregular masses of separate colours, give the first display. They are seen at their best when the sun is shining upon them through the leafless branches of the trees. Narcissus and Daffodils follow the Crocus in quick succession, and later the Bluebells make a charming woodland scene. In the centre of the wood is the botanical garden. This garden was made for the benefit of students attending the local Polytechnic and art schools. Every facility is afforded them to examine the growing plants, and specimens are also supplied for examination in the class-rooms. The flowers in this garden are allowed to grow and bloom so that they appear as natural as possible. There is no attempt at a dazzling display; dotted about in irregular groups can be seen many old-fashioned flowers. The charm of solitude is the one thing dear to the country-bred Londoner, and here is a haven of rest; at all times the noise is softened to a hush, whilst on Sundays a peaceful calm pervades the place. Here the blackbird, the thrush, wood pigeons, robins, tits, and wrens sing their songs and rear their young. The many birds of the park become exceedingly tame in their semi-domesticated state—even such naturally shy birds as wood pigeons and moorhens will take food from the hands of visitors.

It must be confessed, however, that the birds do a great deal of harm. The sparrows destroy the Crocus blooms, Carnation shoots and Polyanthus flowers. The pigeons, blackbirds, and thrushes devour large quantities of berries in the autumn. Nevertheless, to destroy the birds in a park such as this would be a sad blunder; for their presence helps the Londoner to know something at all events of country life.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE ALMOND AND PRUNUS PISSARDII IN SCOTLAND (see pp. 270, 298).—In Lady Fowler's garden at Inverbroom, in the north-west of Ross-shire, *Prunus Pissardii* (*P. cerasifera atro-purpurea*) fruits most summers, and this year an Almond tree had a very heavy crop of fruit. The tree of *Prunus Pissardii* is sheltered from the east, and thereby escapes, to a certain extent, injury from spring frosts. The Almond is also sheltered somewhat, but the cold and wet of the past season have prevented the fruits from ripening. *H. Low, Beaconsford Gardens, Ross-shire.*

APPLE HAMBLEDON DEUX-ANS (see pp. 157, 320, 346).—I agree with *A. D.* as to the merits of this Apple. When I first became acquainted with it 40 years and more since in the West of England, my father sold fine fruits to the best fruiterers in Bath. Thirty years ago, when entering a garden in North Hants., I found a big orchard tree in its prime, and during the 11 years I was there it never failed to crop. The fruits were of a good size, clean, and they kept well into April. So impressed was I with the results of this tree, that, when later I had charge of a garden in the West of England, I planted trees of it; but during the 20 years I was there I never saw any fruits approaching those produced in North Hants., although I had no cause to complain of the trees' bearing. I can endorse all *A. D.* says respecting its behaviour at Hackwood Park. I like this Apple for cooking, and especially from a flavour point of view. After a long experience, I consider this Apple far better than many of the large, soft, modern kinds, both for flavour and keeping. But, after all, soil and situation greatly influence Apples. *John Crook, Camberley.*

ORIENTAL POPPIES (see p. 375).—Mr. Molyneux's article tempts me to supplement his remarks. Having paid considerable attention to these Poppies, I am forced to the conclusion that Mr. Molyneux is not quite up to date with his list of varieties. The cultural hints are good. Many gardeners plant Poppies in poor soil and give them very little attention, and the result is not satisfactory. It is best to cut the flowers in the morning just when they commence to unfold and not simply when the calyx is unfolding. It is difficult to believe that anyone seriously suggests that these or any other flowers will last longer in water if the ends are sealed by the aid of a lighted candle or by any other means. There is certainly no need to seal the stems of Poppies, for they do this themselves if not put in water almost as soon as cut. The plan we adopt is to recut the stems immediately before being put in water. Some exhibitors cut them under water to prevent the sealing. Comment is made on the disagreeable odour, and Mr. Molyneux's experience is that the bracted flower has this more pronounced than the ordinary type. I can only say that I catalogue upwards of 60 varieties, not one of which is mentioned by Mr. Molyneux, and practically all are devoid of the Poppy odour and nearly all have bracts. The larger the bract, the more is the flower admired. In selecting seedlings (and thousands have been raised here) preference is given first to colour and form, then a stiff, sturdy, and upright stem that requires no support. The flower must be odourless, and in most cases have six petals instead of four, which is the number in most seedlings. Another point is substance. Some varieties produce flowers which are very fugacious and become "floppy" almost as soon as cut, whilst others retain a beautiful form for four or five days. It is surprising how tastes vary in respect to the

colours found in Oriental Poppies, and much interest may be found in standing near an exhibit of the newer colour ("art shades") and noting the various expressions of opinion. Most men, especially gardeners, look upon them with distavour, whilst the majority of ladies are rapturous in their praise of them. *W. J. Godfrey.*

—In advising others what varieties to grow, I named those which I knew to be good by close experience. I have not grown any of Mr. Godfrey's "art" shaded varieties, and, although I have seen them at the Temple Show repeatedly now for some years, they do not appeal to me. I have not noticed their inclusion in any other exhibit of these flowers, either from a private grower or in a nurseryman's collection, therefore I am forced to the conclusion that many more beside myself are not quite up to date in their selection. In regard to the sealing of the ends of the stalks when they are cut, if Mr. Godfrey had any experience of even the common wild Poppy for table decoration he would appreciate the difference between sealed and unsealed blooms long before evening of the same day. I not only advise sealing, but practise it with much advantage. When cutting flowers for transmission by rail or post, I know the advantage of securing the buds when the calyx is unfolding, and I fancy the Editors have had the pleasant experience for several days of watching the various colours and forms unfold from the calyx-breaking stage of each variety. Yes, I comment strongly on the disagreeable, opium-like odour given off by some of the bracted varieties, and for that reason I favour the Oriental type, *E. Molyneux*. [Some flower-buds sent us by Mr. Molyneux in June last showed no signs of unfolding at the time of their receipt, but one after another developed beautifully during the succeeding week (see *Gardeners' Chronicle*, June 26, p. 413).—*Ens*]

THE HIGH PRICES OF RUBBER.—The extended cultivation of rubber-yielding plants is a subject that has often been referred to in the columns of the *Gardeners' Chronicle*. This is doubtless due to the fact that rubber plants have, over a very long period, occupied the attention of the authorities at Kew, and a large number of trained men from that establishment have gone forth to distant colonial and foreign possessions of the Empire to take up the cultivation of these plants. They naturally look to their *Chronicle* for any fresh records. To such, as well as to others, some extracts from notes that recently appeared in the *Chemist and Druggist* on the remarkably high prices that have prevailed of late will be interesting. "The price ruling for Para rubber on the London Spot Market during the last three weeks in October, namely, 8s. 9d. to 9s. 2d. per lb., was a record in the history of this product, and 100 per cent. higher than the average value during the years 1905 and 1906. At the close of the year 1907 Para was fetching only 5s. 9d. per lb., and in February, 1908, fine Para sold at 2s. 9d. to 2s. 10d. per lb. Prices continued to increase till the close of the year, when it stood at 5s. 2d. per lb. Opening in January of the present year and continuing to the middle of May, the price ranged from 5s. 2d. to 5s. 4d., which has generally been considered in the trade as a fair normal price for manufacturing. At the end of May it had risen to 5s. 7½d.; at the end of June to 6s. 3d., and at the end of July from 6s. 4d. to 8s. 4d. In August there were very slight fluctuations, but at the close of September the price had risen to 9s. 2d. per lb." It is satisfactory to know that this rapid rise in the price of Para rubber from the Amazon is not due to any shortage of imports, for, compared with the previous four years, they have been quite up to the average; besides this, the supply of "cultivated" Para rubber from the plantations in the Malay States totalled over 200 tons at auction in London in one month. The advance has been partly due to the action of one firm which successfully secured the bulk of the stock. It is reported that the advanced prices are stopping orders, other cheaper articles being substituted where possible; for instance, india-rubber mats were getting very popular and much in use, but the advanced price has driven users to rope and fibre mats again, and the same thing is happening with scores of other things into the composition of which rubber enters. *J. R. J.*

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 21.—There was no exhibition on this occasion, but the respective Committees met to adjudicate upon novelties. There were only two exhibits before the Fruit Committee; both were seedling Apples; and none before the Floral Committee.

In the Orchid section, however, many novelties were forthcoming, and the Committee, consisting of J. Gurney Fowler, Esq. (Chairman), and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, W. Boxall, Stuart Low, F. Sander, H. G. Alexander, A. Dye, W. Cobb, H. A. Tracy, C. H. Curtis, W. H. Hatcher, Gurney Wilson, R. Brooman White, and J. Charlesworth, made a number of awards as follows:

AWARDS.

FIRST-CLASS CERTIFICATES.

Cypripedium Mrs. F. Sander (Eve × insigne Sander), from Messrs. SANDER & SONS, St. Albans.—A charming flower of the albino class. The large, wax-like upper sepal is snow-white, with a small emerald-green base. The petals, which are undulated at the edge, are broad and, like the firm, broad lip, greenish-primrose-yellow, slightly tinged and marked with light purple. The plant is a strong grower and a desirable acquisition.

Dendrobium Phalopsis album, Sander's variety, from Messrs. SANDER & SONS.—The largest and finest-shaped, pure white form which has yet appeared.

Odontioda Keighleyensis, Fowler's variety (Cochlidia Novziana × Odontoglossum cirrhosum), from J. GURNEY FOWLER, Esq., (Glebelands, South Woodford (gr. Mr. J. Davis).—A fine advance on the type. The plant shown bore a spike of deep scarlet flowers, the front of the labellum being abruptly reflexed. The chrome-yellow tint on the crest, and white base to the column, formed an attractive contrast to the deep colouring of the rest of the flower.

Zygo-Colax Charlesworthii, var. rubida (Z. Perrenoudii × Colax jugosus), from Messrs. CHARLESWORTH & Co., Haywards Heath.—A distinct variety of the pretty hybrid for which Messrs. CHARLESWORTH recently received an Award of Merit, the prevailing colour in which was deep violet. In the variety rubida the sepals and petals are cream-white, heavily barred with reddish-purple, the lip being ruby-red with a slight purple shade.

Lalio-Cattleya Firminii (L.-C. Ceres var. × Cattleya Dowiana aurea), from Mons. FIRMIN LAMBEAU, Brussels.—A very distinctly-tinted flower, equal in form and size to Cattleya Hardyana, which it also much resembles in the lip. The sepals and petals are Indian-yellow with a pale rose shade; lip crimson, with two yellow blotches at the entrance of the tube, which has gold lines from the base.

AWARD OF MERIT.

Cypripedium Abaster magnificum (Godseffianum × Aleibiades superbum), from Lieut.-Colonel G. L. HOLFORD, C.I.E., C.V.O., Weston-birt, Tetbury (gr. Mr. H. G. Alexander).—A fine flower, with the large size and good shape of C. Aleibiades. The dorsal sepal, which is pure white, has a very small green base, a broad band of purple up the middle and lesser bands of purple on each side forming a trident. The petals and lip are broad, yellowish, with a tinge of purple.

CERTIFICATE OF APPRECIATION.

Oncidium hybridum (tigrinum × lamelligerum), from Messrs. CHARLESWORTH & Co.—An interesting cross of no great floral beauty, but in which the features of the very dissimilar parents can well be traced. The sepals are stalked, the blades brownish; the base of the yellow lip indicates O. lamelligerum in its spiny, cushion-like crest, the blade being narrowed compared with O. tigrinum.

Amongst other plants than those certificated were *Cypripedium Caruso (J. Howes × insigne Harefield Hall)*, resembling a good, well-rounded C. i. Harefield Hall, but with more purple markings; shown by Lieut.-Col. HOLFORD. *Cypripedium Lusitania*, a pretty green flower with a broad, white margin to the dorsal sepal, which had some obscure brown blotches; also a hybrid *Cypripedium* near to C. Laurebel; shown by H. S. GOMSON, Esq., Putney (gr. Mr. G. E. Day).

Odontoglossum crispum-Harryanum Bruggense var. *illustre* had 15 flowers on the spike, each flower being 5 inches across diagonally, and the upper sepals 1½ inch wide; this was shown by Messrs. SANDER & SONS. *Cypripedium Hercules*, a very large and well-formed flower; and, C. Germaine poix var. *Imperialis* were both shown by FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins). *Cattleya Percivaliana alba* (Chiton's variety, a good white flower with yellow disc to the lip and larger than the original form, was shown by Messrs. STUART LOW & Co., Bush Hill Park. *Brasso-Cattleya Thorntoni alba*, a fine, clear white flower, with fringed lip, came from Messrs. ARMSTRONG & BROWN, Tunbridge Wells.

STIRLING HORTICULTURAL.

DECEMBER 11.—The annual general meeting was held on the above date. Mr. Geo. Petrie presided over a good attendance of the members. The annual report and balance-sheet were submitted and adopted. The society's finances show a great improvement. The deficit of £25 at the beginning of the year has been reduced to £10, and it is hoped by another year the entire debt will be cleared off. A special effort will probably then be made to celebrate the centenary of the society.

SOCIÉTÉ FRANCAISE D'HORTICULTURE DE LONDRES.

THE annual dinner of this Society, in commemoration of its 21st anniversary, will take place at the Café Royal, 68, Regent Street, on January 29, 1910. Mons. Philippe de Villemorin will preside on this occasion. Anyone interested in the subject may obtain full information from the president of the Society, Mr. Geo. Schneider, 17, Ifield Road, Fulham Road, London, S.W.

Obituary.

SIR ALFRED JONES.—In the death of Sir Alfred Jones, which took place on December 13, the country has lost one of its most strenuous and enterprising men of business. From humble circumstances Sir Alfred became one of the leading men in Liverpool. Among the most memorable of his achievements was the rehabilitation of the prosperity of the Canary Islands by the development of the Banana trade between them and this country. In doing this he had absolutely to create a market for this fruit, and it says much for his determination that, when difficulties of distribution of the fruit arose, he collected an army of costermongers at the wharves where the Banana boats were unloading, caused them to pile up their barrows with Bananas, and sent them out in the streets of Liverpool to sell the fruit for what they could get for it, telling them that they themselves could have their stock for nothing. After restoring the prosperity of the Canaries, Sir Alfred turned his attention, at the instance of Sir Daniel Morris, to Jamaica. He solved successfully the problem of the long-distance transport of Jamaica Bananas, and received for his services in Jamaica and in the West African Colonies the distinction of a K.C.M.G. Among his many other activities, the assistance he gave in founding the School of Tropical Medicine in Liverpool, and in supporting the enterprise recently undertaken for growing cotton in British territory, will be long remembered.

COUNT HARRACH ZU ROHRAN.—We learn with regret of the death, on December 12, of Johann Count Harrach zu Rohran, president of the Austrian Horticultural Society of Vienna. Count Harrach zu Rohran was, as his position indicates, one of the most celebrated horticulturists in the Austrian Empire, and his services to the science were both numerous and memorable. We offer our sincere condolences to the Horticultural Society of which he was so distinguished an ornament.

SCHEDULE RECEIVED.

Leamington and County Horticultural Society Flower Show to be held in the Victoria Park, Leamington Spa, on Wednesday and Thursday, July 27, 28. Joint Secretaries: Councillor H. V. Richards and Mr. Leo Rawlinson.

MARKETS.

COVENT GARDEN, December 21.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Leeks, 12 bundles	1 6-—
Lettices (French), per dozen	0 1-2 0

REMARKS.—There has been a brisk trade during the Christmas week, but prices, with the exception of Apples, have not advanced. Very large quantities of Oranges have arrived and, as usual at this time of the year, they have sold readily. California Navel Seedless Oranges are of excellent quality. Cob Nuts are more plentiful, but best Walnuts are scarce. Supplies of Lemons are also abundant, and their value is low. Winter Nuts Pears have fetched high prices. Trade generally is good. *E. H. R., Covent Garden, Tuesday, December 21, 1909.*

Potatoes. per cwt. s.d. s.d.	
Bedfords	3 0-3 6
British Queen	3 0-3 6
Up-to-Date	3 0-3 6
Blacklands	2 6-2 9
Dunbars	5 9-6 0
Manitota	4 6-5 0
Lincolns	2 9-3 0
Impire	2 9-3 0

REMARKS.—The stocks of Potatoes in London are not quite so large, however being received on a count of the frost. Trade is rather better, but the importations do not promise to last, unless the weather remains very cold. *F. J. I., Newbery, Covent Garden and St. Pauls, December 21, 1909.*

COVENT GARDEN FLOWER MARKET.

On Monday last, *Richardia africana* (Callist) was selling a 6s. to 8s. per doz. Gardenias, Tulips, and Camellias were scarce. Tuberoses are now plentiful, but as many are cut with the terminal flowers open, supplies may fall off at any time. *Dafodil obtusilobus* has been making 1s. 6d. per bunch, but this price will not be sustained for long. Tulips are plentiful and fairly good; they have been making good prices; whites, yellows, and reds are all about of equal quality. Roman Hyacinths are also grown in small boxes, but there are some good ones in pots, which are taller than those in the boxes. Dutch Hyacinths are also well developed for so early in the season; they are usual growers. *Ericas* are well flowered from all the usual growers. *Chrysanthemums* are plentiful, the pot plants are holding out later than usual this season. Cut bloom up to now has been over-abundant, except for special sorts of medium size. Single varieties appear to meet with an increasing demand. The colours which sell best are the whites, pinks, yellows, and deep crimson. Roses are scarce, and prices have advanced. Liberty has sold for 8s. per dozen. Madame Chateaux is dearer; all others are making advanced prices, and I noticed a few fine blooms of Frau Karl Druschki. Niphets is still extensively grown. *Poinsettias* have suffered from the cold. A very large trade is being done in Holly, Mistletoe, and other evergreens. The Holly wreaths, crosses, and other designs are seen in large quantities; they vary in value from 1s. to 15s., or some may make 20s. each. *A. H., Covent Garden, December 22, 1909.*

LAW NOTE.

WATER SUPPLY FOR A NURSERY.

His Honour Judge Bray, sitting at the Brentford County Court, on the 17th inst., gave judgment in the case relating to the charges for water supplied to Mr. Joseph Darby, a Twickenham nurseryman (see p. 388, in the issue for December 4).

His Honour said that in a previous action the judge held that a person carrying on such a business as a florist must need more water than would be wanted for mere domestic purposes, and found for the defendant. On the second point—the alleged improper use of water—it was not disputed that there was an implied obligation not to intentionally or recklessly waste water, and that if it was proved there was such waste, the plaintiff was entitled by way of damages to deduct from the rate a sum equivalent to the said waste. He was satisfied that there had been an undue and reckless waste of water by the defendant, and he assessed the amount of damages at £16. He gave judgment accordingly.

*** The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

APPLE TREES DISEASED: C. G. The shoots are affected with Apple-scab fungus. Remove all the injured branches and spray the trees with dilute Bordeaux mixture in spring, when the leaves are expanding.

APPLE TREES FAILING TO FRUIT: S. B. From your note it would appear that the trees are growing too freely, in which case the proper treatment is root-pruning or lifting. You did not describe the situation in which the trees are planted.

BEES: Queen Bee. Your queen will certainly be past her prime next season. As you wish to increase your stocks, you could easily make three colonies from your present stock, and then, in 1911, you would have three hives headed by young and vigorous queens, from which you could reasonably expect excellent results. During next April stimulate your queen by feeding her with syrup, and when drones are flying in your neighbours' apiaries, remove any comb containing little or no brood, and replace it by a frame placed in the centre of the brood chamber containing a full sheet of foundation (worker base). Over this place the syrup bottle, and in three days remove the queen, and any frame containing very young brood, as from this latter the poorest queens are raised. To encourage the forma-

tion of queen cells, some of the cells containing eggs can be enlarged by breaking down the edges below the eggs. The best are those down the sides and at the lower corners of the frame. After 10 days the cells will be sealed, and then you may cut out the queen cells with some of the surrounding cells, and attach them with great care in a hole cut in the centre of the other combs, fixing them with pins. The brood frames and frames of honey should be shared out, with equal portions of the bees. These will be placed in a contracted hive, with the queen cell on the centre comb. In about a fortnight, if the weather is good, each should have a laying queen. The three hives should at first be placed near the old stand, but will need to be removed 3 feet each fine day until they are at least 6 feet apart.

BOOKS: J. B. H., *Leitchworth*. Either of the following works will be suitable for your purpose:—*Dictionary of Gardening*, by Geo. Nicholson; *Johnson's Gardener's Dictionary*, or *The Encyclopedia of Gardening*, by T. W. Sanders. You can obtain these from our publishing department.

CHRYSANTHEMUM EXHIBIT: *An Old Reader*. The schedule required coloured varieties, but you awarded the first prize to a white variety. This was not in accordance with the conditions of the schedule.

CHRYSANTHEMUM UNHEALTHY: *Victoria*. No disease is present in the shoots; the trouble must be due to some cultural treatment.

EXAMINATIONS: A. B. C., *Surrey*. You might apply to the Board of Agriculture for the information needed.

NAMES OF FRUITS: *Scarle*. 1, The Queen; 2, Gooseberry Apple; 3, Roundway Magnum Bonum.—W. H., Apple Peasgood's Nonesuch, Pear Beurré Diel.—M. A. J., 1, Sandringham; 2, Reimette de Caux; 3, Bergamotte Esperen; 4 and 5, Beurré Diel; 6, decayed.

NAMES OF PLANTS: S. Ely. Your tree is not the Butternut (*Juglans cinerea*) but the Black Walnut (*Juglans nigra*).—J. C. B., *Calanthe Veitchii*. The flowers vary in tint from various causes. The colour is often not well developed in dull, sunless seasons. The presence of impure air in the plant-house will often cause the blooms to change almost white.—H. N., Well-grown blooms of *Cypripedium* insigne of the old type.—P. T. T., 1, *Oncidium cheiroporum*; 2, *Stelis ophioglossoides*; 3, *Ocoteira diaphana*; 4, *Oncidium flexuosum*; 5, *Odontoglossum Lindleyanum*; 6, *Calanthe rosca*.

RECORD GRAPE: J. S. The heaviest bunch of Grapes of which we have record was shown at the International Fruit Show held in Edinburgh on September 15 and 16, 1875. The variety was Raisin de Calabre, and the weight was 26 lbs. 4 ounces. It was grown in Mr. Douglas's garden at Eskbank, Dalkeith, the gardener being Mr. Curror. An illustration of the bunch appeared in the issue of this journal for September 25 of that year. In the accompanying text it was stated to be a handsomely-formed bunch, the berries closely and solidly packed so that the shoulders stood out firmly in all directions; the "bloom" was perfect. Another remarkable bunch of Grapes, weighing 25 lbs. 15 ounces, was exhibited at the same show; the variety being White Nice. This was shown by John Jardine, Esq., Arkleton, Langholm, Glasgow (gr. Mr. Dickson).

RICHARDIA (ARTUM) LEAVES SPOTTED: H. S. The black blotches are caused by *Monilia primosa*. Spray the plants with dilute Bordeaux mixture, after first removing the diseased leaves.

TO DESTROY ANTS: H. A. Where the nests can be easily reached, the simplest plan is to pour boiling water over them. If this is difficult, inject a little bisulphide of carbon or vaporite into their burrows. Another effective remedy is the "Ballikibirain Ant Destroyer," prepared by Messrs. Alex. Cross & Son, Glasgow. This is very poisonous, and should be used with care.
